Facility Condition Summary

A single-story building housing offices, lab, and break/conference room.

HVAC is one packaged rooftop heat pump unit, plus lab fume hood and locker room exhaust fans. Plumbing includes one locker room, one drinking fountain, and support for the lab and breakroom kitchenette. No fire sprinkler or alarm. Power sub-fed from adjacent UV Building. Fluorescent lighting with manual control. High-speed fiber-optic data and SCADA.

Facility Condition Summary

A single-story building houses the bio-solids dryer and sludge storage. A pre-engineered metal building frame integrated with CMU base. The pitched gable form roofing is standing seam metal on steel structure, walls are a combination of concrete masonry units and metal wall panels.

Gas-fired overhead infrared heaters; process exhaust fans; minimal plumbing; no fire sprinkler or alarm; power sub-fed from adjacent Equipment Building.

Facility Condition Summary

A single-story brick building with a newer membrane roof on wood deck on wood timbers. Converted use in 1997 for controls, and contains three process pumps for secondary treatment, maintenance shop, and operator office. Underutilized, this facility can be updated to house operator work spaces into the former lab, and to accommodate needs with an addition for maintenance shop and storage (see G9090 - Other Site Systems, under Infrastructure).

HVAC includes several electric resistance unit and wall heaters with no mechanical ventilation other then the bathroom exhaust fans - however there are operable windows and doors. Small locker room. Former wet-lab, now used for makeshift office space. Original (1972) plant power system, mostly abandoned in place, plus several newer smaller panels. Aging fluorescent light fixtures. No fire sprinkler or alarm. SCADA panel.

Facility Condition Summary

The Equipment Building is a one-story concrete masonry building with metal trusses and low-slope roof. There is also a basement housing equipment and a small operations office. The building houses equipment for primary and secondary systems including primary treatment pumps, grit removal, secondary blowers, centrifuge, and additional primary and secondary pumps.

Multiple HVAC exhaust fans and some unit heaters, with poor ventilation in several areas, specifically the centrifuge room, with corrosive gasses damaging other systems. One restroom and plant water system. No fire sprinkler or alarm. The electrical room sub-feeds adjacent buildings and process equipment and includes a standby generator. Lighting is aging fluorescent. Minimal low voltage systems; but includes SCADA process control.

Facility Condition Summary

A single-story concrete masonry building with membrane roof on metal deck and structure. This facility houses the tertiary filtration and UV treatment, plant water reuse, and effluent pumps.

HVAC includes electric resistance heat and several exhaust fans. No significant plumbing other than plant water system. No fire sprinkler or alarm. The electrical room serves the east campus area, and includes a 250 kW standby diesel generator. Fluorescent lighting and minimal low-voltage systems, other than process control and SCADA.

Facility Summary

City of Camas
Wastewater Treatment Plant
Wastewater Treatment Plant Infrastructure

1129 SE Polk Street
Camas, WA 98607

Facility Condition Summary

This fence enclosed site contains the wastewater treatment plant and operations office serving the city.

City water, on-site sewer direct to waste-water treatment plant (WWTP), private utility natural gas, public utility power, high-speed fiber-optic data, on-site storm water management, and extensive WWTP process structures, equipment, pumps, piping, and controls.

A WWTP process study was completed by HDR in 2015, with update during the City-wide sewer plan of 2020; plus separate 2020 Gray & Osborne (G&O) Inflow & Infiltration (I&I) study in conjunction with National Pollution Discharge Elimination System (NPDES) permit - reportedly, I&I is substantial and represents a significant Operations & Maintenance (O&M) cost reduction opportunity.

Reportedly, Alliant is contracted to provide maintenance services for building facility HVAC (heating, ventilating & air-conditioning) equipment throughout the WWTP, and reportedly has a detailed list of equipment maintained - noting some equipment does not appear to be fully maintained - further investigation is suggested. All direct process equipment, including foul air exhaust, but not general space HVAC, such as general space exhaust fans and make-up air louvers, are maintained by WWTP O&M staff. WWTP staff use Rockwell Automation's "Fiix" CMMS (computerized maintenance management system) for maintenance management.

G30 Site Civil / Mechanical Utilities						
G3030 Storm Sewer	1972	1997	3	DCS	01/10/22	On-site storm water management with catch basins to storm water detention and apparent infiltration on the southwest portion of the site, reportedly with overflow to the adjacent Columbia River. Localized flooding in several areas, including at the main entry at the southeast corner of the site - minor maintenance to improve. Reportedly, the wastewater hauler truck dump pad drains to storm, instead of to WWTP influent - minor maintenance to redirect.
G3060 Fuel Distribution	1972	1997	3	DCS	01/10/22	One NW Natural gas rotary meter No. 992137 at northwest exterior wall of the Bio-solids Building, with 5,000 cfh capacity; in turn sub-feeding the adjacent Digester Building, reportedly including SCADA gas sub-metering. Additionally, digester gas is distributed from the Digester Building to both the digester boiler and to the bio-solids dryer, reportedly submetered via SCADA to each of these two buildings. Diesel generator fuel tanks are located under the generators in the Equipment and Bio-solids Buildings.
G40 Site Electrical utilities						
G4010 Electrical Distribution	1972	1997	2	DCS	01/10/22	Clark PUD utility power underground to three 480V, three-phase services: 1) Original (1972) Control Building meter No. 88-677-808, with 800A capacity, but largely no longer utilized, 2) 1997 Equipment Building meter No. 81-463-997 with 1,200A capacity, and 3) 1997 UV Building meter No. 41-401-004 (19214-C34IR3) with 600A capacity. The Equipment Building switchgear powers most of the buildings and plant equipment to west; whereas the UV Building switchgear powers the buildings and plant equipment to east, excepting the Control Building and certain loads sub-fed therefrom. There are two 250 kW diesel generators, located adjacent to the electrical rooms in both the Equipment and UV Buildings, in turn sub-feeding automatic transfer switches (ATS) in past mission-critical buildings, but not the Digester and/or Bio-solids Buildings.
G4020 Site Lighting	1972	1997	3	DCS	01/10/22	Aging high-pressure sodium and/or metal halide exterior lighting - aging but functional with no issues reported.

Facility Summary

City of Camas
Wastewater Treatment Plant
Wastewater Treatment Plant Infrastructure

1129 SE Polk Street
Camas, WA 98607

Facility Components

Systems	Original System Date	Last Renewal Date	Score	Surveyor	Survey Date	Comments
G Sitework						
G40 Site Electrical utilities						
G4030 Site Communications and Security	1972	2010	2	DCS	01/10/22	High-speed fiber-optic data service to the WWTP site for City network connection; plus separate fiber-optic system linking each building's SCADA cabinet with others. Minimal site electronic security including keypad entry gate control and limited site perimeter CCTV monitoring.
G90 Other Site Construction						
G9010 Service and Pedestrian Tunnels	1972	1997	2	DCS	01/10/22	Extensive vaults, trenches, stairs, and bridges between buildings and large process equipment - no issues reported.
G9090 Other Site Systems	1972	1972	3	TRB	01/10/22	Landscape and equipment storage. Roughly 30' x 30' garage (reroofed in 2019), but functionally obsolescent due to size.

Message from the Director

Core to our city, our community, and our residents are the parks, open spaces, forested lands, and recreational system that you've had a hand in building and growing. These treasured amenities compel stewardship as a core value, create great places, and engage our community to be active and healthy. It has been my great honor to start my tenure as Camas Parks & Recreation Director by working with the community, Parks and Recreation Commission, City Council, Planning Commission, City staff and the consultant team to develop this Parks, Recreation and Open Space Plan that will help guide the City and the Parks and Recreation Department over the next 6+ years to maintain, care for and grow this beautiful system we call home. Please join me on the trail to accomplishing our shared vision for Camas.

Trang K. Lam, Parks & Recreation Director

Executive Summary

The City of Camas owns and manages over 1,000 acres of parks and open spaces, which supports a range of active and passive recreation experiences. The park and recreation system provides developed parks with playgrounds, public waterfront access sites, active recreational facilities for team sports, a skate park and 12 miles of walking paths and trails.

Additionally, recreation facilities and services available within Camas are a major community asset and support the physical, mental and social health of community members. Camas residents can also access additional parks, trails, open spaces and recreational facilities provided by Clark County, the Camas School District, the Port of Camas-Washougal, and the cities of Washougal and Vancouver.

This Parks, Recreation and Open Space (PROS) Plan is a six-year guide and strategic plan for managing and enhancing park and recreation services in Camas. It establishes a path forward for providing high quality, community-driven parks, trails, open spaces and recreational opportunities. The Plan proposes updates to service standards for parks and trails and addresses goals, action items and other management considerations toward the continuation of quality recreation opportunities to benefit the residents of Camas.

Camas is preparing for continued growth, with a forecasted 2035 population of approximately 34,100. New investments in parks and recreation will be necessary to meet the needs of the community, support youth development, expand opportunities for inclusion, provide options for residents to lead healthy, active lives, and foster greater social and community connections.

This Plan was developed with the input and direction of Camas residents. The Plan inventories and evaluates existing park and recreation areas, assesses the needs for acquisition, site development

and operations, and offers specific policies and recommendations to achieve the community's goals. Through a robust and COVID-sensitive community engagement process, the Community feedback can be synthesized into three core, community priorities:

- Maintain what we have,
- Fill gaps and improve trail connections, and
- Develop and improve existing park.

With these key community priorities in mind and thorough data driven evaluation of the system, the following Plan findings and recommendations will help Camas meet its growth sustainably:

Maintain what we have

Mindful stewardship of over 1,000 acres of parks and open spaces will require strengthening of maintenance and operational approaches. Specifically, the Plan recommends the preparation of a system-wide Open Space Management Plan to guide City staff in the care, maintenance and stewardship of open space, along with an Urban Forestry Management Plan to examine the health and coverage of the urban forest. These two plans should define an implementation program that effectively carries out the maintenance and operations strategies outlined in the plans.

Fill gaps and improve trail connections & develop and improve existing parks

The Plan includes a modest acquisition program to secure strategically located sites for future parks and/or trail corridors. To connect Camas' residents to destinations throughout the City and provide healthy and safe options for walking and bicycling, the Plan recommends additional trail development, and trail connections including sidewalk and bike lane improvements, along with coordination with local subdivision and site development projects for smaller scale linkages.

Serving existing and future residents will require improvements to existing parks and additional investments in the park, trail and recreation system. To ensure existing and new parks provide desired recreational amenities and offer safe and accessible opportunities to play and gather, the PROS Plan recommends investments throughout the park system to enhance accessibility, safety and usability of park features. Recommended projects include an all-inclusive play area, water feature, pump track, sport field enhancements and mountain bike trails.

Implementing the Plan

The City has built an amazing system of developed parks, trails and open spaces. Per capita, the Camas community enjoys more park land and trail miles than other similarly sized cities. In the last decade, the City has been fortunate to add nearly 463 acres into its system. Despite flat staffing levels since 2010, developed parks have been well maintained; however, park amenities are aging out of their life cycle and levels of service for maintenance of open space have not kept up with acquisition. The City currently relies on Park Impact Fees (PIF), Real Estate Excise Taxes (REET), grants, donations, and general and special revenue funds to finance individual projects or programs. Periodically updating the existing PIF program, which assesses fees on new development to meet the increased demand for parks, will allow the City to obtain future acquisition and development funding from residential development. Dedicated, new funding will be required to finance maintenance and operations, upgrades to, and growth in the parks system to meet community needs.

The Camas community is reaching a size that will result in greater public demand for major facilities investments such as a recreation center with aquatics programs and a sports field complex, which will require additional public and policy conversations. Bond or levy will be needed to augment existing revenue to support major investments such as parkland acquisitions and development, trail development, recreational facilities, waterfront opportunities and general park element upgrades. Such mechanisms would require both political and public support. State and federal grant programs offer additional potential opportunities to leverage available local revenues to fund specific projects.

CHAPTER 1

A Thriving **CAMAS**

When my kids were young, activities such as the Easter Egg Hunt and Boo Bash were important as was safe, accessible and fun playground equipment. Without children in our household, I'm more interested in trails, both walking and biking.

- Online Open House participant

Purpose of the Plan

The City of Camas Parks, Recreation & Open Space Plan (PROS Plan) is an update to the 2014 Parks, Recreation & Open Space Plan that builds on the previously completed planning work and incorporates the feedback from an extensive community engagement process conducted throughout 2021. This Plan creates a vision for a thriving, inclusive, and interconnected system of parks, trails, and open space that promotes recreation, health,

Photo: Paul Newmann

environmental conservation, and fiscal responsibility as integral elements of a thriving, livable Camas.

The PROS Plan serves as a blueprint for the growth, enhancement, and management of the City of Camas park and recreation system and assists in guiding decisions related to planning, acquiring, developing, and maintaining parks, open space, trails, and recreational facilities. This Plan also identifies priorities for recreation programs and special events.

The 2022 PROS Plan provides updated system inventories, demographic conditions, needs analyses, and a comprehensive capital project list. The Plan identifies parks and recreation goals and establishes a long-range plan for the Camas park and recreation system, including action items and strategies for implementation over the next six to ten years. The recommendations in this Plan are based on community input, evaluations of the existing park system, operating conditions, and fiscal considerations.

The PROS Plan is part of the City's broader Comprehensive Plan and is consistent with the guidelines established by the Washington State's Growth Management Act. The PROS Plan, updated approximately every six years, allows Camas to remain current with community interests and retain eligibility for state grants through the Washington State Recreation and Conservation Office (RCO), which administers various grant programs for outdoor recreation and conservation efforts.

Planning Process

This PROS Plan represents the culmination of a year-long planning effort, and it reflects the community's interests and needs for parks, open space, trails, and programming - balanced with the realities of budget considerations. The planning process, which included a variety of public outreach activities, encouraged public engagement to inform the development of the priorities and future direction of Camas' park and recreation system. Community members expressed their interests through surveys, an online open house, stakeholder interviews, focus group discussions, tabling at events, online outreach, Parks and Recreation Commission meetings, and City Council meetings.

In addition to community engagement, the actions identified in this Plan are based on:

- An inventory and assessment of the City's existing park and recreation facilities to establish the system's current performance and to identify needed maintenance and capital repair and replacement projects, and
- Service level and walkability assessments to quantify the system's ability to serve current and future residents.

The Plan's capital facilities section and accompanying implementation and funding strategies are intended to sustain and enhance, preserve, and steward the City's critical parks and recreation infrastructure.

Department Overview

The City of Camas Parks and Recreation Department (Department) provides and manages a wide range of places that provide year-round active and passive recreational opportunities for residents and visitors. The Department develops, operates and maintains:

- 16 developed parks, including Fallen Leaf Lake Park
- A variety of outdoor recreation facilities, ranging from playgrounds and picnic areas to boating and water access points, to sports facilities like the Camas Skate Park and Prune Hill Sports Park
- Three indoor recreation and community gathering facilities – the Camas Community Center, Lacamas Lake Lodge, and Scout Hall
- 12 miles of City trails
- Over 1,060 acres of parks and open space

The Department also provides special events and recreational programs – including sports instruction, arts and crafts, and general education programs – for residents of all ages, often in partnership with local businesses.

Guided by Values

As part of this PROS Plan update, the Parks and Recreation Commission took the opportunity to update the Department's vision and mission statements to reflect current community input. The vision and mission statements, along with the PROS Plan goals, will guide the Department's work in the coming years.

Mission:

Camas Parks and Recreation promotes a healthy and sustainable community by listening and responding to the community's needs and desires, protecting and preserving its natural spaces to improve ecological health, and developing and maintaining parks, trails and recreation programs that are welcoming for all.

Vision:

We envision Camas as a thriving, cohesive community that honors a unique legacy of coordinated parks, trails, natural areas and diverse recreation opportunities highlighted by our lakes, rivers and streams. Stewardship and thoughtful enhancement of these assets ensure a safe, healthy, active and balanced lifestyle for all.

Accomplishments Since the 2014 Plan

The 2014 PROS Plan guided City officials, management, and staff in making decisions about planning, operating, and implementing various parks and recreation services. The following represents a short list of the major accomplishments realized following the adoption of the previous Plan:

- Opened the Lacamas Lake Lodge and Conference Center
- Prepared a site master plan to guide renovations to Fallen Leaf Lake Park
- Completed the first phase of field and site improvements for the Prune Hill Sports Park
- Constructed the Cooper's View Neighborhood Park
- Prepared a site master plan to guide renovations to Crown Park
- Acquired multiple properties along the north shore of Lacamas Lake, also known as Legacy Lands, (165 acres) and forest land at Green Mountain (115 acres)

Parks & Recreation Commission

Additionally, the efforts of the Department are guided by the Parks and Recreation Commission, a seven-member advisory group to the City Council. The Commission meets monthly to provide guidance and give recommendations on policy and issues relating to the delivery of parks and recreation services. The Commissioners are appointed by the Mayor and subject to confirmation by the City Council for three year terms.

Current Challenges

Impacts of the COVID-19 Pandemic

The COVID-19 pandemic and the associated health mandates for social distancing have transformed the way municipalities plan for and conduct public engagement. To develop this Plan, the City implemented a sound public process that was compliant with health mandates by using a range of online tools for communications, engagement and community feedback.

Health mandates related to the pandemic also had dramatic impacts on the City's recreation programming and operations, requiring the temporary closure of some facilities, capacity and use restrictions, and the cancellation of recreation programming. However, with improvements in local caseloads, Camas has now begun to offer in-person recreation programs and community events.

Equity, Inclusivity & Accessibility

Much has been written lately about the subject of equity and inclusion. Maintaining and enhancing social equity across recreational opportunities and facilities should be a core function of municipal park and recreation systems. Through this PROS Plan, the City of Camas made a concerted effort to reach out to and engage its historically underrepresented communities, and the City also invested in a dual language community survey to include Spanish.

Also, portions of the City's parks, trails and open space system were developed before the Americans with Disabilities Act (ADA) was implemented. The conditions assessment identified several deficiencies related to ADA compliance. The City must continue to find ways to provide safe and

equitable access to parks, trails, open space areas, facilities, recreation programs and other services.

Growth & Development

Over the past ten years, Camas has seen rapid population growth, which is expected to continue over the coming decade. More residents and new development will increase the need for recreational spaces and experiences across the city and increase the use of existing parks and facilities. Rapid growth will also intensify existing community needs for safe and accessible walking and biking routes as well as the preservation of open space and natural resources. In response, the City should consider ways to improve recreation facilities and parks to adapt to emerging needs, complete crtical connections in the City's extensive trail network, and proactively aquire or preserve parks and open spaces in strategic areas.

Asset Management

Established park and recreation systems require ongoing maintenance to serve the community safely and effectively. Public recreation providers across the country consider maintaining existing park facilities to be a key management issue. Poorly maintained assets – from benches to playgrounds to pools – can fail, either structurally or operationally, posing safety risks and reducing their recreational value. Aging infrastructure may also fail to meet community expectations or need capital upgrades to adapt to changing community needs. However, recreation providers often struggle to establish adequate funding mechanisms for routine and preventative maintenance and repair of facilities as well as the major rehabilitation and replacement of existing recreation facilities at the end of their useful life.

This Plan includes condition assessments of the City's parks and facilities to provide a baseline of current conditions that then informs facility, maintenance, and operations policies and improvements. Proper maintenance of park and recreation assets will prevent them from deteriorating thereby reducing long-term capital and operating costs, maintaining safety, improving public perception and increasing community use.

Active Older Adults

The City of Camas' relatively older population, low rates of disability among residents over 65, and high rates of participation among residents of all ages, indicate a potential local need for active recreation opportunities for active older adults. Nationwide, active seniors are often looking at retirement age differently, and many are transitioning to new careers, finding ways to engage with their community, and focusing on their health and fitness. To meet the needs of active older residents, the City will need to consider how the City's park and recreation facilities and programming can meet the needs of this growing group.

Guiding Documents

This PROS Plan is one of several documents that comprise Camas' long-range planning and policy framework. Past community plans and other relevant documents were reviewed for policy direction and goals as they relate to parks, open space, trails, and recreation opportunities across Camas.

- Comprehensive Plan Camas 2035
- City of Camas Strategic Plan
- Camas Parks, Recreation and Open Space Plan (2014)
- City of Camas Transportation Plan
- Lacamas Lake Management Plan (under development)
- North Shore Lacamas Lake – A Vision for Conservation and Recreation (2017)
- Lewis & Clark Regional Trail Concept Plan (2020)
- Clark County Conservation Areas Acquisition Plan (2020)
- Clark County Parks, Recreation & Open Space Plan (2020)
- City of Washougal Comprehensive Parks & Recreation Plan (2021)

Contents of the Plan

The remainder of the Camas PROS Plan is organized as follows:

- Chapter 2: Community Profile – provides an overview of the City of Camas and its demographics.
- Chapter 3: Community Engagement – highlights the methods used to engage the Camas community in developing the Plan.
- Chapter 4: Classifications & Inventory – describes the existing park and recreation system.
- Chapter 5: Parks & Trails
- Chapter 6: Open Space & Stewardship
- Chapter 7: Recreation & Events
- Chapter 8: Operations & Maintenance
- Chapter 9: Goals & Objectives – provides a policy framework for the park and recreation system grouped by major functional areas and goal themes.
- Chapter 10: Capital Planning & Implementation – details a 6-year program for addressing park and recreation facility enhancements, maintenance, or expansion projects.
- Appendices: Provides technical or supporting information to the planning effort and includes survey summaries, focus group notes, recreation trends, and funding options, among others.

CHAPTER 2

Community **PROFILE**

Situated in the eastern, hilly portion of Clark County, the City of Camas offers many amenities for the community including a quaint yet vibrant downtown, First Friday evening family events, a beautiful public library, summer farmer's market on Wednesdays, Lacamas Lake and miles of surrounding trails to walk, and much more.

The City of Camas is located along the Columbia River and State Route 14 in southwestern Washington. Incorporated in 1906, Camas is now home to 26,065 residents. Camas prides itself on its small-town character, vibrant downtown, safe residential neighborhoods, and an abundance of open space and trails.

Most of the City is developed with single family homes interspersed with forested green spaces. The City's historic downtown attracts locals and tourists while major employers, including many high-tech manufacturers, provide employment opportunities for city and regional residents. The City is bordered to the east by the City of Washougal and by the City of Vancouver to the west. Camas is located just 20 miles from downtown Portland, Oregon.

The City of Camas provides a wide range of government services and is dedicated to maintaining the community's family-friendly character while providing sustainable economic growth and preserving the city's access to nature. The City's parks, open spaces, trails, and recreational opportunities are highly valued – for recreation, respite, and their ecosystem values.

"I love the walking trails through the natural areas SO MUCH!! Would love to have more of them connected.

- Online Open House participant

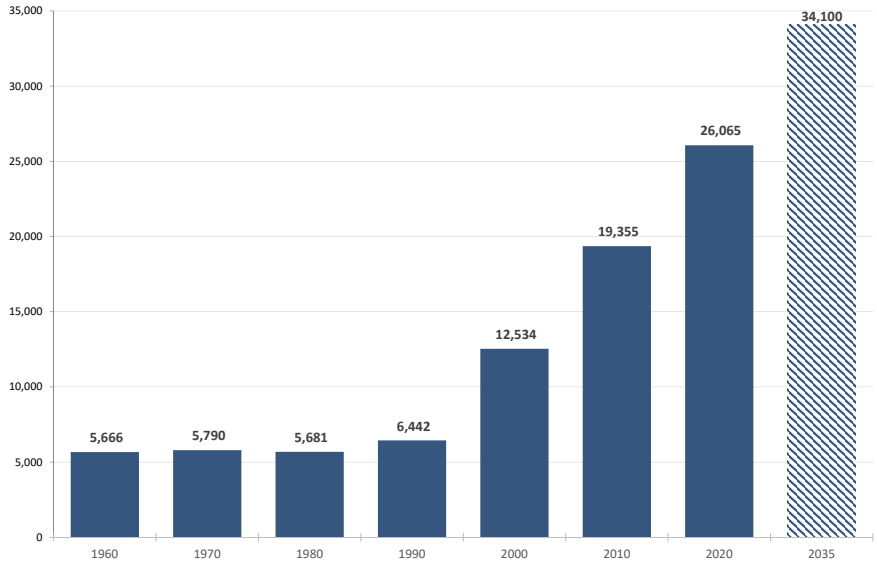
Demographic Profile

Camas is a city of over 26,000 residents and has tripled in population over the past thirty years. The city is home to many families with children, see Figure 1. The City's residents are generally very well educated and have higher incomes than other county residents. Many are employed in the education, health care, professional, or manufacturing sectors, including at the multiple technology companies located in Camas. Residents also commute to other areas of the Portland-Vancouver metropolitan region for work.

Figure 1. Population Characteristics: Camas, Clark County, and Washington

Demographics	Camas	Clark County	Washington
Population Characteristics			
Population (2020)	**26,065**	503,311	7,705,281
Population (2010)	**19,355**	426,709	6,724,540
Population (2000)	**12,534**	347,510	5,894,121
Percent Change (2000-20)	**100.0%**	45.0%	31.0%
Persons w/ Disabilities (%)	**9.1%%**	12.3%%	12.7%%
Household Characteristics			
Households	**9,234**	195,036	3,202,241
Percent with children	**45.1%**	33.8%	30.6%
Median Household Income	**$111,584**	$75,253	$73,775
Average Household Size	**2.81**	2.69	2.55
Average Family Size	**3.16**	3.15	3.09
Owner Occupancy Rate	**77.7%**	67.0%	63.0%
Age Groups			
Median Age	**40.2**	38.4	37.7
Population < 5 years of age	**5.6%**	6.2%	6.1%
Population < 18 years of age	**28.5%**	24.3%	22.2%
Population 18 - 64 years of age	**59.6%**	60.7%	62.7%
Population > 65 years of age	**11.9%**	15.0%	15.1%

Sources: Washington Office of Financial Management Population Estimates, 2020
U.S. Census, 2000 Census, 2010 Census, 2015-2019 American Community Survey



Population and Anticipated Growth

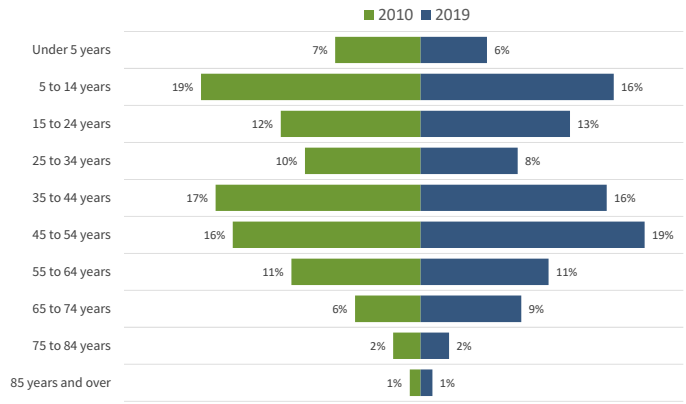
The City of Camas incorporated in 1906 and grew slowly through most of the 20th century, see Figure 2. However, the completion of the Interstate 205 bridge and the opening of Hewlett Packard and Tektronix plants in the mid-1980s spurred rapid growth. Between 1990 and 2000, Camas' population nearly doubled, from 6,442 to 12,534 residents. Continued economic expansion in the technology industry, expansion of the city limits through annexation, and the City's proximity to the growing Portland, Oregon and Vancouver, Washington have spurred steady growth in the past two decades. In 2020, Camas was home to about 26,065 residents and makes up about 5% of the total population of Clark County. Annual population growth has averaged over 5% per year over the past forty years. The Camas 2035 Comprehensive Plan projects that the city will grow to about 34,100 people by 2035, equivalent to about 2.05% annual growth over that period.

In 2020, Camas was home to 9,235 households of which 45% were families with children under 18, and 36% were individuals living alone. The 2019 average household size in Camas was 2.81 people, which is quite a bit larger than that of the county (2.69) and state (2.55).

The size of a community and its anticipated growth over time are key indicators of whether existing park and recreation facilities will be sufficient to meet future needs. Population growth can also result in increased residential density and/or the development of currently vacant land within a city, potentially increasing the need for away-from-home recreation opportunities while simultaneously reducing potential locations for park and open space acquisition. Advanced planning for parks and recreation facilities can help ensure residents can enjoy sufficient, conveniently located parks, open space, and recreation facilities while the community grows and evolves.

Figure 2. Population – Actual and Projected: 1970-2040

Age Group Distribution



Camas has a median age of 40 (2019), older than that of the county (38.4) and state (37.7). The City also has a relatively high population of families with children (45%). These demographics have important implications for park and recreation needs. Adults between 40 to 59 years old make up the city's largest 20-year population group, comprising 35% of the overall population in 2019, see Figure 3.

- Youth under 5 years of age make up 5.6% of Camas' population, see Figure 3. This group represents users of preschool and tot programs and facilities, and, as trails and open space users, are often in strollers. These individuals are the future participants in youth activities.
- Children ages 5 to 14 years make up current youth program, whole-family program, and event participants. Approximately 16% of the city's population falls into this age range.
- Teens and young adults, age 15 to 24 years, are in transition from youth programs to adult programs and participate in teen/young adult programs where available. Members of this age group are often seasonal employment seekers. About 13% of city residents are teens and young adults.

While just over one-third of residents are youth and young adults up to 24 years of age, 43% are 25 to 54 years old, and 23% are 55 and older.

- Adults ages 25 to 34 years are users of adult programs. Approximately 8% of residents are in this age category. These residents may be entering long-term relationships and establishing families.
- Adults between 35 and 54 years of age represent users of a wide range of adult programs and park facilities. Their characteristics extend from having children using preschool and youth programs to becoming empty nesters. This age group makes up 35% of the city's population.
- Older adults, ages 55 years plus, make up approximately 23% of Camas' population. This group represents users of adult and senior programs. These residents may be approaching retirement or already retired and may be spending time with grandchildren. This group also ranges from very healthy, active seniors to more physically inactive seniors.

Figure 3. Age Group Distributions: 2010 & 2019

Race and Ethnicity

According to the 2019 American Community Survey, Camas residents identified as 84% White, 8% Asian, 6% as two or more races, and less than 1% Black or African American, American Indian or Alaskan Native, Pacific Islander, or another race. Approximately 5% of people identified as Hispanic or Latino of any race. Camas' low level of racial diversity is on par with that of Clark County, where 85% of residents identify as White. Camas' population has become only modestly more diverse over the past decade, see Figure 4.

In 2019, approximately 11% of Camas' population spoke a language other than English at home; Asian and Pacific Island languages and other Indo-European languages comprise the largest non-English language groups. However, less than 3% of residents speak English 'less than very well'. Camas has a smaller percentage of people who speak a language other than English at home than compared to Clark County as a whole (15%).

Nationally, the design and marketing of municipal recreation programs have also historically been biased against serving communities of color. In addition, residents who speak languages other than English may face barriers in finding, accessing, and participating in park and recreation facilities and programs. Camas should consider how it could best provide recreational opportunities, programs, and information that are accessible and relevant to, and meet the needs of, all community members.

Figure 4. Changes in Racial Composition - 2000 to 2019

Racial Identification	2010	2019
White	87.4%	83.6%
Asian	6.0%	8.2%
Two or more races	3.6%	6.0%
Some other race	1.2%	0.4%
Black or African American	1.0%	0.8%
American Indian and Alaska Native	0.6%	0.9%
Native Hawaiian & Other Pacific Islander	0.2%	0.1%
Hispanic or Latino (of any race)	4.1%	4.9%

Persons with Disabilities

The 2019 American Community Survey reported 9.1% (2,092 persons) of Camas' population aged 5 years and older as having a disability that interferes with life activities. This is lower than the county (12.3%) and state average (12.7%). Approximately 8% of residents between 18 and 64 have a disability. Among residents 65 and older, the percentage rises to 25%, which is lower than the percentage found in the general senior population of Washington State (35%).

Planning, designing, and operating a park system that facilitates participation by residents of all abilities will help ensure compliance with Title II of the Americans with Disabilities Act (ADA). In addition to ADA, there are other accommodations that people with disabilities may need to access parks and participate in recreation programs. Camas should consider community needs for inclusive and accessible parks, recreational facilities, programs, marketing, and communications.

Employment & Education

According to the 2019 American Community Survey, the 2019 work force population of Camas was 17,743 (76%). Of this population, 68% is in the labor force, 2% is unemployed, and 32% is not in the labor force. Nearly 60% of employed residents work in a management, business, science, or arts occupation. One quarter of employed residents work the education or health care industries, while another 15% work in the professional/management industries. The manufacturing sector also employs a large percentage of local workers (approximately 13%).

Approximately 29% of Camas residents over age 25 have a bachelor's degree or higher, and 82% have at least some college education. This level of education attainment is higher than that of Clark County and the state (in which 68% and 69% of residents have some college, respectively). Additionally, 95% of city residents have a high school degree or higher, approximately four percentage points higher than the statewide average.

Higher levels of employment and educational attainment positively correlate with both the income and health status of a community – both of which have further impacts on the use and need for park and recreation facilities, as described in the next two sections.

Income & Poverty

A community's level of household income can impact the types of recreational services prioritized by community members, as well as their willingness and ability to pay for recreational services. Perhaps more importantly, household income is closely linked with levels of physical activity. Low-income households are three times more likely to live a sedentary lifestyle than middle and upper-income households, according to an analysis of national data by the Active Living by Design organization.

In 2019, the median household income in Camas was $111,584. This income level was about 50% higher than the median income for Clark County ($75,253) and Washington households ($73,775).

Higher income households have an increased ability and willingness to pay for recreation and leisure services, and they often face fewer barriers to participation. Approximately 56% of city households have incomes in the higher income brackets ($100,000 and greater), which is significantly more than across the state (36%).

At the lower end of the household income scale, approximately 6% percent of Camas households earn less than $25,000 annually, significantly fewer than households in Clark County (13%), the State of Washington (15%), and across the United States (23%). In 2019, less than 2% of the city's families were living below the poverty level, set at an income of $25,750 for a family of four. This percentage is lower than the countywide (approximately 5.8%) and statewide (7%) levels. Poverty affects 3% of youth under 18 and 4% of those 65 and older.

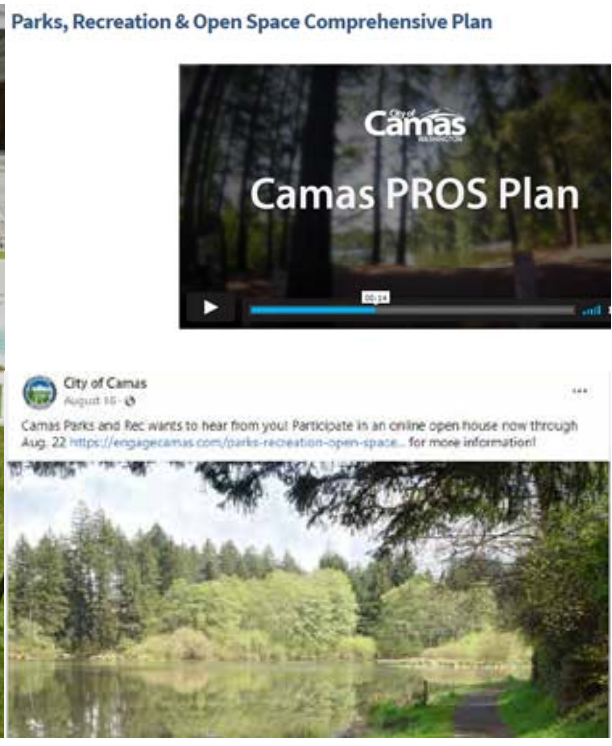
Generally, lower-income residents may face barriers to physical activity, including reduced access to parks and recreational facilities, a lack of transportation options, a lack of time, and poor health. Low-income residents may also be less financially able to afford recreational service fees or to pay for services, such as childcare, that can make physical activity possible.

Health Status

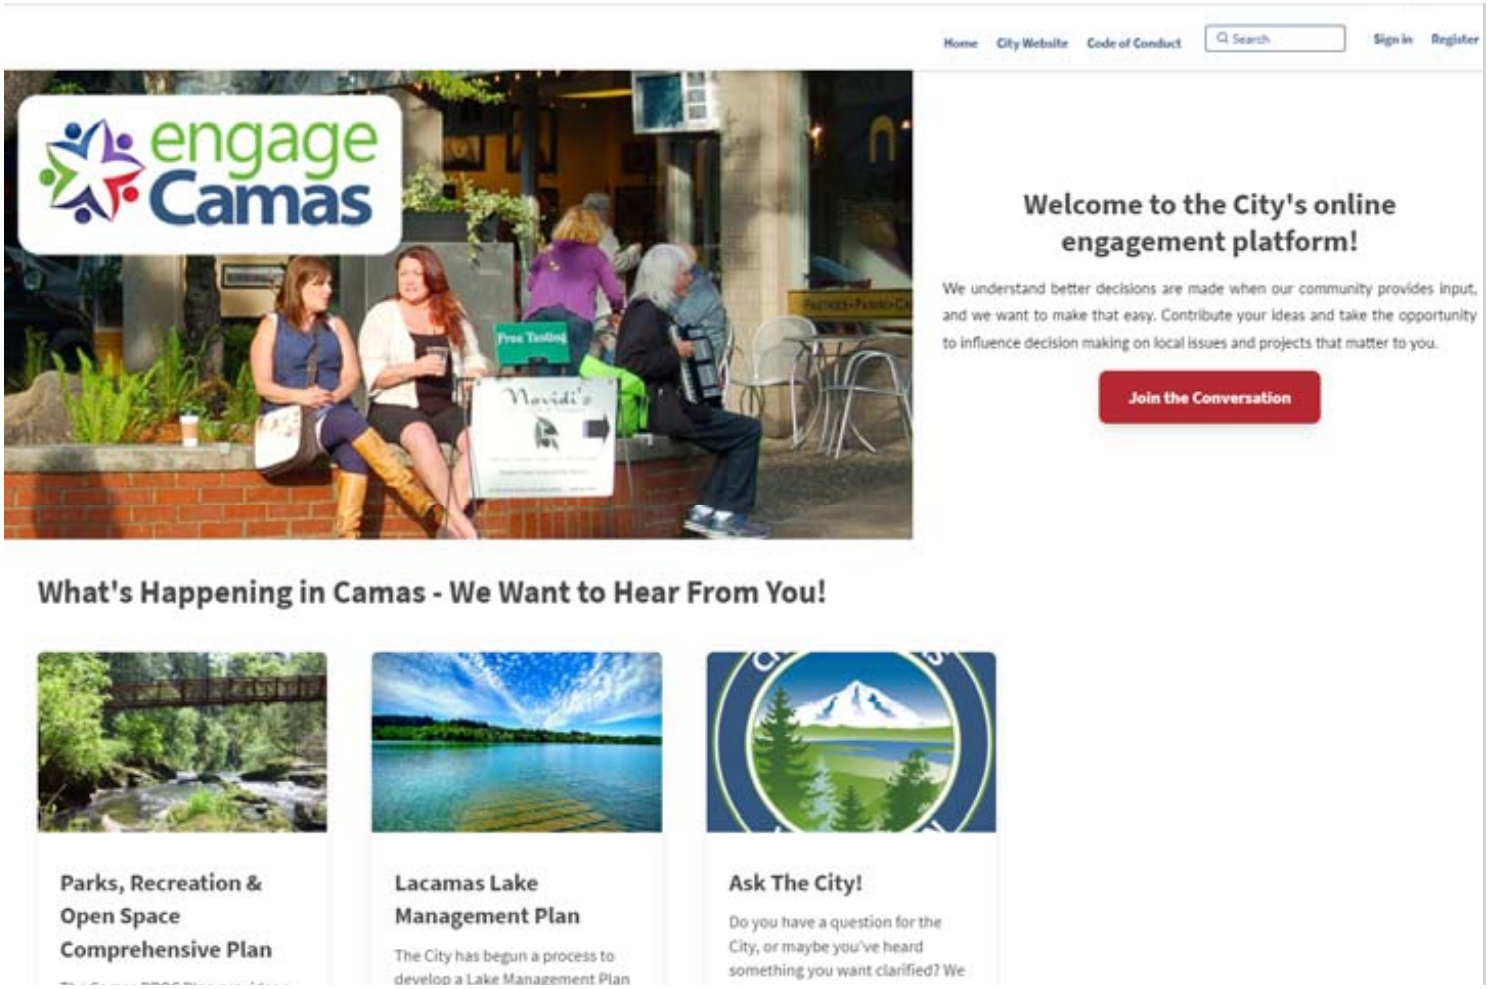
The overall health of a community's residents can impact their ability to participate in recreation and other physical activity and may also reflect, in part, the locality's level of access to appropriate and convenient green spaces, recreation opportunities, and active transportation facilities.

Information on the health of Camas residents was not immediately available. However, according to the County Health Rankings, Clark County ranks in the highest quartile of Washington counties for health outcomes, including length and quality of life.

Clark County residents also rank as some of the healthiest residents in Washington (high middle quartile) when it comes to health behaviors. Only 18% of Clark County adults ages 20 and older report getting no leisure-time physical activity – on par than the statewide average of 17%. This may be due, in part, to the large number of places to participate in physical activity, including parks and public or private community centers, gyms, or other recreational facilities. Over 96% of residents in Clark County have access to adequate physical activity opportunities, more than the 88% average for all Washington residents. However, approximately 29% of Clark County adults are overweight or obese, compared to 27% of Washington adults.



CHAPTER 3



Community **LISTENING**

Community engagement played an essential role in developing the 2022 PROS Plan. Although the planning process occurred during the COVID-19 pandemic, numerous efforts were made to connect with the community, seek their input and provide information about the project. Public outreach methods were varied and extensive, including:

- Random-sample mail survey
- Online community-wide survey in English and Spanish
- Two online open houses
- Stakeholder group discussions
- Individual stakeholder interviews
- Tabling and outreach at multiple community events
- Meetings with the Parks and Recreation Commission, Planning Commission and City Council
- Camas city website and Engage Camas online forum with interactive mapping tool, plan information and feedback opportunities
- Multiple social media postings, email blasts

Over 1,700 participants provided insights on current community preferences and priorities.

Community Survey

A community-wide, online survey was conducted to assess the recreational needs and priorities of Camas residents. The City mailed 2,500 surveys to randomly chosen households in Camas on May 29, 2021, of which 509 surveys were completed and returned. Online versions of the survey in English and Spanish were posted to the City's website on June 4, 2021. An additional 874 surveys in English and two in Spanish were completed from the general, community-wide online surveys. In all, 1,385 surveys were completed.

Information about the survey was provided on the City's website and on the Engage Camas site for the PROS Plan project. It was promoted via public meeting announcements, multiple social media postings, city email blasts and an email blast through Camas School District mailing list. Print copies were made available at the Camas Library and the Camas School District Family Community Resource Center. Also, signage and flyers with QR codes were placed at numerous parks and local businesses.

The survey measured current levels of satisfaction and which facilities were primarily being used by residents. Residents were asked about future improvements and the types of recreational amenities they would like to see considered for the park system. Survey respondents were asked about:

- Performance and quality of programs and parks
- Usage of city parks and recreation facilities
- Overall satisfaction with the value of services being delivered by the city
- Opinions about the need for various park, recreation, and trail improvements
- Preference for learning about programs
- Priorities for future park and recreation services and facilities, including revenue generation and other funding tools

Significant survey findings are noted below, and a more detailed discussion of results can be found in the needs assessment chapters covering parks, open space, recreation, and trails (Chapters 6 - 8).

Major Survey Findings:

- **Livability:** Nearly all respondents (97%) feel that public parks and recreation opportunities are important or essential to the quality of life in Camas.
- **Usage:** Park visitation is high, with 88% of respondents visiting parks or recreation facilities at least once a month. The most popular activities are walking or running (80%), followed by fitness and exercise (70%), and relaxation (56%).
- **Park Amenity Priorities:** More than three in four respondents are very or somewhat supportive of adding walking trails (87%), updated (75%) and accessible (75%) playground features, and more picnic shelters (74%) to the City's existing parks. A plurality of survey respondents think that Camas does not have enough walking and biking trails (46%).
- **Recreation Facilities & Programming:** Respondents to both the mail and online survey ranked maintaining existing parks, expanding trail opportunities, building new parks, and acquiring land for future parks as their top priorities. More than half of survey respondents felt the City needed more outdoor adventure summer camps, teen activities, adult wellness classes, and programs for adults over 55.

The complete survey summary is provided in Appendix A.

Online Open House #1

The City hosted an online open house to share information about the Camas Parks, Recreation and Open Space (PROS) Plan Update with the public and dive deeper into survey responses to explore more about which park and recreation programs, services and facilities are important to them. More than 130 people visited the online open house from July 29 and August 22, 2021, and 74 community members provided responses in the online open house. The online open house was promoted via social media posts, community event tabling, email blasts and public meeting announcements.

Major Online Open House Findings:

- After-school and summer day camps, outdoor adventure camps and youth sport programs were strongly supported by respondents.
- Top park improvement priorities included building new parks on city-owned land, installing a splash pad and building additional shared-used trails.
- Other top improvements included acquiring and developing trail corridors to fill gaps and providing an off-leash dog area.

A summary of responses to the online open house is provided in Appendix B.

Stakeholder Discussions

COVID-sensitive, online focus group discussions and individual interviews with external stakeholders were conducted to more broadly assess local needs and opportunities for partnership and coordination. Stakeholders were identified by city staff based on their past coordination, their involvement, or interest in the future of recreation, park, athletic or trail facilities. The group-based discussion sessions were conducted via Zoom and occurred between July 2020 and September 2021. Representatives from the following organizations participated:

Summary meeting notes from each focus group session are provided in Appendix C.

Engage Camas Online Forum

The City of Camas has implemented an integrated online engagement platform to their city website, called Engage Camas. The PROS Plan was a highlighted city project on Engage Camas, which included information about the plan update and public process, a video introducing the project, periodic updates and interim project documents, such as presentation materials and summaries from community outreach. Engage Camas was also a primary forum for community members to offer direct feedback, comments and questions. The PROS Plan page was maintained and updated through the duration of the project.

Online Interactive Mapping

On the Engage Camas project page, the public was provided an interactive map of Camas and given the opportunity to share which parks, trails, and open spaces they currently visit in Camas; where they think improvements need to be made; and what new things they would like to see offered in Camas' park system. Eleven unique users submitted a total of 22 comments. A highlight of some of the comments follows:

- Replace the play equipment at Grass Valley Park
- Provide parking on the north side of Lacamas Lake
- At Crown Park, consider new/updated programming to tie in with programs/activities to be offered at new Garfield Performing Arts Center, splash pad or kids pool, new restroom
- Consider a splash pad or community fountain, parking lot and picnic tables at Fallen Leaf Lake

Community Event Tabling

This section summarizes the feedback received at the three tabling events held in July and August to build awareness of the PROS Plan Update and share information about the project. Approximately 50 people were engaged at these events. Tabling was held at the following times and places:

- July 31st at Heritage Park from 10 a.m.-12 p.m. and 1 p.m. - 2 p.m.
- August 17th at Concert in the Park from 6:30 p.m. - 8:30 p.m.
- August 18 at Camas Farmer's Market from 3 p.m. - 7 p.m.

Community comments ranged from concerns about water quality at the lakes, to interest in an expanded trail network, to specific park improvements and enhanced communications from the City.

Online Open House #2

The City hosted a second online open house to share information and seek feedback on the public draft of the PROS Plan in January 2022. The online open house garnered a total of 136 survey responses and 923 site visits. The majority of participants (68%) believe the PROS Plan is on the right track. The two most common requests were for a bike park/pump track and new sports fields. Many respondents would like off road/mountain biking trails and turf and/or lights added to sport fields. A few other notable requests include adding a pool, creating more trail connections, and adding more bike lanes and trails.

Parks & Recreation Commission Meetings

The Parks and Recreation Commission provided feedback on the development of the PROS Plan during five regularly scheduled public sessions. The first session occurred on April 28, 2021, immediately after the planning project was initiated. The Commission discussed the update and provided their perspectives on a vision for the system, specific challenges, opportunities, and ideas about parks, trails and programs. The Commission spent significant effort reviewing and commenting on the PROS Plan public process, project priorities, and system-wide goals and strategies to implement improvement projects. Subsequent sessions in July, September (joint with Planning Commission), October, December 2021 and January 2022 (joint with Planning Commission) were used to review public feedback and solicit direction from the Commission on priorities and recommendations for the new PROS Plan.

Other Outreach

In addition to the direct outreach opportunities described above, the Camas community was informed about the planning process through a variety of media platforms. The following methods were used to share information about the project and provide opportunities to participate and offer comments:

- City website home page
- PROS Plan project page on Engage Camas
- Email blasts to the Parks and Recreation distribution list
- Social media: Twitter & Facebook
- Media releases
- Announcements at Council and Parks & Recreation Commission public meetings
- Announcements at Stakeholder Focus Group meeting

BENEFITS OF PARKS, RECREATION & OPEN SPACE

A number of organizations and non-profits have documented the overall health and wellness benefits provided by parks, open space and trails. The Trust for Public Land published a report called *The Benefits of Parks: Why America Needs More City Parks and Open Space*. This report makes the following observations about the health, economic, environmental, and social benefits of parks and open space:

- Physical activity makes people healthier.
- Physical activity increases with access to parks.
- Contact with the natural world improves physical and psychological health.
- Value is added to community and economic development sustainability.
- Benefits of tourism are enhanced.
- Trees are effective in improving air quality and assisting with stormwater control.
- Recreational opportunities for all ages are provided.

Physical Activity Benefits

Residents in communities with increased access to parks, recreation, natural areas and trails have more opportunities for physical activity, both through recreation and active transportation. By participating in physical activity, residents can reduce their risk of being or becoming overweight or obese, decrease their likelihood of suffering from chronic diseases, such as heart disease and type-2 diabetes, and improve their levels of stress and anxiety. Nearby access to parks has been shown to increase levels of physical activity. According to studies cited in a 2010 report by the National Park and Recreation Association, the majority of people of all ages who visit parks are physically active during their visit. Also, the Centers for Disease Control and Prevention (CDC) reports that greater access to parks leads to 25% more people exercising three or more days per week.

Community Benefits

Park and recreation facilities provide opportunities to engage with family, friends, and neighbors, thereby increasing social capital and community cohesion, which can improve residents' mental health and overall well-being. People who feel that they are connected to their community and those who participate in recreational, community and other activities are more likely to have better mental and physical health and to live longer lives. Access to parks and recreational facilities has also been linked to reductions in crime, particularly juvenile delinquency.

Economic Benefits

Parks and recreation facilities can bring positive economic impacts through increased property values, increased attractiveness for businesses and workers (quality of life), and through direct increases in employment opportunities.

In Washington, outdoor recreation generates $26.2 billion in consumer spending annually, $7.6 billion in wages and salaries, and $2.3 billion in state and local tax revenue. Preserving access to outdoor recreation protects the economy, the businesses, the communities and the people who depend on the ability to play outside. According to the Outdoor Recreation Economy Report published by the Outdoor Industry Association, outdoor recreation can grow jobs and drive the economy through management and investment in parks, waters and trails as an interconnected system designed to sustain economic dividends for citizens.

CHAPTER 4

Classifications & INVENTORY

> ***Need to provide facilities for additional outdoor activities that create community connection and activity. With the number of sporting families, Camas lacks facilities that other communities provide.***
> **- Online Open House participant**

The City of Camas manages over 1,000 acres of parks and open space lands, providing several public waterfront access sites, active recreational facilities for team sports, several playgrounds, more than 12 miles of walking paths and trails, picnic areas, and hundreds of acres of natural forest lands.

PARKLAND CLASSIFICATIONS

Parkland is classified to assist in planning for the community's recreational needs. The classifications also reflect standards that inform development decisions during site planning, in addition to operations and maintenance expectations for the level of developed facilities or natural lands. The Camas park system is composed of a hierarchy of various park types, each offering recreational opportunities and natural environmental functions. Collectively, the park system is intended to serve the full range of community needs.

Each park classification defines the site's function and expected amenities and recreational uses. The classification characteristics serve as general guidelines addressing the size and use of each park type. The following six classifications are used in Camas' park system.

Neighborhood Parks

Neighborhood parks provide close-to-home recreation opportunities. These parks provide both active and passive recreation opportunities for people living within approximately one-half mile of the park. Typical facilities found in a neighborhood park include playground equipment, picnic areas, open grass areas for passive use, outdoor basketball court, and multi-use open grass area for field sport practice. Dorothy Fox Park and Cooper's View Park are examples of typical neighborhood parks in Camas.

Neighborhood parks should be located and designed based on the scale and type of surrounding uses. During site master planning, parks in locations with higher residential density should be designed with more resilient features and facilities that can withstand more intensive use.

Site Selection & Design:

- Neighborhood park sites should be 5 to 10 acres in size. The minimum size for neighborhood parks is 3 acres when land constraints do not allow a larger site.
- At least 50% of a neighborhood park site should be suitable for active uses.
- The site should have good visibility from surrounding streets and have a minimum of 200' of street frontage.
- The site should be relatively central to the area it is intended to serve (within about ½ mile of the intended users).
- The site should be accessible by walking, bicycling, or driving. Connections to the community trail network should be provided, where possible, to facilitate walking and bicycling. Sidewalks should be provided.
- Regional-scale facilities (e.g., large sports complex, community center, etc.) should not be provided

Community Parks

Community parks are larger parks, typically between 10 and 30 acres, that provide a wide variety of recreation opportunities that appeal to the entire community. Typically, these sites are designed for active recreation, supported by facilities such as sport fields, outdoor courts, skate parks and recreation centers. Community parks can accommodate large numbers of people and offer a wider variety of facilities than neighborhood parks, such as disc golf, volleyball, tennis courts, dog parks, and group picnic areas. These parks also may serve as destination for access to water and large community events, and they may include significant natural areas and trails. For this reason, community parks require more support facilities, such as off-street parking and restrooms. Community parks can also serve as local neighborhood parks for their immediate areas, and they may be connected to schools or other community facilities. Prune Hill Sports Park and Crown Park are examples of community parks.

