Rough height difference of 24" – the 10' we want to come out would be by the back post by the existing slab. We are proposing to do a block retaining wall with pavers to match the existing by the house. If we can put the pavers in, we would like to turn the last part of the stair onto the patio verses coming down to the wood deck like it is here.

ATTACHMENT 4

We want to come out from the existing garage 10' and this is equal to the outside post by the existing slab on grade

The plan would be to remove the last set of stairs on the left down to the wood deck and return them to the right and have them land on the paver patio,
