RAMP
Warning to Boaters!
Lone Cabbage Reef is now covered with rock
Lone Cabbage Reef has been a shallow reef for centuries.
It has recently been covered with limerock boulders to aid in oyster reef restoration.
It is 3 miles long and covered at high tide.
The reef is temporarily marked with white poles.
Permanent navigation markers will soon show the locations of inlets.
For more information about the project see http://www.wec.ufl.edu/oysterproject/restoration.php