Site Selection & Design:

- Community park sites should be 10 to 30 acres in size. The minimum size for community parks is 6 acres when land constraints do not allow a larger site.
- At least 30% of a community park site should be suitable for active uses.
- The site should have good visibility from surrounding streets and provide parking and restrooms.
- The site should be accessible by walking, bicycling, or driving. Connections to the trail network should be provided, where possible, to facilitate walking and bicycling. Sidewalks should be provided.
- Community parks should accommodate diverse active-use recreation, such as sport fields, sport courts and large playgrounds.

Regional Parks

Regional parks may be provided by Camas and also are provided by Clark County - serving residents from throughout Clark County and beyond. Regional parks are usually larger than 50 acres in size and provide opportunities for diverse recreational activities. Facilities may include sports fields, extensive trail systems, or large picnic areas. In addition, regional parks often include passive recreation space and unique features, such as significant natural areas or access to lakes or rivers.

Site Selection & Design:

- Regional park sites should be 50 to 200 acres in size. There is no minimum size for regional parks, since the size of the site relates to the uniqueness of the landscape or recreational experience provided.
- Regional parks should provide parking and restrooms.
- The site should be accessible by walking, bicycling, or driving. Connections to the trail network should be provided, where possible, to facilitate walking and bicycling.
- Regional parks may accommodate active-use recreation and/or passive uses such as trail walking or wildlife viewing. Specialized regional amenities may be provided, such as mountain biking trails, equestrian trails, and water access (e.g., boat ramps & docks).

Special Use Areas

Special use areas are sites that are occupied by a specialized facility or that fulfill a specialized purpose. Some uses that fall into this park type include waterfront parks, pools, boat ramps, interpretive centers, botanical gardens, community gardens, single purpose sites used for a particular field sport or sites that offer indoor recreation opportunities. Fallen Leaf Softball Field, Lacamas Lodge and the Camas Community Center are examples of special use areas in Camas.

Site Selection:

- Site size should be adequate to support the proposed specialized use, as well as necessary supporting facilities, including parking, stormwater management, etc.
- Site selection criteria will be dependent on the specific specialized use proposed, and may include criteria determined through an economic feasibility study.
- The site should be accessible from the community-wide trail system.
- Prior to the addition of any special use areas, the City should prepare a detailed cost/benefit analysis and maintenance impact statement for each proposed site being considered.

Natural Open Space

Natural open space is defined as undeveloped land primarily left in its natural form with passive recreation use as a secondary objective, such as trails. This type of land often includes wetlands, steep hillsides, or other similar undevelopable spaces. In some cases, environmentally sensitive areas are considered as open space and may include wildlife habitats, stream and creek corridors, or unique and/or endangered plant species. There are currently a number of natural open space areas in Camas, and the Ostensen Canyon Greenway and the Prune Hill South Open Space are examples of natural open space.

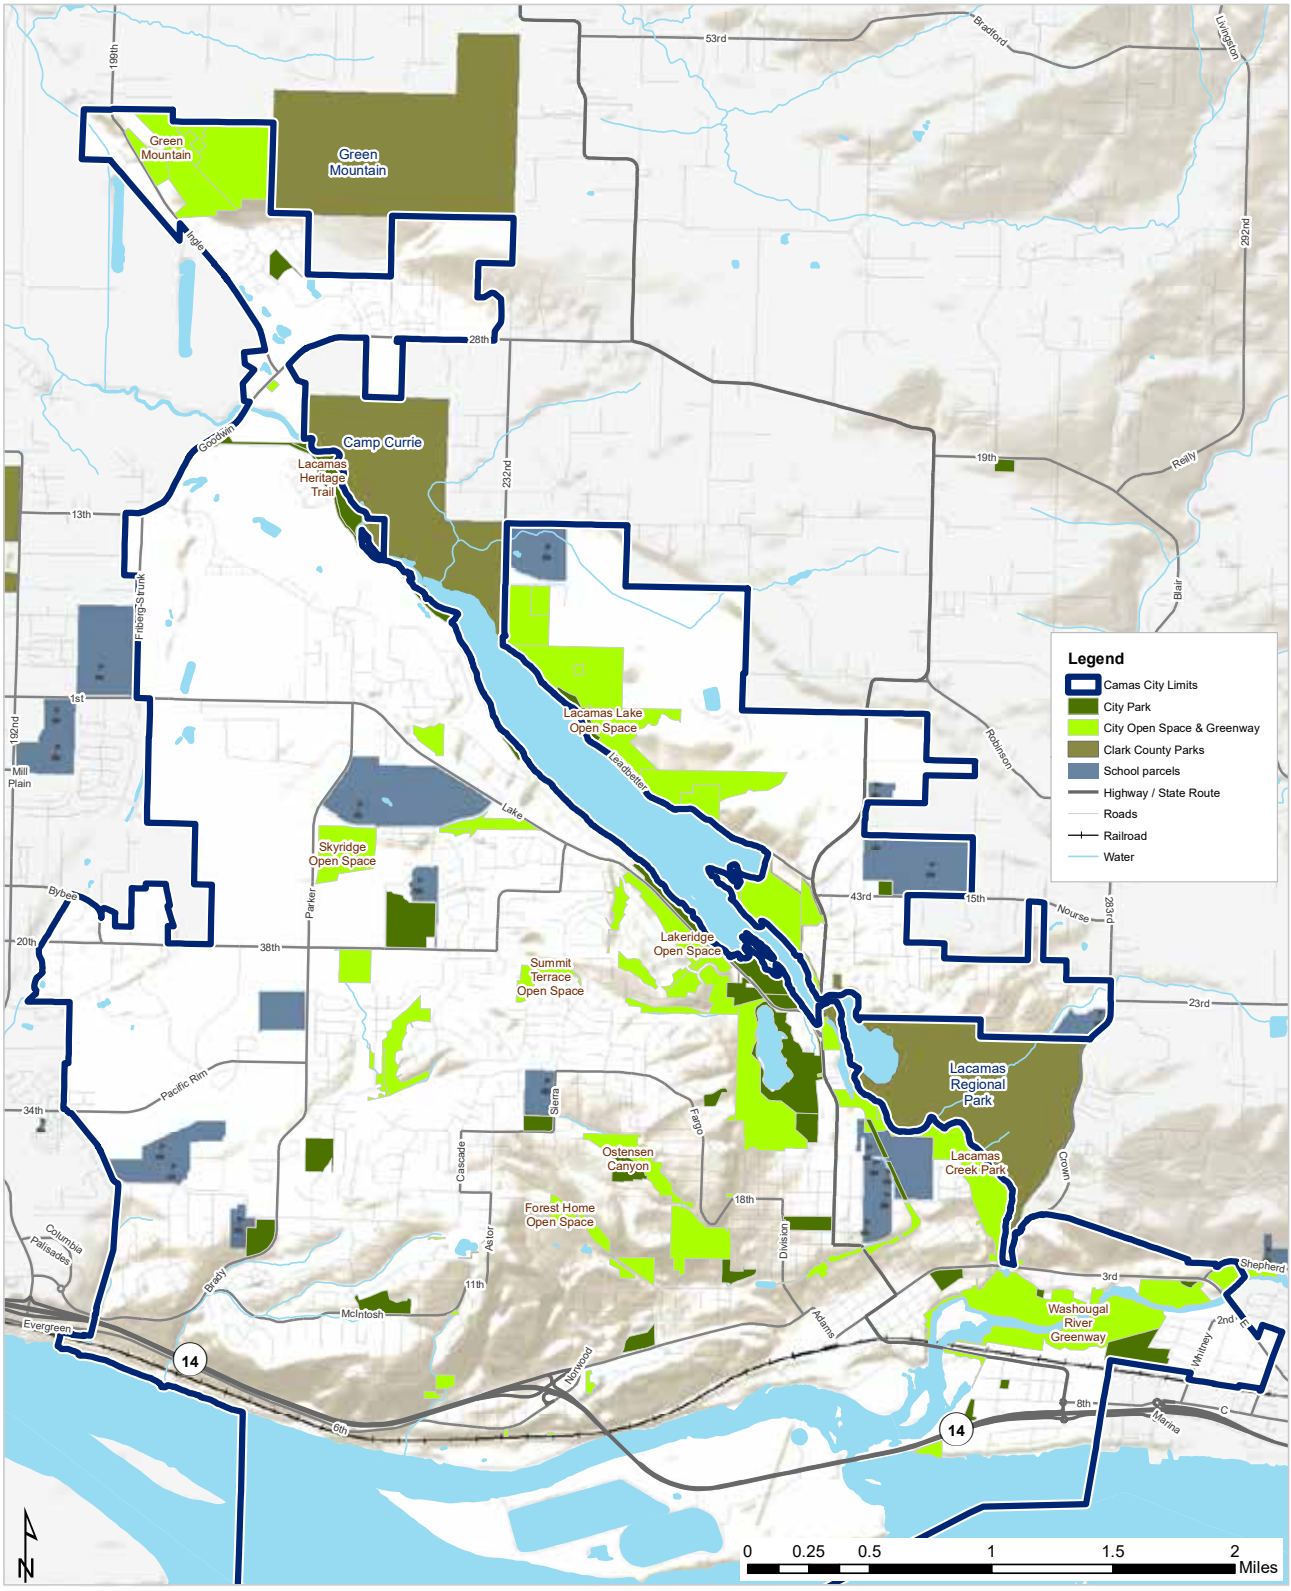
Site Selection:

- Site size should be based on natural resource and connectivity needs.
- Public use of natural open space sites should be encouraged through trails, viewpoints, and other features, but environmentally sensitive areas should be protected.
- The site should have access to a public street, to public land, or contribute to the planned open space network.
- Features in natural open space areas should be limited to those appropriate for the numbers and types of visitors the area can accommodate, while retaining its resource value, natural character, and the intended level of solitude.

Cemetery

The Camas Cemetery is an important historic and aesthetic resource for the City of Camas. Located adjacent to Lacamas Park, the cemetery is a unique, special facility and component of the park and open space system that provides a peaceful resting place and a quiet splace for reflection. The City took over the operations of the cemetery in 2007.

Park & Open Space Inventory



The park and open space inventory identifies the recreational assets within Camas. The City provides 1,068 acres of public parkland distributed among 59 parks and natural area properties, see Figure 6 and 7.

Other Recreational Opportunities Near Camas

The ownership and management of recreational resources in the larger Camas region involves several public agencies. Facilities include parks, trails, boat launches, and other attractions. Though some of these facilities are not located within city limits, their close proximity to residents of Camas makes them important components of the broader recreation ecosystem.

Homeowner Associations

Numerous homeowner associations (HOA) across Camas include open space tracts, and some include small pocket parks serving HOA residents. In all, HOA properties include 385 acres of open space and 43 acres of pocket parks.

School Districts

The Camas School District operates 19 school sites across Camas and, via use agreements, makes certain fields and gymnasiums available for community use by youth sport leagues. Evergreen School District borders Camas to the west and also makes sport fields and gymnasiums available for community use.

Clark County

Clark County provides and maintains a system of regional parks, special facilities, regional trails, greenways and natural areas, in addition to neighborhood and community parks and sports fields in or proximate to the Vancouver urban unincorporated area. The park and open space inventory identifies the recreational assets within the county. The county provides 3,325 acres of public parks and recreation facilities distributed among 88 sites, along with an additional number of greenway parcels that comprises over 3,135 acres of conserved public open space. Within and near Camas, Clark County manages Lacamas Regional Park, Camp Currie, Green Mountain, and Harmony Sports Complex.

Port of Camas-Washougal

The Port of Camas-Washougal provides several recreation opportunities for the greater Camas community.

- Captain William Clark Park at Cottonwood Beach is an 85-acre park that includes walking paths, paved parking, picnic tables, covered cooking areas, a

recognition plaza, three restroom buildings, and replicas of Chinookan canoes and Lewis and Clark's dugout canoes. A two-mile trail on top of the levee at the north side of the Park offers opportunities for hiking, jogging, biking, and horseback riding.

- The 3-mile Lewis and Clark Heritage Trail follows the Columbia River from Steamboat Landing Park to the border of the Steigerwald Lake National Wildlife Refuge. This has been connected to the Washougal Waterfront Park and trail creating a long walking trail into Camas and Washougal.
- Marina Park offers a walking path, picnic tables, an open lawn for entertainment, and a deck overlooking the marina.
- The Natural Play Area features a giant Sasquatch named Eegah along with a hill-side slide, log steppers, xylophone, drums, a boulder maze, and log balancing beams.

Other Urban Park Systems

Adjacent cities provide recreation opportunities that should be considered relevant components of the overall Camas open space system. Some facilities, such as regional trails, will require partnerships and coordination that extend beyond city boundaries. Two adjacent municipalities operate and maintain park and recreation facilities, including:

- City of Washougal: The City of Washougal has over 120 acres of park land, ranging from parks, playgrounds, sports fields, and open space. Washougal's 19 parks include special use areas, including several riverfront sites that enhance Washougal's Park system.
- City of Vancouver: The City of Vancouver serves the community with approximately 1,600 acres of parkland at 113 sites, which includes 90 parks and 20 miles of trails plus numerous natural areas. The city offers a full range of recreation programming and operates two community centers.

CHAPTER 5

Parks & TRAILS

The PROS planning process assesses recreational needs and priorities for park facilities, active use areas, and trails in Camas. The park assessment included a discussion of specific local needs with consideration given to the City's broader park system. Public input and information on park inventory conditions were also heavily relied upon in the planning process.

By considering the location, size, and the number of park facilities by type and use, along with community interests and priorities, the PROS Plan evaluates the existing and future demand for park and recreation amenities and provides recommendations for future initiatives. The six-year Capital Facilities Plan, which identifies and prioritizes crucial upgrades, improvements, and expansions, is based on the needs assessment and the recreational interests expressed by residents.

The recreational interests of Camas residents were captured in the community survey and compared to regional, state and national trend data. Local support for and interest in trails for walking and biking, water access opportunities, and kayaking align with recreation participation data from multiple sources.

Park Use Trends

Various resources have been assembled and summarized to provide an overview of current trends, market demands, and agency comparisons in the provision of parks and recreation services. This information is helpful when balanced with local insights and feedback from the community in guiding future initiatives.

The following national and state data highlights some of the current park use trends and may frame future considerations for Camas' park system. Additional trend data and summaries are provided in Appendix E.

- Nationwide, 82% of U.S. adults believe that parks and recreation are essential according to the American Engagement with Parks Survey from 2020. (1)
- 77% of survey respondents indicate that having a high-quality park, playground, public open space, or a recreation center nearby is an important factor in deciding where they want to live. (1)
- Just over half of Americans ages six and older participated in outdoor recreation at least once in 2019, the highest participation rate in five years. However, the number of outings per participant declined – continuing a decade-long trend – resulting in fewer total recreational outings (pre-pandemic). (2)
- Walking, running, hiking, and cycling saw significant increases in participation in the early months of the COVID-19 pandemic (March to June 2020). (2)
- Running, jogging, and trail running are the most popular outdoor activities across the nation, based on levels of participation, followed by fishing, hiking, biking, and camping. (2)
- Walking ranked as the top activity by participation rate (94%) in Washington State. (4)
- Trail running, day hiking, and recreational kayaking are rapidly increasing in popularity – participation in each increased more than 5% per year between 2014 and 2019. (3)
- People of all ages and income levels are interested in outdoor activities like fishing, camping, hiking, biking, bicycling, and swimming. Younger people are more interested in participating in team sports, such as soccer, basketball, and volleyball. Older adults are more likely to aspire to individual activities like swimming for fitness, bird and nature viewing, and canoeing. (3)

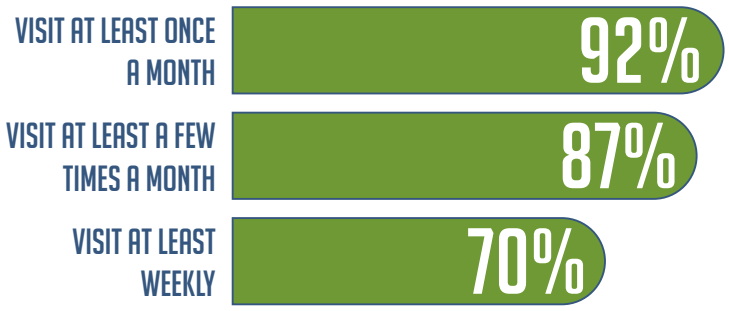
Figure 8. 5-Year Change in Outdoor Recreation Participation by Major Activity (2021 Outdoor Participation Report)

Operational & Service Challenges Due to COVID-19

A statewide survey of Washington park and recreation agencies was conducted in the second half of 2020, with a focus on service demand and operational challenges, both preceding and as a result of COVID-19. City, county, and parks and recreation district leaders were asked to complete the survey, and the survey was sent to 227 agencies - 109 cities, 39 counties, 79 Special Purpose Park Districts with 73 responses. The project was a collaboration between the Washington Recreation & Park Association, the Washington State Association of Counties, the Association of Washington Cities, and Metro Parks Tacoma.

In a question that asked the agency about how stable its outlook is for 2020 pre- and during COVID-19, the percentage of agencies that stated their outlook as very strong and stable decreased by 25 points, with 27.8% indicating as very stable at the beginning of the year to 2.8% indicating as very stable by August 1, 2020. Similarly, agencies that felt moderately or significantly underfunded and unstable rose from 5.5% to 50% by August 1, 2020.

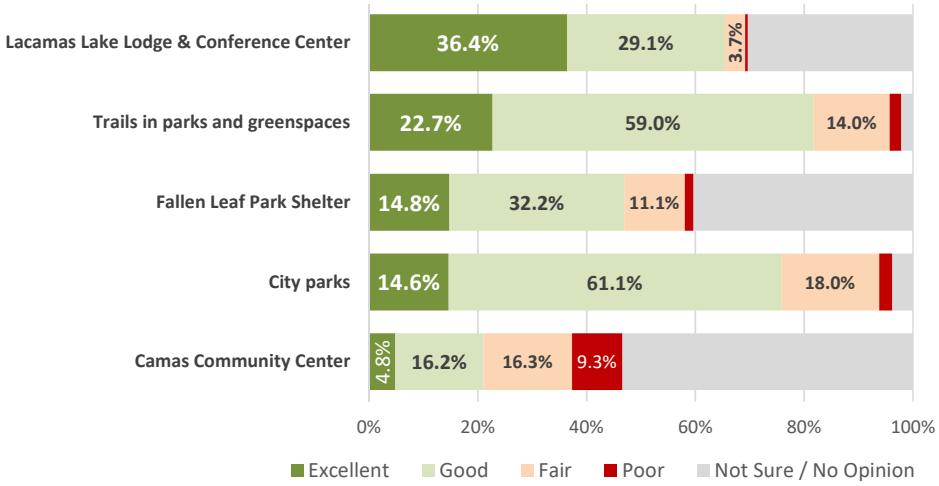
Also, significant majorities of agencies indicated service delivery impacts due to the COVID-19 pandemic in the following ways:



- Reduced ability to manage, maintain, operate, and secure passive parks to safety standards and control access (87%).
- Cancellation of special events and tourism campaigns that support local employment and drives the local economy (87%).
- Inability to operate critical community programs, pools, attractions and facilities, including services for vulnerable populations (81%).
- Lack of ability to hire/maintain seasonal employees & offer programs/services allowable under Safe Start (74%).
- Addressing public use and behaviors that put the community at risk, such as tearing down caution tape, using fields (85%).

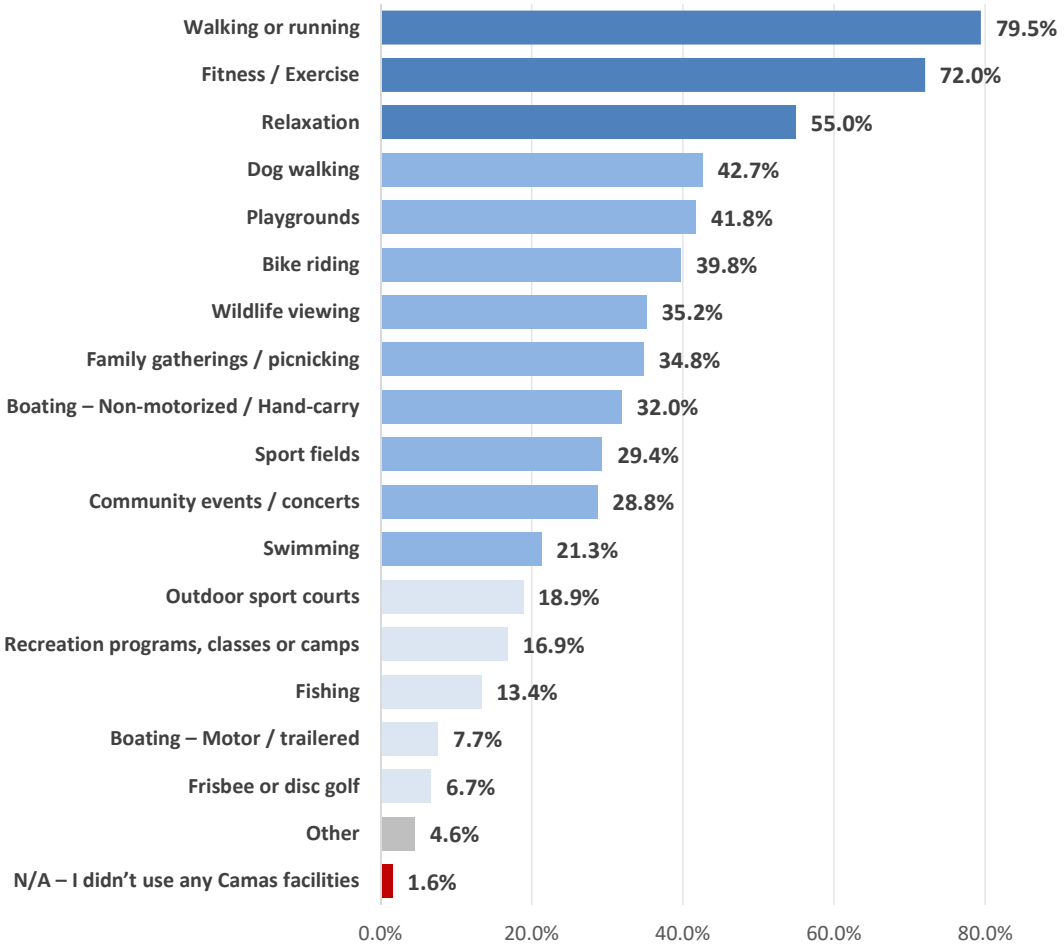
Local Insights

Local recreation demands and needs were explored through various community engagements to gather feedback on the strengths and limitations of existing recreational resources and parks available to Camas residents. Public outreach included a community survey, an online open house and several stakeholder focus group discussions to explore project priorities and opportunities to enhance the City's park system (see Appendices A, B & C). Through this outreach, nearly 1,600 responses were recorded.



The community survey confirmed that local parks, recreation options, and open space opportunities are important or essential to the quality of life in Camas. Virtually all respondents (97%) feel that local parks and recreation opportunities are important or essential to the quality of life in Camas. Respondents tend to visit frequently, with more than two in three visiting at least once a week (68%) and another 20% visiting one to three times per month.

Figure 9. Freequency of Visitation to Parks, Trails & Open Space

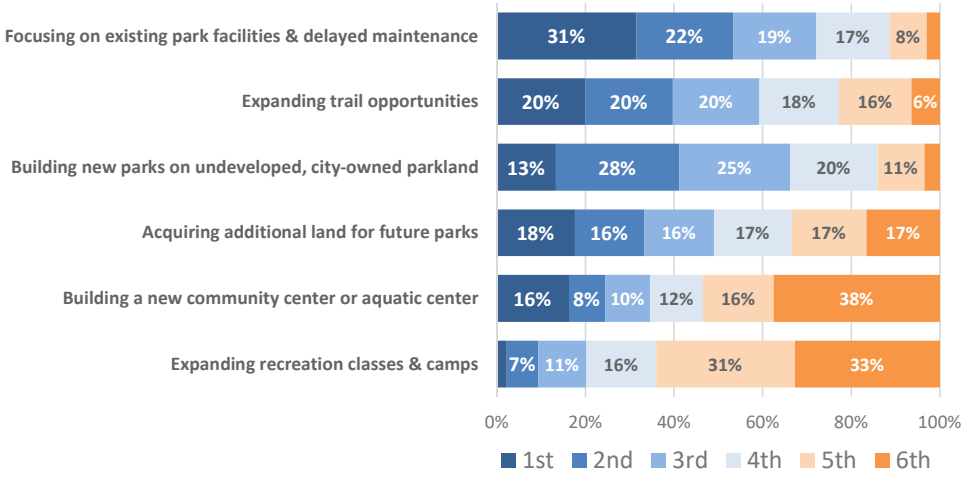


Survey respondents were asked to rate the condition of a variety of park and recreation facilities on a scale from poor to excellent. Respondents gave overwhelming high marks to the condition of the City's trails in parks and greenspaces and the parks themselves. Overall, the Lacamas Lake Lodge & Conference Center received the highest condition ratings, with 95% of respondents who provided a ranking rating it as excellent or good.

Figure 10. Sentiment of Condition of Park and Recreation Facilities.

Survey respondents visit local parks and recreation facilities for a variety of reasons. The most popular activities are walking or running (80%), followed by fitness and exercise (72%), and relaxation (55%). More than three in ten respondents visited to walk their dog (43%), visit a playground (41%), ride their bike (40%), view wildlife (35%), or attend a family gathering or picnic (35%). Relating to statewide and national trend statistics, the popularity of walking and running have consistently ranked as top outdoor activities – in alignment with Camas' survey responses.

Figure 11. Main Reasons For Visiting Local Parks and Recreation Facilities.



More than three in four respondents are very or somewhat supportive of adding walking trails (88%), updated or renovated playgrounds at existing parks (82%), all-abilities accessible playground equipment (81%), and more picnic shelters (80%) to the City's existing parks. A majority of respondents are also supportive of developing more biking trails, splash pads, off leash dog areas, pools or aquatic centers, tennis or pickleball courts, a new community center, disc golf course, and basketball courts. However, through the community survey, approximately two out of three community members are willing to travel for an unmet recreational amenity in Camas (such as splash pad, aquatic/pool center, community center and bike skills park) versus increasing taxes to pay for development of a new facility.

Recognizing the significance of trail access to the Camas community, the survey also inquired about different trail types. Respondents overwhelmingly rated unpaved trails in natural areas (94%) as very or somewhat important. Majorities of respondents also feel paved, shared use paths for pedestrians and cyclists (87%) and accessible trails (73%) are either very or somewhat important. An online open house followed the community survey to dive deeper into the community's strong interest in trails. Respondents to the online open house, 74 respondents total, noted the need to acquire land and develop trails to fill gaps in trail corridors as a top priority. Also, respondents were particularly interested in improving trail connections for the North Shore of Lacamas Lake, the Mill Ditch, Lake Road, and the Lewis & Clark Regional Trail.

Respondents were asked to rank a list of potential recreation, park, and open space investments. Generally, respondents ranked maintaining existing parks, expanding trail opportunities, building new parks, and acquiring land for future parks as top priorities. Respondents ranked offering building a new community or aquatic center and expanding program offerings as their lowest priorities. Respondents of different ages prioritized the investment options similarly, with the exception of building a new community or aquatic center, which was a higher priority for significantly more younger respondents. Respondents with children in their home tended to rate building a new community or aquatic center higher than those without children in the home, who were more likely to rate expanding trail opportunities as a high priority.

Figure 12. Park Amenities to Consider Adding to Camas Park System

Common Themes from Community Outreach

Considering all of the community feedback from the survey, online open house, stakeholder interviews, and stakeholder focus group discussions, a number of core themes and interests emerged.

Trails

- Trail connectivity is important. Complete loops and circuits, and focus on trail connectivity (connecting trail gaps).
- Enhanced linkages between residential neighborhoods and downtown via pedestrian- and bicycle-friendly routes are an important focus area.
- COVID has accelerated the trends toward higher trail usage, which include more users on trails and a wider age distribution of off-road bike riders.
- There is broad interest and excitement for the potential of expanded trail connections via the Mill Ditch property for walking/hiking and the Green Mountain acquisition for mountain biking and hiking. The Mill Ditch property for walking/hiking and the Green Mountain acquisition for mountain biking and hiking are two examples of potential projects.

Parks & Open Space

- The maintenance of existing parks and open spaces remains a key priority.
- Building new parks on undeveloped, city-owned parkland was one of the highest rated priorities.
- There has been strong interest in expanding recreational options in the park system that include the installation of a splash pad, bike skills/pump track, off leash dog areas, and tennis or pickleball courts.
- The City should provide space and amenities for programming (sport fields & courts, shelters for outdoor education, etc.) and increase sport field capacity by improving field quality and adding lighting where appropriate.
- Coordination with the school district might result in benefits for more community access to existing school fields and the development of additional sport fields.

Convenience & Support Amenities

- Upgraded and expanded access to restrooms and parking is a highly-desired user convenience improvement.
- Wayfinding, maps and communications were noted as ways to improve the user experience and familiarity with the park and trail system.

Park System Conditions Assessment

The overall condition of park infrastructure and amenities is one measure of park adequacy and assurance of public safety. Proper stewardship of park infrastructure requires developing a long-term maintenance and capital plan to ensure the safety of park users that aligns with community needs and allocates limited funding resources properly.

The current conditions of the Camas park system were assessed to identify existing site maintenance issues and opportunities for future capital improvements. The assessment included walkways, parking lots, park furniture, drainage and irrigation, lighting systems, vegetation, and other amenities. The following conditions assessment matrix summarizes the results of these assessments. They will inform the PROS Plan, including developing the project prioritization strategy for park improvements, identifying funding strategies, and updating the recommended parks six-year Capital Facilities Plan.

Park infrastructure and amenities were rated based on the following scale:

1 – Good Condition: Generally, amenities in good condition offer full functionality and do not need repairs. Good facilities have playable sports surfaces and equipment, working fixtures, and fully intact safety features (railings, fences, etc.). Good facilities may have minor cosmetic defects and encourage area residents to use the park.

2 – Fair: In general, amenities in fair condition are mainly functional, but need minor or moderate repairs. Play surfaces, equipment, fixtures, and safety features that are operational and allow play, but have deficiencies or periods where they are unusable. Fair facilities remain essential amenities for the community but may slightly discourage the use of the park by residents given the current condition.

3 – Poor: In general, amenities in poor condition are largely or completely unusable. They need significant repairs to be functional. Some examples include athletic fields that are too uneven for ball games, irreparably broken features, buildings that need structural retrofitting, etc. Poor facilities discourage residents from using the park and may present safety issues if left open or operational.

In general, good conditions should be the goal for the management and stewardship of park facilities. Where infrastructure or amenities are rated as “fair,” strategies should be developed for repair or restoration. Park features, structures, amenities, or landscapes rated as “poor” should receive immediate attention and be prioritized for near-term maintenance, capital repairs, or a new capital project. Facilities in “poor” condition should also be evaluated and taken out of operation if they are deemed unsafe. Based on this assessment, the City’s sport courts, trails, site furnishings, turf and ADA compliance are in the greatest need of attention.

Detailed site conditions and site enhancement recommendations are noted in Appendix D for the park sites visited.

Overview of Condition of Existing Parks

The following list summarizes some of the key observations and recommendations to enhance the City's park and trail system, its visual character, and longer-term sustainability.

1. Overall, the level of maintenance observed at the developed parks appears to be very good.
2. Consider upgrades to City Park Standards for signage and furnishings. For future park improvements and prior to implementing new master plans for undeveloped parks, it would be beneficial to use the same standard design, style and color for benches, picnic tables, other site furnishings and signs to provide a consistent identity to the park and trail system and reduce future maintenance costs.
3. As the trail system develops with additional connections, a wayfinding system would be beneficial. Coordinated with the graphic style for the park identification signs, this wayfinding signage would help trail users navigate the connections and know the destinations along the trails. Distances, destinations, trail etiquette, and other essential information should be planned and located at strategic sites to inform walkers, runners, and bikers.
4. Consider adding more destination amenities into the park system, such as splash pads, rock climbing, fitness equipment, nature play, inclusive play and/or themed designs to add a more diverse character to the system.
5. Many of the developed sites need ADA upgrades. Among the most common deficiencies observed are:
    - Current park standard trash and recycling receptacles are not ADA
    - The minimum ratio of ADA compliant tables and benches is below the required ADA standards
    - Lack of companion spaces adjacent to ADA compliant benches
    - Minimum clearances surrounding picnic tables are often not met
    - Several ADA compliant amenities are not along accessible routes
    - Many of the playgrounds lack ADA ramps leading into the play pit areas
    - All of the playground surfacing consists of engineered wood fiber. Although it is considered accessible when it is properly maintained; however, infrequent maintenance and refilling is fairly common. Consider transitioning to more stable playground safety surfacing options for the heaviest used playgrounds.
    - Several playgrounds do not have the minimum number of ADA accessible features
6. Several parks have vegetated open space within or adjacent to the property and may be good candidates for trail locations. Some open spaces connect residential neighborhoods with parks together and could provide alternative routes to City parks.
7. Camas has multiple storm facilities and or wetlands throughout the City, some of which are adjacent to existing developed parks. These facilities might offer opportunities to incorporate interpretive and educational experiences within the parks for a relatively low implementation cost. Proposed educational amenities might include wildlife viewing blinds and overlooks accompanied by interpretive signage.

Most of the undeveloped open space that was observed consisted of dense vegetation, including invasive species. The City should consider an invasive weed removal program, along with a more broadly framed open space management plan to identify resources and tactics to care for the City's nearly 700 acres of natural areas.

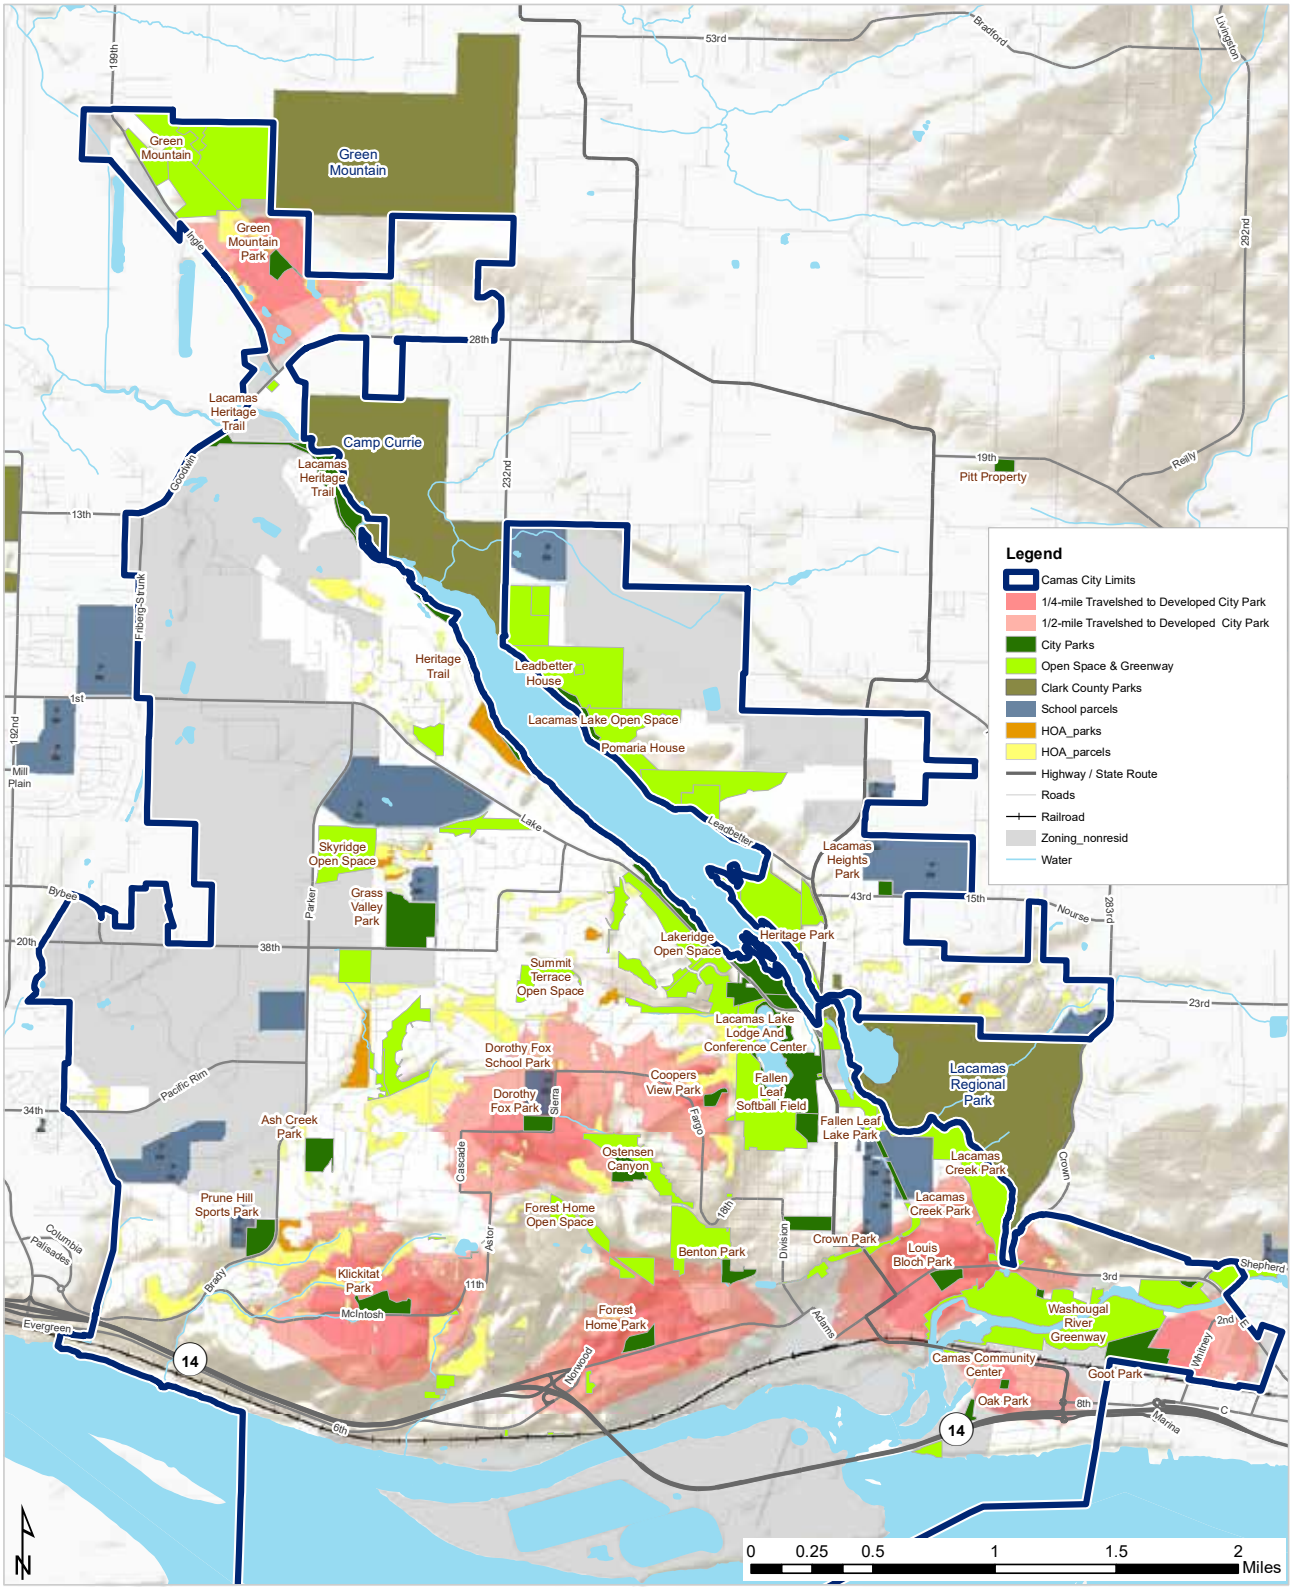
Page Left Intentionally Blank

Gap Analysis

Understanding the known gaps in the park system and evaluating the City's existing levels of service for parks (i.e., snapshot in time of how well the City is meeting its adopted standards) will provide a foundation for strategic planning as a basis for a balanced distribution of parks, trails and recreation amenities in the future.

To better understand where acquisition efforts should be considered, a gap analysis of the park system was conducted to examine and assess the current distribution of parks throughout the City. The analysis reviewed the locations and types of existing facilities, land use classifications, transportation/access barriers and other factors as a means to identify preliminary acquisition target areas. In reviewing parkland distribution and assessing opportunities to fill identified gaps, residentially zoned lands were isolated, since neighborhood and community parks primarily serve these areas. Additionally, travelsheds were defined for neighborhood parks using a ¼-mile primary and ½-mile secondary service area with travel distances calculated along the road network starting from known and accessible access points at each park. Travelsheds for community parks were derived using ¼-mile, ½-mile, 1-mile and 2-mile travel distances to acknowledge that these park types (including athletic fields) serve a wider array of users and driving to such sites is typical.

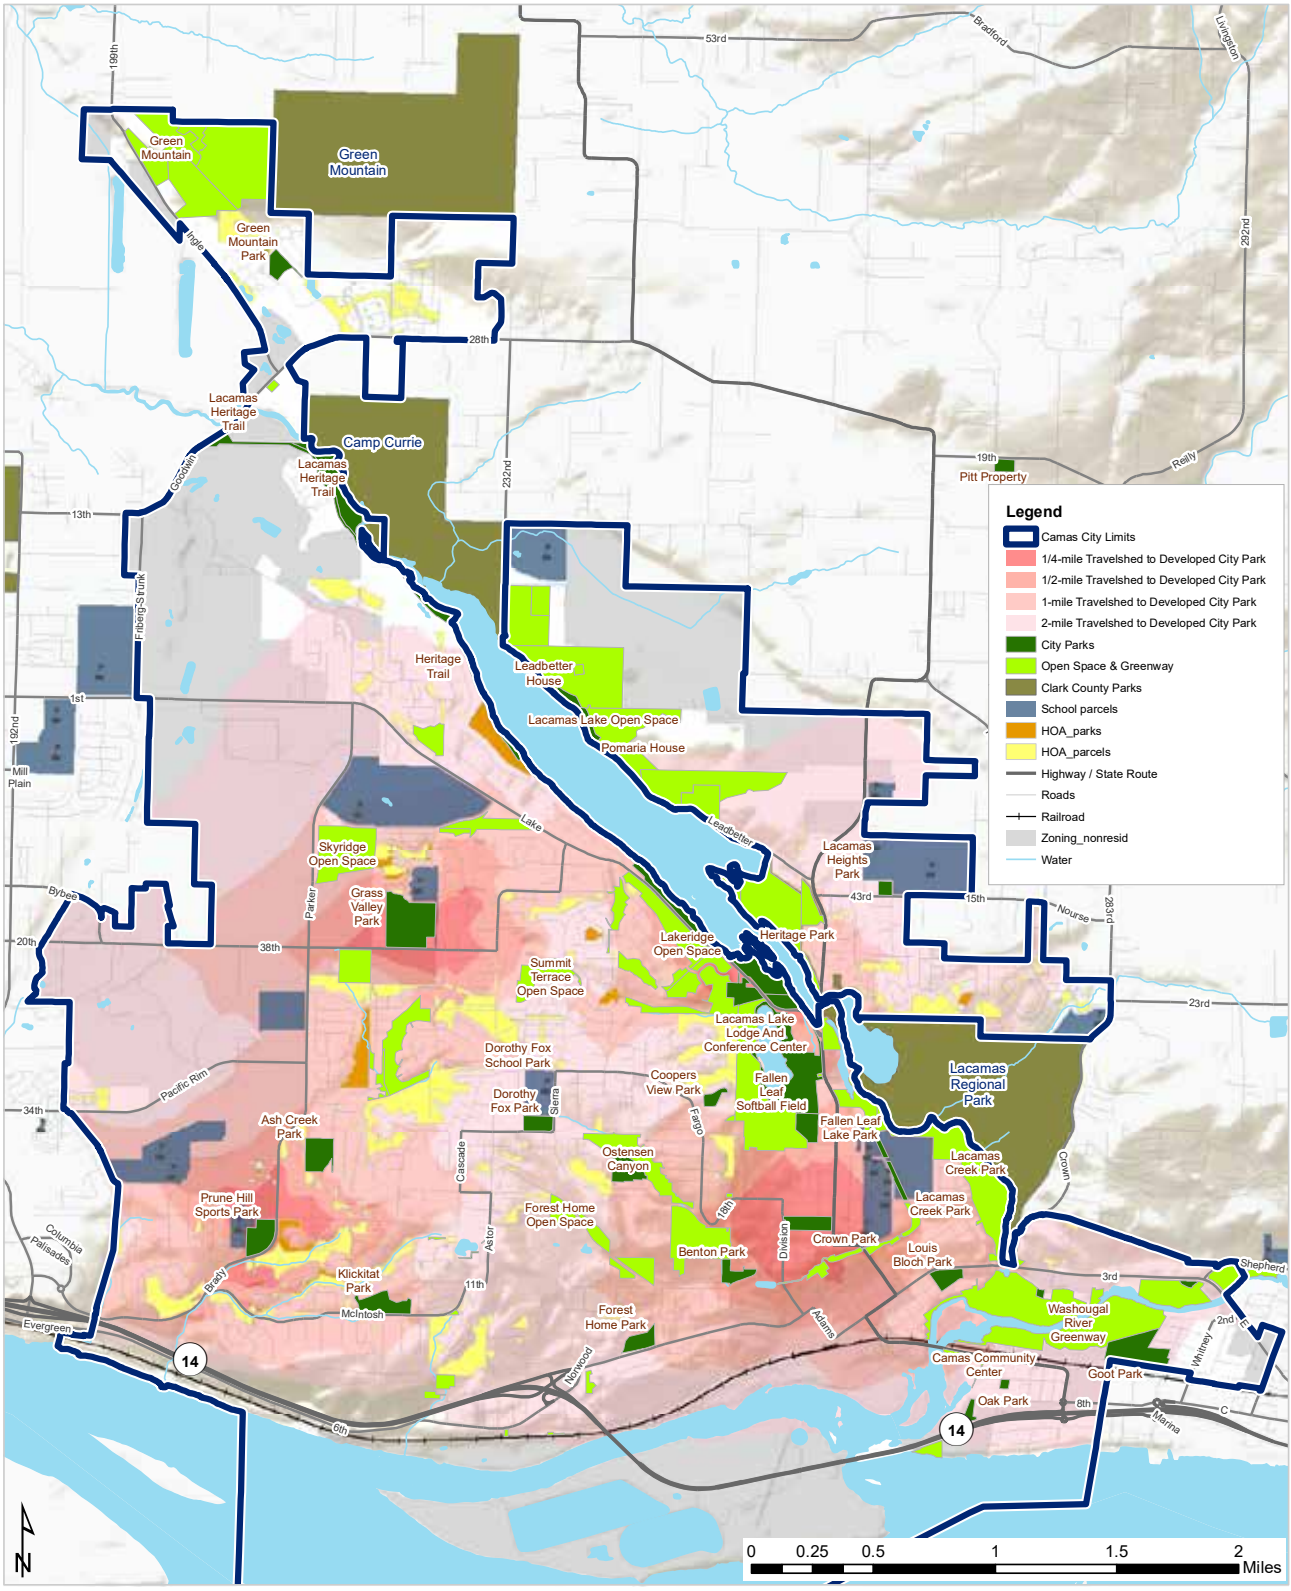
Maps 2 through 5 illustrate the application of the distribution criteria from existing parks. Areas in white do not have a public park within reasonable walking distance of their home. The illustrated 'travelshed' for each existing Camas park highlights that certain areas within the city do not have the desired proximity to a local park.



Striving to provide a neighborhood park within a reasonable walking distance (e.g., ½-mile) may require acquiring new park properties in currently under-served locations or improving multi-modal transportation connections to allow local residents to safely and conveniently reach their local park. As Camas develops and acquisition opportunities diminish, the City should consider taking advantage of acquisition opportunities in strategic locations and as funding allows to fill remaining gaps. In concert with the search for developable park land, the City should continue to coordinate with proposed residential land development projects to consider when and how a public park (or trail connection) could be incorporated into the planning of newly developed residential areas.

The mapping of park distribution and 'travelsheds' helps to illustrate the underserved neighborhoods in Camas. Areas of southwest Camas and north-central Camas have limited access to public parks or open space as indicated by white areas on Map 6. These areas of the City should be targeted for future acquisitions to help create more equitable access for all residents.

Camas has been very successful in securing park and open space as the community has grown, and the small number of potential acquisition sites is a testament to that effort. It should also be noted that the City owns several properties that are intended to serve as neighborhood parks, but are as of yet undeveloped. The future planning and development of these sites will further improve the overall distribution of parks for the Camas community, and these sites have been accounted for in the gap analysis. These future parks include:



- Ash Creek Park (future neighborhood park)
- Ostensen Canyon Park (future neighborhood park on approximately 8 acres of upper shelf)
- Lacamas Heights Park (future neighborhood park adjacent to Camas High School)
- Green Mountain property (pending community planning)
- North Shore Lacamas Lake (TBD, pending community planning)

Trails

The City of Camas consistently has been working to create a network of trails to connect important destinations and help create a more walkable community. Individual parks typically have internal (and usually paved) pathways that provide walking opportunities within the park. While these are popular amenities for park visitors and help provide access to recreational amenities, their isolation from other destinations limits their value. The lakefront, riparian areas and woodlands in Camas also have provided locations for aligning recreational, off-road trails as opportunity arises. Trail connections and walking or biking linkages have been noted as the highest priority for future improvements to Camas' park system.

The Heritage Trail offers the longest, singular trail at 3.7 miles within City ownership, and Lacamas Creek Park provides an additional 2.4 miles within a forested, park setting. Other significant trails within City open space include those at Fallen Leaf Lake (1.7 miles), Heritage Park (1.3 miles) and the Washougal River Greenway (1.5 miles). In total, Camas has almost 12 miles of walking or biking trails dispersed across its park system.

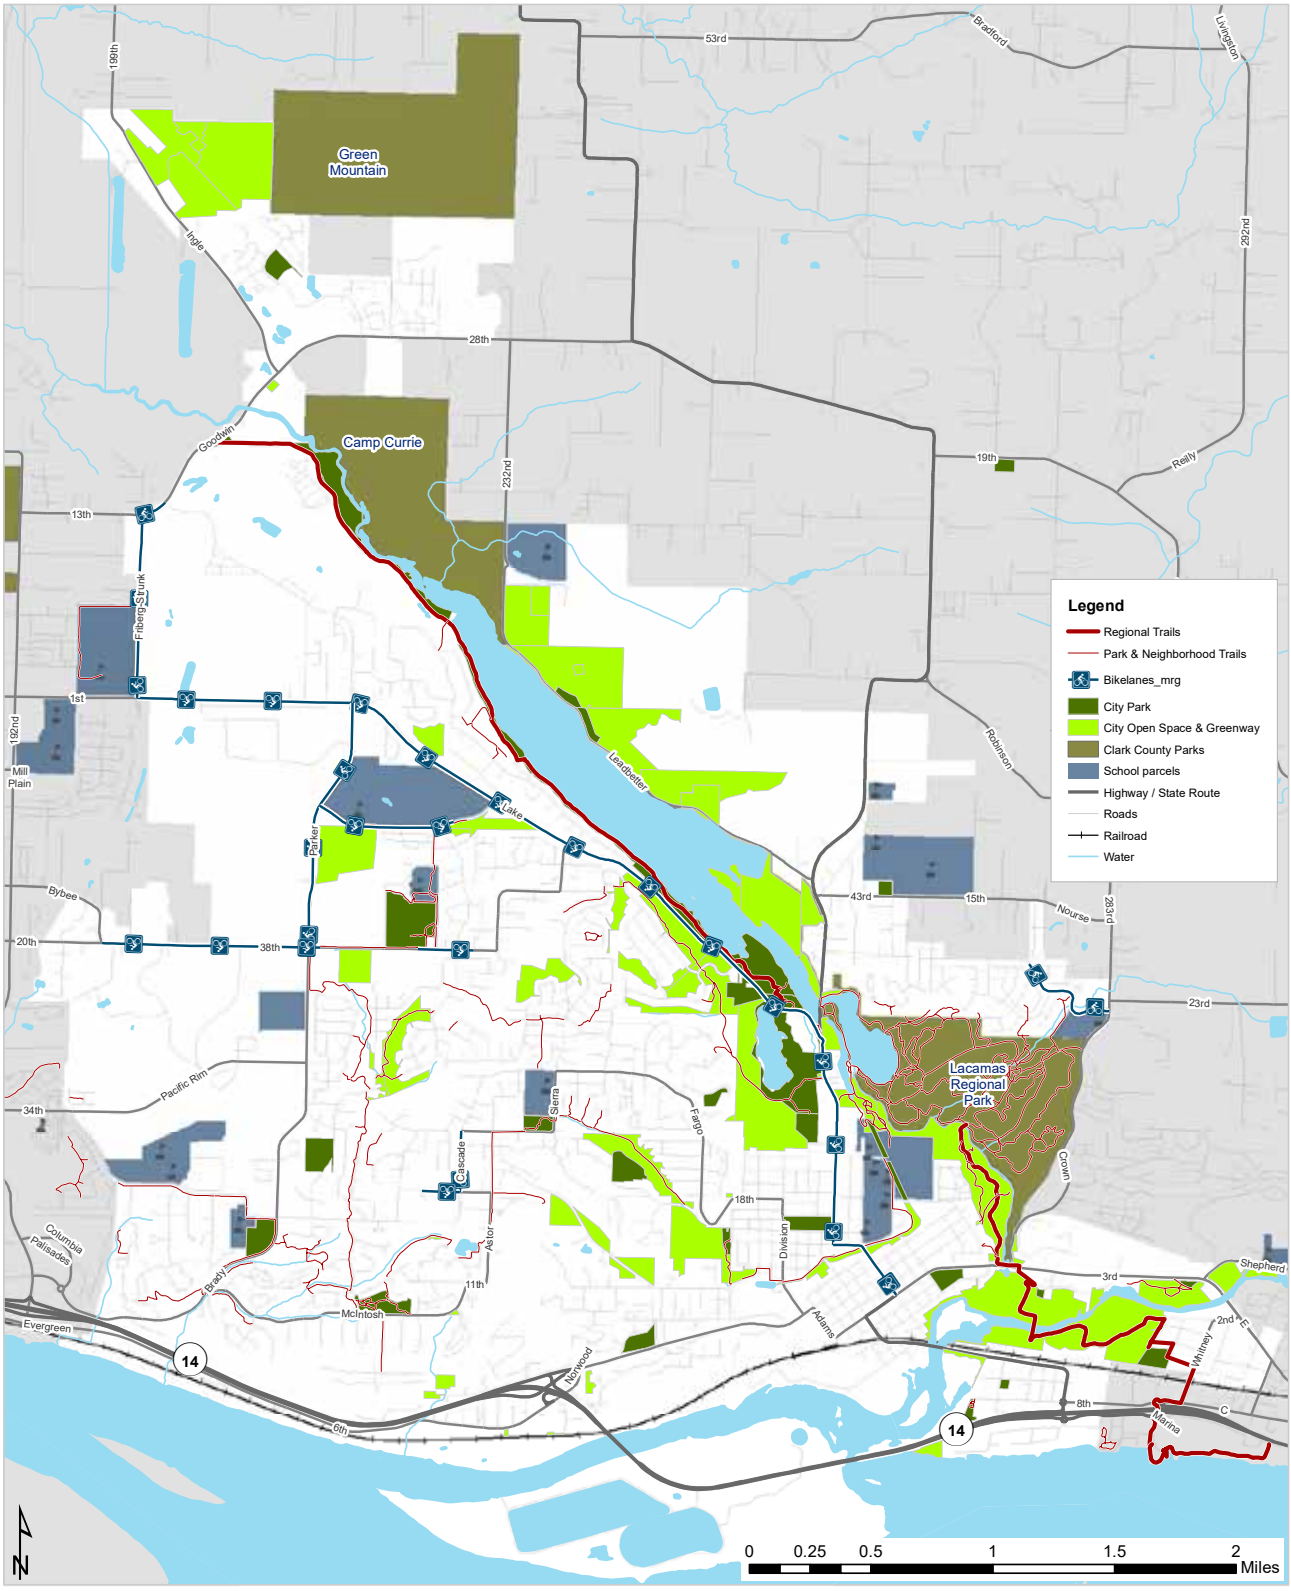
Trails for Walkable Communities

Parks are known to contribute to a healthier community by providing accessible outdoor recreation particularly through the walking trail within each park. Getting to the park by foot or bike can also offer a healthier choice integrated with the park destination and its amenities. In the NRPA publication *Safe Routes to Parks*, the elements of walkable, healthy community design are outlined as convenience, comfort, access & design, safety, and the park itself. Sidewalks, bikeways and trails should provide an integrated alternative transportation system for residents to access parks and other destinations within their community. As further emphasis for the importance of a walkable community to promote public health, the Surgeon General has issued a *Call to Action* to "step it up" and promote more walking and build a more walkable world. A more connected network of trails, sidewalks, and bike lanes with links to public transit also provides economic values.

Credit: Camas Post-Record

Trails for Aging Populations



Today's active seniors are looking at retirement age differently, as many are retooling for a new career, finding ways to engage with their community and focusing on their health and fitness. It will be critical for Camas' park and recreation system to take a comprehensive approach to the city's aging population needs. Accessibility and barrier-free parking and paths, walkability and connectivity will be paramount to future planning. Providing programming for today's older adults includes not only active and passive recreation, but also the type of equipment needed to engage in certain activities. Trails provide the infrastructure for the most popular and frequent outdoor recreation activity of older adults: walking.

Credit: Camas Post-Record

Trails for Economic Health

In the 2009 report, *Walking the Walk: How Walkability Raises Housing Values in US Cities* by Joe Cortright for CEOs for Cities, research cited the connection between home value and walkability. Higher WalkScore measurements, where more typical consumer destinations were within walking distance, were directly associated with higher home values. Homes located in more walkable neighborhoods command a price premium over otherwise similar homes in less walkable areas. The National Association of Realtors reports in their *On Common Ground* publication with numerous articles citing the preference of walkable, mixed-use neighborhoods and the role of walkability in creating healthier communities. These preferences translate into higher housing values. Even the National Association of Homebuilders (March 2014 publication: "Walkability, why we care and you should too") have recognized that walkability is desired by consumers, creates lower development costs and allows flexibility in design. As part of the system of walkability and bike-ability, recreational trails are real estate assets that enhance community connections and contribute to economic health, and these attributes should be considered as Camas enhances trail connections to downtown and plans the future of the North Shore.

Map 7: Existing Trails

Page Left Intentionally Blank

Trail Demand

Park & Neighborhood Trails

During the public outreach, 80% of the community clearly identified that walking or running was a top reason for visiting Camas' parks. Park pathways are popular recreational amenities and significant contributors for promoting physical activity. This recreational trend is notable in state and national recreation surveys. Running, jogging and trail running are the most popular outdoor activities across the nation, based on levels of participation. Also, the need for more walking and biking trail connections that link parks together has been reinforced in the community survey and other public feedback. The online open house polled opinions about potential trail links and which were the highest priority. The Mill Ditch connection and safe crossings along Lake Road were also noted as important.

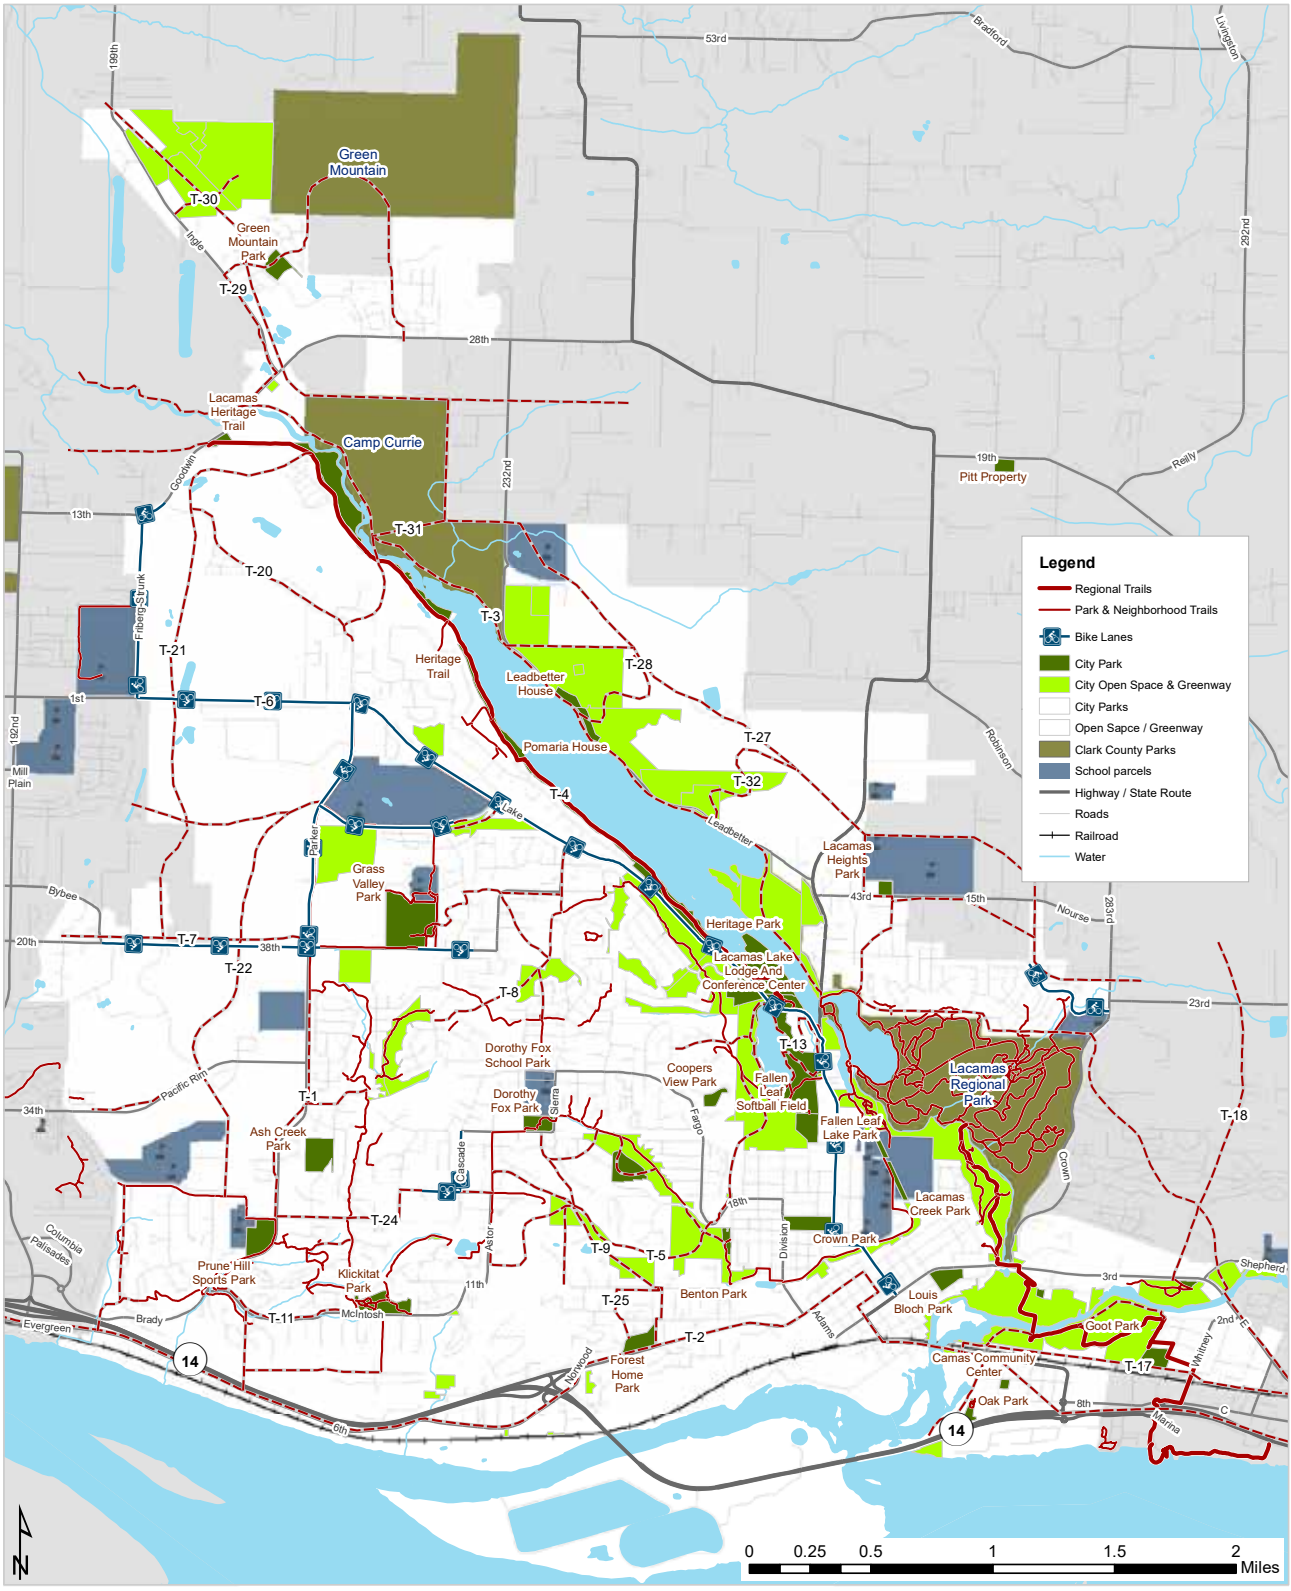
With the array of existing park trails and pathways within homeowner association lands, the City should prioritize a couple other connections to close existing gaps and improve options for loop trail routes, to include:

- Ostensen Canyon gap to link Dorothy Fox Park to Benton Park
- Prune Hill Sports Complex to Forest Home Park via Forest Home Open Space (will require on-street connections in coordination with transportation system planning)

Regional Trails

A regional trail system helps knit communities within Clark County together. Public feedback deemed longer trails segments, such as the Lewis and Clark Regional Trail along the Columbia River and a North Shore Lacamas Lake connection important for Camas. The ongoing development of the North Shore Subarea Plan and conceptual trail planning outlined in the North Shores Lacamas lake - A Vision for Conservation and Recreation will guide more specific planning of trails through the North Shore Lacamas Lake area, including completing the loop to Heritage Trail. Future trail connections should link Round Lake to Camp Currie to Green Mountain, in addition to neighborhood and commercial area connections, trailheads, parking and signage.

Transportation Planning



The City is currently in the process of preparing an updated Transportation System Plan, and a review of existing pedestrian and bicycle infrastructure and discussion of future needs will be included in that plan. The existing conditions memo for the plan noted that paved, shared-use paths exist along portions of NW Parker Street, NW 18th Avenue, Lacamas Lake, Washougal River, and are also scattered throughout the residential neighborhoods. Regarding pedestrian routes and sidewalk coverage, a few areas do not have complete sidewalks, and gaps are most significant in southwest, southeast and northeast Camas.

Additionally, the City of Camas has a number of targeted improvement projects that will help further the alternative transportation options for residents. The City's Six-Year Transportation Improvement Program (TIP) from 2022 to 2027 lists planned road, intersection, sidewalk and bikeway projects. Funding and project partners are identified for each planned improvement project. The TIP includes 15 road projects that include bike lanes that will improve connectivity and rider safety along Camas streets.

I just love the natural spaces, so if they're there and accessible (and safe), I'll be so grateful to walk for miles and miles. Thank you!

- Online Open House participant

Map 8: Potential Trails

Page Left Intentionally Blank

Trail Design Considerations

Alignment

The future growth of the trail network will need to balance between alignments that are optimal from trail user, trail experience and connectivity perspectives and those that are practical from cost, design and engineering, regulatory and availability perspectives. Future consideration should be given toward finding alignment options that can accommodate different trail use types (i.e., commuter vs. recreational/destination oriented, and ADA accessibility), as well as potentially interim solutions that rely on wider sidewalks to serve trail users or routing that utilizes existing or planned sewer lines or utility corridors. Accommodating alignments for local, neighborhood link trails as connections to regional, shared-used trails or major park trails is important for providing access and reducing the sole reliance on trailheads for providing access to the trail network.

Access & Trailheads

Safe, convenient entryways to the trail network expand access for users and are a necessary component of a strong, successful system. A trailhead typically includes parking, kiosks and signage and may include site furnishings such as trash receptacles, benches, restrooms, drinking fountains, and bicycle parking. Trailheads may be within public parks and open space or provided via interagency agreements with partner organizations (e.g., county, school district, etc.) to increase use and reduce unnecessary duplication of support facilities. Specific trailhead design and layout should be created as part of planning and design development for individual projects and take into account the intended user groups and unique site conditions. Trail connections and walking or biking linkages also are good access point to designated local and regional trails.

Trail Development Limitations

One underlying tenet of the recreational trail system is to enable the placement of trails within or close to natural features to provide access to the city's unique landscapes, as well as accommodate outdoor recreational access to creeks, hillsides and waterfront. The future planning and design of trail routes through natural areas should be based on sensitive and low-impact design solutions that offer controlled access that protects the resource, while providing for a positive experience for trail users. Trail routes should consider intended and unintended impacts to natural areas, such as soil erosion, especially near streams and shorelines. The determination of future trail alignments should place high priority on natural resource and natural hazards planning and protections, in part to meet local land use policies as well as Washington State requirements.

Ongoing Maintenance

Following trail construction, ongoing trail monitoring and maintenance will keep the trails functioning as designed, while working to protect capital investments in the network. Future trail renovation projects should be included in the Capital Improvement Plans as a means to identify and secure appropriate resources for needed enhancement, such as adding additional capacity to the trail. The City should maintain and expand their connection to and communications with the robust network of local volunteers to provide support as appropriate.

Trail Signs & Wayfinding

Coordinated signage plays a crucial role in facilitating a successful trail system. A comprehensive and consistent signage system is a critical component for the trail network and is necessary to inform, orient and educate users about the trail system itself, as well as appropriate trail etiquette. Such a system of signs should include trail identification information, orientation markers, safety and regulatory messages and a unifying design identity or element for branding. The following signage types should be considered and consistently implemented throughout the network:

- Directional and regulatory signage
- Trail user etiquette and hierarchy signage
- Continuous route signage for route identification and wayfinding
- Mileage markers or periodic information regarding distance to areas of interest
- Warning signs to caution users of upcoming trail transitions or potential conflicts with motor vehicles
- Interpretive information regarding ecological, historical and cultural features found along and in proximity to the trail
- Add QR codes to signs to provide links to additional information

Also, the installation of kiosks at trailheads is a best practice that should continue and provides important trail information, while reinforcing the visual brand of the Camas trail experience.

Level of Service Assessment

A level of service (LOS) review was conducted in addition to and in support of the gap analysis as a means to understand the distribution of parkland acreage by classification and for a broader measure of how well the City is serving its residents with access to parks, trails and open space. Service standards are the adopted guidelines or benchmarks the City is trying to attain with their park system; the level of service is a snapshot in time of how well the City is meeting its adopted standards.

Many jurisdictions are developing guidelines that are customized to their community and its unique and often changing park and recreation demands, rather than solely applying the historic National Recreation and Park Association's (NRPA) published park standards that primarily focused on parkland acreage per capita. The use and application of standards continues to evolve and develop diverse approaches. This Plan evaluates the City's current parkland level of service through a variety of characteristics, including acreage per capita, as a snapshot in time and means to describe the performance of the park system.

Figure 16. Existing & Projected Levels of Service by Park Classification

Type	Current Inventory	Existing Level of Service (2020)	Projected Level of Service (2035)
Regional & Community Park	219.1 acres	8.4 ac./1000	**6.4** ac./1000
Neighborhood Park	75.9 acres	2.9 ac./1000	**2.2** ac./1000
Special Facility	15.9 acres	0.6 ac./1000	**0.5** ac./1000
Trail / Linear Park	61.8 acres	2.4 ac./1000	**1.8** ac./1000
Open Space & Greenway	691.5 acres	26.5 ac./1000	**20.3** ac./1000
	1,064.1 acres	**40.8 ac./1000**	**31.2 ac./1000**

The National Recreation and Park Association (NRPA) conducts annual surveys to generate a Park Metrics database (formerly known as PRORAGIS) that reflects the current levels of service of park agencies across the country based on a variety of factors: population size, population density, number of full-time equivalent employees, number of park facilities, acres of parkland, and more. The Park Metrics survey data are used to compare different park and recreation providers in widely different communities across the country; however, the Park Metrics database relies on self-reporting by municipalities. Some agencies only include developed, active parks, while others include natural lands with limited or no improvements, amenities or access. The comparative standards in the table below should be viewed with this variability in mind.

A few highlights from the NRPA agency comparison provide perspectives on Camas' park system. Figure 17 compares jurisdictional populations served by park and recreation agencies against certain performance metrics. The number of residents per park and acres of parkland per 1,000 residents implicate the potential wear and tear on park facilities. Compared with similar population sizes, Camas provides considerably more parkland acreage (40.8 acres, including open space) per 1,000 residents. Comparing just developed park properties, the City has 6.4 acres per 1,000 residents. Looking at the numbers of residents per playground, Camas has more playgrounds (at 1,862 residents per playground) than similar-sized jurisdictions (at 3,157 residents per playground).

Figure 17. Service Levels Comparing Park Metric (NRPA) Data

Metric	Median Value		
	All Agencies	Pop. Range 20-50,000	Camas
Residents per Park	2,281	1,963	1,629
Acres of Parkland per 1,000 population	9.9	9.6	40.8
Miles of Trails *	11	8.5	39.2
Number of Residents per Playground	3,750	3,157	1,862
Number of Residents per Recreation Center**	31,141	25,716	6,516

* Note: Includes trails in County parks

** Note: Assumes 25% of Camas population for Camas Community Center and Lacamas Lake Lodge as neither facilities function as traditional recreation centers

The use of numeric standards is a blunt and limited tool to assess how well the City is delivering park and recreation services, since the numeric values alone neglect any recognition for the quality of the facilities or their distribution (i.e., the ease to which residents have reasonable, proximate access to park sites). While public ownership of a broad range of recreation lands is crucial to the well-being of the city, the simple use of an overall acreage standard does not match with the citizen input received during this planning process. Residents were particularly interested in the availability of trails, water access, and open space within a reasonable distance from their homes.

The City's park system also was assessed using Washington Recreation and Conservation Office's (RCO) level of service metrics provided in their planning manual. In reviewing the park system as a whole, Figure 18 illustrates the current levels of service across different performance measurements. From the community survey results, public satisfaction of the facilities and amenities that Camas provides ranked as the strongest indicator for the park system. Future development of Ash Creek Park, Lacamas Heights Park and Ostensen Canyon Neighborhood Park will further improve the distribution rating noted in the figure.

Figure 18. Levels of Service with RCO Metrics (System-wide)

Scale: Condition Assessment

A	= <1.2
B	= 1.2 - 1.74
C	= 1.75 - 2.24
D	= 2.25 - 2.79
F	= >2.8

Scale: Satisfaction, Distribution & Usage

A	= >80%
B	= 70 – 79.9%
C	= 60 – 69.9%
D	= 40 – 59.9%
F	= <40%

Quality Criteria	
Public Satisfaction	
Condition of City Parks (rated as Excellent or Good)	**75.8%**
LOS Grade	**B**
Condition of Trails in Greenspaces (rated as Excellent or Good)	**81.7%**
LOS Grade	**A**
Agency-based Assessment	
Condition Assessment Rating of Existing Parks (3-point scale)	**1.67**
LOS Grade	**B**
Distribution Criteria*	
Parkland Access (within 1/2-mile travelshed)	
Percent Service Area with Access to Active-Use Parks	**71%**
LOS Grade	**C**
Usage / Visitation Criteria	
Frequency of Park or Trail Usage	
Percent Visiting Parks at Least Multiple Times per Month	**86.9%**
LOS Grade	**A**

* Note: The percentage of land area covered by service area walksheds is a proxy for the population within the residential portion of the City.

No numeric standards are recommended or proposed for open spaces. While numerical planning standards are common for helping to determine a desirable number of neighborhood parks per thousand residents, they do not translate easily to open space because of the uniqueness of the land base itself. Rather than being guided by numerical standards for open space, the priority for future open space acquisitions, if any, should be focused toward those lands that expand ownership of adjacent City-owned properties or to ensure sufficient property is available to accommodate public access and future trail connections.

As with roadway system and transportation planning, planning for recreational trails should be geared toward connectivity, rather than mileage. Considering a mileage standard for paths within the Camas park system would provide only an isolated and inadequate assessment of need for the community and its plans for better connectivity, and as such no numeric standards are recommended or proposed for trails. This Plan recommends a connectivity goal that re-states and reinforces the desire to improve overall connections across the City and enhance off-street linkages between parks and major destinations, as feasible.

Other Considerations

While this Plan uses total parkland acreage and parkland access as primary indicators of parkland need, the City could also consider other factors as its population grows, including:

- Park pressure, or the potential user demand on a park: Residents are most likely to use the park closest to their home. This measure uses GIS analysis to assign all households to their nearest respective park and calculates level of service (in acres of parkland per 1,000 residents) based on the acreage of the park and the number of residents in the 'parkshed'. Areas with lower levels of service are more likely to be underserved by parkland and to see higher degrees of use and wear and tear on park amenities.
- Availability of park amenities: Park systems should include an equitable distribution and quantity of the most common amenities like playgrounds, picnic shelters, sports courts, sports fields and trails to meet local needs and help distribute the potential usage of individual parks. Working to provide well-distributed basic park amenities, while also offering unique outdoor experiences, will result in a varied park system with a range of different recreational opportunities for residents. See Appendix G for considerations.

Credit: Camas Post-Record

Park & Trail System Recommendations

Acquisitions and Development for Trail Connections

Additional trail connections are needed, as well as sidewalk and bike lanes improvements, to help link destinations across the community and park system to offer more walkability and promote healthier outdoor lifestyles. Acquisitions of easements, corridors and parcels will be needed to create the comprehensive linkages for Camas' future trail system. The Public Works and Parks and Recreation Departments will need to collaborate on the project planning to ensure the most appropriate links that improve the park and trail system. This should also include coordination with the Transportation System Plan (and subsequent updates), as well as coordination with local subdivision and site development projects.

Park Development & Improvement Projects

The preparation of an updated site master plan for Ash Creek Park and a new site plan for the flat, upper shelf of Ostensen Canyon Park will be beneficial to guide future decision-making and development of those two parks. Once master plans have been adopted, phased park development should be planned as part of the capital facilities program.

Field drainage problems are observed issues at various parks. The City should conduct a city-wide field assessment to create a capital improvement project list and on-going maintenance plan. Ongoing coordination with local leagues and the school district should inform other field improvements, including turfing existing fields, installing lights to expand play seasons and the development of additional fields to accommodate demand.

Expanding Recreation Options

Splash Pads / Spray Parks

Spray parks are water play features that are very popular and provide a means of integrating aquatics into parks at a relatively low cost. Camas currently does not have a splash pad in the park system, and strong public support exists for this feature. The City should consider at least one spray park to serve residents as an option for summertime water play that doesn't require lifeguarding. This special use amenity typically is supported by parking and restrooms, since it draws users from a wider area. Any spray park facility should be designed to recycle water, if practical.

Bike Skills

Engaging older youth, teens, and adults in more intense physical activity within parks requires amenities that support challenging active movement. The City should plan for a pump track and connecting flow track in a visible location that can accommodate parking and can enable a synergy with other park uses. These features would add new challenges for riders and add to the range of outdoor recreational opportunities across older youth and teens.

Alternative Sports

Providing facilities for alternative or emerging sports, such as skateboarding, BMX, mountain biking, climbing and parkour, can offer residents a more diverse range of recreational experiences, while creating destinations that attract local and regional visitors. Camas currently has an outdoor, concrete skatepark located next to the Washougal River Greenway, and opportunities and facilities for other alternative sports should be considered as new parks, such as Green Mountain, are designed and developed.

All-Inclusive Playgrounds

Upgrading play areas for ADA-accessibility will be necessary to ensure compliance and universal access; however, providing for ADA-accessibility should not be the City's only goal. As new parks or playground replacements are planned, Camas should consider opportunities for fully-accessible all-inclusive play areas to provide for users of all abilities.

Off-Leash Dog Area

Walking with a dog is a very popular recreational activity, and off-leash areas have become desired amenities for dog owners living in urban environments who may otherwise have limited opportunities to exercise their pets. Recreational trends and community input indicate an existing

need for an off-leash area. The City of Camas currently does not have an official off-leash dog area; however, the City of Washougal has prioritized implementation of a dog park within the next year with opportunities for Camas residents to use.

Appropriate sites should be safe, not isolated, and noise impacts on neighbors should be considered. Ideally, a dog park would be a component to a larger (future) community park, where infrastructure (e.g., parking, restrooms and garbage collection) exists and supports multiple activities. The development of a dog park may require code revisions, the development of rules and policies, and community support for self-policing for behavioral issues and waste pick-up. Communities throughout the Northwest have relied on grassroots or non-profit organizations, such as DOGPAW, for the ongoing operations and maintenance of such facilities.

Sport Courts

A limited variety of sport courts exists within Camas. Two tennis courts, three volleyball courts and nine basketball courts are provided at City parks. Tennis court surfacing will require attention in the coming years, and Camas has an opportunity to transition one or both courts to multi-sport use. Camas currently has no outdoor, dedicated pickleball courts available within public parks.

Pickleball continues to rank as one of the fastest -growing sports and has seen significant jumps in participation over the past decade, attracting a wide range of age groups. As an interim step, the City should plan to convert some tennis courts to multi-sport courts through striping and examine the need for additional multi-sport courts in the future.

Community Gardens

Community gardens provide common space for residents to grow fruits, vegetables and flowers. Gardens have been shown to increase healthy food consumption, while providing opportunities for active living, social interactions and lifelong learning. Community gardens are becoming more popular park amenities in urban environments, where residents may have limited outdoor space. Gardens are also popular with a diverse range of residents. Additional gardens could be sited in community or neighborhood parks or in stand-alone locations with parking and access to water. Due to limited staffing, the City should continue to seek partnerships for garden management with local community groups.

Water-oriented Recreation

Camas' location on the Columbia River and with three major lakes provide substantial opportunities for water-based recreation, including both motorized and non-motorized boating, fishing, paddle sports, wildlife watching, and beach activities. The City has made significant investments in waterfront acquisitions and water-oriented infrastructure over past decades, and this infrastructure, which includes docks, ramps and other water access amenities, should continue to be monitored.

Outdoor recreation businesses in the Camas-Washougal community benefit from the close proximity of the rivers, forests and mountains that provide venues for mountain biking, backpacking, rock climbing and similar outdoor activities. The cities of Camas and Washougal should coordinate and partner with local businesses to run classes that provide an introduction to these outdoor sports and broaden the outreach to new participants.

Acquisitions for a Complete Park System

Camas' park system has been expanding as the City grows and the need for more facilities triggers additions of both parkland and recreational amenities. The City is expected to continue its growth as a desirable place to live and, thus, must press forward to acquire more parkland and develop more amenities within existing parks. The mapping of existing parks within Camas' residential neighborhoods illustrated the need for three more strategically located park sites to ensure reasonable access to walkable parks for the bulk of the community. Acquiring parkland requires a proactive approach and may need to look beyond undeveloped or partially developed properties. In addition to fee-simple purchases, the City should continue to work and coordinate with local residential developers to include public parks in new subdivisions and utilize tools, such as park impact fee credits, to facilitate the process.

User Conveniences

Restrooms

Supporting park and trail use through the provision of restrooms is a critical element in any park system. Based on the park site assessments, several parks should have the restrooms replaced or upgraded; and where possible add new permanent bathrooms to parks and trailheads.

Parking

Camas has several park and trail assets that are heavily used during the summer, especially those that are adjacent to water or have access to water-oriented recreation such as Heritage Park and Heritage Trail. The City should evaluate such locations for parking and transportation constraints and needs and consider improvements to add capacity for heavy seasonal uses.

Picnic Areas & Shelters

Improving access to existing picnic areas and shelters for ADA compliance should be a core focus. Additionally, the City should assess and consider installation of new picnic shelters by city quadrants. Site master plans for Ash Creek Park and Ostensen Canyon Park should guide the future decisions about the need and location of picnic areas and shelter facilities.

Wayfinding

The City of Camas can benefit from enhanced wayfinding and signage supporting its overall park and trail system. Opportunities exist to help visitors navigate and inform them about the public spaces they are entering. A good wayfinding system can provide a consistent identity and display valuable and accessible information to orient the user. This guidance system ensures efficient use of the trail, park, or other public space and conveys safety to the user by translating the environment into a known geography. Signs, symbols, mapping, color, and standardized site amenities combined with good design of the physical environment (i.e., trail or park) help the user navigate the space and stay comfortably oriented.

ADA compliance

Minor improvements to access, such as providing ramped entrances, for site furnishings are necessary to conform to the Americans with Disabilities Act (ADA) and ensure universal accessibility. Also, the City should evaluate the play equipment and its signage for code compliance and replace outdated equipment, as appropriate. The Capital Planning section includes a line item for covering small upgrades and improvements to remove barriers and improve universal access. In general, the City should complete a system-wide ADA assessment and make improvements to existing parks as needed to ensure proper maintenance, usability and quality of park features and grounds.

CHAPTER 6

Open Space & **STEWARDSHIP**

Camas' open space, greenways and waterways are a critical component of the City's green infrastructure and play critical roles in supporting healthy, well-functioning ecosystems. These many benefits include maintaining and enhancing air and water quality, mitigating impacts of climate change, capturing stormwater runoff, and providing recreational and scenic opportunities to connect with nature that promote physical and mental well-being.

Open Space

The Camas community is fortunate to have retained several significant natural areas across the City. Over 700 acres of open space properties and natural lands are either owned or managed by the City, in coordination with the acreage of the developed park areas. These open space properties include forested lands, riparian corridors, wetlands, and steep slopes across 31 different sites. Together, the open space properties around Lacamas Lake comprise the most extensive and contiguous public open spaces, accounting for 49% of the open space in the City. Several other significant natural areas, ranging in size from 11 to 125 acres, also provide substantial forested areas. Smaller open space properties, under 10 acres in size, are distributed across Camas.

The open space classification distinguishes natural lands from parks developed for active recreation and other highly managed landscapes. Open space may refer to public properties that are exclusively natural areas or portions of larger parks that are managed as natural areas. These open space lands are managed to preserve, restore, and conserve ecosystem functions, water quality, native vegetation, and wildlife habitat. Open space properties are undeveloped, primarily left in their natural form, and are managed to retain or enhance natural or

> ***Would like to see development of parking, picnic shelters, and water entry to Fallen Leaf Lake on opposite side of Lake Road.***
> **- Online Open House participant**

scenic resources. However, open space may include trails or interpretive signs, along with modest support amenities such as parking or restrooms. Additionally, some properties that are acquired and held as future, active-use parks are managed as open space until they are developed as parks, which may last five to ten years or even longer from the time of purchase.

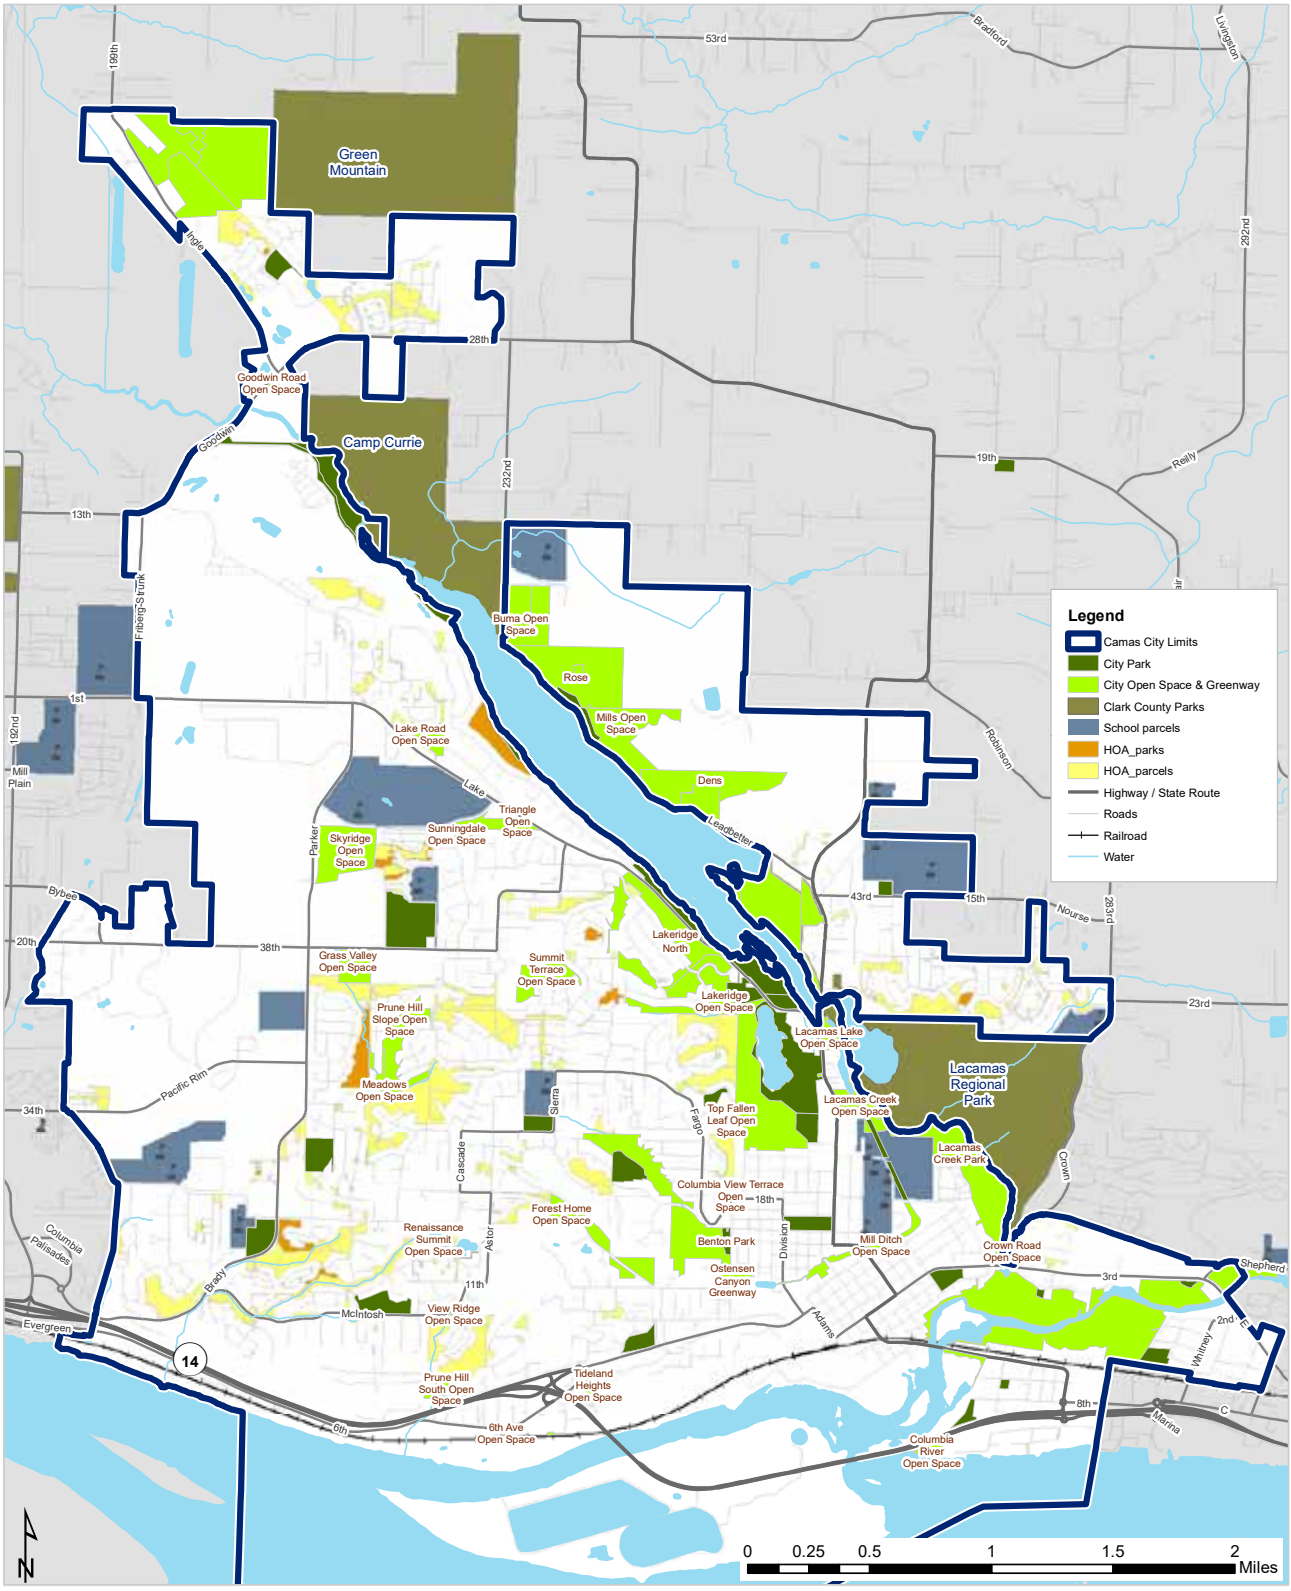
Lacamas Heights Park	2.30
Ostensen Canyon Park	8.23
Subtotal	**139.05**
TOTAL OPEN SPACE	**835.78**

Large Open Space Properties

The City manages several other sizable open space properties. At more than 10 acres, significant habitat for wildlife and a quiet experience for park visitors is buffered by nature from the surrounding urban environment. These areas, in addition to the Lacamas Lake and Washougal River Greenway areas, include Ostensen Canyon, Prune Hill, Skyridge, Forest Home, and Grass Valley. These large open space areas contain a variety of distinct habitats, such as wetlands and creeks, adding to the diversity of plant species they host. Some of these open spaces also include developed trail systems, serving as recreation opportunities and valuable pedestrian connections for local streets and neighborhoods.

Smaller Open Space Properties



Smaller open space areas, ranging from less than one acre to ten acres, are distributed across the City. Though small, these pockets of natural area serve as refuges for wildlife traveling between larger forested areas, and in some cases, provide meaningful trail connections between adjoining neighborhoods. Several of these areas have no developed trails or site improvements and are managed exclusively as natural area set-asides and to preserve or enhance their ecosystem functions. These include Crown Road Open Space, Lake Road Open Space, Meadows Open Space, Mill Ditch Open Space and Triangle Open Space, among others. Development of these sites for public recreational use, including the construction of trails, may be limited, or restricted by natural characteristics of the land, including steep slopes, wetlands, and other features.

Other Open Space Properties

Other significant natural open space areas include sites owned by Clark County, such as Lacamas Regional Park and Camp Currie, and a significant collection of privately-held parcels owned by various homeowners' associations throughout the City.

Figure 20. Other Open Space Areas

Land Conservation

The City of Camas has demonstrated its commitment to conserving its natural resources within the context of a major metropolitan region. The preservation of the network of open space around Lacamas Lake and the Washougal River Greenway are shining examples of the importance of land conservation to the community. The City has also preserved a variety of public waterfront access and public park amenities along Lacamas Lake and the Washougal River.

Many of the public lands that the City owns and manages host unique, high-value landscapes, such as intact forests, waterfronts, and vistas. These areas are prioritized for conservation, acquisition, and restoration activities to ensure that they continue to thrive and provide their distinct ecosystem functions and benefits. High-quality waterfronts, watercourses, and wetlands are all vital to protecting water quality of these environments and preserving Camas' diversity of habitats. Providing safe public access to and within these areas needs to be carefully balanced with the crucial goal of environmental stewardship and natural habitat protection.

Waterfronts

Camas' diverse waterfronts present some of its most aesthetic and environmentally important characteristics. With only small exceptions, nearly the entire waterfronts of Lacamas Lake, Round Lake and Fallen Leaf Lake are in public ownership. Water access sites are provided at Heritage Park, Fallen Leaf Lake Park, Lacamas Regional Park and along Leadbetter Road. River access is provided within the Washougal River Greenway, and the Port of Camas-Washougal provides water access to the Columbia River. Through ongoing planning and coordination with Clark County, the City should continue to explore options to expand its waterfront ownership along the Columbia River. The conservation and continued restoration of these open spaces further highlight the conservation values of the Camas community.

Watercourses

The City's stormwater management area includes three major watersheds: the Columbia River, the Washougal River, and the Lacamas Lake watersheds. The Stormwater Management Program aims to inform and assist in the development of water quality management policies and strategies to protect local waterways, consistent with the state and federal requirements. Watercourses traversing the numerous sub-basins within the three main watersheds are naturally occurring or partially altered streams characterized by perennial or seasonal flows that contribute to water filtration, stormwater buffering, erosion control, and the provision of wildlife habitats. Within City-owned properties, preservation and restoration of the land surrounding watercourses are a priority, ensuring that these areas continue to provide their unique ecosystem services.

Wetlands & Steep Slopes

The City code also protects and regulates wetlands and steep slopes in Camas. The City's natural open space areas include several wetland areas, including riparian or lakeside wetlands and perched wetlands in upland forest areas. Steep slopes exist throughout the drainage basins and small canyons, such as Ostensen Canyon. These areas continue to be a high priority for protection and restoration efforts. Generally, they represent fragile ecosystems that host unique plant communities and serve as a valuable habitat for many animals, including bird and amphibian populations. These areas should be included in future open space management planning.

Forest Lands

Healthy and resilient forest lands are crucial for the preservation of Camas' high-value ecosystems. The City is fortunate to have acquired and protected many of the forested hillsides and canyons and open spaces around the three major lakes. Ongoing monitoring and management of these forest lands will be necessary to control impacts to water bodies and water quality, control invasive vegetation, maintain native plant communities and accommodate appropriate recreational access and usage.

Land Acquisition

Conservation may also take the form of acquiring important lands that contribute to the ecological health of Camas' forests, wetlands, and watercourses. For many years, the City has partnered and planned with Clark County on the Legacy Lands Program to secure such lands adjacent to the North Shore of Lacamas Lake.

The 2021 update to the Clark County Natural Areas Acquisition Plan provides a vision for preserving and enhancing a system of natural lands that includes greenways, habitat, farm, and forest resource lands. The plan provides a regional perspective, identifying specific acquisition opportunities, as well as accommodates future opportunities for park development, trail creation, and restoration. Within Camas, this county-wide plan continues to identify high-value conservation lands along the Columbia River shoreline (including Lady Island) for open space and to accommodate the Lewis and Clark Regional Trail, in addition to lands along Lacamas Creek.

Undeveloped lands or sections of existing properties are often restricted in their potential development by steep slopes, wetlands, or critical areas. These features are often highly valued for habitat conservation. These areas may extend existing natural areas or serve as essential habitat corridors between larger open space lands. Conservation easements and public access easements are tools that could be applied to increase habitat benefits and access across the parks and open space system.

Stewardship

With the growth of the open space network, the City has initiated several studies to guide the stewardship and management of these lands, informed by quantitative data and best practices.

Open Space Studies and Management Plans

Lacamas Lake Management Plan

The City has begun a process to develop a Lake Management Plan to outline actions to improve water quality in Lacamas, Fallen Leaf, and Round lakes. The project will address algae blooms, along with other water quality concerns that City Council has identified as a top priority. The planning effort will include water sampling and monitoring to better understand current water quality and to develop potential management strategies to improve the overall health of the lakes.

North Shore Subarea Plan

The area north of Lacamas Lake is anticipated to experience substantial growth and redevelopment within the next 20 years, and the City is actively planning the future of the North Shore through an ongoing community process. Current uses are primarily agriculture and single-

family residences, and most of the subarea is in private ownership. Planned transportation infrastructure will improve connectivity and support the employment and retail uses desired in the North Shore area. A large portion of the land in this area is zoned Business Park and Multi-Family, with some Commercial and lower density residential zoning. An eight-point vision statement, adopted by City Council in September 2020, includes as the first two points the intent to preserve the natural beauty of the North Shore and plan for connected greenspace.

1. Preserve the North Shore's natural beauty and environmental health. Policies, regulations and design rules must protect significant trees, tree groves, and surrounding lakes. Identify and preserve views to the treed hillside and the lake.
2. Plan a network of green spaces and recreational opportunities. Integrate a variety of parks, playgrounds, trails, and open spaces into residential and employment areas throughout the North Shore area. Create a "green corridor" along the lake that completes the Heritage Trail, provides lake access, and buffers the lake from adjacent development.

System-wide Open Space Management

In 2003, the City prepared Policy Guidelines for an Open Space Management Plan, which was intended to give staff the basis for effective resource management decisions. The plan identified nine management goals and eight policies to guide open space management. The plan identifies high-level issues related to land management and trail development in and through the open space network.

Since 2003, the City's open space network has grown by over 50% in terms of city-owned acreage, and an updated, more specific and science-oriented open space management and urban forest management plans are required to better guide City staff in the care, maintenance and stewardship of open space and forested lands. In particular, these new plans should reflect the realities of limited program funding and the challenges presented by climate change to include the following considerations:

1. Maintain the functional benefits of open space vegetation.
2. Foster resilient plant communities that can recover from disturbances and adapt to climate change and its impacts, such as forest fires.
3. Implement work based on the value of these functional benefits, the community's priorities for the open space properties and the condition of the vegetation found there.
4. Maximize the return on available funding through volunteers, matching grants, and donations.

Sustainable Stewardship Practices

The management of landscapes in City parklands, whether formal plantings in developed parks or diverse forest ecosystems in open space areas, requires continual attention and an investment of significant resources to properly steward and maintain the living landscape. Regardless of the use of these landscapes, the desired outcomes are the same – to sustain healthy, thriving plants.

Past practices and traditional horticultural methods to achieve this goal have become less reliable in recent years. Changes to the Pacific Northwest climate have increased summer heat and drought, causing more stress for mature and establishing plants. This change has been accompanied by a shift toward more sustainable landscape maintenance practices, reducing potential impacts on the surrounding environment and its inhabitants.

Water Conservation

Despite the rainy winters, water is not an unlimited resource in the mid Columbia River valley, and summers are expected to get even hotter and drier as climate change intensifies. It is increasingly likely that not just voluntary, but mandatory, water conservation measures will become necessary on occasion to preserve supplies for the most critical uses, such as domestic consumption.

In landscaped areas where shrubs and trees rely on some summer water, maintenance staff have adjusted the irrigation systems to water before sunrise to reduce water waste and maximize plant uptake. Depending on the landscape, watering also may need to be shifted to a deeper and less frequent watering schedule to reduce evaporation and encourage plants to root more deeply. In addition to reducing irrigation volumes and frequency, the City should consider shifting to planting more drought-tolerant species and schedule the majority of new plant installations in the early part of the rainy season to maximize root growth and establishment before the onset of the dry season.

Plant Selection

Selecting appropriate plants species for park landscapes is the source of a great deal of discussion, both on the local and regional scale. While drought-tolerant plants will be better able to establish in the short term, consideration is also given to how well newly established plants will survive in the long term. In recent years, cities across the Pacific Northwest have seen many mature native trees decline and die in recent years, unable to adapt quickly to the increased summer temperatures and lack of summer moisture. Plant selection for tree replacements or renovations that consider the anticipated climate in 10-50 years will be more likely to create resilient, mature landscapes that can better transition to warmer, drier conditions.

In natural areas, generally replanted with trees and shrubs native to the immediate area, staff should begin selecting new plants from seed zones that reflect the greater Portland-Vancouver area's projected climate. This focus on plant provenance (the original geographic source of seed, pollen, or propagule) will allow staff to plant the same native species better adapted to future conditions.

In addition to considering the climate in the selection of plants for developed parks, other factors must also be considered, including the mature size of the tree or shrub, any known pests or diseases that may affect the species, and how a fully developed root system will interact with nearby paved surfaces.

Invasive Species Management

The control of invasive species is a critical element of the restoration process and essential in maintaining a healthy natural landscape. Many invasive and non-native species exhibit strong adaptability to Pacific Northwest environments and displace native species, especially within the disturbed landscapes proximate to urban development. In relation to the need for an updated open space management plan, the City should expand resources to managing invasive species and enhanced partnerships to help with these efforts. While removal efforts may be ongoing, those sites cleared of invasives will require continuous monitoring and intervention to reduce or limit the re-establishment of the invasive plants. Through proper management of public open spaces and natural areas, the City and its partners can maintain and enhance its open space areas and the critical ecosystem and community benefits they provide.

Stormwater Management

The Pacific Northwest region is experiencing more severe rainstorms due to climate change, and more of that rain is falling on impervious surfaces: roads, parking lots, and rooftops. This untreated surface water runoff is a source of contamination along the Columbia River, Washougal River, Lacamas Lake, and in other riparian areas, impacting both people and wildlife, especially salmon populations.

State requirements for surface water management are becoming more stringent and costly for both developers and the City. Ongoing updates to and management of the City's NPDES Phase II Permit, Stormwater Design Standards, Stormwater Management Plan, and Stormwater Management Program should be acknowledged in relation to park and open space system management.

Runoff volumes, peak stream flows, and local flooding can be reduced by incorporating trees into stormwater management planning, lessening the need for expensive detention facilities (e.g., catch basins) and the cost of treatment to remove sediment and other pollutants such as lawn chemicals. Green infrastructure is far more cost-effective than grey infrastructure.

Using open space areas and greenspaces to capture stormwater runoff encourages infiltration into the soil, prevents excessive streambed erosion, and reduces sedimentation in major waterways. In addition, a healthy tree canopy increases carbon sequestration potential, encourages local biodiversity, and enhances overall environmental resilience by reducing heat island effects and offering cooler, shaded air.

CHAPTER 7

Recreation & **EVENTS**

> *...my top priority "Outdoor adventure summer camps, including archery..." I would be very interested in these types of activities/camps not only for children and youth, but adults as well. I would love to participate in all of the activities that were listed, not only to learn more but also to meet more people in the community.*
>
> **- Online Open House participant**

The recreation facilities and services available within Camas are a major community asset and support the physical, mental and social health of community members. Recreation services are available through a range of public and private recreation, health and fitness providers and facilities. The City currently provides nearly all of its programing through partnerships and program contractors and does not provide a full suite of 'traditional' recreation offerings, such as fitness and aquatics, due to limited facility space and staffing.

RECREATION MACROTRENDS

The following national and state data highlights some of the current trends in recreation and may frame future considerations in Camas' recreation programs. Additional trend data are provided in Appendix E.

- Nationwide, eighty-two percent of U.S. adults believe that parks and recreation are essential. [1]
- Seventy-seven percent of survey respondents indicate that having a high-quality park, playground, public open space or recreation center nearby is an important factor in deciding where they want to live. [1]
- Nearly all (93%) park and recreation agencies provide recreation programs and services. The top five most commonly offered programs include holiday or other special events (65%), educational programs (59%), group exercise (59%), fitness programs (58%), and day or summer camps (57%). [2]
- Youth aged 6 to 17 were active outside far less in 2019 than in previous years – the average

number of outings per child dropped 15% between 2012 and 2019. [4]

- Adults over the age of 65 showed significant change in inactivity rates in the six year period between 2014 and 2019, decreasing 6.8%. The rise in popularity of low impact exercise like aquatic exercise, swimming for fitness, yoga, and barre could be attributing to the decline of inactivity in this older age group. [5]
- Nearly all park and recreation providers in the U.S. experienced a decline in revenue in 2020 due to the COVID-19 pandemic. As early as May 2020, most providers had to close facilities temporarily in accordance with health and safety directives. Nearly half had also furloughed or laid off staff due to the funding and facility impacts of the pandemic. [3]

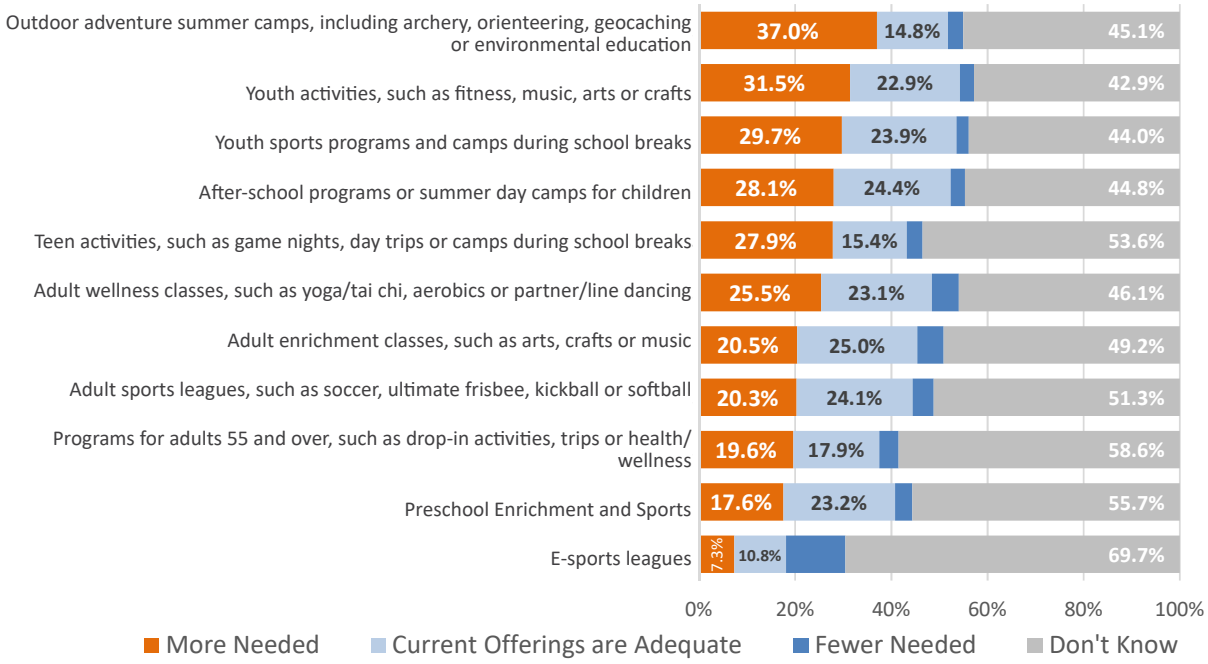
(1) American Engagement with Parks Survey

(2) 2020 NRPA Agency Performance Review

(3) 2020 State of the Industry Report



(4) 2020 Outdoor Participation Report

(5) 2020 Sport & Fitness Industry Association Sports, Fitness, And Leisure Activities Topline Participation Report

Local Perspectives

The community survey conducted as part of this PROS Plan update asked respondents which types of recreation programs, classes and activities they would like to see more of. Notably, approximately half of respondents indicated that they did not know whether current offerings were adequate or not. Of those who expressed an opinion, more than half felt the City needed more outdoor adventure summer camps, teen activities, adult wellness classes and programs for adults over 55. Respondents under 34 years of age were more likely to feel the City needs more adult sports leagues, youth camps and after-school programs, preschool activities, and E-sports leagues.

Figure 21. Adequacy of Current Recreation Options

Additional insight was gleaned from the online open house, which asked participants to prioritize the list of recreation programs and activities that ranked strongly from the above community survey. The top three recreation program priorities were noted as the following:

(1) After-school programs or summer day camps for children

(2) Outdoor adventure summer camps, including archery, orienteering, geocaching or environmental education

(3) Youth sports programs and camps during school breaks

The online open house also included a question about community events. Participants were asked to rate the priority (high, medium or low) from a list of ten program options. The top three event priorities were noted as the following:

(1) Hometown Holidays

(2) Movies in the Park

(3) Concerts in the Park

Recreation Programs

Interest in the City providing recreation programs appears to be strong; however, the number and types of activities the City can offer is very limited due to the lack of staffing and indoor facility capacity. The City should consider incremental growth in recreation programs and initially focus on facilitating programs via contract vendors who provide their own staff and/or focusing on those programs that are not currently offered by local or regional providers.

Programming Classifications

Recreation program offerings can be classified and segmented into general program categories to assist in the planning and provision of programs and activities. The following general program categories have been applied to a review of programs offered by the City to illustrate the range and variety of program options:

- Education – Language programs, tutoring, science (STEM) classes, computer, financial planning, and CPR/AED/First Aid
- Fitness – Group fitness classes, personal training, education, and nutrition
- Outdoor Recreation – Environmental education, hiking, camping, kayaking, and other activities
- Sports – Team and individual sports including camps, clinics and tournaments, as well as adventure/non-traditional sports
- Seniors – Programs and services that are dedicated to serving the needs of seniors
- Special Events – City wide special events that are conducted throughout the year
- Teens - Programs and services that are focused on serving the needs of teens. This can include all of the activity areas noted above (except seniors)
- Youth – Before and after school programs, summer/school break camps, and preschool

Figure 22 highlights the major areas of focus for current Camas recreation programs, segmented by general program classification and age group. The programs noted are based on a review of program offerings for 2018-2021, that were provided by the Department.

Figure 22. Existing City Programs by Classification

Area	Focus	Programs
Sports	Youth Sports	Sports Camps, Soccer, Skyhawks Sports Camps, Co-ed Flag Football
	Adult Sports	Adult Co-ed Softball, Men's Softball
Fitness / Wellness	Youth	Fencing, Kung Fu, Fitness Classes, Tiny Tots Tumbling
	Adult	Fitness Classes, Yoga, Tai Chi, Women's Self Defense, Barre
Youth		Spring Kids Camp, Preschool, Preschool Summer Camp, Brickzone Summer Camp, School Break Camps
Teens		Camtown Art Show, plus Sports & Fitness (see above)
Education	Youth	CPR/AED/First Aid. Busy Bee Preschool
	Adult	CPR/AED/First Aid
Specialty / General Interest	Youth	Music Together, Craft Workshops, Family Paint Night
	Adult	Craft Workshops, Family Paint Night
Special Events		Easter Egg Hunt, Camtown Youth Festival, Movies in the Park, Summer Concerts, Family Fun Fridays, Hometown Holidays
Outdoor Recreation	Youth	Spring Adventure Camp
	Adult	N/A
Seniors		Fitness Classes, Tai Chi, Self-Defense, Cultural Bus Tours, Casino Tours

Programs Available by Age Groups

Below is listed the general program categories that are available for different age groups. Full dots represent categories where Camas has an established set of programs, and hollow dots represent categories where Camas currently provides some program options and is working to grow the programming.

Figure 23. Segmentation of City Programs by Age Group

Program Category	Preschool	Youth	Teen	Adults	Senior
Education	●		◎	◎	◎
Fitness		●	◎	●	●
Outdoor Recreation		●			
Seniors					●
Special Events	●	●	●	●	●
Sports	●	●	●	◎	◎
Teens			●		
Youth		●			

For the programs it provides, Camas serves all of the major age groups to a degree. Education and Outdoor Recreation have very limited programs in place and should be supplemented as staff and resources allow. Education programs could include language programs, tutoring, science (STEM) classes, computer classes and financial planning. Outdoor recreation programs could occur at many of the local parks and include environmental education, birding, hiking, camping, kayaking and other activities.

As shown in the community survey conducted as part of this Plan, the Camas community considers youth programs to be a high priority for City recreation services. More than three in ten survey respondents indicated that there were not enough youth activities, such as fitness, music, arts or crafts (31.5%) and outdoor adventure summer camps, including archery, orienteering, geocaching or environmental education (37%). To address community needs and demand, the City should explore how to provide adequate resources to expand and diversify its youth programs to meet the growing need for engaging, affordable, safe options for children and teens. The City should continue to work with the school district, community partners, recreation providers, and sports organizations to explore facility options and availability. In utilizing existing parks and outdoor resources during the summer months, the City should explore specialized outdoor youth camps focusing on hiking, climbing or orienteering, as well as expand and strengthen its Adventure Camp program.

If opportunities are created for additional indoor or classroom space, the City should consider whether to expand the quantity and breadth of youth and adult programs offered. In particular, the City should consider health and fitness classes, additional team sports programs, classes in alternative sports, art and music classes, and educational programs, such as language, and personal and home improvement. Because recreational programming can be influenced by national and regional trends, staff must stay abreast of current trends and continue to evaluate and adjust program offerings within its contractor-reliant service model and if indoor program space becomes available.

The City also should continue to coordinate with the school district and explore options to partner with the district for the use of school facilities (e.g., gymnasiums and classrooms) as space for expanded program options, especially during non-school summer months. Such an option would require the loosening of COVID restrictions, as the school district has stopped allowing outside organizations to use their spaces for activities.

Regarding programs for adults over 55, the depth and breadth of programming for seniors may need to increase or be adjusted as the overall population ages, with a greater emphasis on the wide-ranging needs and expectations of the Baby Boomer generation. As noted in the Community Profile chapter, Camas has a slightly higher median age than the county and state, and nearly one-quarter of the city population is 55 years of age and over. Today's seniors are generally more active than previous generations and would benefit from a diverse array of recreational and educational programs that promote active, healthy lifestyles. The City will likely see an increased demand for programs offered on evenings and weekends, as older community members maintain employment or volunteer activities later in life.

Additionally, the following program categories are not provided due to the limited nature of the City's facilities and staffing capacity to support these programs:

- Aquatics – Learn to swim classes, aqua exercise classes, competitive swimming/diving, SCUBA, and other programs (synchro, water polo, etc.).
- Cultural Arts – Performing arts classes, visual arts classes, music/video production and arts events.
- Self-Directed – This includes the opportunities for individuals to recreate on their own. This can include activities such as open gym, use of weight/cardio space, and lap/recreational swimming.
- Special Needs – Programs for the physically and mentally impaired, as well as inclusion programs.
- Social Services – This can include nutrition and feeding programs, job training, life skills training, childcare and other activities, such as health screenings.

Recreation Facilities

Camas Community Center

The Camas Community Center is a historic school building located south of the Washougal River and downtown Camas, in the Oak Park neighborhood. The center is used for community meeting and private event space, recreation programs, senior activities, as well as storage for non-profit partners, special event and recreation program supplies. The facility has limited function due to its small size, limited amenities, location, and inability to expand. Built in 1915, the Center was not designed for recreation programming and does not have a full-size gym. In the future, if a new recreation center is approved, the City should reexamine the use of the existing community center to avoid duplication of services.

Lacamas Lake Lodge

The Lacamas Lake Lodge is located adjacent to Heritage Park on Lake Road, along Lacamas Lake. Located on the site formerly occupied by the Camas Moose Lodge, the new building provides community meeting and event space, adult and youth recreation programs, as well as improved access to Lacamas Lake and public parking. This facility is intentionally designed for multiple uses but is especially well suited to rent for events. The City should continue to program this facility to support recreation programs, but in a manner balanced with rental use of the facility, which provides the greatest revenue to support this facility and other City services.

Private Fitness

Several private fitness and aquatic clubs are located in or near Camas. These facilities vary in their offerings and clientele, and their strength in the marketplace is an indicator that the wider Camas-Washougal community seeks out and has a need for fitness-related activities and programs.

School District Facilities

In addition to school gymnasiums and sport fields, the Camas School District also operates the Jack, Will and Rob Center. The facility was opened in 2002 and run as a Boys & Girl Club until 2017. At that time, the Camas School District assumed operations. The center provides after-school programs, classes and rentals, and the facility offers a gym, classroom space, art room, computer lab and Family Community Resource Center.

Future Recreation & Aquatic Center

In 2019, Camas voters rejected a $78 million bond to build a community recreation and aquatics center with a recreation pool and competitive pool, in addition to sport field improvements. Although the outcome of that vote was clear, the outreach conducted through this planning effort indicates that many in the Camas community still have interest in an aquatics facility and indoor recreation space.

Traditional guidelines from the National Recreation and Parks Association for service demand for recreation centers are based on a population benchmark, with the idea that one recreation center could be supported by a population of 40,000. With the City's current population and projected growth, the City should continue to explore the potential to site and finance an indoor facility and continue the dialogue with the community about what could be included in a new facility, its projected costs, and the community willingness to support such an endeavor – at a scale that would be supported by voters. Partnerships will be necessary to offset development and operational costs of a community recreation center, so the City should continue discussions with local agency partners (e.g., City of Washougal, Camas School District) and with operators (e.g., YMCA) to explore options for the development and operations of a future center.

Special Events

The main recreation program area that is directly offered by Camas Parks and Recreation is special events, which include the following (pre-COVID):

- Easter Day Egg Hunt
- Camtown Youth Festival
- S'more Stories Under the Stars
- Concerts in the Park
- Camas Days Kids Parade
- Family Fun Fridays
- Movies in the Park
- Family Halloween Night
- Hometown Holidays

Community and special events should continue to be an area of emphasis. Special events draw communities together, attract visitors from outside the community, and are popular with residents. However, due to resource requirements of coordinating special events, the overall growth in the number of events should be carefully managed. This will ensure the City can adequately invest in its overall recreational offerings and maintain high-quality special events. Other community groups should be encouraged to be the primary funders and organizers of as many community-wide events as possible. If the City decides to offer more events, it should obtain sponsorships to offset costs and develop a series of seasonal activities.

Program Enhancement & Development

Staff should periodically review data from the following sources to determine community needs for programs and services:

- Historical registration trends/success of current programs and services
- Surveys and questionnaires
- Washington SCORP and national trend data
- Suggestions provided by current instructors and current employees
- Suggestions submitted by prospective instructors/ employees

Staff should continue to evaluate and assess the City's program offerings and prioritize future programs based on a mix of criteria that include:

- Current or potential importance for community-wide or broad individual benefit
- Community needs or deficiencies
- Potential for increased participation
- Revenue potential, affordability and accessibility

With the City of Washougal's interest in expanding recreation options, the City of Camas should directly coordinate and plan with Washougal staff to provide a balanced suite of programs in a complementary manner. This should be in parallel with the development of Camas' programming philosophy to detail how the City will deliver recreation programs and services in the future, which also is framed by the availability of flexible, indoor space for programs and classes. As part of the programming philosophy, the City must determine what programs and services will be offered directly by recreation staff and which will be contracted to other individuals or organizations. The City's current model of utilizing program contractors could be expanded or supplemented as indoor space is available via arrangements with the school district and/or the construction of a larger recreation center that can accommodate fitness, athletics and classes.

Before determining which programs and services to contract or have provided by others, an assessment of the specific pros and cons of such a move needs to be completed. A major aspect of this analysis should be to determine the financial impacts and

quality of the services that will be provided. Key questions to be asked include:

- Is this program offer consistent with community wants and needs?
- Do we have the facility capacity to provide the program? If not, can we partner with someone who has the space?
- Will this be the most cost-effective method to obtain the program, service or function?
- Does the Department have the knowledge, equipment, staffing resources and systems to provide the program, service or function?
- Are there other more qualified organizations that should provide the program, service or function? Will the quality of the program, service or function suffer if it is contracted to other organizations?
- Is the program, service or function only available from a contract provider?
- Are the safety and liability risks too high to provide the program or service in house/
- How will we effectively and efficiently market this program?

Communications & Marketing

As staffing and resources allow, the City should take a stronger role in coordinating and delivering recreation programs and services in the community to ensure that there is a broad base of inclusive programming options available. This will require strong communications with other providers to determine roles, tracking of programs offered and number of participants, plus actively promoting the availability of services. Strong marketing efforts will be needed to inform and promote the recreation programs that are available and should focus on the following areas:

- Website enhancement to better promote programs and services
- The development of an updated program catalog, circulated multiple times a year
- Promotion of program registration options
- Programs and services offered by other providers
- Using appropriate communication channels to effectively market to various demographic segments.
- Cross marketing and/or promotional opportunities with other organizations such as the Camas School District, Camas Library, Meals on Wheels, Camas-Washougal Rotary and others.

There must be a strong recognition of the different demographic markets that have to be served. The youth, senior and family populations in the area should be specifically addressed, as should the different ethnic groups. Cross marketing programs with the school district and using social media to highlight programs by target audience also should be employed.

CHAPTER 8

Operations & MAINTENANCE

Near-term – increase field capacity by improving field quality.
- Stakeholder Focus Group participant

The City of Camas aims to provide a quality park, recreation, natural open space, and trail system that is efficient to administer and cost-effective to maintain. The previous 2014 PROS Plan outlined a set of objectives for operations and maintenance to help achieve this goal. These included staff training, updated equipment, the exploration of additional resources through alternative staffing, a volunteer coordinator position and the investment in preventative maintenance and upgrades to park facilities to maximize long-term benefits. Camas has since purchased larger mowing equipment, added two FTE positions in the fiscal 2019/20 period and added a playground inspection program with funding for playground equipment repair. This park management effort is ongoing as resources are available but further progress

is needed. Park Operations staff have demonstrated their dedication to keeping parks functioning while the parkland system, city population, and park use has been expanding rapidly.

This chapter will provide data and assessments to help identify existing resource gaps and explore opportunities that may improve the capacity of park operations and maintenance.

Background

The City of Camas has doubled its population since 2000 and has been very successful at implementing its plans for acquiring and preserving open space in the face of development pressures. The City has worked diligently to create its open space network with a connecting system of trails around Lacamas Lake and linked to regional trails. In the last decade alone the City has added over 316 acres of open space and over 146 acres for future parks. The ten years of successful acquisitions increased the 2010 park system size by over 75%.

Figure 24. Camas Parklands Acquisitions since 2010

	Acquisition Acreage		
Year	Park	Open Space	Total
2011	7.02	4.92	**11.93**
2012		48.92	**48.92**
2013		23.59	**23.59**
2014		5.82	**5.82**
2015	25.12		**25.12**
2016			**0**
2017			**0**
2018		75.57	**75.57**
2019		37.99	**37.99**
2020	58.55	119.66	**178.22**
2021	55.65		**55.65**
Subtotals	**146.34**	**316.47**	
	Total Acquisitions since 2010		**462.81**

While the park system in Camas increased by over 462 acres, the park maintenance staffing remained at the same equivalent employee level. There is some degree of maintenance outsourcing that accomplishes tree pruning or removal and invasive weed control.

Figure 25. Camas Park Maintenance Staffing Levels from 2010-2020

Metrics	2010 Actual	2020 Budget	2020 Actual
Parks Maintenance Expenditures	$842,449	$1,284,856	$1,246,099
Parks Maintenance Staffing (FTEs)*	7.3	7.3	*

* No seasonal workers were hired in 2020 due to COVID
2010 FTE's combined full-time and seasonal equivalents

In 2010, park maintenance was conducted by 5.3 full-time employees (FTE) and two FTE equivalents for summer seasonal work. Having added two FTEs in 2019, park maintenance was executed by 7.3 FTEs with two additional seasonal positions. In 2020, no seasonal workers were hired due to COVID restrictions. While the park maintenance budgetary expenditures increased by about 48%, the actual personnel level was similar to 2010. Those budget increases were mainly from normal inflation, additional playground repair/maintenance, and cost of living adjustments. Clearly, the operational resources have not kept up with the increase in the park system.

National Park and Recreation Agency Comparisons

The National Recreation and Park Association (NRPA) 2020 Agency Performance Review provides some park metrics that offer perspectives on the Camas park system. Selected findings from their benchmarking tool illustrate some disparities with park acreage, population size and Park Operations staffing levels.

Figure 26. NRPA Agency Performance Comparisons with Camas' City-owned Park Facilities

Metric	All Agencies	Pop. 20,000-49,999	Camas
Number of Parks	20	-	**18**
Park Acres	437.1	-	**240**
Parks & Open Space Facilities (# sites)	27	-	**70**
Parks, Open Space & Non-Parks Acres	530	-	**1,064**
Residents per Park	2,281	1,963	**1,448**
Park Acres per 1,000 Residents	9.9	9.6	**40.8**
Trail Miles	11	8.5	**18.7**

The City of Camas, with 1,064 acres of parks and natural areas, has more than double the acreage of parks and open space than the median park and recreation agency (at 530 acres). That acreage comparison uses only city-owned parklands excluding the parklands owned by Clark County. The City also manages much more than the median trail mileage as typical agencies across the country. For Camas residents, these additional park facilities help improve the quality of life. However, the existing park operations staffing level does not provide enough resources to oversee, monitor or steward this extent of open space and natural parkland. A review of additional NRPA metrics provides further comparison with other agencies and jurisdictions of similar size. The number of park FTE positions relative to the population size for most park and recreation providers is 8.9 FTEs per 1,000. The Camas park and recreation system has 0.4 FTEs per 1,000 population; the number of FTEs is considerably lower. The operating expenditures per capita is much lower than comparable cities.

Figure 27. NRPA Agency Performance Metrics Comparisons – Park & Recreation Staffing

Metric	All Agencies	Pop. 20,000-49,999	Camas 2020
Park & Rec FTEs*	41.9	27.3	**11.1**
P&R FTEs per 1,000 Residents	8.1	8.9	**0.4**
Annual Operating Expenditures	$4,342,495	$2,885,847	**$1,771,272**
Operating Expenditures per Capita	$81.19	$95.34	**$67.96**
Operating Expenditures per Park Acre	$7,160	$8,522	**$1,665**

**No seasonal FTEs for Camas in 2020 due to COVID*

The comparison with NRPA metrics predicts the need for additional staffing resources to effectively manage the extensive system of parklands owned by the City. As the City continues to work to fill in the gaps in its open space network and to further develop its comprehensive trail system, park operations will need to be expanded to meet the need for more active stewardship and care.

Additional agency performance review findings are located in the 2020 NRPA Agency Performance Review summary in Appendix E.

Washington Cities Park and Recreation Provider Comparisons

Park and recreation operations can be highly variable, particularly at different population sizes and residential densities. A more refined comparison of park metrics was prepared using several cities in western Washington with population sizes within range of the population size of Camas. This comparison used budgetary and staffing numbers from 2018 to avoid the highly variable impacts from the COVID-19 shutdown and ensuing restrictions.

Figure 28.. Comparable Washington Cities' Park & Recreation Performance Measures

		City Park Providers				Park District Providers	
Performance Measure	**City of Camas**	**Port Angeles**	**Maple Valley**	**Mercer Island**	**Mountlake Terrace**	**Si View**	**PenMet**
Population	**26,065**	19,960	28,013	25,748	21,286	25,410	37,485
P&R total spending (2018)	**$1,020,000**	$3,462,300	$2,525,940	$5,209,047	$3,623,851	$7,645,050	$14,567,517
Spending per resident (2018)	**$39.13**	$173.46	$90.17	$202.31	$170.25	$300.87	$388.62
Operating Budget (2018)	**$2,050,000**	$3,356,600	$2,525,940	$5,864,507	$3,623,851	$5,042,038	$6,297,517
Operating per Resident	**$78.65**	$168.17	$90.17	$227.77	$170.25	$198.43	$168.00
Annual Capital Spending (2018)	**-**	$1,024,000	$8,100,000	$3,154,753	-	$1,460,952	$8,270,000
Capital Spending per Resident	**N/A**	$51.30	$289.15	$122.52	-	$57.50	$220.62
Park & Rec FTE (2018)	**5.25**	25.6	11.75	29.75	44	14.5	22.3
Seasonal FTE positions	**3.75**	7.6	(combined)	(combined)	(combined)	-	(combined)
P&R FTEs per 10,000 Residents	**3.45**	16.6	4.2	2.6	2.1	5.8	4.6
Total Developed Parks (acres)	**240**	270	320	259.9	269	46	266.1
Park acres per 1,000 Residents	**9.2**	13.5	6.9	10.1	12.6	1.8	7.1
Total Parks & Natural Areas (ac.)	**1064**	270	370.8	479	269.0	890	570.9
Parkland acres per 1,000 Residents	**40.8**	13.5	13.2	18.6	12.6	35.0	15.2
Parkland acres per P&R FTE	**118.2**	8.1	31.6	16.1	6.1	61.4	25.6
Population Density (people/sq. mi.)	**1,853**	1,865	4,669	4,036	5,243	941	742
Park Facilities	**18**	23	9	52	15	65	19
Trails (miles)	**18.7**	8.5	3	24.9	-	-	1.6

Note: 2018 budget numbers were used for the provider comparison to avoid the highly variable budget impacts from COVID.

In reviewing the comparisons, a few observations about the Camas system stand out.

- Overall spending per resident for park and recreation services was considerably lower for Camas ($39.13 per resident). The average across the other comparable cities was $220.95 per resident.
- Also, Camas parks and recreation budget allocated the equivalent of $78.75 per resident compared with an average $170.46 per resident for the other cities.
- Overall, Camas had more total park and open space acres per 1,000 population (40.8 per 1,000) than the comparable agencies. However, when comparing staffing for that larger parkland system, Camas measured at 118.2 parkland acres per FTE significantly higher than the averaged 24.8 parkland acres per FTE of other comparable cities.

This comparison indicates some off-balance traits for Park Operations charged with stewardship of the entire Camas park system.

Open Space Management

The City provides conserved public lands and undeveloped parklands temporarily held as greenspace totaling over 830 acres. Recent additions of Green Mountain and properties in the north Lacamas Lake area have helped create a significant network of contiguous natural areas with high ecosystem value. Park Operations currently manage to accomplish field mowing in open space lands such as Goot power lines, Ostensen Canyon, etc. and have performed annual invasive species spraying in areas identified by the County Weed Management Board in the spring.

However, the capacity of the Park Operations staffing has not kept up with the more extensive need for open space management that may involve proactive hazard tree removal, vegetation monitoring, invasive plant control and addressing any ecological restoration needs. The open space network has grown by over 50% in terms of City-owned acreage since 2000.

With the growth of its open space network, the City has responsibilities for extensive conserved landscapes and has conducted several studies to guide the stewardship and management of these lands.

To highlight the intended need for open space management, past planning efforts have been summarized below.

The 2003 City of Camas Policy Guidelines for an Open Space Management Plan established the overall policies to guide the management of both public and private property within the Open Space Network. The Open Space Network was identified and mapped as part of the 2000 Parks & Open Space Comprehensive Plan. The Policy Guidelines document was intended to set the direction of open space planning and to provide staff with the foundation for effective resource management decisions. The Management Goals for open space policy included nine directives that coordinated best management practices in natural areas and funding for an open space management program by the City. The Parks and Recreation Department was designated with the responsibility for administration, management and maintenance of the open space network. Trails are considered to be an integral part of the open space network. The Parks and Recreation Department is designated with the responsibility for trail safety and security, inspection and monitoring, and maintenance.

The 2014 PROS Plan included Design and Development Guidelines for the City's Natural Open Space Areas that recognized natural areas should be protected for their environmental value with only limited improvements for passive recreation where appropriate. The guidelines encouraged public use of the natural open space through trails, viewpoints and other features while ensuring protection of ecologically sensitive areas. A minimum of park features were cited for improving natural open space including trails and site furnishing such as benches, picnic tables, bike racks, trash receptacles, and signs. The guidelines suggest additional park features for consideration such as parking, restrooms, picnic shelters, gathering spaces (for education), interpretive exhibits, trailhead or entry kiosks, and restoration areas.

The Legacy Lands Master Plan – 2020 Draft Design Report, was the culmination of a consensus-building process for guiding the future development of the north shore of Lacamas Lake. The City had secured significant lands intended for shoreline protection, conservation and recreation. The Legacy Lands Master Plan built on the concepts that were put forth in the 2016 North Shore Lacamas Lake Vision Plan whose guiding principles included recreational trails with connections to the regional trail network, active recreational facilities, native habitats, and preserving key visual landmarks along the shore. Acknowledging future population growth and development pressures, the City is undergoing the North Shore Subarea Plan that encompasses 800 acres north of Lacamas Lake, and will incorporate the concepts developed in the draft Legacy Lands Master Plan.

None of the above planning efforts addressed the predictable need for more maintenance staffing or the necessary increased funding for management and maintenance.

Trail Maintenance

Camas' trail network provides tremendous value to its residents and visitors with walking and biking infrastructure for healthy outdoor recreation and connections to destinations across the city. With limited Park Operations staffing, trail maintenance, upkeep and capital repairs will fall behind or be deferred on a recreational asset that receives continual, daily use. Park Operations are currently able to manage brush clearing on significant trail on the Washougal River Greenway and Heritage Trails. Trail resurfacing is scheduled when pathway tread conditions deteriorate. Other maintenance activities tend to be triggered by public comments or complaints.

The planned expansion of Camas' trail network along the north shore of Lacamas Lake, Mill Ditch and connecting to Green Mountain will add miles of public shared-use trails. To ensure safe and beautiful trails, park operations estimates one FTE to maintain trails, at .04 FTE per trail mile. The current level of service for trail maintenance is estimated at .02 FTEs/mile. As miles of trail are added, additional FTE resources should be increased concurrently.

To help convey the importance of trail upkeep, parks operations may want to consider adding one or two trail counters along the busier trail sections. Measuring the trail use can help communicate how many people are affected daily by the trail conditions. A record of trail use can also help when providing quantifiable data for grant support or submittals.

Sport Field Maintenance

Camas has sport fields in ten of its park facilities. Some of its sport fields receive extensive maintenance and care through partnering sports organizations (such as Little League) while other fields may only receive mowing, annual weed control and litter control. In parks where local sports organizations are not providing added level of care, Camas should address deficiencies to ensure that access and equity for sports facilities is maintained across the city. Additional maintenance on these sport fields calls for turf maintenance, including over seeding, fertilization, and top dressing; athletic field fence maintenance, including backstops and fence perimeters; and goal post maintenance.

Park Facilities Maintenance

Park maintenance staffing has been stretched to care for the City's aging park facilities, while the system continues to expand to meet the increased park use. Additional attention needs to be given to bolster existing general park maintenance tasks: playgrounds inspections, maintenance and repairs, and noxious and invasive weed control. Updating the older park amenities can help lighten the load on needed repairs and ongoing maintenance tasks, but as newly developed parks are added to the system, additional operational and maintenance resources will be necessary to ensure those park assets are managed for safe and enjoyable public use and longevity. Park Operations has not been able to proactively perform tree assessments within parks to ensure proper care of its tree canopy resource or to mitigate for potential tree hazards. Additionally, Park Operations is tasked with managing and maintaining the Camas Cemetery.

Asset Management

The NRPA has developed a quality risk assessment tool called "Park Check" to provide an analysis of an agency's risk profile. The online tool uses a series of questions to explore the likelihood of problems due to lack of resources available over time. The Park Check risk assessment tool rates your responses to these questions to determine if your agency's ability to deliver quality park and recreation amenities and services to all members of your community in the future is at "low," "moderate" or "high" risk. The online tool generates a customized report that could help department's further articulate their needs for dedicated and reliable funding and local support.

More specifically, the conditions assessment conducted in this PROS planning process reveals a number of areas where more attention in needed to physical amenities with park facilities. Whether the need to repair site furnishings, reduce ADA barriers, or correct deficiencies is identified, the conditions assessment should be used to help improve public safety in the parks and reduce public risk.

As an example, playgrounds across the city are in different stages of their life cycles. Some play equipment has aged beyond its life expectancy and may not meet current safety standards.

While the city has started regular scheduled safety inspections, additional funding needs to be evaluated to ensure timely repair or replacement of play equipment. In addition, the inspection report could include assessment of the likelihood and consequence, in terms of financial, community and environmental impact, of the future failure of its assets, such as shelters and other structures. Such an assessment can provide key information for the strategic prioritization of limited resources toward those assets whose failure would have the greatest negative impact on the Camas community.

As an element of Park Operations, the management of physical assets requires proactive planning for capture cost efficiencies. Tracking repairs, maintenance tasks, routine operations and seasonal work can help predict the needs for future labor resources as the system grows. The 2014 PROS Plan recommended developing a detailed list of the assets at each park facility site and evaluating asset conditions annually. Such a tracking schedule would create a framework for long-term management of the Camas park system. Detailed inventories with conditions tracking will inform replacement needs, monitor safe use, and assist in assigning maintenance frequency.

Most built park amenities have limited lifespans. Buildings, play equipment, pavement, etc. can be tracked from installation dates. As repairs are needed, those assets can have predictable replacement dates that are added to the capital facilities program. Life-cycle planning can help avoid extra time spent repairing outdated amenities and foster more cost effective labor resource use.

Following on a program of asset management tracking and life-cycle planning, a regular capital repair program should proactively address minor repairs and help extend the life of some amenities. The delay of small repairs can lead to more frequent maintenance that could be avoided. When existing staffing is stretched to its limit, park agencies must rely more heavily on outside contractors for implementing even the small capital repair projects. Without adequate staffing, a backlog of needed maintenance and repairs usually exists. With a sufficient skilled labor force, the City can capitalize on using existing staff resources to complete the smaller capital repair projects during off-season capacity.

Americans with Disabilities Act Compliance

The Americans with Disabilities Act of 1990 (ADA) prohibits discrimination on the basis of disability. Titles II and III of the ADA require, among other things, that newly constructed and altered state and local government facilities, places of public accommodation, and commercial facilities be readily accessible to, and usable by, individuals with disabilities. Recreation facilities, such as play areas, are among the types of facilities covered by Titles II and III of the ADA.

The U.S. Department of Justice 2010 ADA Standards for Accessible Design provide guidelines that are intended to address design conditions to ensure that barriers or obstacles blocking outdoor recreation facilities are prevented or removed, such that all park patrons have reasonable access to site amenities. As older facilities are in the process of renovations and replacements and new facilities are added to the system, Camas will need to ensure compliance with ADA accessibility requirements.

Invasive Species Management

The control of invasive species is a critical element in the stewardship of open space lands to ensure their continued conservation values and ecosystem services. An active invasive species control program is also necessary to ensure that the City is meeting the requirements of RCW 7.10 Noxious Weed regulations. This may involve direct control measures for known and identified noxious weed problems, pre-construction prevention of noxious weed spreading, and evaluating new parkland or conservation land noxious weed coverage. Clark County's Vegetation Management Division currently handles some of the invasive weed control for the Camas park system but more work needs to be accomplished to effectively meet the regulations. Camas should consider hiring and training its own staff to perform an invasive weed control program for all its park and open space lands.

In-House vs. Outside Contractors

Park and recreation agencies throughout the country should continually weigh the costs of service provision through internal staffing versus external contracts. Full-time staffing weighed against seasonal resources should explore the off-season workload, training time for new part-time seasonal employees, the availability of seasonal labor, and the specialized skill sets for some types of operations. One-time projects and specialized repairs and renovations may require outside contractors while some park agencies have enough trained in-house staff to accomplish smaller capital projects.

Staffing Needs

The assessments and comparisons of park operations staffing have indicated the need for a stronger labor force for maintaining Camas' parks and open space/natural lands. The 2014 PROS Plan recommended adding specialized trail position, an urban forester or arborist, and a natural resource specialist to the operations team to build the level of expertise needed to effectively manage the existing natural resources owned by the City. Since the 2014 PROS Plan, several additional open space properties have been acquired, increasing the natural lands owned by the City from 440 to 691 acres.

For the Clark County park system that includes extensive natural areas, regional parks, community and neighborhood parks, many years of tracking maintenance tasks and labor expenditures produced some five-year averages for the amount of labor required to adequately care for its park system.

Figure 29. Performance Metrics for Clark County Parks Maintenance

Predictive Labor Staffing Needs	Total Park Acres	Labor Hours/Acre	Total Labor Hours	FTE # (1,820/yr)
Neighborhood Parks	75.9	152	11,536.8	6.3
Community Parks	67.7	111	7,514.7	4.1
Regional Parks	151.4	98	14,837.2	8.2
Open Space/Natural Areas	691.5	21	14,521.5	8.0

Using those metrics can help predict the potential park maintenance staffing needs for the Camas park system as it ramps up its stewardship of natural areas and adds new developed parks.

Figure 30. Predictive Staffing Levels for Camas Park System

Annual Labor Expenditures per Acre	5-yr Average
Greenspace Labor Hours per Acre	21
Neighborhood Parks Labor Hours per Acre	152
Community Parks Labor Hours per Acre	111
Regional Parks Labor Hours per Acre	98

The table in Figure 30 (above) uses acreage that includes both developed and undeveloped parkland acreage. If only the currently developed park acreage was calculated in this staffing prediction and included special facilities sites, the 240 acres of developed facilities (not including trails or open space) would suggest the need for 15 full-time equivalent employees, double the size of the current staff level. Staffing resources are needed to implement the updating and renovations for older parks, to provide maintenance for expanded trail connections and to steward its hard-earned open space lands. Camas should be prepared to support its park system with adequate operations and maintenance staffing to ensure protecting and preserving the value of its outdoor assets now and in the future.

CHAPTER 9

Goals & OBJECTIVES

> ***Add interpretive cultural and historical information to the parks or trails to honor local heritage. Highlight tribal history. This information can draw people into a park, and it helps teach kids. Provide signage in a blind/deaf-friendly way.***
>
> **- Stakeholder Focus Group participant**

The goals and objectives described in this chapter define the recreation and park services that Camas aims to provide. These goals and objectives were derived from input received throughout the planning process, from City staff, the Parks and Recreation Commission, City Council and community members.

The Growth Management Act (GMA) adopted by the Washington State Legislature in 1990 provided a foundation for land use planning in selected cities and counties throughout the state, including Clark County and the City of Camas. The GMA's purpose is to help communities manage efficiently with the challenges of growth to ensure their long-term sustainability and high quality of life. It identifies 14 planning goals to guide the development of comprehensive plans and development regulations (codified in Chapter 36.70A of the Revised Code of Washington). Four of these goals directly affect the development and implementation of this plan.

- "Encourage the retention of open space and development of recreational opportunities, conserve fish and wildlife habitat, increase access to natural resource lands and water, and develop parks." RCW 36.70A.020(9)
- "Protect the environment and enhance the state's high quality of life, including air and water quality, and the availability of water." RCW 36.70A.020(10)
- "Identify and encourage the preservation of lands, sites, and structures, that have historical or archaeological significance." RCW 36.70A.020(13)
- "Carry-out the goals of the Shoreline Management Act

Credit: Camas Post-Record

with regards to shorelines and critical areas." RCW 36.70A.020(14)

Furthermore, the Camas Comprehensive Plan, the previous park system plan and county-wide planning policies provide a framework for this PROS Plan.

The following goals matrix is structured by functional areas and thematic goals, as follows:

Functional Areas

- Administrative
- Projects & Programs
- Policy

Goal Themes

- Welcoming For All
- Stewardship of Land, Parks & Programs
- Plan for & Fill Known System Gaps
- Organizational Excellence

Goals are stated within each thematic area and associated to the functional areas. Under each goal, action item(s) will be listed.

A goal is a general statement that describes the overarching direction for the park and recreation system. Action items are more specific and describe an outcome or a means to achieve the stated goals. Near-term recommendations are specific and measurable actions or projects intended to implement and achieve the goals, and will be contained within the Needs Assessment and Capital Planning chapters of the PROS Plan.

Page Left Intentionally Blank

WELCOMING FOR ALL

STEWARDSHIP OF LAND, PARKS & PROGRAMS

PLAN FOR & FILL KNOWN SYSTEM GAPS

ORGANIZATIONAL EXCELLENCE

PROJECTS & PROGRAMS

Actively communicate and improve outreach and marketing to increase participation.

- Promote and increase participation in youth and senior scholarships.
- Keep park and trail facilities map updated.
- Pursue opportunities for alternative outreach and education to diverse groups, such as piloting youth parks stewardship programs and active communication through faith groups and non-profit organizations that work with people of color and underserved communities.
- Pursue partnership opportunities with health care organizations to promote active recreation and wellness activities and events.

Opportunities for dogs to recreate with their human family.

- Partner with non-profits for more pet and animal and animal friendly events.
- Explore a partnership with DOGPAW to develop and manage off leash areas.

Increase capacity for sports field users.

- Explore opportunities through joint use agreements with school districts to use existing fields or interim use of other lands.
- Enable an effective scheduling system.
- Implement creative design options, such as multi-use fields, upgrade field turf surfacing, and/or install lights.

Improve Asset Management.

- Improve the asset management system; to include parks facilities and amenities assets along with tree and plant assets.
- Update levels of service standards and develop a per acre maintenance budget.
- Develop an urban forestry program that articulates long-term strategy for tree protection, urban forestry management and education.
- Develop and implement improved natural area management practices to enhance ecological health and remove invasive plant species.
- Continue to build on playground equipment inspection program, prioritizing removal and replacement of unsafe/hazardous equipment and plan for a cycle of replacement based on equipment age and anticipated useful life.

Enhance parks and trails amenities.

- Refresh existing legacy parks with new features to reflect current community desires, such as Crown Park.
- Prioritize permanent bathrooms at neighborhood parks and trailheads.
- Increase portable restrooms when permanent bathrooms are unavailable during the summer.
- Provide additional picnic shelters, tables and benches.
- Maximize the multiple-use aspects of critical areas, stormwater detention ponds, etc. with addition of public trails or viewing access and education of ecological value of the area.

Design new parks, trails and amenities with environment, safety and accessibility in mind.

- Design and maintain parks and facilities to offer universal accessibility for residents of all physical abilities, skill levels and age; at a minimal in compliance with the Americans with Disabilities Act (ADA) Standards for Accessible Design.
- Identify and grow trail segments and trailhead amenities that can accommodates residents of all physical abilities.
- Standardize and install a more complete wayfinding and signage system.
- Incorporate sustainable development and low impact design practices into the design, planning and rehabilitation of new and existing parks, trails and facilities.

Enhance outdoor recreation opportunities.

- Identify and prioritize the acquisition of parklands based on factors such as contribution to level of service, connectivity, preservation and scenic or recreational opportunities for residents.
- Develop park master plans that reflect local needs, community input, recreation and conservation goals; with consideration for financial resources and availability of similar amenities/facilities within the city and region.
- Prioritize implementation of existing master plans with consideration for service gap delivery and available financial resources.
- Add new unique park amenities to the system such as nature play area, a splash pad, a bike skills pump track, and all-inclusive playgrounds.

Partner with Developers to fill parks and trails gaps.

- Actively pursue trail connections via rights-of-way or easements.
- Continue and maintain Parks & Recreation review and comment on private development proposals that includes park and trail siting and design.
- Partner with developer to create robust public engagement process for park and trail design projects within the development project site intended to be transferred to the city.

Continued...

Continue building strong partnerships.

- Collaborate with local arts organizations, business, education institutions, other non-profits and jurisdictions to deliver on recreational programs and community events.
- Partner with user groups of specialized facilities, such as sport fields, off-leash areas, disc golf, skatepark, bike skills/pump track, etc. to continually improve programing and maintenance.

PLAN FOR & FILL KNOWN SYSTEM GAPS

Continued...

Partner with neighboring jurisdictions to fill regional trail network gaps.

- Work with Clark County, City of Washougal, City of Vancouver and Port of Camas-Washougal to align trail connectivity priorities.
- Coordinate and connect the City's pedestrian and bicycle system with the Clark County regional system of on-street and off-street trails.

Promote water access and safety.

- Collaborate with other agencies regionally in developing and operating parks and/or programs that access our bodies of water.
- Promote water safety through educational and marketing program in partnership with County and School Districts.
- Evaluate the north shores city-owned Legacy Lands properties to expand trails and water access points around Lacamas Lake.

Page Left Intentionally Blank

WELCOMING FOR ALL

STEWARDSHIP OF LAND, PARKS & PROGRAMS

PLAN FOR & FILL KNOWN SYSTEM GAPS

ORGANIZATIONAL EXCELLENCE

ADMINISTRATIVE

Regularly review and renew recreational classes for all ages, interest and abilities.

- Provide annual recreational program summary to Parks & Recreation Commission for review and input.
- Pilot new classes each year that reflects current market trends and community desires.
- Provide Summer free pop-up classes to promote recreational programs.

Continue to host events and provide community spaces that bring people together.

- Continue to partner to implement legacy events.
- Have intentional engagement with diverse community groups to create and partner on new diverse events.
- Expand locally sourced food options at parks and events.

Maintain Parks and Facilities.

- Standardize park furnishings and amenities (trash cans, tables, benches, fencing, etc.) to reduce inventory and replacement costs and improve appearance.
- Continue growing volunteer parks enhancement and beautification program.

Continue to preserve, protect and restore natural area corridors, include shorelines.

- Strengthen partnerships with public agencies, tribes, and private partners to facilitate greenway corridor connectivity.
- Continue to support and actively participate in shoreline and/or bodies of water conservation and restoration projects lead by other city departments, agencies and/or non-profits.
- Pilot environmental education program.
- Add educational interpretive signage to natural areas, shorelines and trails.

Evaluate user satisfaction and use.

- Implement periodic surveys to gauge user satisfaction, program initiatives and statistical use of parks, facilities and programs, including trail counts.

Promote and support Parks & Recreation Commission.

- Promote P&R Commission meetings as forum to discuss parks and recreation topics.
- Provide more training and resources to build parks and recreation knowledge base within Commission members.

Encourage staff innovation and creativity.

- Provide professional development opportunities through training and affiliation with NRPA and WRPA, among others.
- Provide opportunities to explore and implement pilot programs.

POLICY

Enhance our parks and recreation system to make it more welcoming and accessible.

- Develop Diversity/Equity/Inclusion policy that removes accessibility barriers (socio-economic, language, physical, geographic, transportation) to programs, parks and trails, and in alignment with City vision and policies.

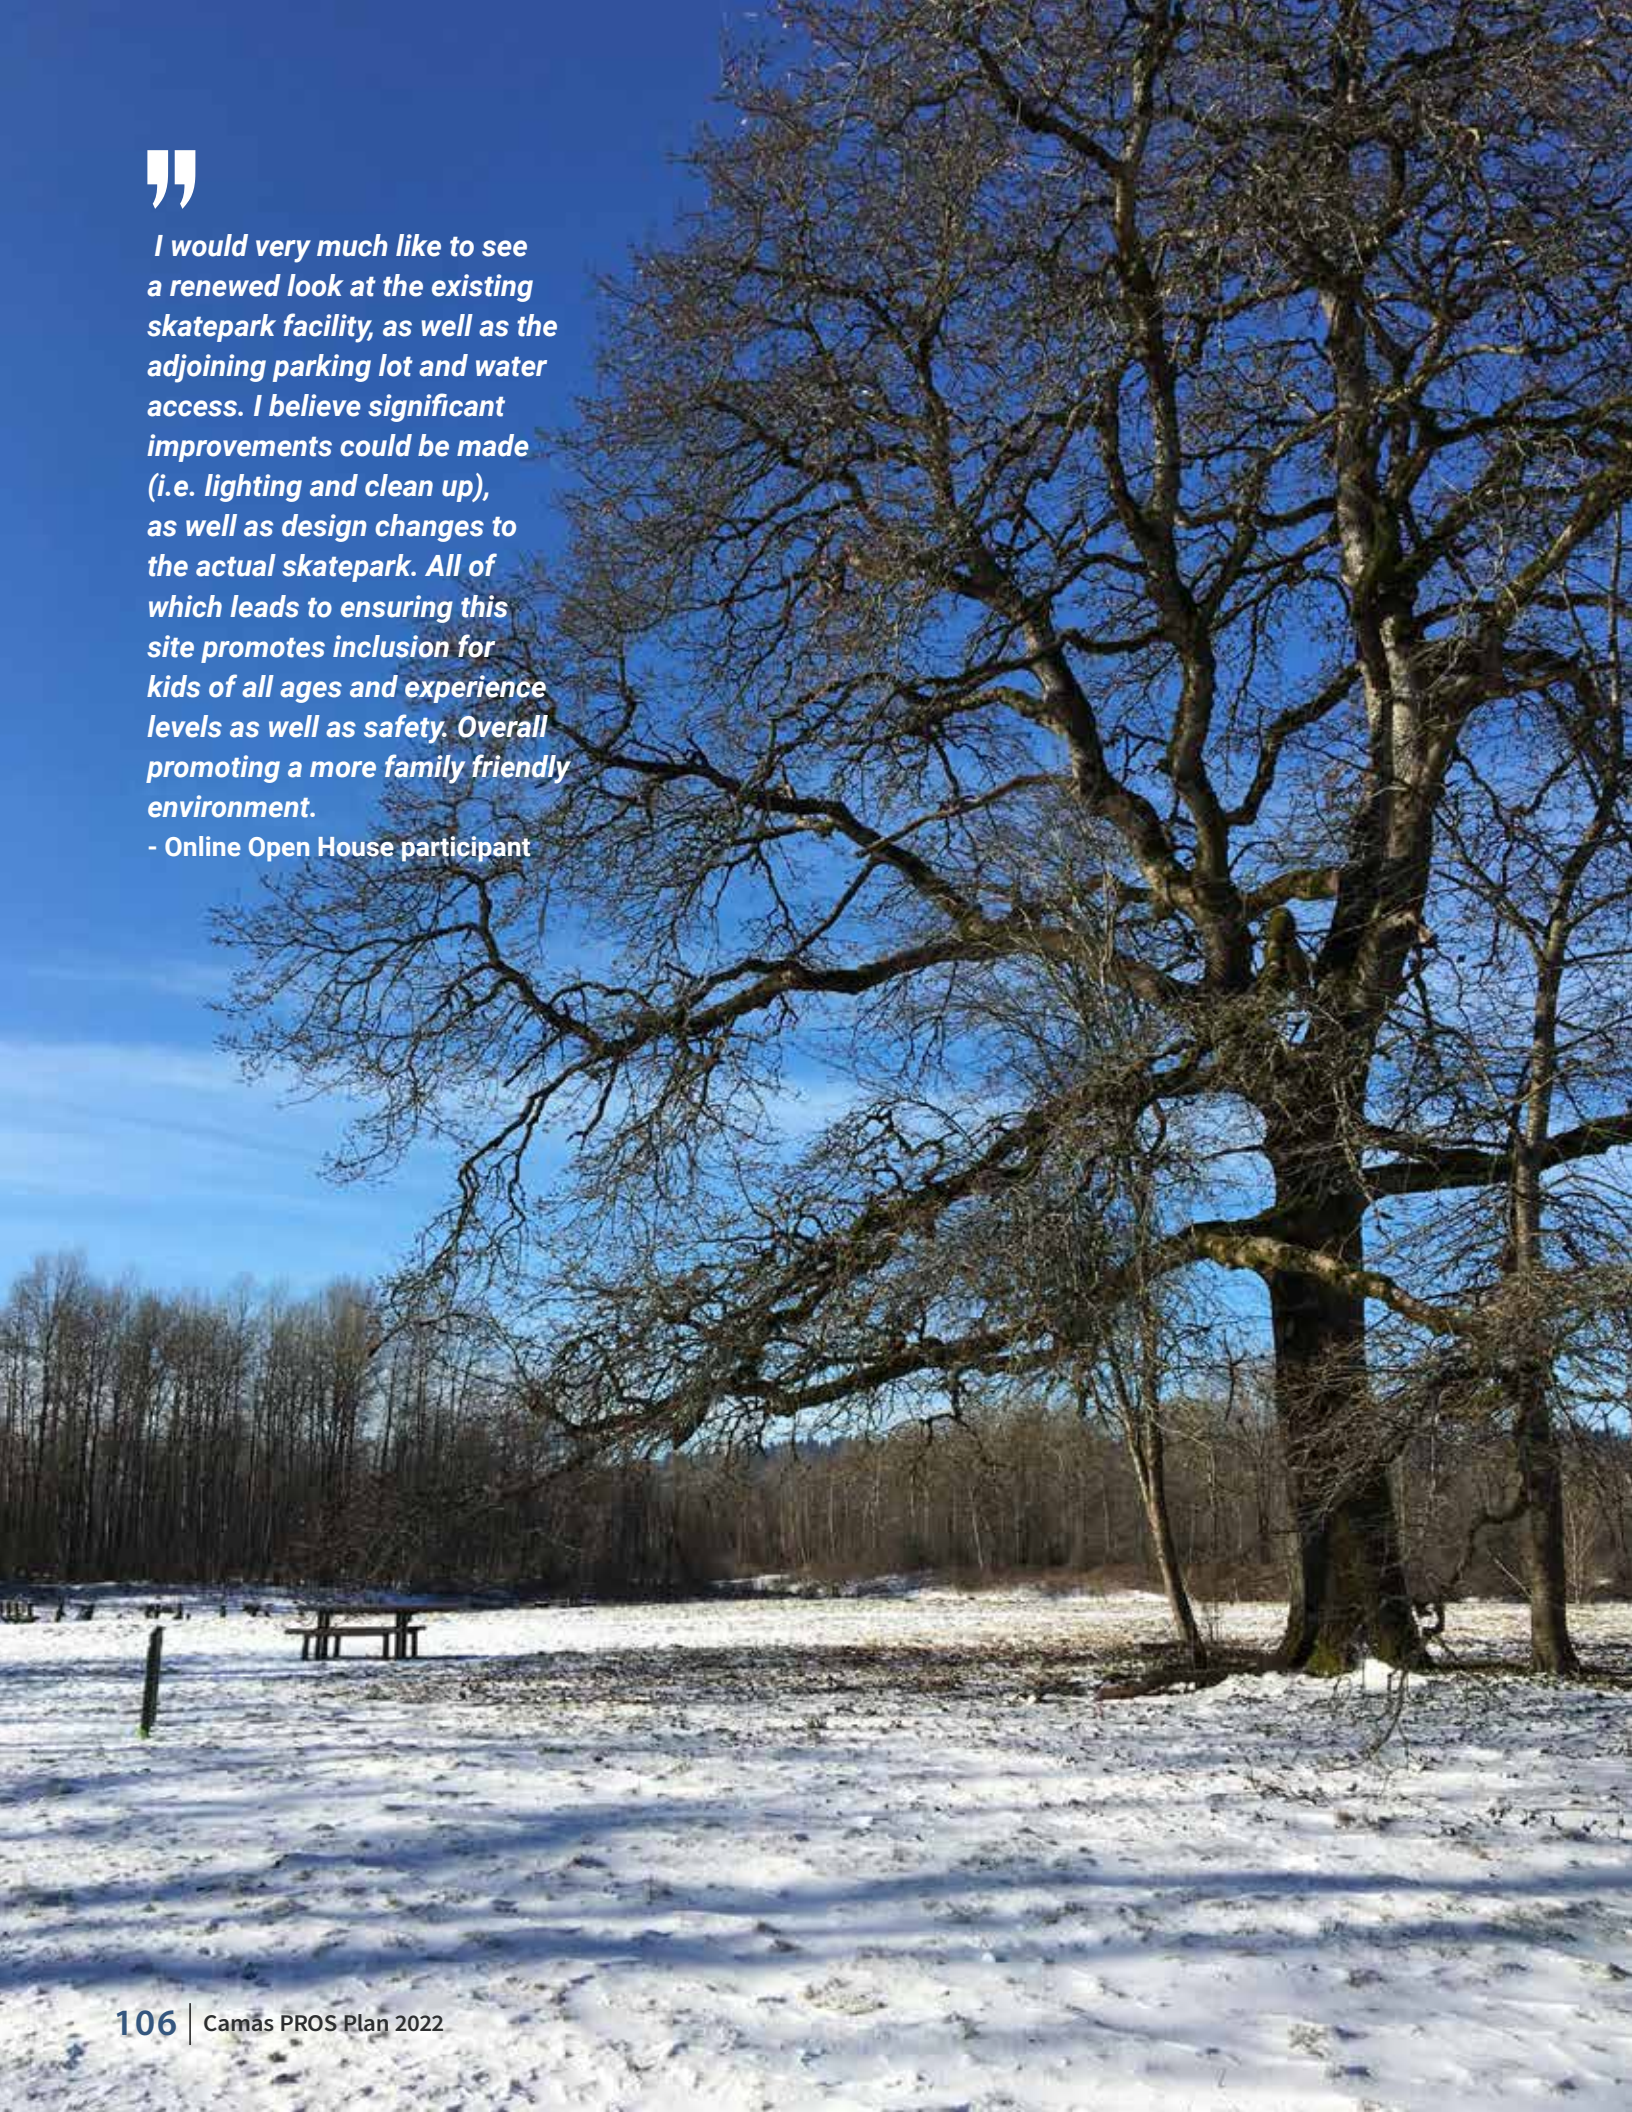
Better understand funding gaps and funding alternatives.

- Develop and implement a cost recovery policy that provides for an equitable fee structure for park facilities and recreation programs, with high-community benefit programs and event funded appropriately to ensure accessibility for all residents.
- Periodically revise the park impact fee methodology and rates to accurately reflect changes in level of service standards and/or the costs of expanding the park infrastructure to accommodate population growth.
- Review and update the adopted six-year Parks Capital Facilities Plan (CFP) every two years to remain current with local recreational interests and account for the capital needs of the parks and recreation system.
- Pursue alternative funding options and dedicated revenues, including engaging and exploring with the City of Washougal a feasibility study to assess the potential of establishing a regional financing tool for recreation service.

Provide equitable access to parks and open space system.

- Prioritize park and trail development in areas where service gaps exist (e.g., where households are more than ½-mile from a developed park, open space or trail) and in areas of the City facing population growth and residential and commercial development.
- Evaluate and update design and development standards for parks and recreation amenities within private development to promote and achieve equitable levels of service and provide amenities that are complementary to the city park.

Expand recreational services.



- Re-examine the opportunity for new recreational center with aquatics facility, taking into consideration financial feasibility and partnership opportunities.

Coordinate collaborative discussions on policy matters.

- Bring together Parks and Recreation Commission, City Council, and other standing City boards, such as the Planning Commission, to discuss policy matters pertaining to recreational resources, opportunities and funding.

Page Left Intentionally Blank

Page Left Intentionally Blank

> *I would very much like to see a renewed look at the existing skatepark facility, as well as the adjoining parking lot and water access. I believe significant improvements could be made (i.e. lighting and clean up), as well as design changes to the actual skatepark. All of which leads to ensuring this site promotes inclusion for kids of all ages and experience levels as well as safety. Overall promoting a more family friendly environment.*

CHAPTER 10

Capital Planning & **Implementation**

KEY PROJECT RECOMMENDATIONS

The following is a summary of key project recommendations which will require commitment from the City and its residents for the continued support of a healthy park and recreation system that preserves and enhances the safety, livability, and character of the community.

Trail Connections

Trail connections, including sidewalk and bike lane improvements, are needed to help link destinations across the community. Acquire easements, corridors and parcels to create the comprehensive linkages for Camas' future trail system. Develop larger trails desired by the community, such as North Shores of Lacamas, Mill Ditch, Lewis & Clark. Coordinate with the Transportation System Plan (and subsequent updates), as well as coordinate with local subdivision and site development projects.

Park Design & Planning

Prepare an updated site master plan for Ash Creek Park and a new site plan for the flat, upper shelf of Ostensen Canyon Park. As development and maintenance funding allow, prepare site plans for Lacamas Heights, Green Mountain and Benton Park.

Sport Field Improvements

Conduct a city-wide assessment of sport fields to plan for drainage improvements and other field improvements, including turfing existing fields, installing lights to expand play seasons, and the development of additional fields to accommodate demand.

Splash Pads / Spray Parks

Install at least one spray park to serve residents as an option for summertime water play in a park that provides parking and restrooms.

Bike Skills & Mountain Bike Trails

Plan for a pump track and connecting flow track in a visible location that can accommodate parking and can enable a synergy with other park uses. Pursue options for mountain bike trails during the planning for the new Green Mountain property.

Skate Park Upgrade

Upgrade and enhance the existing concrete skatepark to improve the design and flow, as well as improve adjoining recreational amenities such as access to the Washougal River.

All-Inclusive Playgrounds

Develop fully-accessible, all-inclusive play areas as new parks are built or playground upgrades occur to provide for users of all abilities.

Off-Leash Dog Area

Coordinate with the City of Washougal on off-leash dog park planning for the potential of a joint use facility for Camas residents to use.

Sport Courts

Convert existing tennis courts to multi-sport courts through striping and examine the need for additional multi-sport courts in the future.

Community Gardens

Partner with local community groups for the installation of community gardens in community or neighborhood parks or in stand-alone locations with parking and access to water.

Acquisitions to Fill Park System Gaps

Acquire strategically located sites for future parks to ensure reasonable access to walkable parks. Coordinate with local residential developers to include public parks in new subdivisions and utilize tools, such as park impact fee credits, to facilitate the process.

Universal Accessibility

Complete a system-wide ADA assessment and make improvements to existing parks as needed to offer universal accessibility of park features and grounds.

Water Access

Improve shoreline and water access for motorized and non-motorized launches, including user conveniences such as restroom facilities and parking.

Recreation Programming

Continue to foster agreements or partnerships with programming partners and contract vendors for providing recreation services. Coordinate and partner with the City of Washougal on programming options. Explore new pilot programs, and partner where possible, to broaden the portfolio of offerings to youth. Explore options for access to additional flexible indoor recreation space to accommodate programs, classes and fitness.

North Shore Subarea Plan

Maintain strong role in planning for future parks and trails along the North Shore.

Open Space Management Plan

Prepare an updated, science-oriented open space management plan to guide City staff in the care, maintenance and stewardship of open space, as well as forecast maintenance needs and staffing resources.

Urban Forestry Management Plan

Prepare an urban forestry management plan to examine the health and coverage of the urban forest, define maintenance and operations strategies, and respond to the challenges of climate change, as well as other environmental and fiscal factors on long-term tree health and forest resiliency.

Wayfinding & Signage

Continue to implement a wayfinding program that includes both visual graphic standards. Colors, sign types, and information can help users navigate the outdoor recreation experiences offered by the City.

Communications

Maintain the website for easy-to-access park system maps, trail maps and an up-to-date listing of park sites and amenities to enhance the experience of the on-the-go user. Continue to promote via social media and highlight events, volunteer opportunities and parks and trails to visit. Utilize QR codes or comparable technology on signage as a means to share with or receive information from visitors about maintenance, restoration or monitoring data. Utilize the network of partners to help disseminate information on parks and recreational programs and events.

Implementation Tools

A number of strategies exist to enhance and expand park and recreation service delivery for the City of Camas; however, clear decisions must be made in an environment of competing interests and limited resources. A strong community will is necessary to bring many of the projects listed in this Plan to life, and the Camas City Council has demonstrated its willingness in the past to support parks and recreation, legacy land acquisitions and a high quality of life.

The recommendations for park and recreation services noted in this Plan may trigger the need for funding beyond current allocations and for additional staffing, operations and maintenance responsibilities. Given that the operating and capital budget of the Parks and Recreation Department is finite, additional resources may be needed to leverage, supplement and support the implementation of proposed objectives, programs and projects. While grants and other efficiencies may help, these alone will not be enough to realize many ideas and projects noted in this Plan. The following recommendations and strategies are presented to offer near-term direction to realize these projects and as a means to continue dialogue between City leadership, local residents and partners. The tools presented only capture development of the capital improvements and not the long-term operations of the new assets.

Additionally, a review of potential implementation tools is included as Appendix F, which addresses local financing, federal and state grant and conservation programs, acquisition methods and others.

Enhanced Local Funding

According to the city budget, Camas maintains reserve debt capacity for local bonds and voter approved debt. The city's non-voted general obligation debt is under its debt capacity limit of $41 million for non-voted debt. Community conversations regarding the potential to develop a recreation center with aquatics and/or bundle several projects from the Capital Improvements Plan warrant a review of debt implications and operating costs for the City, along with the need to conduct polling of voter support for such projects.

Park Impact Fees & Real Estate Excise Tax

Park Impact Fees (PIF) are imposed on new development to meet the increased demand for parks resulting from the new growth. PIF can only be used for parkland acquisition, planning and/or development. They cannot be used for operations and maintenance of parks and facilities. The City of Camas currently assesses impact fees, but the City should review its PIF ordinance and update the methodology and rate structure, as appropriate, to be best positioned to obtain future acquisition and development financing from the planned growth of the community. The City should prioritize the usage of PIF to secure new park properties and finance park or trail development consistent with the priorities within this Plan.

The City currently imposes both of the quarter percent excise taxes on real estate, known as REET 1 and REET 2. The REET must be spent on capital projects listed in the City's capital facilities plan element of their comprehensive plan. Eligible project types include planning, construction, reconstruction, repair, rehabilitation or improvement of parks, recreational facilities and trails. Acquisition of land for parks is not a permitted use of REET 2. REET is used for other City projects, such as facility construction and public works projects, and may be used to make loan and debt service payments on permissible projects. Through annual budgeting and with discussions with City Council, the Parks and Recreation Department should seek access to REET funds and use the capital facilities plan to compile compelling projects to enhance service delivery of the amenities the community has provided voice to.

Conservation Futures & Legacy Lands Program

Clark County assesses the maximum allowable excise of $0.0625 per $1,000 assessed value to fund the Conservation Futures program and provides cities a venue to access these funds through a local grant process. The City should continue to submit applications for support in financing the acquisition of additional natural areas identified in the most recent Legacy Lands Program Natural Areas Acquisition Plan to facilitate the protection of these lands and enable improved linkages to expand the trail network.

Parkland Donations & Dedications

Parkland donations from private individuals or conservation organizations could occur to complement the acquisition of park and open space lands across the City and urban growth boundary. Gift deeds or bequests from philanthropic-minded landowners could allow for lands to come into City ownership upon the death of the owner or as a tax-deductible charitable donation. Also, parkland dedication by a developer could occur in exchange for Park Impact Fees or as part of a planned development where public open space is a key design for the layout and marketing of a new residential project. Any potential dedication should be vetted by the Department to ensure that such land is located in an area of need or can expand an existing City property and can be developed with site amenities appropriate for the projected use of the property.

Grants & Appropriations

Several state and federal grant programs are available on a competitive basis, including WWRP, ALEA, and LWCF. Pursuing grants is not a panacea for park system funding, since grants are both competitive and often require a significant percentage of local funds to match the request to the granting agency, which depending on the grant program can be as much as 50% of the total project budget. Camas should continue to leverage its local resources to the greatest extent by pursuing grants independently and in cooperation with other local partners.

Appropriations from state or federal sources, though rare, can supplement projects with partial funding. State and federal funding allocations are particularly relevant on regional transportation projects, and the likelihood for appropriations could be increased if multiple partners are collaborating on projects.

Internal Project Coordination & Collaboration

Internal coordination with the Public Works and Community Development Departments can increase the potential of discrete actions toward the implementation of the proposed trail and path network, which relies heavily on street right-of-way enhancements, and in the review of development applications with consideration toward potential parkland acquisition areas, planned path corridors and the need for easement or set-aside requests. However, to more fully expand the extent of the park system and recreation programs, additional partnerships and collaborations should be sought.

Public-Private Partnerships

Public-private partnerships are increasingly necessary for local agencies to leverage their limited resources in providing park and recreation services to the community. Corporate sponsorships, health organization grants, conservation stewardship programs and non-profit organizations are just a few examples of partnerships where collaboration provides value to both partners. The City has a variety of existing agency and community-based organization partners and should continue to explore additional and expanded partnerships to help implement these Plan recommendations.

Volunteer & Community-based Action

Volunteers and community groups already contribute to the improvement of park and recreation services in Camas. Volunteer projects include park clean-up days, invasive plant removal, tree planting and community event support, among others. Camas should maintain and update a revolving list of potential small works or volunteer-appropriate projects for the website, while also reaching out to civic groups and the high school to encourage student projects. While supporting organized groups and community-minded individuals continues to add value to the Camas park and recreation system, volunteer coordination requires a substantial amount of staff time, and additional resources may be necessary to more fully take advantage of the community's willingness to support park and recreation efforts.

Metropolitan Park District

Metropolitan park districts (MPD) may be formed for the purposes of management, control, improvement, maintenance and acquisition of parks, parkways and boulevards. Several years ago, the City started a preliminary look at a metropolitan park district as a tool for Camas Parks and Recreation. The City should continue to evaluate the potential of an MPD along with other implementation tools as part of a long-term funding strategy.

Other Implementation Tools

Appendix F identifies other implementation tools, such as voter-approved funding, grants and acquisition tactics, that the City could utilize to further the implementation of the projects noted in the Potential Projects List.

Capital Improvements Plan

The following Capital Improvements Plan (CIP) identifies the park, trail and facility projects considered for the next six to twenty years, along with brief project descriptions. The majority of these projects entail the maintenance, acquisition and development of parks, recreational amenities and trails. Based on survey results and other feedback, Camas residents have indicated an interest in park facility upgrades and enhanced trail connections as priorities, and the Capital Improvements Plan is reflective of that desire.

2022 Camas PROS Plan

Capital Facilities Plan

Amended per ORD 22-002

Project Type	Site	Project	Current Cost
A	Trail Corridors	Acquisition to link corridors	$2,500,000
D	Crown Park	Park development per site master plan	$6,200,000
P	Open Space Management Plan	Develop Plan	$200,000
P	Urban Forestry Management Plan	Develop Plan	$150,000
P/D	System-wide	Trails & Trailheads - planning and development	$1,800,000
D	T-3 Trail - East segment of N. Shore Trail	Development of trail	$350,000
P/D	Closing the Loop - Heritage and N. Shore trails	Planning and development	$1,500,000
P	Mill Ditch Trail	Trail corridor access point & stairway planning	$225,000
R	System-wide	Minor repair/replacement (parks amenities) projects	$250,000
D	Forest Home Park	Picnic shelter, drainage, building replacement & minor upgrades	$300,000
P	Skate Park	Phase I - Redesign and construct skate park	$250,000
D	3rd Ave. Trailhead	Trailhead development	$700,000
P	Legacy Lands - Phase I, develop site master plan	Using existing draft Vision Plan, phased approach to Master Planning. This would be Phase I.	$200,000
D	Legacy Lands - Phase I, implementation site master plan	Phase I Implementation - interim use, trails, trailhead, boat ramp, parking, Rose facility, Leadbetter facility	$4,000,000
D	Mill Ditch Trail	Shared-use trail development	$3,500,000
D	Skate Park	Phase II - Water access, trail and parking improvements	$2,000,000
D	Bike pump track	Install bike pump track at selected site	$350,000
D	Dog Park	Install dog park at selected site	$125,000
D	All-inclusive playground	Install all-inclusive playground at selected site	$600,000
P/R	System-wide	ADA compliance projects: facilities, pathway & amenities	$200,000
P	System-wide	Sports Field - assessment of existing fields & planning for system gaps	$100,000
R	Fallen Leaf Softball Field	Field improvements, new fence, infield dirt/grading, etc.	$200,000
P	Green Mountain property	Site master plan	$250,000
P/D	System-wide	Wayfinding and Park Signage program	$150,000
R	Heritage Park	Modify dock, staging to separate non-motorized launches and Gate access control upgrades	$125,000
R	System-wide	Playground replacements	$1,000,000
R	Dorothy Fox Park	Sport field drainage/renovations	$150,000
R	Grass Valley Park	Sport field drainage/renovations	$150,000
D	Green Mountain property	Park development (Phase 1 trails)	$1,500,000
R/D	Heritage Park	Picnic shelter installation & minor upgrades	$280,000
R	Prune Hill Sports Park	Sport field drainage/renovations	$150,000
R	Heritage Park	Install additional parking	$250,000
D	Prune Hill Sports Park	Picnic shelter installation & minor upgrades	$200,000
P/D	Sports Complex *	Site selection, site master plan, implementation	$20,000,000
P	Ash Creek Park	Site master plan	$90,000
D	Goot Park	Picnic shelter installation, replace bleachers & minor upgrades	$150,000
D	Louis Block Park	Upgrade baseball facilities (fencing, restroom, concession, etc.)	$750,000
P	Ostensen Canyon Park	Site master plan	$100,000
P/D	Leadbetter House redevelopment	Feasibility analysis and redevelopment	$2,000,000
D	Community garden support	New garden to fill gap in the system	$50,000
P	Lacamas Heights Park	Site master plan	$75,000
D	Oak Park	Restroom installation & minor site upgrades	$400,000
A	Neighborhood park	Acquisition to address distribution gap (Area A, 2-3 ac.)	$4,500,000
A	Neighborhood park	Acquisition to address distribution gap (Area B, 2-3 ac.)	$4,000,000
P/D	Camas Community Center *	Feasibility analysis and redevelopment	$10,000,000
R	Heritage Park	Upgrade playground & restroom	$450,000
R	Grass Valley Park	Replace playground	$250,000
D	Ash Creek Park	Park development per site master plan	$2,200,000
A	Neighborhood park	Acquisition to address distribution gap (Area C, 2-4 ac.)	$3,500,000
D	Fallen Leaf Lake Park	Park development per site master plan	$2,600,000
D	Lacamas Heights Park	Park development per site master plan	$1,000,000
D	Ostensen Canyon Park	Park development per site master plan	$3,000,000
P	Goot Park - area under powerline	Site master plan and development	$1,750,000
P/D	Aquatic Center *	Site selection, master plan, implementation	$19,000,000
P/D	Public Plaza	Master Planning and development	$1,000,000
P/D	Pickelball Courts	Master Planning and development (upto 8 courts)	$895,000

Total Estimated Project Costs $107,665,000

Project Type

A	Acquisition
P	Master planning
D	Development - new
R	Replacement/Upgrade

NOTES:

This list identifies planning-level cost estimates and does not assume the value of volunteer or other non-City contributions.

Detailed costing may be necessary for projects noted.

Legacy Lands and Green Mountain projects will have additional phase in the future (i.e. 20+ years).

This list is not an official budget and intended as a guiding document for City staff in the

*Additional public and policy discussion needed to refine project

Items highlighted in green are top priortity for the next 2-3 years (2022-24).

Items highlighted in blue bing high priority as opportunities arises.

Survey Summary

To: Trang Lam, Parks & Recreation Director

From: Steve Duh, Conservation Technix, Inc.

Date: July 19, 2021

Re: **City of Camas Park, Recreation & Open Space Plan**
Community Survey Summary Results

Conservation Technix is pleased to present the results of a survey of the general population of the City of Camas that assesses residents' recreational needs and priorities.

KEY FINDINGS

Camas residents strongly value their parks and recreation facilities.

Nearly all respondents (97%) think parks and recreation are important or essential to quality of life in Camas. Very few, less than 4%, feel they are useful, but not necessary, or not important at all.

Residents visit frequently and are generally very satisfied with existing parks, trails and recreation facilities and programs.

Respondents visit the city's parks, trails, and recreation facilities frequently – most at least once a week – often for fitness or exercise, to walk or run, or to relax. Respondents are less likely to have participated in the City's recreation programs, classes, and camps, with less than one in four households participating in 2019. Those who had participated were most likely to have participated in youth-oriented classes and camps.

Overall, respondents feel that the City's parks and trails are in good condition. Not all respondents are familiar enough with Lacamas Lake Lodge & Conference Center and the Fallen Leaf Park Shelter, but those who are feel they are in very good condition. However, nearly six in ten respondents who rated the Camas Community Center responded that it is only in fair to good condition, signaling a potential need for maintenance and improvements at this facility.

Respondents generally feel the City has sufficient parks, water access, community events, and other recreation opportunities. The notable exception is trails, which 44% of respondents would like to see expanded. Most expressed a preference for more unpaved trails in natural areas over other trail types.

While residents prioritize maintaining existing parks and facilities, they are generally supportive of improving the City's park and recreation system as well.

When asked to rank their priorities for future City investment, respondents prioritized maintain existing parks, expanding trails, and building new parks. More than three in four respondents are very or somewhat supportive of the City adding walking trails, updated and accessible playgrounds, and more picnic shelters to the existing park system. A majority of respondents are also supportive of developing more biking trails, splash pads, off leash dog areas, pools or aquatic centers, tennis or pickleball courts, a new community center, disc golf course, and basketball courts.

As a whole, respondents are most supportive of raising revenue through reservation fees for rentals of part facilities, rather than through parking passes or raising taxes. Again, developing trails is a notable exception, where nearly six in ten respondents were willing to pay additional taxes to support improvements. Younger respondents and respondents with children at home are generally more supportive of expanding the City's park, trail, and recreation system and of increasing taxes or other revenue sources to support system expansion.

SURVEY METHODOLOGY

In close collaboration with City of Camas staff and the Parks and Recreation Commission, Conservation Technix developed the 17-question survey that was estimated to take less than ten minutes to complete.

The City mailed 2,500 surveys to randomly chosen households in Camas on May 29, 2021, of which 509 surveys were completed and returned. Online versions of the survey in English and Spanish were posted to the City's website on June 4, 2021. An additional 874 surveys in English and two in Spanish were completed from the general, community-wide online surveys. In all, 1,385 surveys were completed.

Information about the survey was provided on the City's website and on the EngageCamas site for the PROS Plan project. It was promoted via multiple social media postings, city email blasts and an email blast through Camas school district mailing list. Print copies were made available at the Camas library and the Camas School District Family Community Resource Center Also, flyers with QR codes were placed at numerous parks and local businesses. The survey was closed on July 2, 2021, and data were compiled and reviewed.

Although households were randomly chosen to receive the mail survey, respondents were not necessarily representative of all City residents. However, age group segmentation shows general alignment with current Census data. The table below shows the age demographics for the mail and online surveys, as well as comparative percentages for Camas' population.

	Survey Respondents			Camas population	
Age group	Mail	Online-only	Combined	All	Over 20
Under 20	<1%	<1%	<1%	31%	--
20 to 34	7%	9%	8%	12%	17%
35 to 44	25%	36%	32%	16%	23%
45 to 54	25%	31%	28%	19%	27%
55 to 64	17%	13%	15%	11%	16%
65 to 74	18%	8%	12%	9%	12%
75 and older	8%	2%	4%	3%	5%
Total	100%	100%	100%	100%	100%

This report includes findings of community opinions based principally on mailed survey responses. Each section also notes key differences between different demographic groups and among responses to the online-only survey, where applicable. Percentages in the report may not add up to 100% due to rounding.

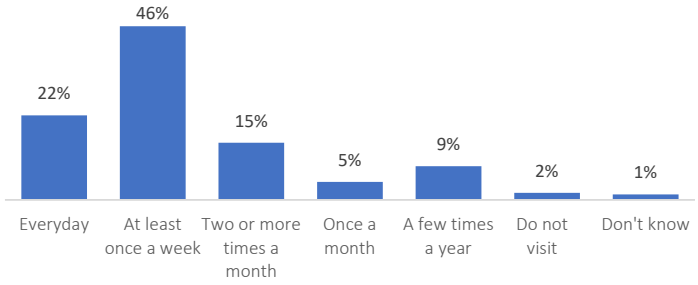
DETAILED FINDINGS

Value and use of parks and recreation

How much do residents value parks and recreation?

Virtually all respondents (97%) feel that local parks, recreation opportunities are important or essential to the quality of life in Camas. More than eight in ten respondents feel that they are essential; while an additional 16% believe that they are important to quality of life, but not essential. Less than 1% of respondents believe parks are "Useful, but not important".

1. When you think about the things that contribute to the quality of life in Camas, would you say that public parks and recreation opportunities are…



Response options	Mail		Online-only	
Essential to the quality of life here	81%	97%	88%	99%
Important, but not really necessary	16%		11%	
Useful, but not important	3%		<1%	
Not important or don't know	1%		<1%	

Though respondents of all ages value parks and recreation, younger respondents were significantly more likely to deem them essential to quality of life. Respondents with children at home, as well as those who responded to the online survey, also valued parks and recreation even more strongly than the general population.

How often do residents use Camas' parks, trails, recreation facilities, and natural areas?

Respondents were asked how often they, or members of their household, visited a City of Camas park, trail, recreation facility, or natural area (prior to the COVID-19 pandemic). Respondents tend to visit frequently, with more than two in three visiting at least once a week (68%) and another 20% visiting one to three times per month. Only 9% of respondents visit just a few times per year. Very few (2%) did not visit a park at all.

3. Prior to the COVID-19 quarantine, how often did you visit or use Camas' parks, trails, recreation facilities, or natural areas?

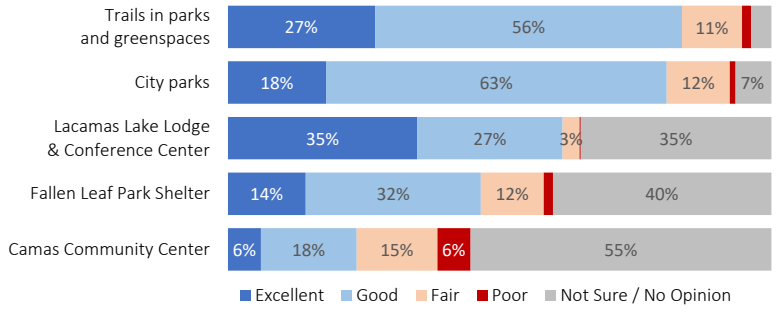
While younger respondents visit the City's parks, trails, and natural areas more frequently than older respondents, over half of respondents over 75 years old still visit at least once a week. Those in households with children also visit significantly more frequently than those without children, with participation increasing in correspondence with the number of children in the home. Respondents who live in the southwest portion of the city are less likely than respondents elsewhere to use parks and recreation facilities frequently. Online-only survey respondents tend to visit at similar frequencies as mail survey respondents.

Why do residents visit parks, trails and recreation facilities?

Respondents visit local parks and recreation facilities for a variety of reasons. The most popular activities are walking or running (80%), followed by fitness and exercise (70%), and relaxation (56%). More than three in ten respondents visited to walk their dog (40%), view wildlife (36%), visit a playground (33%), ride their bike (33%) or attend a family gathering or picnic (30%). Between 15% and 30% of respondents visit parks for non-motorized boating, like canoeing or kayaking, to attend a community event or concert, play on a sports field, swim, or use an outdoor sports court. Less than one in six respondents visit fish, participate in a recreation program, use a motorized boat, or play disc golf.

With a few exceptions, respondents who responded to the online-only survey were more likely to visit recreation facilities and parks for each reason listed than mail respondents were.

4. Prior to the COVID-19 Pandemic, what would you say are the main reasons you visited Camas recreation facilities, parks or open spaces in the past year?



Reason	Mail	Online
Walking or running	80%	79%
Fitness / exercise	70%	73%
Relaxation	56%	54%
Dog walking	40%	45%
Wildlife viewing	36%	35%
Playgrounds	33%	47%
Bike riding	33%	44%
Family gatherings / picnics	30%	38%
Boating – non-motorized	28%	34%
Community events / concerts	23%	32%
Sport fields	21%	35%
Swimming	18%	24%
Outdoor sport courts	17%	20%
Fishing	13%	13%
Recreation program, class, or camp	10%	21%
Boating – motorized	9%	7%
Frisbee or disc golf	5%	8%

Respondents under 44 years of age are more likely than other groups to visit for community events, playgrounds and recreation programs. Respondents over 65 are more likely than younger respondents to visit to view wildlife. Some activities, including fitness and exercise, family gatherings, walking or running, and relaxation are similarly popular with all age groups. Respondents with children in their home are more likely to visit for playgrounds, recreation programs, sports fields, swimming, and family gatherings, than respondents without children who are more likely to visit to view wildlife.

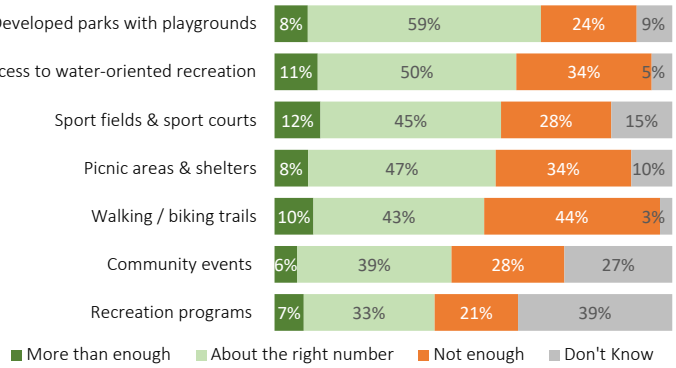
How would residents rate the condition of Camas' parks and recreation facilities?

Respondents were asked to rate the condition of a variety of park and recreation facilities on a scale from poor to excellent. Respondents gave overwhelming high marks to the condition of the City's trails in parks and greenspaces and the parks themselves.

5. How would you rate the condition of the following parks or recreation facilities?

Overall, the Lacamas Lake Lodge & Conference Center received the highest condition ratings, with 95% of respondents who provided a ranking rating it as excellent or good. About 40% of respondents did not rate the condition of the Fallen Leaf Park Shelter – of those who did, nearly eighty percent rated its condition as either

excellent or good. The Camas Community Center received the lowest ratings, with 58% of respondents rating its condition as fair or poor (excluding those who responded not sure/no opinion). Notably, more than half of respondents were unsure and may have not visited this facility recently.



There were no significant variations in how respondents rated the condition of parks and facilities based on age, number of children in the home, or location of residence.

Does the number of existing park and recreation amenities meet residents' needs?

Respondents generally feel that the City already provides enough, or more than enough, of all of the amenities listed.

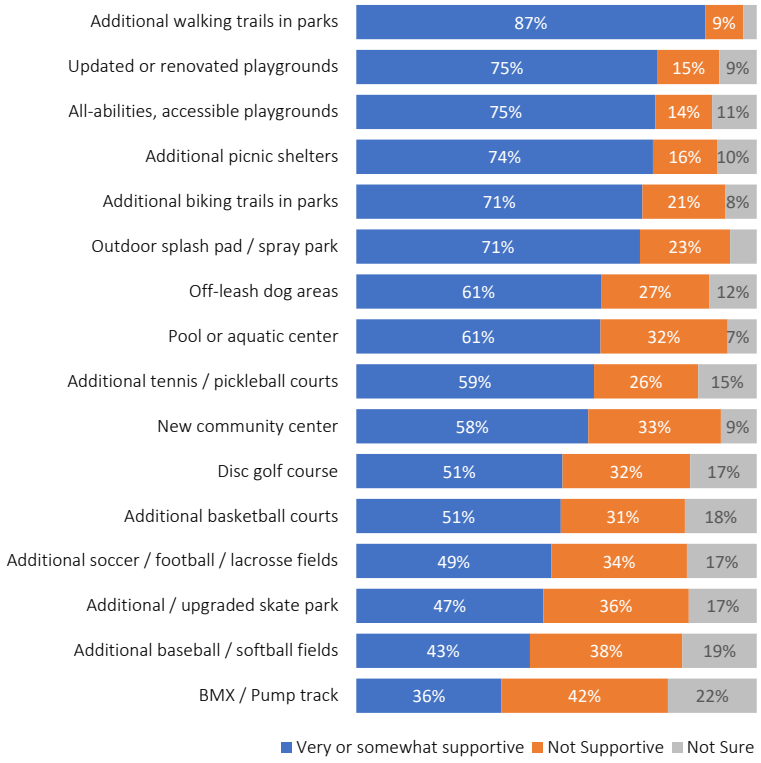
If respondents who answered "Don't Know" are excluded from the results, 46% of respondents believe there are not enough walking and biking trails. Between 33% and 39% of respondents who rated the options believe that there is not enough access to water-oriented recreation, picnic areas, sports fields and courts, community events, and developed parks.

2. When it comes to amenities provided by the City of Camas for meeting your needs for parks, trails and recreation facilities, would you say there are…

Younger respondents – those under 44 – were more likely than older respondents to feel there were not enough developed parks with playgrounds, picnic areas, recreation programs, and community events. Respondents between 55 and 64 years of age were far more likely than respondents of other ages to want more walking and biking trails in Camas. Respondents with children in their home are more likely than those without to believe there are not enough of every listed amenity except walking and biking trails. Respondents who live in southwest Camas (Council Ward 3) were more likely than respondents of other areas to feel there are not enough walking and biking trails.

Parks

What park improvements would Camas residents like to see?



More than three in four respondents are very or somewhat supportive of adding walking trails (87%), updated (75%) and accessible (75%) playground features, and more picnic shelters (74%) to the City's existing parks.

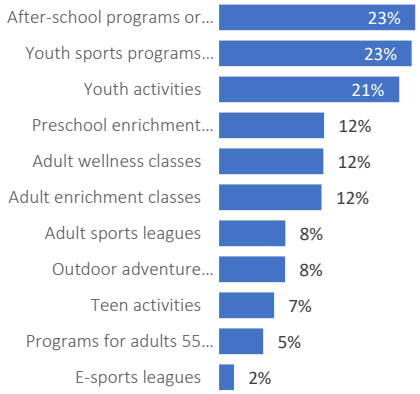
A majority of respondents are also supportive of developing more biking trails, splash pads, off leash dog areas, pools or aquatic centers, tennis or pickleball courts, a new community center, disc golf course, and basketball courts.

Less than half of respondents were supportive of adding more basketball courts, sports fields, skate parks, and BMX or pump tracks.

Respondents under 45 years old were more likely than older respondents to support every improvement listed in the survey.

6. The following list includes park amenities that the City of Camas could consider adding to the park system. Please indicate whether you would be very supportive, somewhat supportive, not sure, or not supportive of each.

Respondents with children in their household were more supportive of city investment in playgrounds (including accessible playgrounds), sports fields and courts, community and aquatic centers, outdoor splash pads, BMX/bike skills courses, skate parks, and disc golf courses than those without children.

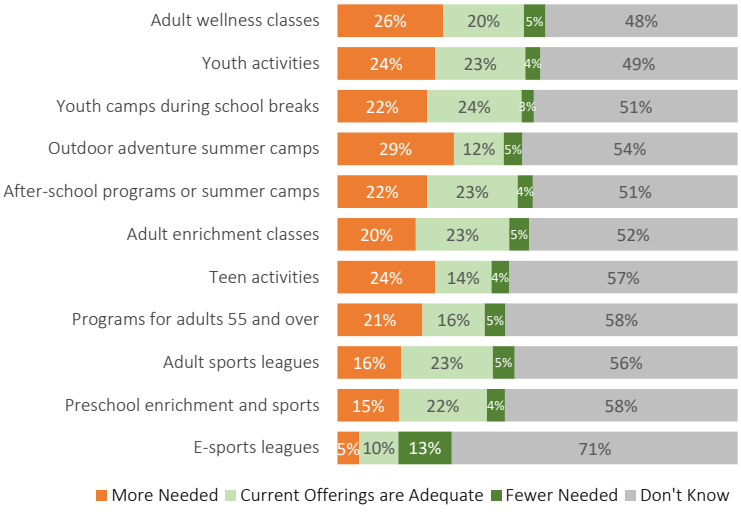


Recreation programs

What recreation programs have residents participated in?

Less than one in four respondents who took the mailed survey have participated in the City's recreation programs. Of the listed activities, the greatest number of respondents had participated in after-school programs or summer camps for children (23%), youth sports programs (23%), and youth activities (21%). In general, respondents were less likely to have participated in activities for teens, adults, and older adults.

Members of households of younger respondents (under age 44) were more likely to have participated in youth-oriented programming, while those of older respondents were more likely to have participated in adult programs and classes. Respondents with children in their home were significantly more likely to have participated in youth-oriented programs and camps than those without.

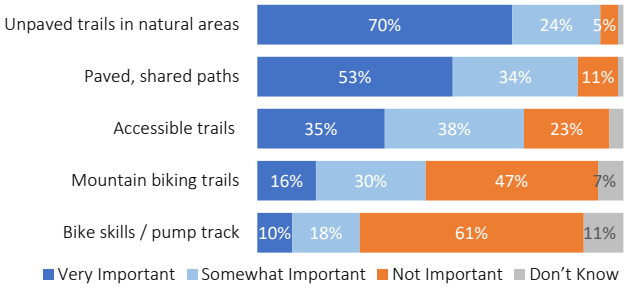


8. Please indicate if your household used each of the listed recreation program types in 2019 (pre-COVID-19).

What recreation options do residents have a need for?

The survey asked respondents which types of recreation programs, classes, and activities they would like to see more of. Notably, approximately half of respondents responded that they did not know whether current offerings are adequate or not. Of those who expressed an opinion, more than half felt the City needed more outdoor adventure summer camps, teen activities, adult wellness classes, and programs for adults over 55.

9. Please indicate whether you think there should be more less of each of the listed program types.



Respondents under 34 years of age were more likely than older respondents to feel the City needs more adult sports leagues, youth camps and after-school programs, pre-school activities, and E-sports leagues. Adults over 55 had the greatest unmet needs for classes and programs specific to people over 55. Respondents of all ages expressed similar levels of need for adult enrichment and wellness classes. Households with children were more likely than those without to feel like their need for youth activities were not well met. In general, respondents of southwest Camas (Ward 3) were more likely than respondents of other areas to feel that current offerings are adequate or more than enough.

Trails

What trail types do residents think are important?

Of various types of trails, respondents overwhelmingly rate unpaved trails in natural areas as important – 94% believe they are very or somewhat important. Majorities of respondents also feel paved, shared use paths for pedestrians and cyclists (87%) and accessible trails (73%) are at least somewhat important. Respondents are less likely to feel mountain biking trails (46%) and bike skills / pump tracks (28%) are important. In general, the importance of each type of trail decreased with the age of respondent. However, similar percentages of adults in each age group from 35 to 64 considered mountain biking trails to be very or somewhat important, with slightly stronger levels of importance noted by respondents between 45 and 64. There were no significant differences in importance based on where respondents live or whether they have children at home.

10. Please rate how important each trail type or amenity is to your household.

Investment and revenue priorities

What recreation and park investments would residents prioritize?

Respondents were asked to rank a list of potential recreation, park, and open space investments. Generally, respondents to both the mail and online survey ranked maintaining existing parks, expanding trail opportunities, building new parks, and acquiring land for future parks as their top priorities. Respondents ranked offering building a new community or aquatic center and expanding program offerings as their lowest priorities in both the mail and online surveys.

Respondents of different ages prioritized the investment options similarly, with the exception of building a new community or aquatic center, which was a higher priority for significantly more younger respondents. Respondents with children in their home tended to rate building a new community or aquatic center higher than those without children in the home, who were more likely to rate expanding trail opportunities as a high priority. Respondents did not vary significant in their priorities depending on which part of the city they live in.

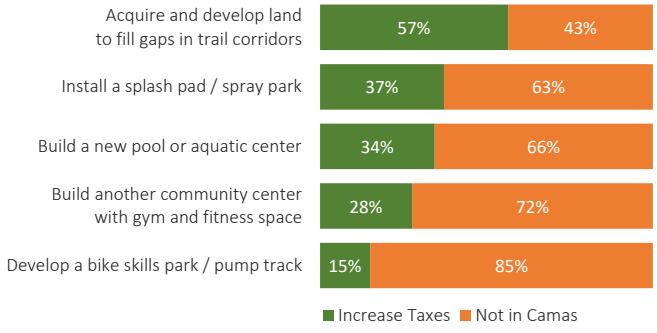
8. For the following list, indicate how you would rank the priority for each.

	Mail	Online
Highest	▪ Focusing on existing parks & delayed maintenance	▪ Focusing on existing parks & delayed maintenance
	▪ Expanding trail opportunities	▪ Building new parks on undeveloped, city parkland
	▪ Building new parks on undeveloped, city parkland	▪ Expanding trail opportunities
	▪ Acquiring land for future parks	▪ Acquiring land for future parks
	▪ Building a new community center or aquatic center	▪ Building a new community center or aquatic center
Lowest	▪ Expanding recreation classes & camps	▪ Expanding recreation classes & camps

What revenue generating options would residents support?

The survey asked respondents whether they would support various revenue generating options. Large majorities of respondents were either very or somewhat supportive of a) charging advertising fees for outfield fence banners at sports fields (88%), b) increasing rental scheduling for private events and gatherings (72%), and instituting a reservation system and rental fees for additional group picnic shelters (70%). A slight majority (54%) were supportive of instituting a reservation and fee program for sports fields and courts. Significantly fewer respondents (29%) were supportive of implementing a parking pass program at major City parks.

There were no consistent, significant differences in support for revenue generating options across respondents of various ages or between respondents with children at home and those without.

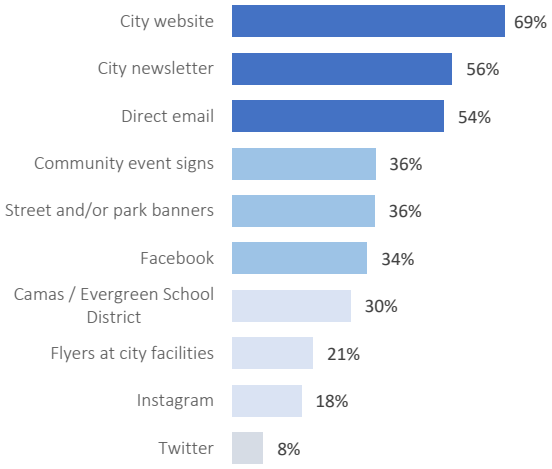


11. The Parks & Recreation Department has limited budget to deliver parks and recreational services, and the City is exploring options to enhance revenue generation to support the delivery of services. How would you rate your level of support for each of the following options?

Are residents willing to support increased taxes to fund new amenities and experiences?

Respondents with children at home were significantly more likely that those without to support increasing taxes for all improvements other than expanding trails (which received similarly high support levels). However, building a community or aquatic center was the only option for which more than half of respondents with children supported raising taxes. Respondents under 44 years of age were significantly more likely than older respondents to support raising taxes to fund a new pool or aquatic center or to install splash pads. There were no significant differences based on respondents' location of residence.

12. There may be some park and recreation experiences that are limited or not available in Camas but are available in neighboring communities. If it came down to a choice between increasing taxes to develop that facility in Camas versus not having that in Camas, which would you choose?



Communication preferences

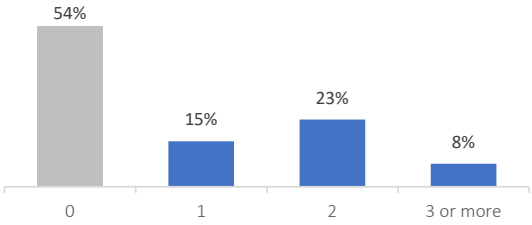
How do residents want to hear about Camas' parks, programs, and events?

More than two-thirds of respondents would prefer to learn about City parks, programs, and events through the City's website. The City newsletter and direct email are also popular communication options, preferred by 56% and 54% of respondents respectively. These sources were popular with respondents to both the mail and online-only surveys and with respondents of all ages.

13. Please check ALL the ways you would prefer to learn about Camas' parks, programs, and events.

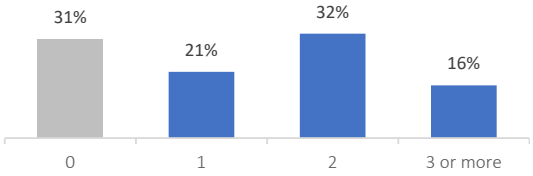
About a third of resident preferred to learn about City offerings through various types of promotional signs, including community event signs (36%), street or park banners (36%), and flyers at City facilities (21%). Thirty percent of respondents would like to hear about programs and events through local school districts.

Fewer than about one in three respondents would like to hear about park and recreation opportunities through social media (Facebook (34%), Instagram (18%), and Twitter (8%)). However, social media – especially Facebook and Instagram – is a significantly more popular source of information for respondents under 44 years of age. Respondents who responded to the online-only survey were also significantly more likely to prefer social media sources – 61% prefer Facebook, 29% Instagram, and 13% Instagram.



Respondents with children at home were significantly more likely to prefer receiving information through the school district than those without. There were no significant differences in communication preferences between respondents living in different areas of the city.

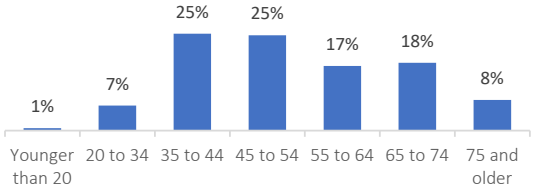
Demographics



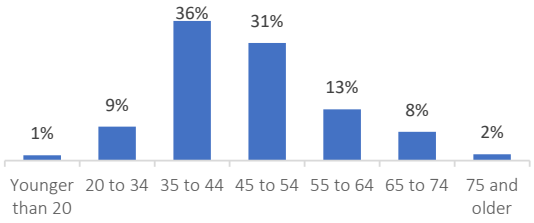
Number of children in household

The majority (54%) of respondents to the mail survey live in households with no children under 18, while about just under half live in a household with either one (15%), two (23%), or three or more (8%) children. Online-only survey respondents were significantly more likely to live in households with children than respondents to the mail survey – nearly 70% had children in the home.

Mail survey responses



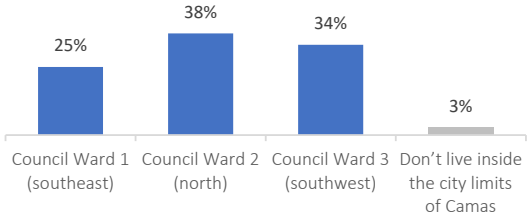
Online-only survey responses



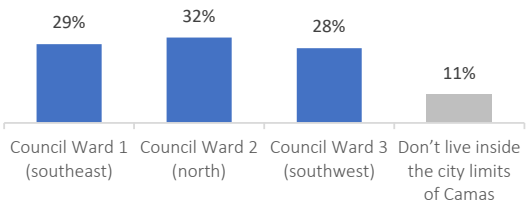
Age

Approximately half of respondents to the mail survey were between the ages of 35 and 54. Another 35% were between 55 and 74, while 8% were older than 75 years. Fewer than 8% of respondents were less 35 years old. The online-only survey tended to be younger than those who responded to the mail survey – 10% were under 35 years old, 67% were between 35 and 54 years, and only 23% were over 55.

Mail survey responses



Online-only survey responses



Location of residence

Respondents were relatively evenly distributed throughout the City of Camas. Thirty-eight percent live in Council Ward 2 (north Camas), 34% live in Ward 3 (southwest), and 25% live in Ward 1 (southeast). The mail survey garnered a few responses (3%) from people who live outside the City of Camas, however all live within the 98607 zip code. Respondents to the online survey were similarly distributed across the city, with slightly higher representation of residents in Ward 1. However, a larger portion (11%) of online-only respondents do not live in the city.

City of Camas WASHINGTON

Community Survey on Parks and Recreation

Dear Camas Resident:

The City of Camas is beginning a community-led process to update its citywide Recreation, Parks and Open Space Plan (PROS Plan, for short). We need your help to determine how to prioritize projects and what we should focus on to keep our parks and programs thriving for the next 6-10 years. As an initial step, the City is conducting this short survey to assess the community's recreation needs. We understand that COVID-19 has impacted your ability to participate in programs and visit parks this year. We ask that you consider needs for the future as you evaluate recreation amenities. Your opinions are important to the City.

The survey has 16 questions and will only take a few minutes to complete. Use the QR code to take this survey online at https://www.surveymonkey.com/r/CamasPROS

1. **When you think about what contributes to the quality of life in Camas, would you say that public parks and recreation opportunities are... (CHECK ONE OPTION)**

   ☐ Essential to the quality of life here
   ☐ Important, but not really essential
   ☐ Useful, but not necessary
   ☐ Not Important
   ☐ Don't know

2. **When it comes to amenities provided by the City of Camas for meeting your needs for parks, trails and recreation facilities, would you say there are... (CHECK ONLY ONE BOX IN EACH ROW)**

	More than Enough	About the Right Amount	Not Enough	Don't Know
Developed parks with playgrounds	☐	☐	☐	☐
Walking / biking trails	☐	☐	☐	☐
Sport fields & sport courts	☐	☐	☐	☐
Picnic areas & shelters	☐	☐	☐	☐
Access to water-oriented recreation (lakes, rivers)	☐	☐	☐	☐
Recreation programs (camps & classes)	☐	☐	☐	☐
Community events (such as the Movies in the Park)	☐	☐	☐	☐

3. **Prior to the COVID-19 pandemic, how often did you visit or use Camas parks, trails, recreation facilities or natural areas?**

   ☐ Everyday
   ☐ At least once a week
   ☐ Two or more times a month
   ☐ About once a month
   ☐ A few times over the year
   ☐ Do not visit facilities / parks / open spaces
   ☐ Don't know

4. **Prior to the COVID-19 pandemic, what would you say are the main reasons your household visited Camas parks, recreation facilities or open spaces in the past year? (CHECK ALL THAT APPLY)**

   ☐ Fitness / Exercise

Bike skills / pump track	☐	☐	☐	☐

10. **The Parks & Recreation Department has limited budget to deliver parks and recreational services, and the City is exploring options to enhance revenue generation to support the delivery of services. How would you rate your level of support for each of the following options?**

	Very Supportive	Somewhat Supportive	Somewhat Unsupportive	Very Unsupportive	Don't Know
Install and institute a reservation system and rental fees for additional group picnic shelters	☐	☐	☐	☐	☐
Charge advertising fees for the installation of outfield fence banners at sport fields	☐	☐	☐	☐	☐
Institute a parking pass program at major parks	☐	☐	☐	☐	☐
Institute a reservation system and rental fees for sport fields and courts	☐	☐	☐	☐	☐
Increase rental scheduling for private events and gatherings	☐	☐	☐	☐	☐

11. There may be some park and recreation experiences that are limited or not available in Camas but are available in neighboring communities. If it came down to a choice between increasing taxes to develop that facility in Camas versus not having that in Camas, which would you choose?

	Increase Taxes	Not in Camas
Install a splash pad / spray park	☐	☐
Build a new pool or aquatic center	☐	☐
Acquire and develop land to fill gaps in trail corridors	☐	☐
Build another community center with gymnasium and fitness space	☐	☐
Develop a bike skills park / pump track	☐	☐

12. Please check ALL the ways you would prefer to learn about Camas's parks, programs and events.

- ☐ City website
- ☐ City newsletter
- ☐ Facebook
- ☐ Twitter
- ☐ Instagram
- ☐ Camas / Evergreen School District
- ☐ Direct email
- ☐ Community event signs
- ☐ Flyers at city facilities
- ☐ Street and/or park banners
- ☐ None of these
- ☐ Other: _____

The following questions help us understand whether we have a cross-section of the community responding to this survey. It's important that you provide a response to each question.

13. How many children under age 18 live in your household?

- ☐ 0
- ☐ 1
- ☐ 2
- ☐ 3 or more

14. What is your age?

- ☐ Younger than 20
- ☐ 20 to 34
- ☐ 35 to 44
- ☐ 45 to 54
- ☐ 55 to 64
- ☐ 65 and 74
- ☐ 75 and older

15. In which section of Camas do you live?

- ☐ (1) Council Ward 1 - southeast Camas
- ☐ (2) Council Ward 2 - north Camas
- ☐ (3) Council Ward 3 - southwest Camas
- ☐ Don't live inside the city limits of Camas

16. If you don't live in Camas, what is your zip code? _____

Thank you for taking the time to complete this survey!

Your input will help guide the development of the Camas Parks, Recreation & Open Space Plan.

ATTACHMENT 2. OPEN-ENDED RESPONSES

Question 4. Prior to the COVID-19 pandemic, what would you say are the main reasons your household visited Camas parks, recreation facilities, or natural areas in the past year? (open-ended "other" responses)

Mail

- The parks are why I moved here
- Photography
- Cemetery - pry of Parks responsibility
- Meeting a friend or getting out of the house
- DOG PARK PLEASE!!!!
- Miss public swim pool
- Kayaking, paddle boarding
- Too much noise, dangerous bikes, boats disruptive
- We moved here during the pandemic
- Kites
- Just moved here
- Internet access and restrooms
- Hiking Lacamas park
- Getting out of yard work!!!
- Overall enjoyment of nature in its natural state on maintained trails
- Visit my wife's cemetery plot
- We moved to Camas during the pandemic.
- Skatepark
- Moved here during PHE
- Photography
- Hiking
- Skateboarding

Online

- Bike Riding
- Bird watching
- Did not live in Camas
- Didn't live here prior to COVID
- Disc Golf
- Gather with friends
- Horseback riding
- I moved here during the pandemic, so the question doesn't really apply to me, but I'm utilizing many of these now and have been since arriving.
- I moved to Camas during COVID.
- Lacamas Lake is toxic and should be cleaned and filtered, currently unsafe
- Mental health / forest bathing

- Mental health, community health
- Mountain biking
- Mountain biking
- Moved here during COVID
- Moving to Camas during COVID
- Nature immersion
- Paddle boarding
- Photos
- Pickleball at Crown Park!!!
- pump track and dirt jumps
- Relaxing
- Scouts
- Skateboarding
- Skatepark
- sketching
- Soaking up nature
- SUP
- To be outside for no reason
- To practice disc golf throws!
- Turf the baseball fields. For how much u make it taxes stop wasting money and invest in the youth or I'll move to Ridgefield
- Visiting with out-of-town guests
- We just moved here last June during the pandemic.
- We just moved to Camas in July 2020, so we didn't have experiences before the pandemic.
- We need an off-leash dog park
- We recently moved here during the pandemic.
- Would have gone to pool if still had one

Question 13. Please check ALL the ways you would prefer to learn about Camas' parks, programs and events. (open-ended "other" responses)

Mail

- Advertising/information around downtown Camas
- Camas Post Recorder
- Direct mail
- Direct mail - USPS
- Direct mailing
- Direct mailing once or more per year
- Do not know
- Don't care. Any.

Appendix B: Interactive Map Comments 17

INTRODUCTION

The City of Camas conducted outreach between July 29 and August 22, 2021 to share information about the Camas Parks, Recreation and Open Space (PROS) Plan Update with the public and solicit input about which park and recreation programs, services and facilities are important to them. Feedback received through this outreach period will help the city build the draft PROS Plan, which will be shared in late fall through a second round of outreach.

OVERALL PARTICIPATION AND NOTIFICATION

To gather feedback to inform the PROS Plan update, the project team developed an **online open house, online interactive map,** and held **three (3) tabling events** in Camas to build project awareness and solicit feedback.

Overall, **we reached approximately 131 people**, with 74 participating in the online open house, approximately 50 visiting with the team at tabling events, and 7 people contributing to the interactive map.

Community members were informed about the online open house and tabling events through the following:

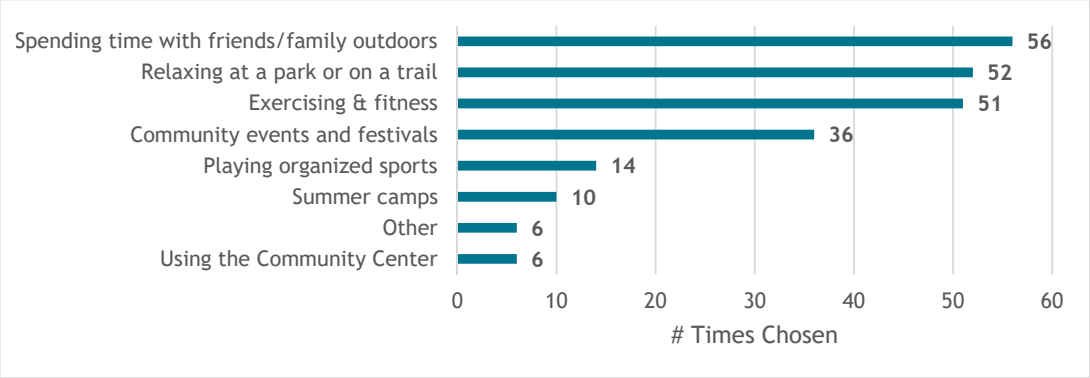
- Social media posts to the City of Camas Facebook page and Twitter account
- Social media posts to the Camas Parks & Recreation Facebook page
- Posts on the project Engage Camas page
- Emails sent to the Parks and Recreation distribution list
- Media release
- Announcements at Council and Parks & Recreation Commission public meetings
- Announcements at Stakeholder Focus Group meetings

FEEDBACK SUMMARY

OPEN HOUSE QUESTIONS

This section summarizes the feedback received through the online open house.

ONLINE OPEN HOUSE RESPONSES



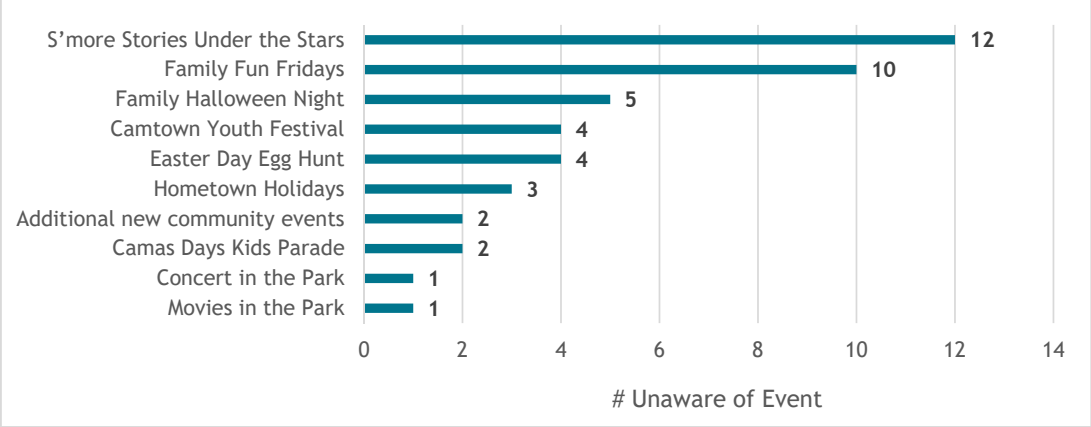
Online open house participants were given the opportunity to respond to a series of questions about park and recreation programs, services, and facilities. Feedback is summarized below.

Note: Unless otherwise stated, the percentages listed in the analysis of each question take into consideration the number of participants who responded to the question, not the total number of people who participated in the online open house.

1. **What are you most looking forward to doing again in City parks and facilities as COVID-19 restrictions are lifted? (Select all that apply.)**

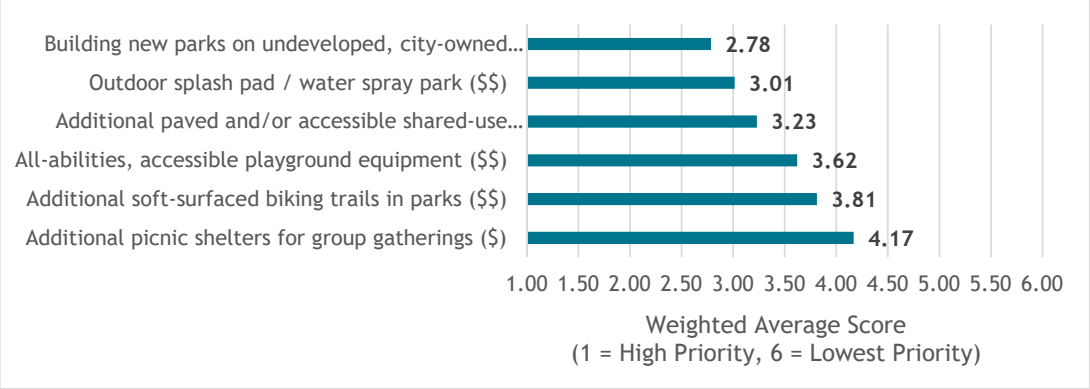
   As COVID-19 restrictions are lifted, participants are most looking forward to spending time with friends/family outdoors, relaxing at a park or on a trail, and exercising and fitness.

   For those who selected "Other," kayaking, floating on the river, swimming, and taking children to the playgrounds was mentioned. Someone mentioned splash pads at Crown Park and that bathrooms are needed. Please see **Appendix A** to read the individual, unedited comments.

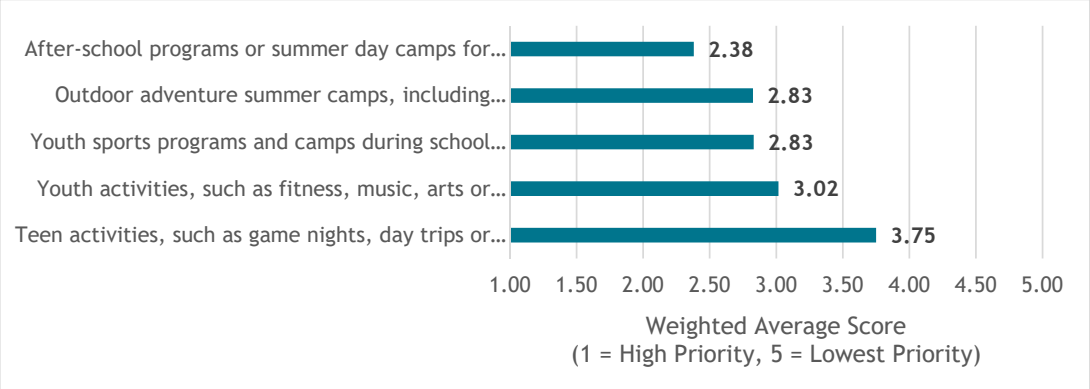


2. **The City of Camas offers or supports many community events throughout the year that are free to the public but utilize city staff resources and funding. Below is a list of Camas community events that are currently offered. For each event, indicate whether you think it is a High Priority, a Medium Priority, a Low Priority, or Not a Priority for your household.**

   "Concert in the park" scored the highest, indicating it was a high priority for respondents. This was followed by "Hometown Holidays" and "Movies in the Park." Respondents indicated that "S'more Stories Under the Stars" was the lowest priority community event.

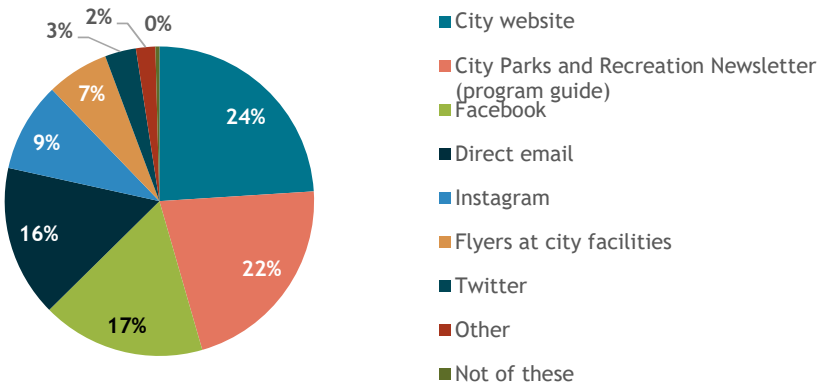


12 respondents indicated that they were unaware of S'more Stories Under the Stars, 10 were unaware of Family Fun Fridays, and 5 were unaware of Family Halloween Night.



3. **The spring 2021 community survey identified six priorities for the park system. For the following list of park system priorities, indicate how you would rank the priority for each (first (1) priority is highest and sixth (6) priority is lowest). Cost estimates are shown as $ (somewhat expensive), $$ (moderately expensive) or $$$ (expensive).**

   Respondents ranked **"Building new parks on undeveloped, city-owned parkland ($$$)" highest,** followed by "Outdoor splash pad / water spray park ($$)." Respondents ranked "Additional picnic shelters for group gatherings ($)" the lowest.



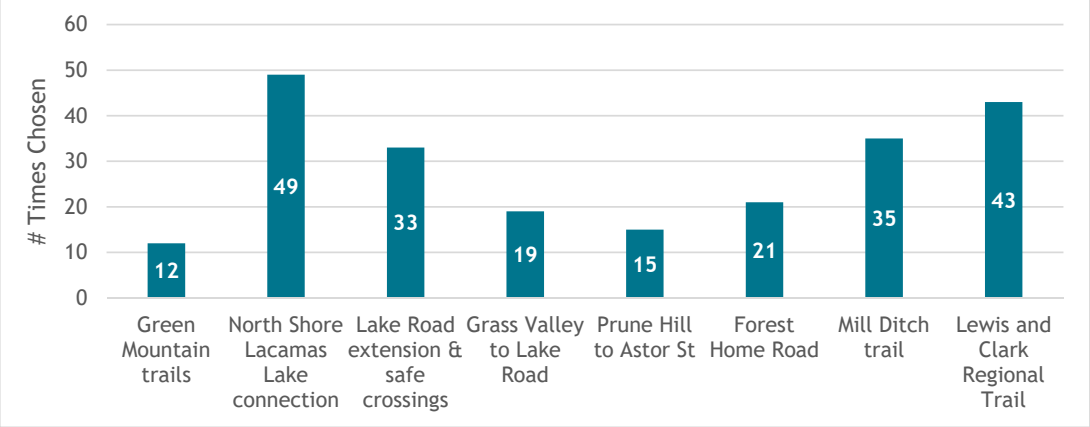
4. **The spring 2021 community survey identified five priorities for recreation programs and activities. For the following list of recreation programs and activities, indicate how you would rank the priority for each (first (1) priority is highest and fifth (5) priority is lowest).**

   Respondents ranked **"After-school programs or summer day camps for children" highest,** followed by "Youth sports programs and camps during school breaks" and "Outdoor adventure summer camps, including archery, orienteering, geocaching or environmental education." Respondents ranked "Teen activities, such as game nights, day trips or camps during school breaks" the lowest.

5. **Please check ALL the ways you would like to get information about Camas' recreation programs and activities.**

   Most people would like to get information about Camas' recreation programs and activities through the **city's website and/or through the City Parks and Recreation Newsletter.**

For those who indicated "Other," text messaging, events on Facebook, Camas Library, and Nextdoor were mentioned as ways people like would to get information



6. **The following list of new facilities/amenities may be considered in the new PROS Plan. For each item, please tell us if it should be a top priority, a high priority, a low priority or not a priority at all. Cost estimates are shown as $ (somewhat expensive), $$ (moderately expensive), $$$ (expensive) or $$$$ (very expensive).**

"Acquire and develop land to fill gaps in trail corridors ($$)" scored the highest, indicating it was a high priority for respondents. This was followed by "Install an outdoor splash pad / spray park ($$)" and "Provide an off-leash dog park ($)."

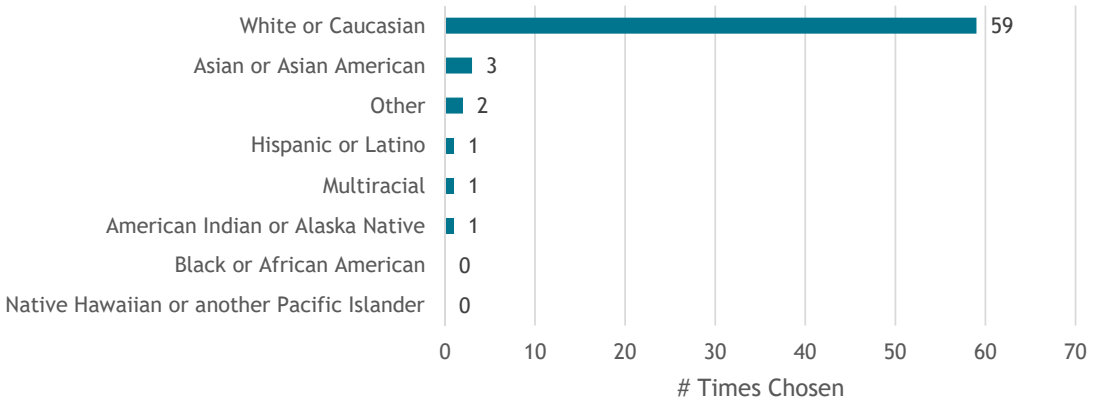
7. **Thinking about trails and paths, which potential trail connections are the highest priority for your household? (Select up to 4.)**

Respondents chose the **North Shore Lacamas Lake connection the most (49 times),** followed closely by Lewis and Clark Regional Trail, chosen 43 times, indicating that these two trails were highest priority for households. Green Mountain trails was chosen the least.

8. **Please share any additional needs for park and recreation improvements, programs or activities that you think are important and relevant to the growth of our community for the next five years.**

   36 people left feedback in this open text box. Below are some common themes found for those who responded. Please see **Appendix A** to read the individual, unedited comments.

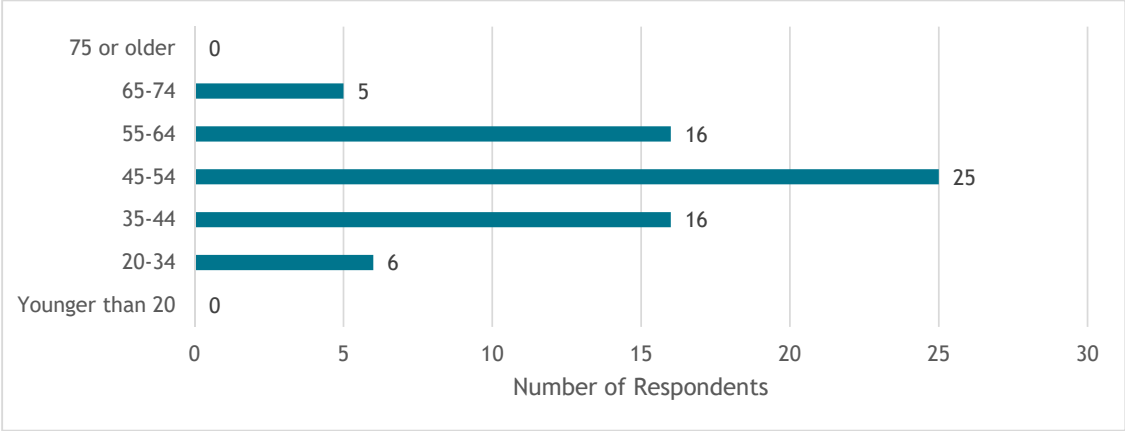
   - 7 said that maintenance of existing parks needs to be a priority.
   - 5 said they would like to see more water features, such as pools and splash pads, at parks.
   - 6 said they want expanded bicycle facilities.
   - 6 said there is a need for an accessible and safe system of interconnected trails.
   - 4 said they want more and improved/expanded sports fields and courts.
   - 2 said the restrooms at Crown Park need to be improved.



DEMOGRAPHIC INFORMATION

Participants from the online open house were asked a series of optional demographic questions.

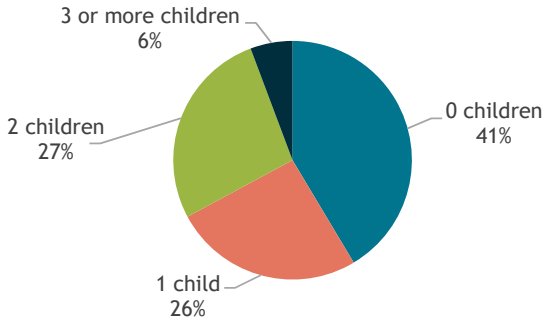
Note: Unless otherwise stated, the percentages listed in the analysis of each question take into consideration the number of participants who responded to the question, not the total number of people who participated in the online open house.



Racial or Ethnic Identity

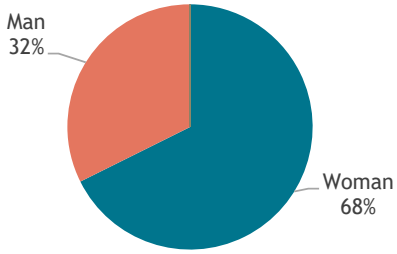
The majority of participants identify as white (88%). The second largest group of participants selected Asian or Asian American (4%).

Age



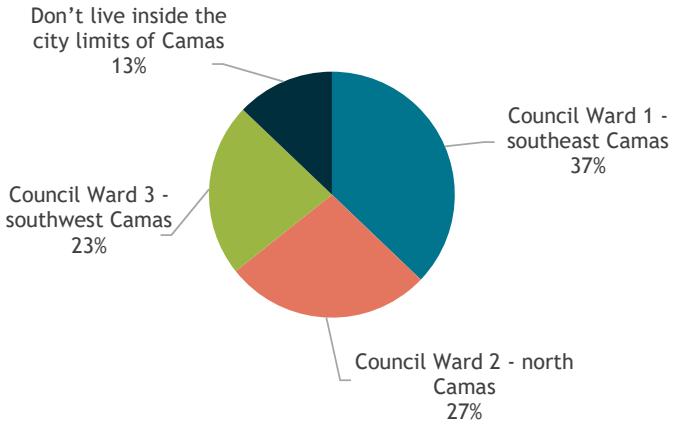
Of those that responded, the **largest group of participants were between the ages of 45 – 54 (37%).** The second largest groups were between the ages of 55 – 64 (24%) and 35-44 (24%)

Number of children in household

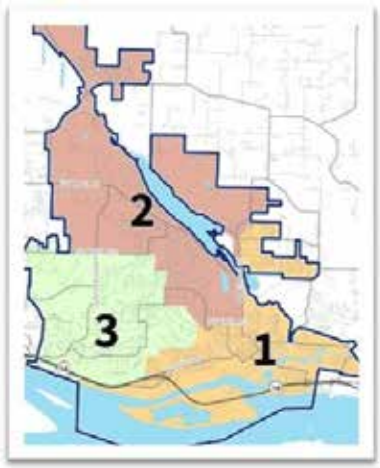


The majority of participants **(41%) indicated they had no children under the age of 18 living in their household.** This was followed by a little more than a quarter (27%) having two children

and 26% having one child.

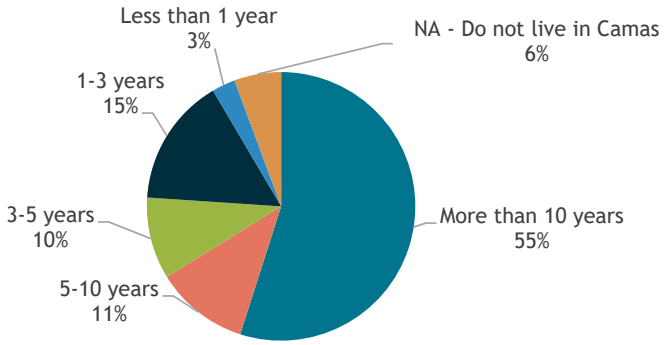


Gender



The majority of participants (68%) identified as women, while 32% identified as men. No one identified as transgender, non-binary, genderqueer, or third gender.

Primary Residence



Most respondents (37%) indicated that they live in Council Ward 1 – southeast Camas. About a quarter of respondents live in Council Ward 2 and a quarter also live in Council Ward 3.

Time living in Camas

Most respondents, 55%, have lived in Camas for over 10 years. This was followed by 15% of respondents saying they have lived in Camas for 1-3 years.

TABLING EVENTS FEEDBACK SUMMARY

This section summarizes the feedback received at the three (3) tabling events held in July and August to build awareness of the PROS Plan Update and share information about the project. Approximately 50 people were engaged at these events. Tabling was held at the following times and places:

- July 31st at Heritage Park from 10a-12p and 1-2p
- August 17th at Concert in the Park from 6:30-8:30p
- August 18 at Camas Farmer's Market from 3-7p

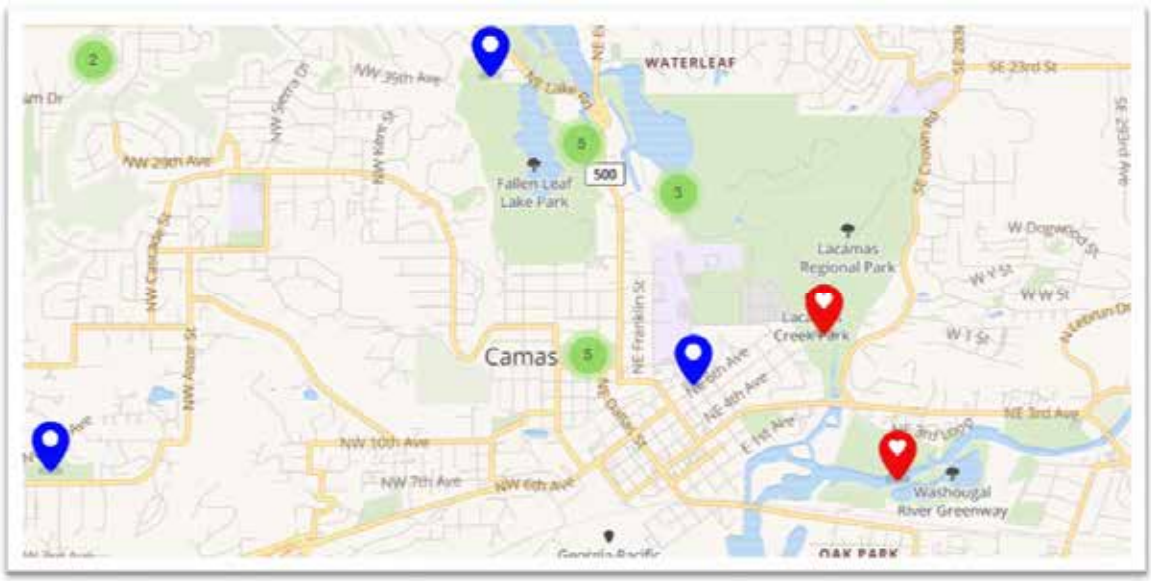
Below is a summary of the feedback we received organized by common theme:

- **Heritage Park and Surrounding Lakes:**
    - **Trail signage is needed** at Heritage Park and Lacamas Lake; topographic maps may be helpful
    - **More outreach, promotion and notification** are needed about the annual Drawdown Event
    - Someone asked **if the lakes are stocked with fish** or if the fish are being studied
    - People expressed **concern about algal blooms** at the lakes
    - Desire for **more tree protection policies**
    - **Recycling bins** are needed
    - Desire for **more educational and interpretive offerings and facilities**
    - More **lake access and beaches** needed
    - **Parking at the lakes is an issue**. A few people mentioned that parking could be added on the north side of Lacamas Lake

    - Concern about **filtration at Lacamas Lake**
    - Concern about **erosion and wear-and-tear to trails around Round Lake** due to bikes
    - Someone mentioned that **Lacamas Creek Trail is blocked**
    - Consider **cutting back foliage in Lacamas Lake** sooner
    - **Fallen Leaf Lake is peaceful**, but sometimes it is easy to get lost
- **Crown Park:**
    - People like that **Crown Park is clean and quiet** – it is the heart of the neighborhood
    - Desire for **restrooms and sprinklers/splash pad**
- **Parks and Recreation in Camas:**
    - Desire for **more facilities to serve people in Camas** (i.e., parks, trails for bicyclists and pedestrians, etc.)
    - Would like to see **better bike connections** from downtown waterfront area to Crown Park
    - Need **more promotion for Concert in the Park** events
- **Other:**
    - People expressed **concern about population growth** in Camas, as well as **increased traffic** – especially when thinking about development in North Shore area
    - Someone mentioned that people are having **survey fatigue** and would have liked to have seen open text questions on the Spring PROS Plan survey
    - Someone mentioned that a **Parks and Recreation QR code** from a month ago is not working
    - There was some **confusion about the summer online open house** – some people thought it was the same as the spring survey

People were able to share on a map the places they like to visit and areas that need improvement. They are as follows:

- **Places people like to visit** (indicated by green dot):
    - Lacamas Lake
    - Heritage Park
    - Fallen Leaf Lake
    - Lacamas Regional Park
    - Lacamas Creek Park
    - Washougal River Greenway
- **Places needing improvement** (indicated by red dot):
    - Open space area on lower end of Lacamas Lake
    - Area between Lacamas Lake and Round Lake
    - Forest Home Park



INTERACTIVE MAP

On the Engage Camas project page, the public was given the opportunity to share which parks, trails, and open spaces they currently visit in Camas (denoted by a red heart pin); where they think improvements need to be made (denoted by a blue pin); and what new things they would like to see offered in Camas' park system (denoted by a yellow star pin). **11 unique users** submitted a total of **22 comments.** Below is a summary of their comments:

- **Places people currently visit:** Fallen Leaf Lake, Washougal River Greenway, Lake to Lake Trail, Lacamas Lake
- **Improvements needed:**
    - **Lake to Lake Trail:** Replace the broken fences and add danger signs around cliffs on both sides of the river, place more trashcans along the trail, replace maps
    - **Mill Ditch Trail:** Fill in Mill Ditch and make it a large accessible walking path
    - **Grass Valley Park:** Play equipment is in disrepair and needs to be replaced
    - **Lacamas Lake Dam:** Extend the fence for safety
    - **Klickitat Park:** Landscaping and removal of dead trees
    - **Roof cleaning and painting** of buildings near Fallen Leaf Lake and Lacamas Lake
    - **Parking on the north side** of Lacamas Lake needed

    - Someone indicated there are **overgrown brambles** behind houses on NW 31st Ave and NW Dahlia Dr
- **Ideas for new park offerings:**
    - **Crown Park:** New/updated programming to tie in with programs/activities to be offered at new Garfield Performing Arts Center, splash pad or kids pool, new restroom
    - **Fallen Leaf Lake:** Splash pad or community fountain, parking lot and picnic tables; retaining walls and a sort of "art walk" fencing could highlight local artistry and sculptures.
- **Other:** Someone was concerned about the Sierra/43rd Street corridor and that because of increased traffic, it needs improvement

Please see **Appendix B** for more details about the comments as well as the specific addresses of the locations or places participants submitted comments about. It may be helpful to view the comments in context with the location they were placed. The issues map and comments are viewable at this link: **https://engagecamas.com/parks-recreation-open-space-comprehensive-plan/maps/camas-park-system-interactive-map**

APPENDICES

APPENDIX A: ONLINE OPEN HOUSE OPEN TEXT QUESTIONS

Below are the unedited comments respondents submitted for the open text questions in the open house.

QUESTION 1: What are you most looking forward to doing again in City parks and facilities as COVID-19 restrictions are lifted? (Select all that apply.)

Those who chose "Other," wrote the following in the open text box:

- Kayaking on the lakes
- River Access for inner tubing
- Skatepark
- Swimming
- Taking child to playgrounds
- Using the splash pad at Crown Park that replaced the pool you tore down. Oh, that's right, you haven't fulfilled that promise yet. And the new bathrooms at Crown Park are wonderful 😉.

QUESTION 5: Please check ALL the ways you would like to get information about Camas' recreation programs and activities.

Those who chose "Other," wrote the following in the open text box:

- Camas Library
- Events Page on Facebook so I can simply add it to my google calendar with ease. Also include link to register there.
- NextDoor
- text
- text

QUESTION 8: Please share any additional needs for park and recreation improvements, programs or activities that you think are important and relevant to the growth of our community for the next five years.

- Algae bloom control at Lacamas Lake

- Crown Park is in dire need to be updated to make the playgrounds safe for children. The community was promised a splash pad when the pool was removed.
- I think providing a walking path from Green Mountain to the Heritage Trail is imperative. I don't know why this wasn't insisted upon during annexation and development approval.
- The current parks are a mess. Weeds are so bad at some parks that you can't even sit on the grass or put a baby on it. The small park area on NW 8th, really?? Weeds up to my knees and so brown. No reason for this. Hire some new employees instead of office workers and suits.
- I'd like to see the existing parks better maintained. I live near Klikitat Park and have had to comment several times over the past several years about how poorly the park is cared for. Oversight is needed apparently. New neighborhoods should be required to have natural green space. Camas has needed sports fields and practice fields for over a decade. Consider turfing existing fields for improved playability ie. GV ball park is almost never game-ready (picture of it on city website is not a real representation.) Better and more access points to put kayaks, canoes, etc. into Lacamas and Round Lakes. Make known how residents can donate or buy new sports equipment/uniforms, etc. for kids who need it. Trail connections are super important with the increased road traffic.
- The city buys LaCamas Swim and Sport and makes it into a Camas recreation center. The loss of crown park pool means no public pools in Camas. Parks department works to get public support to build an aquatics center with a pool that local swim teams can rent and use. Less emphasis on the splash pads, pools get more use by a range of age groups."
- #1 Lighted pickleball courts. #2 Soccer fields/basketball courts #3 Walking trails Pickleball, pickleball, pickleball
- Would like to see development of parking, picnic shelters, and water entry to fallen leaf lake on opposite side off Lake Road.
- Bike safety improvements between north end of Heritage trail and Green Mountain and North Shore Lacamas Connection. That segment of road is very dangerous for bikes and there are no alternate routes.
- We are in desperate need of additional sports fields and a multi use complex. Other cities seem to be way ahead with their facilities vs Camas
- Hi there! I would love recycling options at our parks and promote leave nothing behind. Education about recycling. Also, more education about our native trees, how trees provide oxygen etc., mainly environmental education. Signs and interactive "stations" for this. Educating how we can all make a difference to keep and maintain our natural beauty.

- Please add to the high priority, 2 way Bike paths off the freeway to share with Joggers path along SR500 from downtown all the way to Fern Prairie Market and up or down Lake Road. Huge safety issue!
- Most wanted: Car-free , soft-surfaced walking/running trails
- More adult sports options please!! Would love to see volleyball or a tennis league offered
- Both Forest Home Road and Leadbetter Road have tremendous recreational potential as multi-use roads but current traffic speeds are just too dangerous. Please consider lowering and enforcing traffic speeds on these roads so walkers and bikers can also enjoy the routes. Thanks!
- Sidewalks that connect our neighborhoods and get us to the paths and the trails should be a priority. There are many areas in our city that we cannot access because the sidewalks end.
- Maybe a few trash receptacles on the trails for dog poop bags. Bags are all over the trail.
- Number 1 priority is restrooms - Crown Park, trail heads and open space. This is a public health issue. Life stage definitely affects my priorities. When my kids were young activities such as the Easter Egg Hunt and Boo Bash were important as was safe, accessible and fun playground equipment. Without children in our household, I'm more interested in trails, both walking and biking.
- Please limit horsepower (speed) of boats allowed on Lacamas Lake to reduce/eliminate dangerous wakes and ensure safety of fishing boats, canoes, kayakers and swimmers. Thank you.
- I previously submitted a review on making current renewal or repairs to the current skatepark facility and would be thrilled to have that issue become a part of the discussion. Having past engaged, in discussions with the skatepark committee for tualatin hills park and recreation as well as assisting in maintenance and promotion of a popular indoor skatepark facility in portland. I would very much like to see a renewed look at the existing skatepark facility off of 3rd avenue as well as the adjoining parking lot and water access. I believe significant improvements could be made i.e. lighting and clean up as well as design changes to the actual skatepark. All of which leads to ensuring this site promotes inclusion for kids of all ages and experience levels as well as safety. Overall promoting a more family friendly environment.
- Improvements made on the existing skate park, utilizing someone with actual skatepark design knowledge or experience. Re-designing or rebuilding of the skatepark. Possibly building an all new skatepark with a bike/pump track next to it. The facility could offer a recreational area for kids of all ages to enjoy and stay out of trouble. However the current facility does not meet all levels of experience and is designed poorly, it has resulted in users bringing in outside equipment in order to make it somewhat usable. Also cleaning up the area around it i.e. the parking lot and water access/trails as well as

adding lighting for the park and parking lot would add safety and promote a more family friendly atmosphere.

- We would like to see a pool in Camas again, but perhaps not on the scale of a full aquatic center.
- I walk and bike the Mill Dutch trail regularly and am wondering what is going to happen with the stagnant water in the ditch. It's turning into a mosquito farm. Is the city going to do something with it such as flush it out or fill it in?
- I have been wondering why the play areas aren't covered. Children could play on rainy days and hot days
- The little green space on NW 8th is disgusting. It needs to be taken care. Kids want to play there and the weeds have taken over the grass. City really needs to wake up and take care of what we it has before it adds more to the list. Can't go to any park and put a toddler or crawler down to play in the grass, to many weeds.
- What would be most beneficial is a network of *connected* bike paths and hiking trails not a series of separate, non-contiguous trails, in order to provide safe and extensive opportunities for families and people of all ages. In particular new bike patgs should be integrated with the side walk NOT the road as this is much safer, particularly for children, and will encourage more use by families and bike commuting.
- Exercise equipment in select parks -- pull-up and dip bars, etc.
- It would be great if you could adjust the Camas rules regarding new housing developments to require more green space and/or trails for each large development. This way the city of Camas isn't competing with developers to purchase land for parks and other recreational activities. Allow the developer to buy the land and then require that they build the park you wanted!
- Maintenance on some city-owned trials is non-existent. Vegetation, especially blackberries, hang over the trail in many areas. Some of the trails are so steep in sections that they are pretty much non-usable, especially when it is wet or icy. The city-owned so-called "natural" area and collection pond north of Knapp Street in Parker Estates had maintenance delayed so long that many of the trees have died and beavers moved in further making a mess of the whole thing (project is currently in process to hopefully mitigate). I wish there were more safe places to ride bicycles (road bikes, not mountain or off-road) and that the trail system was more continuous. Ash Creek Park was promised to be developed MANY years ago and nothing has been done with it yet. Parker Estates (where I live) would appreciate it. I would like city staff to walk the full distance of all the trails in the area to get a good understanding of what it is like to live in the neighborhoods and walk them.
- No need for a million dollar pool, just build a splash pad or fountains with wading pools. Keep is accessible and add more parking. Better fishing opportunities on lacamas lake would be good.

- We need to see bathroom facilities in our parks. Crown Park is a beautiful park with ugly dirty porta potties. It's kind of sad. Also since The pool was destroyed CrownmPark has big wide open areas that aren't used for anything.
- I just wish so badly we could have an outdoor pool again! It made Camas so unique and we used it all summer long! I don't understand the cost issue when it comes to an outdoor pool. If you can build an aquatic center, why not an outdoor pool? I will forever be sad that the outdoor pool was taken away. It was a yearly tradition in our family and made Camas unique. It seems like all the fun things for kids are being taken away!!!!
- I love the walking trails through the natural areas SO MUCH!! Would love to have more of them connected. However, would also love to know that they are safe since I'm a woman walking a medium-size, cuddly-looking dog. The recent attack near Round Lake has me avoiding the trails right now. Are there regulations about camping in the local parks, or any way to help our law enforcement actually do the enforcing (they can't do anything about someone breaking a law if the law doesn't exist)? Official programs and organized events aren't particularly useful to me. I just love the natural spaces, so if they're there and accessible (and safe), I'll be so grateful to walk for miles and miles. Thank you!
- I put as my top priority "Outdoor adventure summer camps, including archery..." I would be very interested in these types of activities/camps not only for children and youth, but adults as well. I am a single adult in Camas, and would love to participate in all of the activities that were listed under that option, not only to learn more but also to meet more people in the community. I would love to support the city in creating such programs for kids and adults as well, I'm assuming we have a lot of untapped talent here, i.e. I'm an Herbalist/Botanist/Teacher who already does plant walks, I would be happy to volunteer for the city in putting together some sort of program/activity around that with our trails and greenspaces.
- Need to provide facilities for additional outdoor activities that create community connection and activity. With the number of sporting families Camas lacks facilities that other communities provide.
- Water quality improvements at all of our local lakes/rivers. Also, would like to ensure we don't see homeless camps springing up in our parks/shared forest lands.

APPENDIX B: INTERACTIVE MAP COMMENTS

Below are the unedited comments respondents submitted in the issues map, grouped by address.

Category	Comment	Address

Place I visit now	A trash can at the waterfall would be really wonderful please.	1644 Northeast 5th Court, Camas, Washington 98607, United States
Place I visit now	Love the accessible trail with benches for our elderly family members to rest during their walks, and viewing the wildlife here throughout the seasons	1906 Northeast 3rd Loop, Camas, Washington 98607, United States
Place I visit now	We love the solitude of Fallen Leaf and are here almost daily.	2911 Northeast Everett Street, Camas, Washington 98607, United States
Place I visit now	Great place to hike or trail run	Round Lake Loop Trail, Camas, Washington 98607, United States
Place I visit now	Love the lake for open swimming and kayaking. It's peaceful	2911 Northeast Everett Street, Camas, Washington 98607, United States
Needs improvement	Trash cans next to the map signs would be really wonderful. Additionally, all the maps need to be redone (they've been peeled away).	2700 Northeast Everett Street, Camas, Washington 98607, United States
Needs improvement	Replace the broken fences and add danger signs around cliffs on both sides of the river.	Camas School District #117, 841 NE 22nd Ave, Camas, Washington 98607, United States
Needs improvement	At one point (2-3 years ago) Jerry Atkinson had shown us a concept for filling in the Mill Ditch and making it a large accessible walking path through the town to the trails. Would love to see that happen, or at the very least, clean the mill ditch.	935 Northeast 6th Avenue, Camas, Washington 98607, United States

Needs improvement	Used to take the kids here frequently. Would love to still, but the play equipment is in disrepair. Swings broke a while ago and still aren't replaced. When a bench near the play area was wrecked years back it took months for it to be replaced. The large slide has been broken for over a year and the receiving pole dangerously stuck out where kids run without removal. It gets a ton of use - an upgrade and better maintenance is a must.	2949 Northwest 38th Avenue, Camas, Washington 98607, United States
Needs improvement	I get nervous with small children on the sides of the dam particularly one end that has only half the fence covering the drop	2828 Northeast Everett Street, Camas, Washington 98607, United States
Needs improvement	Multiple trees are dead, pruning of shrubs is half done, mulch needed in landscaping areas, general weed management	824 Northwest Klickitat Street, Camas, Washington 98607, United States
Needs improvement	Roof cleaning and painting of building is needed	2911 Northeast Everett Street, Camas, Washington 98607, United States
Needs improvement	Roof cleaning is needed	Round Lake Loop Trail, Camas, Washington 98607, United States
Idea for something new	Please add a splash pad to Crown Park (similar to beautiful, architecturally-designed Jamison Park splash pad in Pearl District in Portland) which will be a wonderful activity for kids/families	126 Northeast 15th Avenue, Camas, Washington 98607, United States
Idea for something new	Consider new/updated Crown Park programming to tie in with programs/activities to be offered at new Garfield Performing Arts Center -- 2 blocks away, such as regional Art Fair similar to nationally-known Salem Art Fair (Oregon), family	1437 Northeast Everett Street, Camas, Washington 98607, United States

	athletic event similar to Pole Pedal Paddle (Bend, OR), etc. which would boost local economy, increase tourism, and highlight our "Crown Jewel" of a park!	
Idea for something new	A water feature for the kids- pool or splash pad. Something safe and fun for all ages.	Camas Municipal Pool, 120 Northeast 17th Avenue, Camas, Washington 98607, United States
Needs improvement	Adding a splash pad or community fountain, parking lot and picnic tables could be a nice addition to Fallen Leaf Lake area for the community. Retaining walls and a sort of "art walk" fencing could highlight local artistry and scultures.	252 Northwest Lake Road, Camas, Washington 98607, United States
Needs improvement	This Sierra/43rd Street corridor needs speed improvements. With the addition of 7% growth in traffic (prior to new homes being actually completed), the daily traffic including large earth moving vehicles and construction vehicles has dangerously increased speed down this TWENTY FIVE MPH corridor.	1642 Northwest 43rd Avenue, Camas, Washington 98607, United States
Idea for something new	Splash pad would be great	120 Northeast 17th Avenue, Camas, Washington 98607, United States
Needs improvement	Parking at Heritage Park and Round Lake always fill up quickly. Making the north side of the lake more of an attractive destination (with parking) could help distribute the congestion	811 Southeast Leadbetter Road, Camas, Washington 98607, United States
Needs improvement	Brambles overgrowing the path	3105 Northwest 31st Avenue, Camas, Washington 98607, United States

Needs improvement	Needs a nice restroom. A splash park would be nice here since they removed our pool.	120 Northeast 17th Avenue, Camas, Washington 98607, United States

Appendix C
Stakeholder Summaries

STAKEHOLDER DISCUSSION NOTES

Project Name:	Camas PROS Plan Update		**Project No.:**	Proj-# 21-135PLN	
Location:	Zoom Video Conference	**Interview Date:**	July 9, 2021	**Time:**	3:30 pm
Notes by:	Steve Duh, Conservation Technix				
Participant:	Annette Anderson, Camas Lacrosse		Jeff Immel, Camas Little League		
	Karen Gibson, Camas Lacrosse		Trang Lam, Camas Parks & Recreation		
	Nick Kralj, Camas Little League		Steve Duh, Conservation Technix		

Subject: **Stakeholder Group Discussion with Field Sport Associations**

PURPOSE

To discuss current interests and future needs addressing sport field improvements and capacity. The meeting took place on July 9, 2021, via a Zoom video conference from 3:30 – 5:00 pm.

DISCUSSION

The discussion began with brief introductions and an overview of the City's PROS Plan update process. A set of questions were used to initiate the discussion and explore ideas about field usage, capacity, maintenance and potentially needed improvements to local sport fields.

Lacrosse Comments

- Lacrosse can only use school-owned facilities due to need for larger field and fencing to manage errant balls. It has been a challenge using Camas School District (CSD) facilities, and the league can't use fields until 5 or 5:30p, which is difficult for elementary and middle school age players
- Prune Hill is the only other field, but it is on a first come, first served arrangement.
- School field have maintenance and quality issues; there are a lot of mole/gopher holes
- Lacrosse is at capacity for the fields it uses. There is competition for field space with soccer (which has every school field booked, except Cardon). If Lacrosse had more field access, then it could accommodate more teams and more localized competition (instead of competing against Portland, Hood River, etc.). All games are on turf fields. The season is in the spring – generally March through June

Little League Comments

- Little league uses a mix of city fields and rents fields from CSD. Little League has a use rights agreement with City for Forest Home Park, which is used primarily for games. Softball is exclusively at Doc Harris. Lower divisions use Doc Harris and Woodburn. Younger players use Crown Park, Goot and Klickitat.

Interview Notes (continued)

Other Comments

- CSD is starting middle school soccer and spring football. These will impact field availability.
- Within Camas, there are only two turf fields, and both are at CSD. High school sports get priority use, and CSD charges a lot for field rental ($100/hr.). Little League pays CSD $15,000 annually for field rentals.
- Soccer mostly uses Doc Harris, with Woodburn as an alternative
- CYSF (fall) plays at Sky Ridge, upper and lower
- Pop Warner practices at Prune Hill; they would like more field space and turf
- Babe Ruth is exclusively at Louis Bloch, but the league seems to be diminishing and numbers are down

Sport Field Needs

- Near-term – increase field capacity by improving field quality
- Prune Hill is turfed for baseball and football. The baseball infield is in rough shape and is weedy
- Prune Hill has infrastructure (bleachers, fencing, parking, restroom), so improve the function of the field
- Adding lights adds capacity, and there are few neighbors near Prune Hill who might be impacted
- The property across the street from Prune Hill is for sale again. Maybe consider this as an expansion site to accommodate a complex
- Grass Valley and Prune Hill are weedy. City could do weed mitigation to improve field grass quality
- Drainage issues at Grass Valley (doesn't dry out until June) and Forest Home (outfield is wet)
- The irrigation system at Forest Home Park is aging – leaks, broken sprinkler heads, etc.
- Fallen Leaf Park could be utilized for more capacity as a single event space. Parking is limited and a challenge, but it has lights and restroom
- The leagues need to work with school district to build out other CSD property

Collaboration with City

- Communication with City for Little League has been tremendous. Dennis Ryan has helped with weed control, plugging the outfield, fertilizing and providing dumpster use
- Little League volunteers add a lot of value by improving field conditions
- Leagues can support field improvements and development with fundraisers, grant support and sweat equity
- The field turf program offered as part of the pool levy was rejected, but it could have made improvements to Prune Hill, Dorothy Fox and Forest Home
- Sport leagues are volunteer organizations and have transient membership. Is there a role for the city in helping with continuity of leadership – maybe a leadership forum. Continuity of leadership could help develop a more collective voice across sports

Other Feedback: Annette and Nick provided written comments via email to the discussion questions. These are attached on the following pages.

-- End of Notes --

City of Camas
Parks, Recreation & Open Space Plan Update
Camas Parks and Recreation

July 9, 2021
Sport Fields Group – 3:30 p.m.
Discussion Questions

The following are intended to spark group discussion and interaction; questions posed/topics addressed might not follow as shown.

Introductions & Background
- Brief overview of PROS Plan & process
  Camas Lacrosse - 7/6/21 by Annette Anderson Youth Girls VP

Group Discussion Questions
- What has been the trend in participation by your league/sport over the past 3 years? (i.e., trending up/down; number of participants by age group/gender) **Trending up. K-12 girls and boys. 2019 - 280 2020 - 410 2021- 201**

- What sport recreation opportunities are missing? What facilities do you see as the most needed in the community? **Turfed fields.**

- Discuss coordination between leagues (overlapping calendars, multi-use fields, seasonality, etc). Do you have any concerns about availability and scheduling? Would a coordinated annual booking system, with a nominal fee help? **Our concerns have been with the High School kicking us off the only turf fields in the city. The youth have no other options. Also with only being able to use school run fields we are not allowed to use them until 5:30 at night which causes problems with booking so many teams and also with the younger elementary players. If they were city run fields we could have the elementary kids start practices after school gets out at 2:30.**

- Besides Camas Parks & Rec fields, what other fields does your group/organization use? **The school distrtict. ZAC, Doc Harris, Cardon.**

- What does your organization see as the key priorities for the city's system of parks and sport fields? **Short term capacity increase - turf at Prune Hill, Grass Valley, Dorothy Fox. Long term - new complex**

- Jump forward 5 years and imagine Camas in 2026. Please share your vision for one stand-out project completed to improve the parks system and/or local sport facilities.
  2 turf fields at Prune Hill

- How is field maintenance? Are there ways to improve this, especially through partnerships?
  We have been maintaining Prune Hill, ZAC, and Doc Harris E & F fields filling the mole holes multiple times a year. If the dirt/sand was provided that would be nice.

- With the understanding that the PROS Plan will help guide the City's investments and use of resources for the next 6 years; in your opinion, where should the City focus resources and energy in the next 5 years? **Getting fields turffed so that we can be competitive with the teams in Portland and Vancouver.**

- What contribution, collaboration, and responsibilities can your organization bring to the future implementation of the City's public park and recreation system? Are there opportunities for more collaborative projects between the leagues and City? **We could help provide funding through fundraising activities and sponsorships for the turf fields.**

Additional Information Request (not for group conversation – please email feedback)

- Describe the current state and quality of City of Camas-managed athletic fields and sport courts (quantity, quality, geographic distribution, etc.) **The quantity is good, quality is lacking in turf (all of our games in Vancouver and Portland are played on turf, their players practice on turf. Our players practice on grass and it is a hard transition for them during game days because the ball bounces different and is harder to pickup.). Geographic distribution is good.**
- How is the geographic distribution of fields / courts? Are they well distributed? Where are more needed? **Yes well distributed.**

City of Camas
Parks, Recreation & Open Space Plan Update
Camas Parks and Recreation

July 9, 2021
Sport Fields Group – 3:30 p.m.
Discussion Questions

The following are intended to spark group discussion and interaction; questions posed/topics addressed might not follow as shown.

Introductions & Background

- Brief overview of PROS Plan & process

Camas Little Leage Responses - 7/5/2021 by Nick Kralj, president

Group Discussion Questions

- What has been the trend in participation by your league/sport over the past 3 years? (i.e., trending up/down; number of participants by age group/gender)
  Trending steady; 2020 = 483 participants, 2019 = 513 participants, 2018 = 476 participants
  Boys and girls baseball and softball ages 5-13 (could be thru 15 soon)
- What sport recreation opportunities are missing? What facilities do you see as the most needed in the community?
  Field capacity is and will be the primary issue. Under-utilization of existing space due to weather or infastrucure issues. Growing community will make it even harder. Could be solved in some cases with turf and lights and other infrastucture like ADA dugouts and bathrooms, and drainage
- Discuss coordination between leagues (overlapping calendars, multi-use fields, seasonality, etc). Do you have any concerns about availability and scheduling? Would a coordinated annual booking system, with a nominal fee help?
  We feel the above would create more opportunities for all leagues. For instance, Fallen Leaf turfed could be used for football, lacrosse and soccer offseason, and with turf and lights, even during season with proper scheduling
- Besides Camas Parks & Rec fields, what other fields does your group/organization use?
  Camas school district rental Doc, other leagues fields, such as Schmid and others in Washougal
- What does your organization see as the key priorities for the city's system of parks and sport fields?
  Short term capacity increase - turf, lights at key facilities that are not optimized, such as Prune Hill, Fallen Leaf, Grass Valley, Dorothy Fox, and Goot Park. Long term - new complex
- Jump forward 5 years and imagine Camas in 2026. Please share your vision for one stand-out project completed to improve the parks system and/or local sport facilities.
  Turf and lights added to parks facilities to increase time available/not waste existing space
- How is field maintenance? Are there ways to improve this, especially through partnerships?
  This is good. We utilize our field rights usage agreement to maintain fields with support from Cama
  We appreciate our relationship with Parks and Rec today.
- With the understanding that the PROS Plan will help guide the City's investments and use of resources for the next 6 years; in your opinion, where should the City focus resources and energy in the next 5 years?
  Creating more capacity for our growing community. With more people coming, the fields are close to maxed in their current state. New opportunities will be needed
- What contribution, collaboration, and responsibilities can your organization bring to the future implementation of the City's public park and recreation system? Are there opportunities for more collaborative projects between the leagues and City?
  We can provide seed funding to contribute to grants for lights and turf. Our membership base is passionate and ready to help support. We can also reach out to business community partners as we
- Are there other organizations/individuals that the City could bring to the table as partners?
  Yes, we can work with other business organizations to provide loand, donations and other financial support. We have run this exercise before and would be able to leveage our network.

Additional Information Request (not for group conversation – please email feedback)

- Describe the current state and quality of City of Camas-managed athletic fields and sport courts (quantity, quality, geographic distribution, etc.) See below**
- How is the geographic distribution of fields / courts? Are they well distributed? Where are more needed? Distribution is reasonably good. We have land/parks that are nicely spread out; however, we cannot use them fully due to poor drainage, poor maintenance, lack of infastructure such as lights, dugouts, restrooms, etc.
  Long-term, we feel that a new complex would benefit Camas the most, as it has the ability to generate rental income as well as provide tourism revenue to the local area from tournaments.

** Forest Home Park - 2 baseball fields with lights. Needed: ADA dugouts, bathrooms, and pathing, as well as outfield drainage and turf. Already has lights.
** Prune Hill - excellent setting, however, hardly used due to exceptionally poor drainage and no lights. Turf and lights needed. Dugouts and storeage are needed as well
** Fallen Leaf - excellent facility, but limited parking and poor drainage. Not really available until late June/early July which is too late. Our spring season is primary and is late Feb thru July. Turf recommended.
** Grass Valley Park - limited parking and poor drainage. Not really available until late June/early July which is too late for baseball/softball.
** Goot Park - limited parking and poor drainage. Not really available until late June/ early July which is too late for baseball/softball
**Dorothy Fox - no infastructure available. Need to build out.
** Other practice fields used include today Klickitat Park, Crown Park, Doc A, B, C, Liberty

STAKEHOLDER DISCUSSION NOTES

Project Name:	Camas PROS Plan Update		**Project No.:**	Proj-# 21-135PLN	
Location:	Zoom Video Conference	**Interview Date:**	July 6, 2021	**Time:**	8:00 am
Notes by:	Steve Duh, Conservation Technix				
Participant:	Patty Barnard, Mountain bike advocate		Katy Daane, Parks & Recreation Commissioner		
	Jeff Cary, Camas Bikes		David Dewey, Parks & Recreation Commissioner		
	Jeremy Mores, Evergreen Mountain Bike Alliance		Trang Lam, Camas Parks & Recreation		
	Ross Swanson, Portland Parks & Recreation		Steve Duh, Conservation Technix		

Subject: **Stakeholder Group Discussion on Mountain Biking & Pump Track Interests**

PURPOSE

To discuss current trends, interests and future needs addressing mountain biking and skills development. The meeting took place on July 6, 2021, via a Zoom video conference from 8:00 – 9:30 am.

DISCUSSION

The discussion began with brief introductions and an overview of the City's PROS Plan update process. A set of questions were used to initiate the discussion. Ross Swanson from Portland Parks and Recreation was invited to share information about Gateway Green to offer context about design, development and management considerations. The remainder of the session focused on local interests for trail and biking facilities.

Overview of Gateway Green in Portland

- Ross provided an overview of the Gateway Green project and some lessons learned. The 24-acre site lies between TriMet and railroad property. It is a bike to and walk to site only. It has 70-80' of vertical drop and offers good length on laps. It was built in three phases, in part to see how people use the site. The city legitimized the park with restrooms and designed it as a four-hour experience.
- It provides for a range of users: dirt jumpers & BMX, mountain bikers, skaters and runners
- Cross country runners use the site; it is a compatible use
- Pump track is paved and designed/built by Velos

  Tips:
  - Don't assume your rider base is just 24-35 year old white men.
  - Gather data to prove users
  - Consider other features (Gateway Green added nature play area) to give parents an opportunity to play with one kid while the other rides

- Re-frame the perceptions about users: everyone wants to progress and get better; most are willing to help each other

Comments on Camas' Parks and Trails System

- Camas has great trails
- Current usage is outgrowing Lacamas Park
- Heritage Trail is a way to get to Lacamas Park for mountain bikers; trail usage on Heritage Trail is heavy
- Fallen Leaf Lake offers more advanced options for mountain bikers
- New neighborhoods northeast of lake attract residents with interests in trails and mountain biking; however, since COVID, there is more trail usage overall
- Need to have trails built by experienced trail builders and in places sanctioned for trails. Installation of rogue trails by people cutting/digging routes is a problem the City is trying to address.
- There is a need for places for kids to practice on stryders/skoots
- There is a need for a pump track and more mountain bike trails
- Camas has become more of a destination and will continue as new trails are added.
- Have the information to keep people in town and as part of the circuit of regional tourism

Usage & Potential

- COVID has super-charged trends: more usage on trails, wider age distribution of riders, wider age groups
- Consider dedicated infrastructure, directional trails and signage for mountain bikers.
- Green Mountain has potential and could use lower slope area for bike park/skills – perimeter could be for climbing trail and multi-use trail
- New trails are being installed on Larch Mountain / Livingstone
- Consider 'competition-ready' facilities, whether mountain bike trail or pump track or both; people will travel for different experiences. Have a destination bike park with a 'race worthy' track. Design it large to avoid user conflicts. Promote the city/region as a destination and tap into tax and tourism revenue
- Hub-type trail system – how do we find places to build or connect to grow the system over time
- Lake Oswego is building a hub and starting with a network of one trail. It will be a catalyst project to hold the growing system together

Connections to Consider

- Have a network of trails connecting all parts of town. Include a network of flat dirt trails as a great start. Kids can build confidence with beginner mountain bike rides – provide a place for youth to go (i.e., lighted pump track)
- Make connections in areas near Everett and Everett to Leadbetter
- Mill Ditch could act as a longer, linear ribbon
- Make connections along the north side of Lacamas Lake
- Improve road crossings and safety between Fallen Leaf Lake and Lacamas Park

Interview Notes (continued)

Future Investments

- Pump track with lights, parking and restroom, signage/maps, app coordination so people know what to expect
- Have (city) staff who knows community, culture and mountain biking; utilize consultant teams to guide growth and development of a trail system or biking facility
- Use sustainable trail design principles (i.e., 5-7% grade slopes with switchbacks)
- Know the stumbling blocks and how to overcome, especially related to regulations, development codes and local leadership.
- Environmental overlays (development code, zoning, SEPA) – educate regulators
- Be aware of the potential neighbors to act as NIMBYs
- Policymaker rides and outings to buoy interest and build relationships/support

Other examples noted

- Hood River, OR
- Duthie Hills (Issaquah), WA
- Valmont, CO
- Whistler / BC
- Bentonville, AR
- Bend, OR
- Klamath Falls, OR
- Tiger Mountain (Issaquah/Maple Valley area), WA

-- End of Notes --

CONSERVATION TECHNIX

STAKEHOLDER DISCUSSION NOTES

Project Name:	Camas PROS Plan Update		**Project No.:**	Proj-# 21-135PLN	
Location:	Zoom Video Conference	**Interview Date:**	July 7, 2021	**Time:**	12:00 pm
Notes by:	Steve Duh, Conservation Technix				
Participant:	Cassi Marshall, Ivy League		Janet Nenadic, All Weather Walkers		
	Duff Linde, Evergreen Mountain Bike Alliance		Ryan Bridges Golb, Intern with WTA		
	Lyndee Cunningham, local volunteer		Trang Lam, Camas Parks & Recreation		
			Steve Duh, Conservation Technix		
Subject:	**Stakeholder Group Discussion with Bike and Pedestrian Interests**				

PURPOSE

To discuss current interests and future needs addressing bicycle and pedestrian facilities and trails. The meeting took place on July 7, 2021, via a Zoom video conference from noon – 1:30 pm.

DISCUSSION

The discussion began with brief introductions and an overview of the City's PROS Plan update process. A set of questions were used to initiate the discussion and explore ideas about bicycle and pedestrian trail needs.

Initial Comments

- The City has great trails and has done a great job building trails for the community
- Quality of life in Camas is good because of trails
- There are concerns about growth and expansion - houses getting closer together. With population growth and more people on the trails, what can the city do to expand use and access to trails?
- There is some confusion of who maintains/owns the different trails (i.e., city/county)
- Love the Trails to Tables challenge
- Connectivity is important; complete loops and circuits. Connect to Washougal, to the Port and to levee trail. Educate Camas residents about the trail linkages
- Link neighborhoods to downtown via ped/bike friendly routes;
- Develop the Mill Ditch alignment; it's ripe for something amazing. In the short-term, start with basic use and pathway. In long-term, build a shared-use trail
- Create stronger linkages between Camas and Washougal, via Oak Park or Goot Park or WRG
- In the North Shore and around the lake trail, that loop will require work for water crossings, safe street crossings and road segment closures to make it work in the long-term

- The regional Lewis & Clark Trail from refuge to refuge is not well known to the group, but they noted interest and support.

Conflicts

- Users are generally getting along and sharing trails; conflicts are limited and sharing trails is better than it has been in recent years
- Sometimes walkers are intimidated by bikers
- Since COVID, usage on trails has increased, but there has been a low number of conflicts
- Conflict issues are a two-way street. Some walkers have earplugs and dogs and are not paying attention to the surroundings
- Heritage Trail is getting crowded, especially with families and groups of riders. The trail is undersized. If Lake Road had better bike lanes, that might alleviate some of the demand from Heritage Trail. Some users are starting to avoid Heritage Trail due to overuse.
- One spillover trail is Lacamas Creek, but there is simply more trail usage on all the trails. Ostensen Canyon is also underutilized. If improved, this trail could make for better connections to neighborhoods near downtown

Amenities

- Provide restrooms at trailheads. For organized walking groups, they tend to plan the routes to have a restroom at a mid-point during their walks.
- All Weather Walkers prefer paved or gravel trails
- Trails with views should be a priority

Hierarchy

- Should single track trails be shared or not. One-way routes, like Red Tape Trail, is one approach to managing users and flow. Larch Mountain has all shared use trails, and most are 'green' and 'blue' trails
- Family rides – Little Washougal River Greenway Trail – gets washed out each year. The city has changed the design and improved, so it has been recently fixed
- Waterfront Trail (Port) and Dike Trail (Refuge) are not in the Camas system, but these are great destinations to link to
- Improve sidewalks and wayfinding for connections from Prune Hill to downtown. Maybe improved connectivity will reduce parking demand at parks. Sidewalk network is an important part of the overall trail network. Work to fill gaps
- Forest Home Park – Forest Home Road might make for a good connection.

Collaborations

- The Evergreen Mountain Bike Alliance will continue to be involved for trail maintenance; will want to stay informed about trail projects
- All Weather Walkers has trail days to encourage people to come out on trails (5K & 10K routes); will help get the word out and make for bigger events

Getting youth and next generation involved

- Engage kids at young age with volunteer projects and outings, like Watershed Alliance and trail/beach clean-ups
- Scouts bring packs out for clean-ups and other projects
- Camas has a deep pool of volunteers to call on to help
- High School has a 'green club' and could assist with park/trail care
- Have mini Sunday Parkways (ala Portland) throughout Camas

Other Feedback (emailed responses)

From Ryan Ojerio, SW Washington Regional Manager, Washington Trails Association

How do you feel the City is doing in meeting the needs for recreational trails and connectivity in its park system?
I don't think I have enough information to have a solid opinion on this question since I don't live in Camas. My personal experience is limited to using the Lacamas Heritage Trail and the trails at Lacamas Park which I think are really fun to hike run and mountain bike on. I think that a survey of local residents who use the trail system would have a better opinion than mine. We do have WTA members and volunteers who live in Camas, but I haven't talked with them about this question.

What are the gaps, missing links or barriers that need to be addressed? What destinations need to be connected?
Similar to the first question I think I need more information to have a really solid opinion. I'm assuming that the question pertains to all sorts of parks, trails and places that people living in Camas recreate in regardless of the ultimate land manager (e.g., Camp Bonneville will be a Clark County facility, but I expect it will be a destination for local residents.) My guess is that people experience barriers getting to the Waterfront and eventually when Steigerwald is finished they may want to get down there without having to use the car. Likewise, Green Mountain and perhaps Camp Bonneville to the north seem like good destinations for trail-based recreation. Getting to those places may prove difficult for people who don't have ready access to a car or the physical ability to ride a bike all the way there and have enough energy left over to recreate. Some sort of public transit option would be ideal for a future where personal automobiles are less common than they are today.

There seems to be an unmet demand for trail experiences specific two bicycles I think that the proliferation of user-created routes that were adopted into the Lacamas Park trail system is an example of rapidly changing demographic trends over the past 20 years that outpaced agencies' abilities' to evolve and adapt the trail system accordingly.

At WTA we are generally supportive other user types such as mountain bikes and equestrians more and more we find that people who wreck rate on trails enjoy a variety of modes. leave that working with our partners Hugh create Trail systems that meet a diversity of Interest helps people to find Trail base Recreation experiences matched to their particular interest at that time in their life.

Back in the 80s I was heavily into mountain biking in high school which continued through college. Later on I became passionate about hiking and backpacking. Once I had kids I got really excited about trails where I could take our stroller. I enjoy hiking with my parents and their physical limitations are best served by accessible fails. I'm fortunate at this point in my life that I can enjoy a hard trail run, bombing down a mountain bike downhill trail and spending

time with my young children and older parents on a quiet path. I think that this whole-life-cycle approach to designing trail systems is the right lens to look at planning processes.

Are there any conflicts on multi-use trails? Please share some examples. Besides making the trail a single-use trails (i.e., Pedestrian or Bicyclist) what other ideas do you have for reducing these conflicts?
I think that there are always tensions between users on trails. Rather than focusing on specific examples of conflict I think it makes more sense to seek examples where there are many users on a trail system and the tensions are minimal. In the last few decades, a lot of effort has gone into education and promoting empathy between trail users which is good, but I think more emphasis needs to go into thoughtful system design that provides areas within the trail system where users are more likely to find an experience free from intrusions. An "intrusion" is an interaction with a different trail user that breaks sense of peace or flow or rhythm that takes the person's mind off the enjoyment of the experience.

I think that ski areas are a good example of making the most out of a limited geographic footprint to serve a lot of people. A busy downhill ski area and serves a wide range of physical abilities and people seeking different types of experiences from snowboarding in a terrain park to skiing steep powder in the trees. The design of the system allows people to find activity zones that are matched to their skill and even when it gets crowded, they're sharing those spaces with like-minded people generally traveling at similar speeds. In this way the sense of intrusion is minimized, and the design of the system helps reduce the number of times incompatible uses clash like having the dual slalom dump out into the bunny hill - that would be a very bad idea.

But at ski areas there are also places where everybody shares the same space in relative harmony like on lift lines, in the lodge, or even on those wide cat tracks that people use to get from one place to another. Any trail system needs to have segments that are shared use. Some facilities like bathrooms in parking lots that are shared best parts of the trail system or people in or immersed in their particular activity might be designed for that particular activity and that particular speed; these are directional to avoid head-to-head encounters which are particularly intrusive.

I think that single use designations are useful tool, but I also think you can get a lot of use segregation with thoughtful design that nudges people into trail segments where they want to be, and they will naturally congregate with other people doing the same type of activity.

What does you and/or your organization see as the key priorities for the city's local trail system?
One of our focal areas is providing natural surface trail experiences that connect people with nature in their neighborhood. this could include regional parks that someone might take a bus to or ride their bike to, essentially, it's trying to lower the barriers for everyone to have access to healthy physical activities.

Jump forward 5 years and imagine Camas in 2026. Please share your vision for one stand-out project or connection completed to improve the city's trail system.
5 years goes pretty fast when it comes to planning trails at least that's been my experience! there are probably several other projects that other folks would know more about but there is an area adjacent to Round Lake that used to have a user created BMX track could be developed in a thoughtful way to provide trail recreation and environmental protection.

With the understanding that the PROS Plan will help guide the City's investments and use of resources for the next 6 years; in your opinion, where should the City focus resources and energy in the next 5 years?

I find our organization can work more efficiently if we have good relationships and open lines of communication with agencies and other trail user groups sometimes this coordination is driven by the land manager but often due to lack of capacity is informal and based on relationships between trail user groups that evolve organically. Perhaps a good goal for the city would be to figure out how to tap into the different volunteer organizations that could help with maintenance and new construction in the future.

What contribution, collaboration and responsibilities can your organization bring to the future implementation of your vision for the City's trail system? Are there other organizations/individuals that the City could bring to the table as partners?
We've done new trail design, construction and do lots of maintenance work throughout Clark County and the state. Depending on the project and how it aligns with our focal areas we could become heavily engaged or act more as advisor; it all depends on what elements come out of the planning process.

From Jean M. Avery, Vancouver, WA

Heart-felt thanks to Camas for the excellent park system (close to me in East Vancouver). I especially enjoy:
- Round Lake
- Fallen Leaf Lake
- Lacamas Heritage Trail

Overall, I think the parks, trails, and restrooms are in excellent condition. The concerns I have probably relate more to the nature of society, rather than to any improvements that Camas can make, per se.

My thoughts:
1. When the Camas lilies bloom, please mark off the trails (as was done at the end of this season). The fragile blooms got stepped on, with the increased foot traffic.
2. Consider closing off informal side trails, which trample fragile vegetation.
3. Similarly, clarify which trails are for walkers only, without bikers. (I think you do this.)
4. Please provide more trash containers and more dog poop bags. (Unfortunately, folks don't always pick up after themselves.)
5. I'm not a dog owner, but I believe there is a leash law. I'm not sure how that can be enforced. (I see MANY more dogs in recent months, and quite a few off-leash.)
6.. As you know, there is some graffiti (mostly under the bridge). Does it last if the graffiti is painted over? Maybe this could be a service project for a civic group?
7. There's a lot of invasive ivy. Bravo to the Ivy League for removing some of it. But the job is a huge one.
8.The recent news article about the assault near Round Lake was very disturbing. I don't know what can be done. It may come down to individual vigilance.
9. I have not yet seen overnight campers around Round Lake or Fallen Leaf Lake. I hope it stays that way.
10. If things reach the point where "monitors" are needed, here's an idea from the Hoyt arboretum: They have volunteers who walk the trails, direct folks, identify trees, and (yes) pick up trash.
11. I did not realize that Fallen Leaf Lake park can be closed for private events. If so, I hope the revenue collected outweighs the inconvenience to the public.

My requests:

1. In the past, I attended a civic meeting regarding the North Shore of Lacamas Lake. Please limit the amount of tree removal. (It still is a jolt to me when I see the houses on the edge of the Round Lake trails. Do we have to have more houses so close to the park??)
2. The new turnaround at the foot of 1st Ave. (before Everett) is VERY confusing. (I've heard this from other folks as well.)

Thank you for requesting public input.

From Lyndee Cunningham (to Cassi Marshall and forwarded to Trang Lam)

Cassi, I asked a lot of people of varying ages about current and future state of our Camas parks and trails. Some of them had done the survey, but most had not heard of it. A few found it on "Next Door' site. I wish we'd all remember to check out the Parks Dept website more often.

Some common consensus follows:
- Everyone mentions more and expansive trails and connecting all possible ones.
- All want a trail around Lacamas Lake some day.
- Some are afraid there will soon be charges for parking at parks and trails. Everyone prefers to pay more taxes to compensate.
- Too many are confused by the new roundabout.

The Osprey Walking Group input:
- Asking about new property north of Lacamas and hope it will be connected easily to Lacamas Park trails. Also, asking about trail east of Steigerwald continuing farther east.
- Reporting dangers of loose gravel on down slopes of Service roads. Two of their group fell last rainy season when the gullies and rivulets formed, and gravel became loosened. Suggested scraping of those downhill slopes.
- No one enforcing leash law and poop bags not being picked up. One person leaving her bag trailside informed Osprey gal that because bag was biodegradable it was okay. False information. I know that the bag may be, but feces is not. Watershed Alliance informed us volunteers that feces and cigarette butts are the worst toxins for fish and wildlife in waterways.
- Would like to use the ditch more if filled in and looking more appealing.
- Will there be a trail someday around Fallen Leaf Lake?
- Worried about the browning of our trees. Will it become as bad as on Oregon side of river? One gal would like to start a campaign called Save Our Trees before it is too late.
- All are still angry that Crown Park pool is gone. Would like to pay more taxes to get it back.
- They all love and respect the quality of our parks and trails and seem genuinely grateful for them. All are aware of maintaining that same quality with a growing population, yet change is inevitable.

STAKEHOLDER DISCUSSION NOTES

Project Name:	Camas PROS Plan /Vancouver PROS Plan		**Project No.:**	Proj-# 21-135PLN	
Location:	Zoom Video Conference	**Interview Date:**	September 16, 2021	**Time:**	10:30 am
Notes by:	Laura Hoggatt, City of Vancouver Steve Duh, Conservation Technix				
Participant:	Jenna Kay, Clark County Community Planning / Commission on Aging Rebecca Royce, Clark County Community Services / Community Development Block Grant Scott McCallum, Superintendent at Washington State School for the Blind Terese Rognmo, Director of the SW Washington Center of the Deaf and Hard of Hearing		Gigi Olguin, Hispanic Metropolitan Chamber of Commerce of SW Washington Trang Lam, City of Camas, Parks and Recreation Director Laura Hoggatt, City of Vancouver Parks, Recreation and Cultural Services Planner Steve Duh, Conservation Technix		
Subject:	**Stakeholder Group Discussion on Under-Represented Voices**				

PURPOSE

To discuss current interests and future needs addressing community members of traditionally under-represented voices. The meeting took place on September 16, 2021, via a Zoom video conference from 10:30 am – noon.

DISCUSSION

The discussion began with brief introductions and an overview of the PROS Plan updates for Camas and Vancouver. A set of questions were used to initiate the group discussion.

Trang Lam, City of Camas Parks and Recreation Director, provided an overview of their PROS Plan update, noting that it began in the spring of this year. The PROS Plan will cover the six-year period from 2022-2028 and provide a decision-making framework to steward and build upon a park, trail and recreation system that serves and enhances our community's health and quality of life – now and into the future.

Laura Hoggatt provided a brief overview of the City of Vancouver, Parks, Recreation and Cultural Services Comprehensive Plan update and stressed that the plan fundamentally is based on community engagement. A variety of methods were used for public involvement that include two surveys, in-person community outreach at multiple locations, stakeholder group discussions, and information dispersion through multiple resources.

Interview Notes (continued)

Steve Duh, Conservation Technix, provided additional background for the purpose of the comprehensive plan framework and noted that the adoption and certification of the plan for each city fulfills the requirements of the State of Washington Recreation and Conservation Office (RCO) for grant funding eligibility.

Introductions:

- Gigi Olguin is a Business Development Coordinator for the Hispanic Metropolitan Chamber of Commerce in the Clark County area. She works with Hispanic community members to develop a business plan, provides support through business coaching, connects them to resources and additional services.
- Scott McCallum is the Superintendent for WA State School for the Blind, serves on multiple boards and commissions, including the State of WA Commission for blind children. He currently Lives in the Salmon Creek area.
- Terese Rognmo is the Director for the SW Washington Center for the Deaf and Hard of Hearing. She is currently responsible for three regions that includes Clark County, Cowlitz County and the Yakima area. The center was established in 1993 and located in Vancouver, Washington. The center provides advocacy, assistance for basic needs, training services, referrals, advocacy workshops and general support. Their mission is to improve and enhance the lives of deaf and hard of hearing community members in the southwestern Washington region.
- Rebecca Royce, Clark County Community Services oversees the Community Development Block Grant (CDBG) program for affordable housing and community development. She also oversees programs for the community action program. There is a requirement to complete a comprehensive community assessment. The most recent report is available at: https://clark.wa.gov/community-services/community-action
- Jenna Kay is a Land Use Planner for Clark County Community Planning. She also provides support for the Commission on Aging. Part of her participation role in the conversation will center on advocacy for the goals and objectives of the Commission.

Comments on Improving Access to Recreational Opportunities

- Connect directly with blind and low vision people. Some resources include the National Federation for the Blind and the Washington Council for the Blind and Low Vision People.
- Conduct an accessibility audit of the website and signage. Communications and signage need to be accessible.
    - Partner with people who have expertise in varying abilities and pay them for their time.
    - Provide signage in braille.
    - Use simple language.
    - Easier fonts that can be accessed brail are important.
    - Dark backgrounds with yellow/gold colored text are helpful.
    - Pictures in signage are sometimes distracting; they are difficult to read linguistically.
- The Commission on Aging has talked about universal design going beyond ADA accessibility. For instance, benches with backs areas to rest. Utilize an audit of current amenities to help move toward universal design.
- Walking trails are very popular for aging. Many are mobility device (e.g., walkers, scooters) friendly, and others are not.
- Access to bathrooms and water (fountains) is important for all users.

Interview Notes (continued)

- Parks provide multi-generational spaces, and the placement of amenities (such as benches or picnic tables near playgrounds) should be accommodated.
- For those who are struggling financially, accessing parking and having to pay to park are barriers.
- It would be beneficial to provide free parking passes for low income where fees are required. Consider creating options for income-qualified users for free parking or nearby parking in neighborhoods. Also, consider public transportation access and overlay transit route maps with park planning and design.
- It would be nice if the parks had a visual identifier in the park or along a trail, like a map or wayfinding signs that are visually accessible and for the user to know 'you are here'.
- Another thing to consider is disaster events (e.g., flood, wind, ice). How is the park system going to notify people at the park that something is happening if they are blind or hearing impaired? Some ideas could include a flashing light for hearing impaired, a loudspeaker and clear messaging to get people to safety.
- For some in the Latinx community, they don't consider hiking as something to do. The trail areas do not feel welcoming, there are concerns there may not be any phone reception, and the signs are only in English and English units (miles only, instead of miles plus kilometers).
- Many families enjoy picnic shelters and large gatherings in the parks; however, the fees that are added are often intimidating, such as a pinata fee. Re-branding fees as clean-up fees is a better direction.
- There are Hispanic business owners who would like to opportunities to provide pop-up vendors booths at games and events to sell their food or commercial goods. The process to get a permit or who to contact is challenging. Opportunities could be shared with community members to participate at events besides the Farmer's Market.
- Consider paying community members as consultants for advice for development and design. A list of vendors to assist could be developed, and then continue to add folks to the list. If this approach is used, consider what kind of insurance or licensing might be needed. Get help from community-based groups to build up the roster or list.

<u>Age groups or communities needing more focus</u>

- Provide opportunities for a wide range of users that are inter-generational and inter-cultural, so the design does not silo people by age.
- Restrooms should be gender-inclusive and not binary. Gender specific bathrooms are not good for the LBGTQ community.
- Restrooms with baby changing stations should always be provided.

<u>Other barriers to address</u>

- Not everyone knows what is available.
- Make sure communications are provided in the top languages, such as Russian, Vietnamese and Pacific Island languages.
- Schools are trusted resources, use trusted community-based organizations to build trust for both culture and community.
- If tapping into local residents as support for outreach or translations, do not expect them to do this for free. Provide a fee for the service; compensate people for the experience they bring to the community.

- The association for blind athletes a great resource. The athletes have provided tandem bike rides for individuals who would otherwise never get to have the experience of riding a bicycle. The program is run by a person who is low vision. They have also conducted hikes and kayak/paddleboard experiences.
- Larger parks are well advertised. More information is needed to help people be aware of all of the parks. A key or legend of what is available at each location and other information would also be helpful.
- There is wonderful new signage in Vancouver for the Waterfront park. There is little signage for neighborhood parks.
- In terms of access to parks, there is a lack of sidewalks to get to a park to walk or roll, and many are not located near public transit etc.
- The Community Development Block Grant (CDBG) can help with funding to build or improve sidewalks in low-income neighborhoods.

Future Investments

- Add interpretive cultural and historical information to the parks or trails to honor local heritage. Highlight tribal history. This information can draw people into a park, and it helps teach kids. This is very important to tribal members. Provide signage in a blind/deaf-friendly way.
- Expand access for transportation. A shuttle bus could be considered to get people to Vancouver Lake, Frenchman's Bar or other regional parks.
- The Hispanic Chamber of Commerce has clients that would like an opportunity to set up a booth for soccer or other events. Is there a way to help provide support or do something in the future? For example, during a Sunday league championship there are clients who would like to set up a booth for a couple of hours. This is common in the communities where they used to live.
- The COVID pandemic has left us to reimagine what life could be like in the future. For the aging community we are considering how future of programming might need to look different. If recreation programs and senior centers were the only socializing people utilized before the pandemic, how are they doing now? What can we do to make it better?
- The old papermill sight could be used for a venue that might provide indoor and outdoor amenities. Expand the site to provide a great variety of opportunities that brings the whole community together. The old Torpedo Factory in Alexandria, VA was repurposed as an Arts Center, this could provide some ideas.
- If there was a web page that would provide more history, please include video with captions.

Elements to prioritize to advance diversity, equity and inclusion in the park and open space system

- Hire diverse staff and appoint diverse commissions/advisory boards. Provide support, such as a stipend, childcare, free parking, transportation if needed, etc. Don’t make it a burden.
- Make sure to provide communication access for any kind of meetings, such as live captioning. This includes having back up plans in place.
- Make sure you provide the opportunity and hear from the voices of diverse individuals. Talk to the people who are experiencing challenges.
- Go beyond just the requirements for ADA per code. We can all do much better and make our parks and recreation spaces accessible for all.

Interview Notes (continued)

Other Feedback (emailed response)

From Yasmina Aknin, Clark County Chronic Disease Prevention Team Input

A wide array of amenities exists today – from sport fields and courts, to aquatics, to walking/running trails, to playgrounds, to lake and river water access. What recreation opportunities are missing or should be improved to meet the needs of the group(s) you regularly work with and/or support? For example, what is missing and needs to be addressed.

- More public pools needed.
- Extend and expand paved trails for multi-use (example: extend Round Lake pavement)
- Ensure and expand recreation equipment for children living with disabilities
- Improve lighting and other safety features to existing trails (i.e., Burnt Bridge Trail)
- Add more parks (even small ones) or nature spaces in low-income areas
- Add pump station/repair station near recreation water areas for paddle boarders
- Ensure all parks have picnic/gathering places (ideally near play structures, etc.)
- Ensure access to clean bathrooms at all parks, even small ones or porta-potty service during Summer

At recreation centers:

- Affordable childcare services on a regular basis/schedule.
- Breastfeeding/breast-pumping clean, safe spaces and/or family "rooms" for changing diapers/ breastfeeding
- Information about parks/park amenities in different languages
- Bilingual staff
- Grants for children's memberships
- Add a private shower section for respect to some cultures/families

What age groups or communities need more focus in general?

- Community members that don't speak English
- People with disabilities (including youth)
- Seniors
- Low-income communities
- BIPOC
- Teens (offer varied sport opportunities at parks- pickle ball, tennis, skateboarding, etc.)
- New moms/parents (fitness classes/support groups like lactation support, post-partum blues, play groups)

Jump forward 5 years and imagine Vancouver and Camas in 2026. Please share your vision for one stand-out project/amenity to be completed or initiative started to improve access to the park and recreation system.

- Big Dream: add at least two recreation centers in priority areas (low-income areas) with full amenities that are welcoming to all.
- Realistic Dream 1#: Make Burnt Creek Trail more inviting with enhanced safety features, improved signage in multi-language (graffiti free) and other improvements to increase use/value to community
- Realistic Dream #2: Add water fixture and restroom to the Evergreen Park on the Fourth Plain corridor/add camera surveillance system

Interview Notes (continued)

What, if any, barriers do you see or face in accessing either city's park and recreation systems? (e.g., physical access, safety, cultural concerns, communications/information)

- Reduce parking fees
- Make recreation memberships more accessible via multi-lingual applications, promotional materials, diverse staff, etc.
- Some community members may not feel welcome, work to make recreation systems/parks more inviting to diverse cultures/BIPOC communities
- Language/multiple language spoken and offered
- Increase connectivity of trails/transportation systems
- Increase access to off-leash dog parks with walking areas
- Multi-use areas (i.e., play structures next to soccer areas, etc.)

How would you suggest increasing awareness about parks, trails or recreation programs within your community?

- Promote recreation opportunities in multiple languages
- Host Open Houses with multi-cultural activities (pinata-making, etc.)
- "If You Build It, They Will Come" (Washington County does a great job of building inviting spaces and collaborating with schools/youth programs to promote them)
- Create culturally specific trail groups so community members feel safer exploring new trails/being out in nature (i.e., not alone)
- Host walking events for older adults (partner with senior centers/AAA/independent living centers)
- Host day trips to fun places/trails, rivers in our county i.e., Salmon related activities, nature conservancy related, etc. select days for different language hosts/guides

What should the City of Vancouver and the City of Camas prioritize in order to advance diversity, equity and inclusion in its parks and facilities?

- There are significant language barriers. More bilingual staff and multi-lingual signage, promotional materials and forms in multiple language needed at recreation facilities/centers. Translated signs on trails.
- Increase safety -lighting, visibility (open-spaces)
- Add parks/recreation areas in areas of density that are easily accessibility
- Reduce barriers to accessing fee-based programs, streamline application processes and eligibility for paid programming
- Promote services in diverse areas

What contribution or collaboration can you or your organization bring to the advancement of inclusion in either city's park system?

- CCPH shares the vision of encouraging people being active (indoor and outdoors) and could assist with community engagement.

CONSERVATION TECHNIX

STAKEHOLDER DISCUSSION NOTES

Project Name:	Camas PROS Plan Update		**Project No.:**	Proj-# 21-135PLN	
Location:	Zoom Video Conference	**Interview Date:**	August 11, 2021	**Time:**	10:30 am
Notes by:	Steve Duh, Conservation Technix				
Participant:	Monica Tubberville, City of Vancouver		Sadie Prodanovich, Port of Camas-Wahougal		
	Michelle Wright, City of Washougal		Trang Lam, Camas Parks & Recreation		
	Kevin Tyler, Clark County		Steve Duh, Conservation Technix		

Subject: **Stakeholder Group Discussion with Parks & Recreation Agencies**

PURPOSE

To discuss current park system planning issues and explore opportunities for future partnership or collaboration efforts. The meeting took place on August 11, 2021, via a Zoom video conference from 10:30am to noon.

DISCUSSION

The discussion began with brief introductions and an overview of the City's PROS Plan update process.

Past Collaborations with Camas

- Clark County worked with the city on past Legacy Land acquisitions around Lacamas Lake and leveraged Conservation Futures dollars to secure some fantastic property, such as CJ Dens. The County has also participated in visioning exercises for planning the Lacamas Lake north shore area.
- The Port coordinated with Camas and Washougal on the wayfinding system.
- Vancouver appreciated Camas' support for the Joint Agency Review for the Lewis and Clark Regional Trail. The city also coordinated with Camas on a code amendment to extend service limits/areas related to park impact fees. Vancouver has also coordinated with Camas on land acquisitions.

Initial Comments on Park System

- The city's focus around Lacamas Lake has been exemplary. The collection of properties is becoming a regional park in a bigger fashion
- Continue to explore grant pursuits that serve Camas and neighboring jurisdictions
- Camas has done a great job land banking for open space and recreation. Some properties are developed, but there exists more opportunities for trail connections
- The city should also spread park development around the city and not place all of its focus around the lakes

- Washougal is just starting recreation programming and is looking for partners, especially with regard to access to fields and facilities for future program offerings. For example, Washougal doesn't have a full court basketball court in its system, so it is looking for partners with facilities available for use.
- Communications – consideration should be given to a joint publication serving a wider area of the county. Monica referenced that a joint park and trail map was compiled about 4-5 years ago, and it should be updated. Washougal commented that for partnership project(s), coordinate to bring each jurisdictions' Parks Board/Commission along so that project funding can be prioritized similarly in each jurisdiction.

Future Needs

Comments that are not site specific are needs that are also generally needed in other jurisdictions.

- With its waterfront development, the Port has had a lot of requests for pickleball
- A recreation center for indoor programming is a need and should be reconsidered at a lower cost point
- Green Mountain is underutilized, and more emphasis should be placed on access, trails and viewpoints. Trails should be multi-use, as well as consider equestrian use. It could function a bit like Whipple Creek Park and would attract folks for vistas and wildlife.
- Reservable space for gatherings, parties and picnics.
- Clean and safe spaces – address encampment encroachments
- Playgrounds with universal accessibility
- Access to water in some form – during high heat periods, the waterfronts are overrun. Consider a splash pad as an alternative. Access to rivers and lakes is a big draw for users from across the region – including from Multnomah County
- Opportunity for Camas & Washougal to partner on dog park

Coordination with School Districts

- Be cautious developing city amenities on land owned by the school district. In Vancouver, there has been some push back on utilizing school sites for community needs.
- If possible, pursue joint use or maintenance agreements and develop relationships with the local principals to have conversations specific to each school site.
- As the school districts have staff who oversee sport field and facility rentals, the city should also have a staff person who is responsible for coordinating and programming city sport fields and assets.

Other Comments

- Vancouver is working with County GIS to develop a DEI mapping tool that also includes finer grain details about the park system, such as the quality of amenities, and not just whether a site is developed or undeveloped.
- Camas and Vancouver staff suggested the potential to partner on a stakeholder session to engage underrepresented community groups/members
- The group also agreed on the value of sharing contact information for stakeholders, including tribal contacts

STAKEHOLDER DISCUSSION NOTES

Project Name:	Camas PROS Plan Update		**Project No.:**	Proj-# 21-135PLN	
Location:	Teleconference	**Interview Date:**	June 28, 2021	**Time:**	10:00 am
Notes by:	Steve Duh, Conservation Technix				
Participant:	Nan Henriksen, former Mayor		Steve Duh, Conservation Technix		

Subject: **Stakeholder Interview with Nan Henriksen**

PURPOSE

To discuss current interests and future needs for parks, recreation and trails in Camas with a former mayor. The meeting took place on June 28, 2021, via a Zoom teleconference from 10:00 – 10:40 am.

DISCUSSION

The discussion began with brief introductions and an overview of the City's PROS Plan update process. A set of questions were used to initiate the discussion and explore ideas about enhancements or improvements to the city's park, recreation and open space system.

Background

- Value the abundance of parks, open space and trails
- In the 1980s, the City of Camas set out a new vision for itself, knowing that the mill was not going to be sustained. The immediate concerns were on replacing the economic drivers of the city, but, as mayor, Nan also aimed to maintain focus on 'softer' things, such as parks and open space, related to the city's quality of life. At the time, Crown Zellerbach represented about 80% of the tax base of the city.
- In the '80s and '90s, the City was blessed with a high ratio of parklands to population, and her goal was to maintain a high ratio into the future. She worked with community members to position the city for a $1 million bond to acquire parks and open space. Bond funds were leveraged with donations to acquire some of the lands along the Washougal River.
- She convinced City Council to hire a City Administrator (Lloyd Halverson), and he maintained a focus on securing additional lands for the community.

Interview Notes (continued)

Facility Improvements & Ideas

- Connectivity of trails relies on development occurring. The City may need to think through the issue of timing and connections more, since development happens in a haphazard manner.
- With Trang, the focus should be to secure connectivity of trails where development hasn't occurred yet.
- The City has great trails now, but many of them go nowhere. Connectivity for wildlife is also important.
- There should be easy access for and use of parks and trails by people who have disabilities or physical limitations. ADA improvements and universal access are important, so are benches along trails.
- The City should get an off-leash area established and consider working with Washougal to make it happen. Do a joint project.
- On a pool and community center, the focus should be on a more modest pool project. The City needs to keep the project going, but some trust has been lost with the community after the most recent attempt for voter approval.
- Parks and Recreation can be a bit of a bastard child regarding the city budget. Staff have done wonderfully putting on events. The City should work out an arrangement with Camas Community Education to offer more programs. Find ways to augment and coordinate.
- Would like to see more programs designed for those with physical disabilities – whether through old age or other health issues (e.g., seated exercises, stretching or 'walks for walkers')
- On the whole, Parks and Recreation has done a great job with what they have had

Focus areas

- Finish planning and then implement a splash pad at Crown Park
- Develop an off-leash area
- Develop a modest pool and community center
- Trail connectivity

Other Comments

- Keep a focus on 'old' Camas for improvements and enhancements to parks and amenities. Development regulations that are in place will ensure newly developed areas have parks and open spaces.
- Kids at Oak Park and other older areas need to see upgrades and improved access close-in to Camas downtown. The City should aim to provide similar opportunities as those who live in new areas up on the hill.
- Offer programs in Spanish if possible and coordinate with Washougal to make it happen

-- End of Notes --

CONSERVATION TECHNIX

STAKEHOLDER DISCUSSION NOTES

Project Name:	Camas PROS Plan Update		**Project No.:**	Proj-# 21-135PLN	
Location:	Telephone call	**Interview Date:**	June 18, 2021	**Time:**	1:00 pm
Notes by:	Steve Duh, Conservation Technix				
Participant:	Lloyd Halverson, former city administrator		Steve Duh, Conservation Technix		

Subject: **Stakeholder Interview with Lloyd Halverson**

PURPOSE

To discuss current interests and future needs for parks, open space and trails in Camas with a former city administrator. The meeting took place on June 18, 2021 via a telephone call from 1:00 – 1:40 pm.

DISCUSSION

The discussion began with brief introductions and an overview of the City's PROS Plan update process. A set of questions were used to initiate the discussion and explore ideas about enhancements or improvements to the city's park and open space system.

Background Comments

- PROS Plan is a guide and vision for the city, and it will unlock resources.
- The parks and open space part of the PROS Plan and park system is about public space, and public space builds community (meeting people on trails, being in parks)
- City has done a great job with downtown, open spaces, trails and parks.
- Lloyd is a strong proponent of acquire now and develop later mantra. Plan for the next 10-15 years for open space – define what is needed and what gaps exist. Then, pursue purchases with help of dedications, donations, grants and partnerships. For the PROS Plan, a special emphasis should be on identifying the missing pieces in the open space system. The parks and open space elements of the plan should be opportunistic and seize opportunities as the arise or are created.

Future Improvements & Opportunities

- Ostenson Canyon to Dorothy Fox Park – has missing link. Also connect to Drake St Park. Use sidewalk and acquire additional lands to make trail linkage happen.
- The former GPO site (Benton triangle) will have reclamation costs, but it could be used to link a looped trail to Lacamas Park

Interview Notes (continued)

- On recreation, volunteer groups have been exceptionally strong in Camas for youth sports, along with private groups filling a need, such as gymnastics through Vega??
- Downtown events have been the shining star and have help build place together.
- Local taxpayers have financed significant amounts of public land, and too much is locked up to keep the public out. Coordinate more with the school district to explore how to let more people use school district lands and facilities. That would be a great step.
- Trang is dynamic and has the energetic drive to gets plan done. Amazing things will happen, and the community and Council will support it.
- The future is bright.

-- End of Notes --

STAKEHOLDER DISCUSSION NOTES

Project Name:	Camas PROS Plan Update		**Project No.:**	Proj-# 21-135PLN	
Location:	Teleconference	**Interview Date:**	June 18, 2021	**Time:**	10:00 am
Notes by:	Steve Duh, Conservation Technix				
Participant:	Carrie Schulstad, Downtown Camas Association		Steve Duh, Conservation Technix		

Subject: **Stakeholder Interview with Downtown Camas Association**

PURPOSE

To discuss current interests and future needs for parks, recreation and trails in Camas with a representative of the local downtown business association. The meeting took place on June 18, 2021 via a Zoom teleconference from 10:00 – 11:10 am.

DISCUSSION

The discussion began with brief introductions and an overview of the City's PROS Plan update process. A set of questions were used to initiate the discussion and explore ideas about enhancements or improvements to the city's park and open space system.

Background

- The Downtown camas Association (DCA) is a Main Street program and has been established for 15 years. In the early 2000s, several local business owners worked with a city committee to do visioning for the Camas downtown. Events and activities were planned and added, and the 1st Fridays has been ongoing since 2005. During the 2008-2009 recession, the City decided it could no longer support the downtown, and the association found organizational support and resources via the Main Streets program.
- The DCA supports numerous events, including 1st Fridays and the passport program, to promote downtown businesses. The refurbished downtown hotel and improvements to the Port waterfront continue to attract visitors to Camas.

Coordination with City

- The City Parks & Recreation Department partnered with the Camas School District for a socially distanced holiday event in 2020 during the pandemic. It included a passport, story walks and displays in downtown.

Interview Notes (continued)

- In discussions with Trang, the idea of connecting 'urban and nature' surfaced, which could be a way to encourage and link restaurant visits with exploring the trail network – especially trails close to downtown. Trails to Tables was conceived as a five hike passport with five restaurant visits for a pint glass give-away and entry into a raffle for a gift card.
- Another idea is to work with the city for a joint community calendar for the website, so more people can see all of the activities available in Camas.
- The City's acquisition of the Mill Ditch property will create a wide, walking/biking trail to connect downtown to the lakes. It would go by the Performing Art Center and connects businesses, the arts and recreation.
- Downtown is like a park, and the city has made investments over time, with tree plantings in the 1960s and landscaping in the 1990s. Planters on 3rd Avenue are not irrigated, and the city should find resources to care for the past investments.

Facility Improvements & Ideas

- Directional signage and wayfinding to direct people to downtown from the lakes and associated trails.
- Include brochure holders for maps and trail brochures
- A pool and community center that is affordable for Camas could bring people together. Maybe a seasonal, covered outdoor pool could suffice, instead of a large aquatic center. The city should look at the GP property as a potential site. It doesn't require a lot of clean-up, and it is close to downtown.
- According to DCA surveys, other local interests include a bowling alley, rock wall for climbing and splash pad.
- Emphasizing the trail system could be a communications piece, with signage to support a mural tour, bronze bird art or connections to other trails.
- Camas has a history of providing top tier sports through the school district, but there needs to be more accommodation for community recreation sports for all, not just elite players.
- Explore collaborations with the library and Journey for additional studios or classes (i.e., jazz, dance, art)
- Consider food carts or concessions at Heritage Park, especially since it is a popular venue for paddle boarding and kayak launching.

Other Comments

- See Fort Collins CO as an example of an extended downtown promenade that integrates art, fountains, recreation, plaza/stage space to restaurants and shops along the way.

-- End of Notes --

CONSERVATION TECHNIX

STAKEHOLDER DISCUSSION NOTES

Project Name:	Camas PROS Plan Update		**Project No.:**	Proj-# 21-135PLN	
Location:	Teleconference	**Interview Date:**	June 30, 2021	**Time:**	12:00 pm
Notes by:	Steve Duh, Conservation Technix				
Participant:	Kurt Stonex, Olson Engineering		Steve Duh, Conservation Technix		

Subject: **Stakeholder Interview with Development Community Representative**

PURPOSE

To discuss coordination and future needs for parks, open space and trails in Camas with a representative of the local residential development community. The meeting took place on June 30, 2021, via a Zoom teleconference from 12:00 – 12:45 pm.

DISCUSSION

The discussion began with brief introductions and an overview of the City's PROS Plan update process. A set of questions were used to initiate the discussion and explore ideas about enhancements or improvements to the city's park and open space system.

Background & Opening Comments

- Camas has been very aggressive in acquiring parks and open space property during the time Lloyd Halverson was city administrator.
- With its older regulations, the city used to require 30% set-aside for open space. The City was sued and lost. The Planned Unit Development regulations still require land dedication.
- Camas staff have been good with coordinating with and negotiating with developers for layout and design to accommodate set-asides and the use of PIF payments and credits. Developers are generally willing to provide parks with their projects, since the City is willing to use cash and credits and have the developer build the requested parks and trails. Staff have been very flexible and good to work with, and the CIP has accommodated that flexibility.

Recreation-related Improvements Seen as Positive for Developers

- Trails
- Critical area set asides / open space
- Small neighborhood parks and pocket parks

Interview Notes (continued)

Facility Improvements & Ideas

- Green Mountain will be hard to develop. It could have trails, and there is a flatter area on top that might work for picnic area and viewpoint. Depending on access and need, the site might be good for an outdoor education center or nature park. More extensive mountain biking trails might work as well.
- In the Lacamas Lake area, trails are critical to connect the north side of the lake to Green Mountain and to downtown.
- Looking out 50 years, the City should consider what to do with the GP site on the Columbia River.

Coordinating with Developers

- Ridgefield example, staff worked through development agreement and used PIF credits and outright purchase to secure land from developer (required some, credited some and bought some to compile a larger site that was desired). Deer Creek subdivision and Grass Valley were put together in a similar manner.
- Regarding PIF, the development community is resigned to the fact that they will pay impact fees, and most are fine with building parks or trails as part of a project and getting PIF credit. It's important for the public to know that PIF is passed through to the buyer as part of the cost of the home.
- Going forward, City staff should continue working with the same attitude of 'working together' with the development community as a partner. Continue to have flexibility with the CIP and adjust project cost allocations as appropriate with the projects considered and negotiated with developers.

-- End of Notes --

Appendix D
Site Observations

ASH CREEK PARK

9.5 acres (acquired: 2000) **Neighborhood /Undeveloped**

Capital Improvement & Planning Opportunities:

- This site is a wooded natural area. There is a fenced in storm facility on the site. On street parking is available and there is pedestrian access.
- The natural area has potential to be an amenity in the park with trails and interpretive signs. This undeveloped site is in the middle of a neighborhood and would be a good location for a small play area and shelter.

Maintenance Considerations:

- Manage as Open Space until developed.
- The site is very wet, especially on the south and west sides.
- Currently, no public access is provided.

Amenities:

- Wooded natural area

BAZ RIVERFRONT PARK

0.79 acres (acquired: 1989) **Special Facility**

Capital Improvement & Planning Opportunities:

- Opportunity for park master plan process to define site and connect to the river.
- Add interpretive signs.
- Add ADA accommodations for parking and paths to picnic table and trail.

Maintenance Considerations:

- Manage as Open Space with an added emphasis on weed/invasive plant management.

Amenities:

- Limited on street parking along road shoulder
- Picnic table
- Access to Washougal River Greenway Trail
- Narrow deer paths to waterfront
- Fishing
- Swimming
- Natural areas
- Scenic views of the Washougal River

BENTON PARK

4.8 acres (acquired: 1988, 2004) **Neighborhood**

Capital Improvement & Planning Opportunities:

- Improve pedestrian connection from Couch Street to asphalt path.
- Add more walking paths and trails with interpretive signs and rest areas.
- Add benches or tables along asphalt path.
- Standardize site furnishings to match other parks.

Maintenance Considerations:

- Most of the park is wooded area with a trail. Maintain trail surface.
- Enhance natural areas and remove invasive weeds.
- Add additional gravel and compact trail to provide a firm surface that is ADA accessible. Remove drops and elevation changes between the trail and the sidewalk and concrete table pads to provide a smooth transition.

Amenities:

- Earthen/Gravel trail
- Asphalt path
- Tables
- Passive lawn
- Community garden (partner managed)
- Natural areas
- View of creek

COOPERS VIEW PARK

2.5 acres (acquired: 2007) **Neighborhood**

Capital Improvement & Planning Opportunities:

- Consider adding a restroom and drinking fountain.
- Install dog waste station.
- Add accessible routes to existing picnic tables and enlarge pads to provide accessible clearance around table.
- Currently there are not accessible routes around the tables under the shelter for accessibility. Remove some of tables to provide more space and allow better circulation & accessibility.
- Install a ramp into play area with a slide.

Maintenance Considerations:

- Annual evaluation and supplement of playground safety surface.
- Standardize furnishings.

Amenities:

- On street parking
- Picnic tables with built in checkerboard
- Bike racks
- Bench
- Asphalt path
- Playground age 2-5 years old with nature play area
- Slide
- Trash receptacle
- Passive/active lawn

CROWN PARK

7.1 acres (acquired: 1987) **Community**

Capital Improvement & Planning Opportunities:

- Implement site master plan.

Maintenance Considerations:

- Address drainage problems in T-ball field and around shelter.
- Repair/re-surface tennis court.
- Repair asphalt paths.
- Annual evaluation and supplement of playground safety surface.
- Standardize furnishings.

Amenities:

- Off street parking
- Park building
- Picnic tables
- Benches
- Tennis courts with storage unit for pickleball nets
- Trash receptacles
- Trash dumpster
- Water spigot
- Playground 1 (Swing set and play equipment)
- Playground 2 (Age 5-12, Slide and play equipment)
- Playground 3 (Age 2-5, Swings and play equipment)
- Double sided wall ball court
- Carousel play equipment
- Lending library
- 20x20 shelter with lighting and electrical outlet
- T-ball field
- Passive/active lawn
- Volleyball court
- Horseshoe Pits with fence
- Porta putties

DOROTHY FOX PARK

4.8 acres (acquired: 1986, 1989) **Neighborhood**

Capital Improvement & Planning Opportunities:

- ADA improvements: playground ramp, pathway to tables, companion seating.

Maintenance Considerations:

- Replace faded on-leash sign.
- Annual evaluation and supplement of playground safety surface.
- Lawn and pathway repairs.
- Standardize furnishings.

Amenities:

- Interior parking
- Trash receptacles
- Restroom with storage chase
- Gear storage box
- Soccer field with goals
- Playground, age 2-5
- Benches
- Picnic table
- ½ basketball court
- Open lawn areas
- Storm water swale/facility

FALLEN LEAF LAKE PARK

32.9 acres (acquired: 2011) **Regional**

Capital Improvement & Planning Opportunities:

- Implement park master plan.
- Remove volleyball nets.
- ADA improvements: accessible route to lawn, install ADA accessible tables.
- Consider a nature play area for this park.

Maintenance Considerations:

- Clear vegetation around picnic tables along waterfront.
- Cleanup shelter.
- Inspect and repair roof.
- Repain tables.
- The ramp connection the gravel parking area to the shelter has a 1-2” lip, repair to remove lip and provide ADA access from parking lot to shelter.

Amenities:

- Off street gravel parking (inside gate)
- Informal gravel parking for day use parking (outside gate)
- RV host site
- Rough lawn/game area
- Lawn along lake
- Volleyball
- Tables
- Benches
- Large shelter with moveable tables (sinks, preparation tables, lights and power outlets)
- Restroom in shelter
- Trails
- Trash receptacles
- Trash dumpster

FOREST HOME PARK

5.3 acres (acquired: 1987) **Neighborhood**

Capital Improvement & Planning Opportunities:

- Add accessible routes to existing picnic tables, playgrounds and baseball fields and provide accessible clearance around amenities.
- Provide a drinking fountain and shelter.
- Provide additional ADA Parking spaces.
- Replace picnic tables with accessible models.
- Provide bike racks.
- Add other baseball amenities.
- Consider replacing wood bleachers with metal for easier maintenance.

Maintenance Considerations:

- Annual evaluation and supplement of playground safety surface.
- Pathway repairs.
- Standardize furnishings.

Amenities:

- Off street parking
- Trash receptacles
- Trash dumpster
- Picnic tables
- Baseball fields with dugouts, backstops, commentator boxes and bleachers
- Playground 1 (age 2-12)
- Playground 2 (age 2-5)
- Bench
- Passive/active lawn
- ½ Basketball court (no striping)
- Dog waste stations
- Concession building
- Maintenance building
- Porta potty

GOOT PARK

17.0 acres (acquired: 1987, 2006) **Neighborhood**

Capital Improvement & Planning Opportunities:

- Repair or replace bleachers.
- Replace picnic tables with accessible models.
- The natural area has potential to be an amenity in the park with trails and interpretive signs.
- Add accessible routes to existing picnic tables and enlarge pads to provide accessible clearance around table.
- Consider adding a shelter to this site.

Maintenance Considerations:

- Remove graffiti from maintenance structures.
- Repaint rusted play equipment.
- Annual evaluation and supplement of playground safety surface.
- Remove weeds in paved areas, shrub beds and lawn.
- Striping at basketball court is worn, restripe basketball court.
- Standardize furnishings.

Amenities:

- Off street parking
- ½ Basketball court
- Maintenance building
- Restroom
- Picnic tables
- Benches
- Bike rack
- Trash receptacles
- Soccer field with goals
- Baseball field with backstop and bleachers
- Wayfinding signs
- Passive/active lawn
- Dog waste station
- Drinking fountain
- Lending library
- Playground 1 (age 2-12, Swings and play equipment)
- Playground 2 (1 piece of play equipment)
- Water spigot
- Natural area

GRASS VALLEY PARK

24.9 acres (acquired: 1999, 2006) **Community**

Capital Improvement & Planning Opportunities:

- Add accessible routes to existing picnic tables and enlarge pads to provide accessible clearance around table.
- Currently there are not accessible routes around the tables under the shelter for accessibility. Remove some of tables to provide more space and allow better circulation & accessibility.
- The natural area has potential to be an amenity in the park with trails and interpretive signs.
- ADA improvements: accessible routes to tables, drinking fountain and trash grills, install playground ramp, provide companion seating.

Maintenance Considerations:

- Replace the missing restroom signs.
- Repair/re-surface tennis court.
- Remove weeds in paved areas, shrub beds and lawn.
- There are drainage problems in softball field that need to be resolved.
- Lawn has damage from gophers, control gopher population and repair lawn.
- There are minor cracks in paths that need repair.
- Vegetation is encroaching onto asphalt path, clear vegetation.
- Annual evaluation and supplement of playground safety surface.
- There is missing playground equipment, either repair or remove.
- Standardize furnishings.

Amenities:

- Off street parking
- Memorial brick pavers
- Picnic tables
- Bike rack
- BBQ grill
- Restrooms w/storage chase
- Drinking fountains
- Trash receptacles
- Tennis courts with practice wall and fence
- ½ Basketball court
- Softball field w/ backstop
- Playground ages 2-12
- 35’x45’ Shelter with lighting and electrical outlets
- 12’x20’ Shelter
- Asphalt loop path
- Signed natural areas

GREEN MOUNTAIN PARK

4.6 acres (acquired: ----) **Neighborhood**

Capital Improvement & Planning Opportunities:

- ADA improvements: accessible route to picnic tables, provide companion seating.

Maintenance Considerations:

- Replace the missing volleyball net.
- Remove weeds in lawn area and reseed bare spots.
- There are drainage problems in lawn area that need to be resolved.
- Annual evaluation and supplement of playground safety surface.
- Standardize furnishings.

Amenities:

- On street parking
- Restroom building
- Picnic tables
- Bike racks
- Benches
- Drinking fountains
- Full basketball court with striping
- Volleyball court
- 20’x20’ Picnic shelter
- Playground age 2-12 years old
- Asphalt paths
- Trash receptacles
- Passive/active lawn
- Dog waste station

HERITAGE PARK

26.9 acres (acquired: 1993) **Community**

Capital Improvement & Planning Opportunities:

- Gate access control improvements.
- Separate motorized & non-motorized launching.
- Opportunity for bird watching and interpretive signage. These could be combined with rest areas along the Lacamas/Heritage trail.
- Improve waterfront/fishing.
- Consider a large shelter for bigger groups.
- ADA improvements: signs for ADA parking stalls, provide access to grills.

Maintenance Considerations:

- Remove weeds in paved areas, shrub beds and lawn.
- Pathway repair.
- Enhance natural areas and remove invasive weeds.
- Standardize furnishings.

Amenities:

- Off street parking
- Lacamas/Heritage Trail (asphalt or crushed rock)
- Mowed meadows
- Benches along trail
- Views of lake
- Watercraft rentals (kayaks, standup paddle boards)
- Asphalt paths
- Restroom with drinking fountain
- Playground age 2-5
- Grills
- Boat ramp with floating docks and staging area
- Fishing/waterfront area
- Trash dumpster

KLICKITAT PARK

9.4 acres (acquired: 2001) **Neighborhood**

Capital Improvement & Planning Opportunities:

- The natural area has potential to be an amenity in the park with trails and interpretive signs.
- ADA improvements: accessible routes to tables and benches, provide alternate route to viewing area, provide accessible routes to the play areas.

Maintenance Considerations:

- Remove weeds in shrub areas and lawn and play areas
- Annual evaluation and supplement of playground safety surface.
- Control gopher population and repair lawn.
- Replace broken table.
- Clear storm grates.
- Add mulch to plant beds and redefine edges.
- Pathway repair and clearing.
- Add restroom signs.
- Remove tennis backboard.
- Replace unhealthy/failing trees.
- Re-stripe basketball court.
- Replace missing signs.
- Standardize furnishings.

Amenities:

- Interior parking
- Trash dumpster
- Drinking fountain
- Bike rack
- ½ basketball court w/ ¾ fence and wall ball
- Dog waste dispenser
- Play area 1 w/ swings
- Play area 2 age 2-12
- Trash receptacles

LACAMAS HEIGHTS PARK

2.3 acres (acquired: 2006) **Neighborhood /Undeveloped**

Capital Improvement & Planning Opportunities:

- The location is in the middle of a neighborhood and adjacent to Camas High School. Existing pedestrian access is easy and the high school parking lot is close enough that it could be used for parking during off school hours.
- About half of this site is covered in mature trees with lawn cover. There are gentle slopes throughout site. The Butler reservoir facility is located on the adjacent parcel to the west, with a fence around it.
- A playground, basketball court, picnic tables, shelter, walking paths should be considered for future development. This site might be a good location for a future dog park.

Maintenance Considerations:

- Manage as Open Space until developed.

Amenities:

- Trash receptacles
- Bike rack
- Picnic tables
- Bench
- Parking
- Playground
- Baseball/softball field
- Portable toilet

LACAMAS LAKE LODGE & CONFERENCE CENTER

4.3 acres (acquired: 2000) **Regional**

Capital Improvement & Planning Opportunities:

- None noted.

Maintenance Considerations:

- Enhance natural areas and remove invasive weeds.
- Manage and cleanup goose waste.

Amenities:

- Off street parking
- Passive lawn
- Trash receptacles
- Recycling receptacle
- Conference center building
- Patio with view of lake
- Access to pier
- Connecting path to heritage park

LOUIS BLOCH PARK

4.9 acres (acquired: 1987) **Neighborhood**

Capital Improvement & Planning Opportunities:

- Future park site planning to determine potential new amenities.
- ADA improvements: accessible routes to picnic tables, enlarge pads to provide accessible clearance, provide paved access to playgrounds.
- Consider adding another drinking fountain.
- Replace picnic tables in baseball area.

Maintenance Considerations:

- Restripe parking spaces.
- Control gopher population and repair lawn.
- Remove weeds in paved areas, shrub beds and lawn.
- Re-stripe basketball court and repair pavement.
- Annual evaluation and supplement of playground safety surface.
- Standardize furnishings.

Amenities:

- Off street parking
- Fenced in baseball field with backstop, bullpens
- Picnic tables
- Benches
- Concession building
- Commemorative plinth
- Restroom in baseball area
- Restroom in park
- Maintenance building
- Commentators building
- Lending library
- Playground 1 (swings)
- Playground 2
- Trash receptacles
- Recycling receptacles
- Trash dumpster
- Drinking fountain
- Dog waste station
- Bleachers
- ½ Basketball court
- Wayfinding signs
- Passive/active lawn

OAK PARK

2.5 acres (acquired: 1995) **Neighborhood**

Capital Improvement & Planning Opportunities:

- Replace porta potty with a permanent restroom.
- Consider a shelter and picnic area.
- ADA improvements: accessible routes to tables, basketball court and trash grills, provide playground ramp.

Maintenance Considerations:

- Remove weeds in paved areas, shrub beds and lawn.
- Annual evaluation and supplement of playground safety surface.
- Clean moss from asphalt path.

Amenities:

- On street parking
- Playground age 2-5
- Picnic tables
- Benches
- Grill
- Passive/active lawn
- ½ Basketball court
- Porta potty

OSTENSON CANYON PARK

8.2 acres (acquired: 2013) **Neighborhood**

Capital Improvement & Planning Opportunities:

- Conduct park site master plan process to guide development of open, upper shelf as neighborhood park.

Maintenance Considerations:

- Manage as Open Space until developed.

Amenities:

- Trash receptacles
- Bike rack
- Picnic tables
- Bench
- Parking
- Playground
- Baseball/softball field
- Portable toilet

PRUNE HILL SPORTS PARK

8.8 acres (acquired: 1997) **Community**

Capital Improvement & Planning Opportunities:

- The natural area has potential to be an amenity in the park with trails and interpretive signs.
- Add benches, tables and consider a small shelter.
- Add more shade trees near playground, behind bleachers and dugouts and along perimeter of sports fields.
- Stripe basketball courts and install a perimeter fence.
- Install a ramp into playground to provide an ADA accessible route. Sidewalk is sunken next to curb, repair to provide an accessible route into the playground.

Maintenance Considerations:

- Remove weeds in paved areas, shrub beds and lawn.
- Repair drainage problems in baseball field.
- Replace ball fence on east side of park.
- Control gopher population and repair lawn.
- Pathway repair.
- Annual evaluation and supplement of playground safety surface.
- Standardize furnishings.

Amenities:

- Shared off street parking with school
- Free library box
- 2 trash receptacles
- Ramp into park
- Asphalt paths with loop path
- Multisport fields with permanent and moveable soccer goals
- Baseball field with backstop, bleachers and storage bin
- Playground age 2-12
- ½ Basketball courts with no striping
- Storage bin near soccer fields
- Natural area next to fields with radio tower and access drive
- Passive/active lawn

SANDY SWIMMING HOLE

1.4 acres (joint property with Washougal) **Special Facility**

Capital Improvement & Planning Opportunities:

- Parking improvements and expansion.

Maintenance Considerations:

- This swimming hole is very popular. The beach access and experience looked great, but the minimal parking was a major limitation.
- No ADA accessible route to beach.

Amenities:

- 17 – standard stalls
- 1ADA stall (not on designated accessible route, not compliant, not properly signed)
- 6 Movable Recycling and Trash Receptacles
- Paved Overlook/Deck area with 2-picnic tables and 1 – bench
- Identification sign
- Various regulatory signs.

SKATE PARK

0.9 acres (acquired: 1987) **Special Facility**

Capital Improvement & Planning Opportunities:

- Redesign/add to skate park.
- Add permanent restroom, drinking fountain and shelter with lawn area.
- Existing parking lot is large, if it isn't fully utilized part of the parking lot could be repurposed for shelter, lawn area and day use activities.
- Enhance river access and provide more beach area.
- Replace picnic tables and benches.
- ADA improvements: accessible routes to existing picnic tables, replace ADA parking signs, provide companion space.

Maintenance Considerations:

- Restripe parking lot to identify parking stalls and drive aisle.
- Repair cracks or replace skate park.
- Enhance natural areas and remove invasive plant species..
- Standardize furnishings.

Amenities:

- Skate park
- Off street parking
- Trash receptacles
- Picnic tables
- Porta potty
- Benches
- Natural area with river access
- Trails
- Boat launch ramp

Appendix E
Recreation Trends

The following summaries from recognized park and recreation resources provide background on national, state and local park and recreation trends. Examining current recreation trends may guide potential park and recreation improvements and opportunities to enhance programs and services.

2020 NRPA Agency Performance Review

The 2020 National Recreation and Park Association (NRPA) *Agency Performance Review* summarizes the key findings from their Park Metrics benchmarking tool and is intended to assist park and recreation professionals in effectively managing and planning their operating resources and capital facilities. The report offers a comprehensive collection of park- and recreation-related benchmarks and insights to inform professionals, key stakeholders, and the public about the state of the park and recreation industry. The 2020 NRPA Agency Performance Review contains data from 1,053 unique park and recreation agencies across the United States as reported between 2017 and 2019.

Key Findings and Characteristics

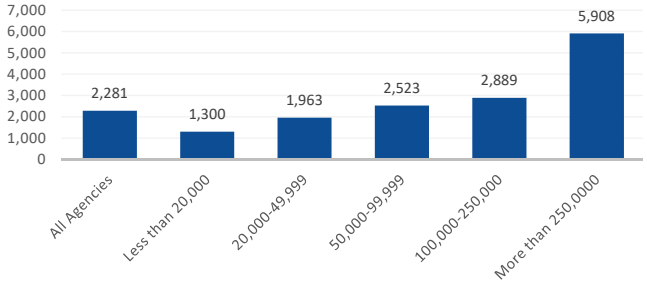
Park facilities and operations vary greatly across the nation. The typical agency participating in the NRPA park metric survey serves a jurisdiction of approximately 42,500 people, but population size varies widely across all responding jurisdictions. The typical park and recreation agency has jurisdiction over 20 parks comprising over 430 acres. Park facilities also have a range of service levels in terms of acres of parkland per population and residents per park. These metrics are categorized by the agency's population size.

Park Facilities

Nearly all (96%) park and recreation agencies operate parks and related facilities. The typical park and recreation agency has:

- One park for every 2,281 residents
- 9.9 acres of park land for every 1,000 residents in its jurisdiction
- 11 miles of trails for walking, hiking, running and/or biking

Figure E1. Median Residents per Park Based On Population Size



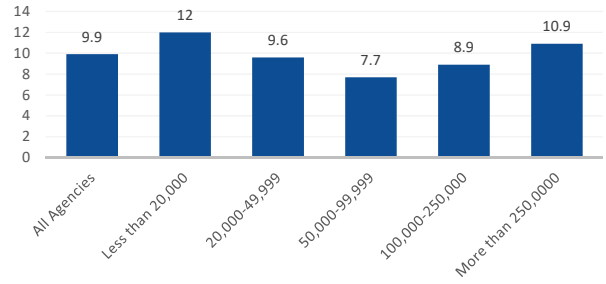


Figure E2. Acres of Parkland per 1,000 Residents based on Population Size

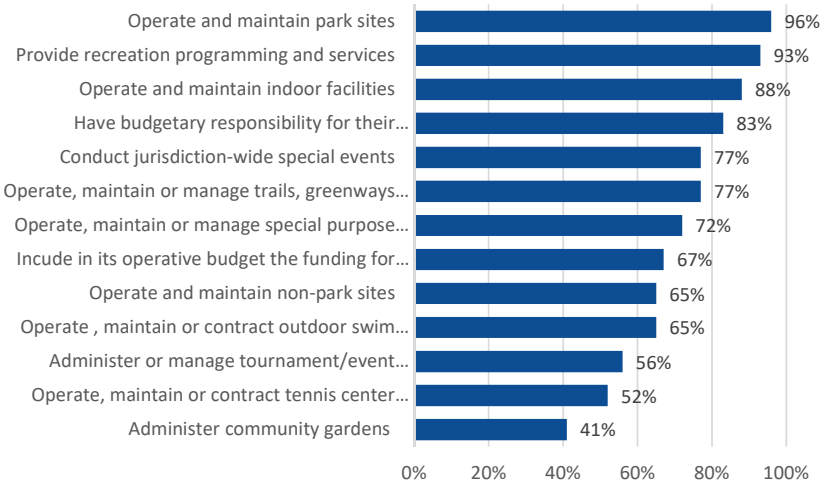


A large majority of park and recreation agencies provide playgrounds (93.9%) and basketball courts (86.5%) in their portfolio of outdoor assets. Most agencies offer community and/or recreation centers (60%) while two in five offer senior centers.

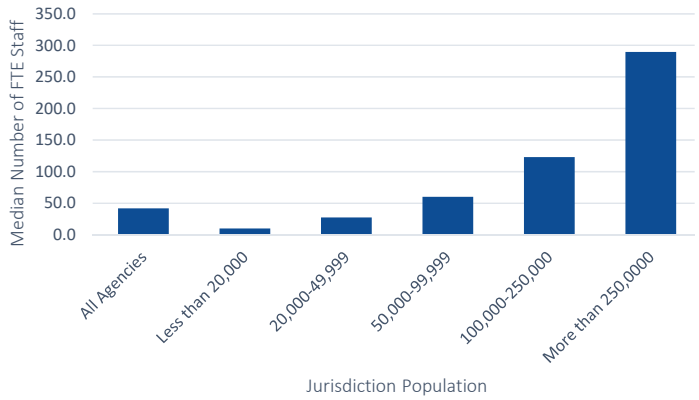
The typical park and recreation agency that manages or maintains trails for walking, hiking, running and/or biking has 11.0 miles of trails. Agencies serving more than 250,000 residents have a median of 84.5 miles of trails under their care.

Park and recreation agencies often take on responsibilities beyond their core functions of operating parks and providing recreational programs. Other responsibilities may include tourist attractions, golf courses, outdoor amphitheaters, indoor swim facilities, farmer's markets, indoor sports complexes, campgrounds, performing arts centers, stadiums/arenas/racetracks, fairgrounds and/or marinas.

Figure E3. Key Responsibilities of Park and Recreation Agencies

Programming

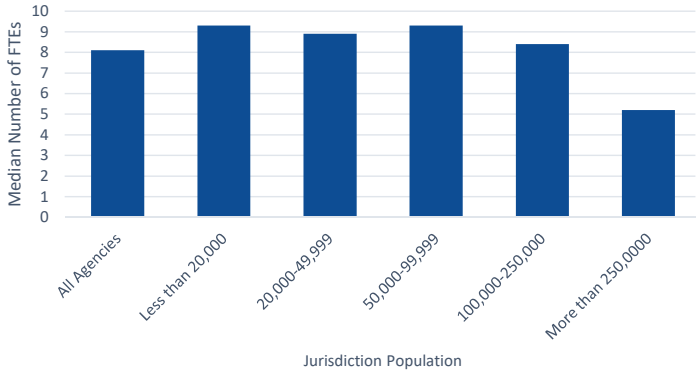
Nearly all (93%) of park and recreation agencies provide recreation programs and services. More than eight in ten agencies provide themed special events (88%), team sports (87%), social recreation events (87%), youth summer camps (83%), fitness enhancement classes (82%), and health and wellness education (81%).



Staffing

Park and recreation employees are responsible for operations and maintenance, programming and administration. The typical park and recreation agency has:

- 41.9 full-time equivalent staff (FTEs) on payroll
- 8.1 FTEs on staff for every 10,000 residents in its jurisdiction



Median FTE counts also positively correlate with the number of acres maintained, the number of parks maintained, operating expenditures, and the population served. For example, agencies that serve populations between 20,000 and 49,999 residents employ an average of 27.3 FTE, while agencies that serve 50,000 to 99,000 people employ an average of 60 FTE.

Figure E4. Park and Recreation Agency Staffing: Full-Time Equivalents (By Jurisdiction Population)

Another way of comparing agency staffing across different park and recreation agencies examines number of staff per 10,000 residents. These comparative numbers hold fairly steady across population sizes with the median for all agencies at 8.1 FTEs.

Figure E5. Park and Recreation Agency FTEs Per 10,000 Residents

Capital and Operating Expenses

For capital expenses, the typical park agency:

- Dedicates about 55% to renovation projects and 32% to new development projects.
- Plans to spend about $5,000,000 million on capital expenditures over the next five years.

For operations, the typical park agency spends:

- $4.3 million per year on total operating expenses
- $7,000 on annual operating expenses per acre of park and non-park sites managed by the agency
- $81.00 on annual operating expenses per capita
- $97,000 in annual operating expenditures per employee
- 54% of the annual operating budget on personnel costs, 38% on operating expenses, and 5% on capital expenses not included in the agency's capital improvement plan (CIP)
- 44% of its operating budget on park management and maintenance, 43% on recreation, and 13% on other activities

2020 State of the Industry Report

Recreation Management magazine's *2020 Report on the State of the Managed Recreation Industry* summarizes the opinions and information provided by a wide range of professionals (with an average 22.3 years of experience) working in the recreation, sports, and fitness industry. Given the emerging COVID-19 pandemic, Recreation Management also conducted a supplemental survey in May 2020 to learn about both the impacts to the industry and what mitigation steps organizations were taking in response.

Partnerships

The 2020 report indicated that most (89%) recreation, sports, and fitness facility owners form partnerships with other organizations as a means of expanding their reach, offering additional programming opportunities or as a way to share resources and increase funding. Local schools are shown as the most common partner (64%) for all facility types. Youth-serving organizations (Ys, JCC, Boys & Girls Clubs) and park and recreation organizations were the most likely to report that they had partnered with outside organizations, at 100% and 95% respectively.

Revenue Outlook

In January 2020, half of respondents expected revenues to increase in both 2020 and 2021. Survey respondents from urban communities are more optimistic about revenue increases as compared to rural respondents.

In last year's report, parks respondents had reported increases in their average operating expenditures with operating costs that grew by 14% between fiscal year 2018 and 2019. Respondents generally expected their operating expenses to continue to increase between 2019 and 2021, with camps expecting a 10% increase, recreation centers at 8%, and parks at 6%.

Relative to costs and revenues, few facilities covered by the survey reported that they cover more than 75% of their operating costs via revenue. The percentage recovered varied with type of organization with the average percentage of costs recovered for all respondents hovering near 50% and private for-profit organizations achieving the highest cost recovery rates. For parks, the cost recovery rate remained steady at 44%.

Over the past decades, public park and recreation departments and districts have faced a growing expectation that facilities can be run like businesses. Many local facilities are expected to recover much of their operating costs via revenues. While this is the business model of for-profit facilities like health clubs, it is a relatively recent development for publicly owned facilities, which have typically been subsidized via tax dollars and other funding sources. Most recreation providers (81%) have been taking actions to reduce expenditures. Cost recovery actions typically involve reduction in expenses with improving energy efficiency as the most common action (51% of respondents). Increased fees and staffing cost reductions and putting off construction or renovation plans were reported as other common methods for reducing operating costs.

As of May 2020, nearly 90% of respondents anticipated that total revenues would decline in 2020 due to the COVID-19 pandemic. Most anticipated a revenue drop of 30-50%, though one in seven expected a decline of more than 50%. In general, respondents are split on when they expect that revenues will begin to recover – 44% believe revenues will begin to rebound in 2021 while 40% expect further revenue declines.

Facility Use

The majority of respondents reported an increase in use of their recreational facilities as of January 2020. Looking forward, more than half of respondents (53%), including 60-65% of park and recreation centers, were expecting to see further increases in the number of people using their facilities over the next two years.

In 2020, 22% of respondents said they were planning to add more staff at their facilities, 75% were planning to maintain existing staffing levels, and 3% were planning to reduce staffing. The May 2020 survey found, however, that nearly half of responding organizations had laid off or furloughed staff due to the impacts of COVID-19 and nearly two-thirds had suspended hiring plans.

Facilities and Improvements

Over the past seven years, the percentage of respondents who indicate that they have plans for construction, whether new facilities or additions or renovations to their existing facilities, has grown steadily, from 62.7 percent in 2013 to 72.9 percent in 2020. Construction budgets have also risen. The average amount respondents were planning to spend on their construction plans was up 10.8% in 2020, after an 18.4% increase in 2019. On average, respondents to the 2020 survey were planning to spend $5.6 million on construction.

A majority of park department respondents (54%) reported plans to add features at their facilities and were also the most likely to be planning to construct new facilities in the next three years (39%).

The top 10 planned features for all facility types include:

1. Splash play areas (25.4% of those with plans to add features were planning to add splash play)
2. Playgrounds (20.3%)
3. Park shelters (17.3%)
4. Dog parks (17.1%)
5. Park restrooms (16.1%)
6. Synthetic turf sports fields (14.8%)
7. Walking and hiking trails (14.8%)
8. Fitness trails and outdoor fitness equipment (14.8%)
9. Disc golf courses (12.9%)
10. Outdoor sports courts (11.3%)

The COVID-19 pandemic is having a significant impact on construction plans. As of May 2020, over one-third (34%) of respondents had put construction on hold due to the impacts of the pandemic, rising costs, and supply shortages.

Programming

Nearly all respondents (97%) offer programming of some kind. The top 10 most commonly offered programs include: holiday events and other special events (provided by 65.3% of respondents); educational programs (59%); group exercise programs (58.8%); fitness programs (57.6%); day camps and summer camps (57.3%); youth sports teams (55.2%); mind-body balance programs such as yoga and tai chi (51.2%); adult sports teams (46%); arts and crafts programs (45.8%); and programs for active older adults (45.4%).

Respondents from community centers, parks and health clubs were the most likely to report that they had plans to add programs at their facilities over the next few years. The ten most commonly planned program additions were:

1. Fitness programs (24% of those who have plans to add programs)
2. Group exercise programs (22.4%)
3. Teen programs (22%)
4. Environmental education (21.8%)
5. Day camps and summer camps (20.9%)

6. Mind-body balance programs (20.5%)
7. Programs for active older adults (18.1%)
8. Special needs programs (17.9%)
9. Holidays and other special events (17.4%)
10. Arts and crafts (17%)

Addressing the COVID-19 pandemic required many respondents to either put programs or services on hold (82%) or cut programs or services entirely (34%). Additionally, many respondents have had to rethink their programming portfolios. Two-thirds of respondents (67%) had added online fitness and wellness programming as of May 2020, 39% were involved in programs to address food insecurity, and one in four was involved in programs to provide educational support to out-of-school children.

General Challenges

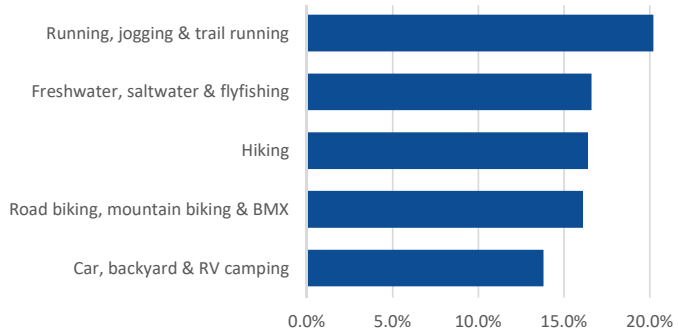
In January 2020, facility managers were asked about the challenges they anticipated impacting their facilities in the future. Generally, overall budgets are the top concern for most respondents including their ability to support equipment and facility maintenance needs (58%) and staffing (54%). Marketing, safety/risk management, and creating new and innovative programming also remain continuing challenges for facility managers. Facility managers also report that environmental and conservation issues (13%) and social equity and access (10%) are posing increasing challenges. However, as of May 2020, many respondents concerns had shifted to addressing the COVID-19 pandemic impacts described in the sections above.

2020 Outdoor Participation Report

Overall Participation

According to the 2020 Outdoor Participation Report, published by the Outdoor Foundation, just over half of Americans ages 6 and older participated in outdoor recreation at least once in 2019, the highest participation rate in five years. This increase was not universal, however, and there was significant variation in participation between age, gender, and racial groups.

Despite the overall increase in the percentage of Americans engaging in outdoor recreation, the total number of recreational outings declined in 2019. Outdoor participants went on a total of 10.9 billion outdoor outings in 2019 – a 12% drop from the 2012 high-water mark of 12.4 billion outings. In addition, the number of outings per participant declined 17% in the past five years, from 85 outings per participant in 2014 to 71 in 2019.



This drop mirrors a decline in the total number of outings per participant. Each year for over a decade, participants have engaged less often in outdoor activities. As a result, the percentage of 'casual' participants in outdoor recreation (i.e. those who participate one to 11 times per year) has grown by about 4% over the past 15 years, while the percentage of 'core' participants (i.e. weekly participants) has declined.

Figure E6. Frequency of Outdoor Outings: Trending Over Many Years

Frequency of Outdoor Outings	2007	2010	2013	2016	2019
Casual (1 to 11 times)	28.2%	27.9%	28.4%	31.7%	32.6%
Moderate (12 to 51 times)	32.5%	31.8%	33.1%	32.5%	32.6%
Core (52+ times)	39.3%	40.4%	38.5%	35.8%	34.9%

Running, jogging and trail running is the most popular outdoor activity by level of participation, as shown in the chart below, followed by fishing, hiking, biking and camping.

Figure E7. Most Popular Outdoor Activities by Participants, Nationwide

Youth Participation Declines

The youngest participants, children 6 to 17, were outdoors far less than in previous years. Their average outings fell from a high of 91 in 2012 to just 77 per child in 2019. Youth participation declined across the board in 2019, with the biggest declines seen in girls aged 18 to 24 (-5%) and boys ages 13 to 17 (-4%). Households with children, however, continue to drive growth in participation. Adults with children had much higher outdoor recreation participation rates (57%) than adults without children (44.4%).

Female Participation Continues to Grow

In 2019, women made up 46% of participants in outdoor recreation while men made up 53.8%, representing the smallest gender gap measured in the report's history. Women's participation has increased from 43% of all participants in 2009 to 46% in 2019.

Diversity Gap Remains

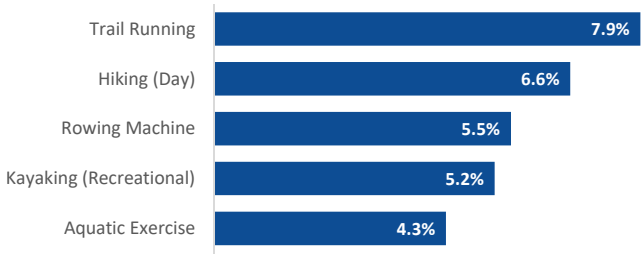
Despite increases in participation, Black/African American and Hispanic Americans continue to be significantly underrepresented in outdoor recreation. Hispanics made up 11.6% of outdoor recreation participants, a 35% shortfall relative to their proportion of the population ages 6 and over (17.9%). Similarly, Black/African Americans represented 12.4% of the U.S. population ages 6 and over in 2019, but just 9.4% of outdoor participants, a 24% participation deficit. Black youth were the least likely to participate in outdoor recreation as compared to Asian, Hispanic, and Caucasian youth – signaling a potential future gap in outdoor participants. However, those Black and Hispanic Americans who do participate in outdoor recreation do so frequently – more often, on average, than members of other racial groups.

In 2019, 62% of Asian Americans participated in outdoor recreation, followed by 53% of White, 48% of Hispanic, and 40% of Black/African Americans.

Impacts of COVID-19

An August 2020 report from the Outdoor Industry Association indicated that COVID-19 impacted recreation participation in April, May and June as Americans flocked to outdoor recreation amid COVID restrictions. Americans took up new activities in significant numbers with the biggest gains in running, cycling, and hiking given that these activities were widely considered the safest activities during pandemic shutdowns. The hardest hit activity segments during COVID shutdowns were team sports (down 69%) and racquet sports (down 55%). Reviewing just April, May and June 2020, participation rates for day hiking rose more than any other activity, up 8.4%.

2020 Sports, Fitness, and Leisure Activities Topline Participation Report



Prepared by a partnership of the Sports and Fitness Industry Association (SFIA) and the Physical Activity Council (PAC), this February 2020 participation report summarizes levels of activity and identifies key trends in sports, fitness, and recreation in the US. The report is based on over 18,000 online interviews of a nationwide sample that provides a high degree of statistical accuracy using strict quotas for gender, age, income, region, and ethnicity. The study looked at 122 different team and individual sports and outdoor activities.

Compared to 2014, eight million more Americans were casually active in 2019 indicating a positive movement toward an increasingly active population. Sports that made great strides in the last six years include trail running, cardio tennis, BMX biking, and day hiking. Over the last year, only 2.1 million additional people reported participating in an activity that raises their heart rate for more than 30 minutes. Participation in active high calorie activities has remained flat for the last four years.

The percentage of people reporting no physical activity during the past year declined to 27% in 2019 - its lowest point in six years – continuing an increasing trend in activity. Rates of inactivity continue to be linked to household income levels, with lower income households having higher rates of inactivity. However, in 2019, households across the income spectrum saw declines in inactivity.

Fitness sports continue to be the most popular activity type for the 5th consecutive year. Other sports activities, including individual sports, racquet sports, and water sports have seen a modest decline in participation since 2018. Team sports experienced a slight increase in participation, driven by the increasing popularity of basketball and outdoor soccer. While racquet sports lost about 2% of participants since 2018, mostly due to declines in squash and badminton participation, the rising popularity of pickleball and cardio tennis may reverse this declining trend.

Figure E8. Total Participation Rate by Activity Category

When asked which activities they aspire to do, all age-groups and income levels tend to show interest in outdoor activities like fishing, camping, hiking, biking, bicycling, and swimming. Younger age groups are more interested in participating in team sports, such as soccer, basketball and volleyball, while older adults are more likely to aspire to individual activities like swimming for fitness, bird/nature viewing, and canoeing.

Physical education (PE) participation shows 96% of 6 to 12-year old youth and 82% of 13-17 year olds participated in PE in 2019. While younger children were more likely to participate in PE, older youth had higher average days of participation. Children were more than twice as likely to be inactive if they did not attend PE. Overall, all ages saw an increase in PE 2019. Participation in PE is thought to lead to an increase of active, healthy lifestyles in adulthood.

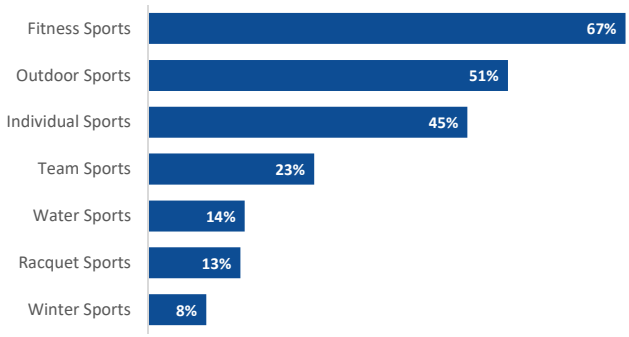

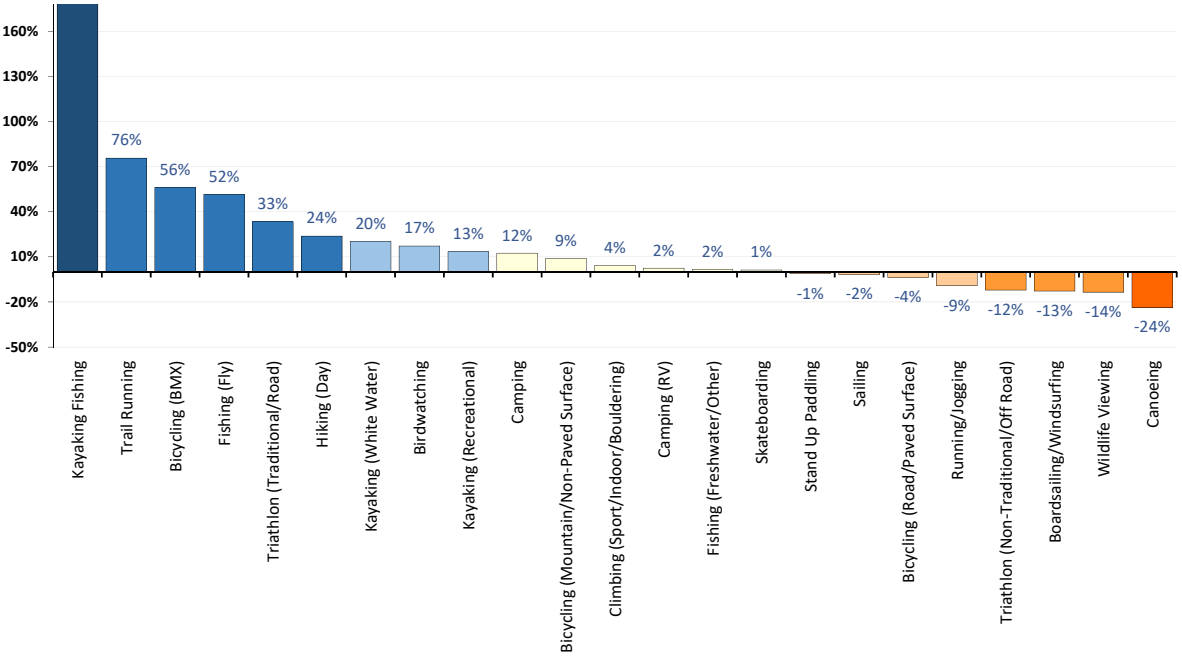

Figure E10. 5-Year Change in Outdoor Sports Participation

2020 Americans Engagement with Parks Survey

This annual study from the National Park and Recreation Association (NRPA) probes Americans' usage of parks, the key reasons that drive their use, and the greatest challenges preventing greater usage. Each year, the study examines the importance of public parks in Americans' lives, including how parks compare to other services and offerings of local governments. The survey of 1,000 American adults looks at frequency and drivers of parks/recreation facilities visits and the barriers that prevent greater enjoyment. Survey respondents also indicate the importance of how park and recreation plays in their decisions at the voting booth and their level of support for greater funding.

In 2020, NRPA conducted a shorter-than-typical Engagement survey because of the dynamic nature of life during the COVID-19 pandemic. The 2020 Study focused on the impacts of the COVID-19 pandemic on park and recreation usage, whether residents see public parks as an essential public service, and whether people vote for political leaders based on their support for park and recreation funding.

Key findings include:

- Eighty-two percent of U.S. adults agree that parks and recreation is essential.
- Seventy-seven percent of survey respondents indicate that having a high-quality park, playground, public open space or recreation center nearby is an important factor in deciding where they want to live.
- U.S. residents visit local park and recreation facilities more than twice a month on average.
- Three in five U.S. residents — more than 190 million people — visited a park, trail, public open space or other recreation facility at least once during the first three months of the pandemic (mid-March through mid-June 2020).

Impacts of the COVID-19 Pandemic

According to the Americans Engagement with Parks report,

> "In many communities across the nation, parks, trails and other public open spaces have been crucial resources available to people seeking a brief respite from the public health crisis. As businesses shut down operations during the spring, many parks and trails remained open, providing people with opportunities to safely enjoy outdoor physical activity with its many attendant physical and mental health benefits. According to NRPA Parks Snapshot Survey data (nrpa.org/ ParksSnapshot), 83 percent of park and recreation agencies kept some/all of their parks open during the initial wave of COVID-19 infections in April 2020, while 93 percent did the same with some/all of their trail networks.
>
> Consequently, people flocked to their local parks, trails and other public open spaces. Three in five U.S. residents — more than 190 million people — visited a park, trail, public open space or other recreation facility at least once during the first three months of the pandemic — from mid-March through mid-June 2020. Park and recreation usage was particularly strong among GenZers, Millenials, Gen Xers, parents, people who identify as Hispanic/Latinx and those who identify as nonwhite.
>
> As has been the case with virtually every aspect of life, the COVID-19 pandemic has altered the frequency with which most people engage with their local park and recreation amenities. Still, slightly more than half of people have been visiting parks, trails and other public open space amenities as often — if not more often — since the start of the pandemic than they had during the same period in 2019. Twenty-seven percent of U.S. residents report that their use of parks, trails and other public open spaces increased during the first three months of the pandemic relative to the same period in 2019. A quarter of survey respondents indicates their park and recreation usage during the period from mid-March to mid- June 2020 matched that of the same three months in 2019. Forty-eight percent of people report that their usage of parks, trails and public open spaces declined during the early months of the pandemic."

Washington State Recreation and Conservation Plan

The 2018-2022 Recreation and Conservation Plan for Washington State provides a strategic direction to help assure the effective and adequate provision of outdoor recreation and conservation to meet the needs of Washington State residents. The plan identifies the following five near and long-term priority areas and establishes specific actions within each priority to help meet the outdoor recreation and conservation needs within the state:

1. Sustain and Grow the Legacy of Parks, Trails, and Conservation Lands
2. Improve Equity of Parks, Trails, and Conservation Lands

3. Meet the Needs of Youth
4. Plan for Culturally Relevant Parks and Trails to Meet Changing Demographics
5. Assert Recreation and Conservation as a Vital Public Service

Sustain & Grow the Legacy

A wealth of existing recreation and conservation areas and facilities should be kept open, safe, and enjoyable for all. Some modifications to meet the interests of today's population may be needed at some facilities. Sustaining existing areas while expanding and building new facilities to keep up with a growing population is one of the five priority goals.

Improve Equity

The National Recreation and Park Association's position on social equity states:

> "Our nation's public parks and recreation services should be equally accessible and available to all people regardless of income level, ethnicity, gender, ability, or age. Public parks, recreation services and recreation programs including the maintenance, safety, and accessibility of parks and facilities, should be provided on an equitable basis to all citizens of communities served by public agencies."

The Washington plan restates that equity goal for all its citizens. Improving equity is also a strategy for improving a community's health. Current statewide participation rates in outdoor activities were surveyed as part of the plan.

Figure E11. Participation Rates for Washington Residents in Outdoor Activities

Participation Rates for Top 12 Categories	
Activity	**%**
Walking	94%
Nature activities	89%
Leisure activities at parks	82%
Swimming	68%
Sightseeing activities	67%
Hiking	61%
Outdoor sports	48%
Water-based activities (freshwater)	46%
Camping	45%
Trending activities	33%
Snow and ice activities	30%
Bicycling	28%

Get Youth Outside

Washington State youth participate in outdoor activities to a greater extent than youth nationally. Park and recreation providers are urged to offer a variety of outdoor activities for youth and to support youth programs. Most youth are walking, playing at a park, trying new or trending activities, fishing in freshwater, exploring nature, and riding bikes. Other activities of interest to youth are activities in freshwater such as boating and paddling, fishing in saltwater, target shooting, hiking, outdoor sports, and riding off-road vehicles.

Figure E12. Youth Participation Rates for Washington Residents in Outdoor Activities

Youth Participation Rates Activity	%
Walking	88%
Leisure in parks	78%
Trending activities	77%
Fishing in freshwater	77%
Nature-based activities	75%
Bicycling	74%
Freshwater-based activities*	66%
Target shooting	62%
Hiking	57%
Outdoor sports	57%
Off-road vehicle riding	57%
Fishing in saltwater	53%

*(not swimming)

Plan for Culturally Relevant Parks and Trails to Meet Changing Demographics

Washington's population is expected to grow by 2 million people by 2040 leading to more congestion and competition for recreation resources. Between 2010-2040, the percent of people of color are expected to increase from 27 percent to 44 percent. With the cultural change in the population, preferred recreational activities also will change. By 2030, more than one of every five Washingtonians will be 65 years old or older. By 2040, there will be more seniors than youth. Park and recreation providers should be prepared to create new and diverse opportunities and accommodate the active senior population.

Assert Recreation and Conservation as a Vital Public Service

The plan recognizes that outdoor recreation contributes to a strong economy and is a public investment like other public services and infrastructure. The report cites the Outdoor Industry Association and other economic studies that reinforce the importance of park and recreation services locally, regionally and statewide.

2019 Special Report on Paddlesports & Safety

In 2019, the Outdoor Foundation produced a report focused on paddlesports data based on a participation survey (over 20,000 online interviews with a nationwide sample of individuals and households). In 2018, 22.9 million Americans (approximately 7.4% of the population) participated in paddle sports. This represents an increase of more than 4 million participants since the study began in 2010. Over the last five years, there continues to be an increase in paddlesports popularity among outdoor enthusiasts, with significant portions of the nationwide growth occurring in the Pacific region.

Recreational kayaking continues to grow in popularity but may be driving some of the decline in canoeing. The popularity of stand-up paddling has soared, increasing by 1.5 million participants over the past five years, though it does not have nearly as high a participation rate as either recreational kayaking or canoeing.

Most paddlers are Caucasian, other racial and ethnic groups are largely under-represented. However, Caucasian participation has remained relatively flat while participation by people identifying as Hispanic

or Black/African American has grown by 0.5% to 1% per year since 2013. This growth has led to more than 773,000 new Hispanic paddlers in just six years, signaling the importance and potential of engaging minority groups in paddlesports.

One in eight paddlers have been participating in the sport for 21 years or more. However, many participants – between thirty and sixty percent, depending on the discipline – tried a paddlesport for the first time in 2018. Such high levels of first-time participation may produce longer term growth in paddling, assuming participants continue to enjoy the sport.

Among adult paddlers, most participate for excitement and adventure, for exercise, or to be close to nature. Kayakers, rafters, canoers and stand-up paddlers often enjoy, or would be willing to try, other paddlesports. Many also enjoy similar outdoor "crossover" activities such as hiking, camping, walking, and nature viewing.

Appendix F
Implementation Tools

LOCAL FUNDING OPTIONS

The City of Camas possesses a range of local funding tools that could be accessed for the benefit of growing, developing, and maintaining its parks and recreation facilities and programs. The sources listed below represent potential funding sources, but some also may be dedicated for numerous other local purposes which limit applicability and usage. Therefore, discussions with City leadership are critical to assess the political landscape to modify or expand the use of existing City revenue sources in favor of park and recreation programs.

Councilmanic Bonds

Councilmanic general obligation bonds may be sold by cities without public vote. The bonds, both principal and interest, are retired with payments from existing city revenue or new general tax revenue, such as additional sales tax or real estate excise tax. The state constitution has set a maximum debt limit for councilmanic bonds of 1½% of the assessed value of taxable property in the city.

Voted General Obligation Bond

For the purposes of funding capital projects, such as land acquisitions or facility construction, cities and counties have the authority to borrow money by selling bonds. Voter-approved general obligation bonds may be sold only after receiving a 60 percent majority vote at a general or special election. If approved, an excess property tax is levied each year for the life of the bond to pay both principal and interest. The maximum debt limit for voted debt is 2.5% of the assessed value of taxable property in the city. The state constitution (Article VIII, Section 6) limits total combined debt to 5% of the total assessed value of property in the jurisdiction.

Property Tax Excess Levy – One Year Only

Cities and counties that are levying their statutory maximum rate can ask the voters, at any special election date, to raise their rate for one year (RCW 84.52.052). As this action increases revenue for one-year at a time, it is wise to request this type of funding for one-time uses only. Majority approval by voters is required.

Regular Property Tax - Lid Lift

Cities are authorized to impose ad valorem taxes upon real and personal property. A city's maximum levy rate for general purposes is $3.375 per $1,000 of assessed valuation. Limitations on annual increases in tax collections, coupled with changes in property value, causes levy rates to rise or fall; however, in no case may they rise above statutory limits. Once the rate is established each year, it may not be raised without the approval of a majority of the voters. Receiving voter approval is known as a lid lift. A lid lift may be permanent, or may be for a specific purpose and time period.

A levy lid lift is an instrument for increasing property tax levies for operating and/or capital purposes. Taxing districts with a tax rate that is less than their statutory maximum rate may ask the voters to "lift" the levy lid by increasing the tax rate to some amount equal to or less than their statutory maximum rate. A simple majority vote of citizenry is required.

Cities and counties have two "lift" options available to them: Single-year/basic or Multi-year.

Single-year: The single-year lift does not mean that the lift goes away after one year; it can be for any amount of time, including permanently, unless the proceeds will be used for debt service on bonds, in which case the maximum time period is nine years. Districts may permanently increase the levy but must use language

in the ballot title expressly stating that future levies will increase as allowed by chapter 84.55 RCW. After the initial "lift" in the first year, the district's levy in future years is subject to the 101 percent lid in chapter 84.55 RCW. This is the maximum amount it can increase without returning to the voters for another lid lift.

The election to implement a single-year lift may take place on any election date listed in RCW 29A.04.321.

Multi-year: The multi-year lift allows the levy lid to be "bumped up" each year for up to a maximum of six years. At the end of the specified period, the levy in the final period may be designated as the basis for the calculation of all future levy increases (in other words, be made permanent) if expressly stated in the ballot title. The levy in future years would then be subject to the 101 percent lid in chapter 84.55 RCW.

In a multi-year lift, the lift for the first year must state the new tax rate for that year. For the ensuing years, the lift may be a dollar amount, a percentage increase tied to an index, or a percentage amount set by some other method. The amounts do not need to be the same for each year. If the amount of the increase for a particular year would require a tax rate that is above the maximum tax rate, the assessor will levy only the maximum amount allowed by law.

The election to implement a multi-year lift must be either the August primary or the November general election.

The single-year lift allows supplanting of expenditures within the lift period; the multi-year left does not, and the purpose for the lift must be specifically identified in the election materials. For both single- and multi-year lifts, when the lift expires the base for future levies will revert to what the dollar amount would have been if no lift had ever been done.

The total regular levy rate of senior taxing districts (counties and cities) and junior taxing districts (fire districts, library districts, etc.) may not exceed $5.90/$1,000 AV. If this limit is exceeded, levies are reduced or eliminated in the following order until the total tax rate is at $5.90.

1st.	Parks & Recreation Districts (up to $0.60)
	Parks & Recreation Service Areas (up to $0.60)
	Cultural Arts, Stadiums & Convention Districts (up to $0.25)
2nd.	Flood Control Zone Districts (up to $0.50)
3rd.	Hospital Districts (up to $0.25)
	Metropolitan Parks Districts (up to $0.25)
	All other districts not otherwise mentioned
4th.	Metropolitan Park Districts formed after January 1, 2002 or after (up to $0.50)
5th.	Fire Districts (up to $0.25)
6th.	Fire Districts (remaining $0.50)
	Regional Fire Protection Service Authorities (up to $0.50)
	Library Districts (up to $0.50)
	Hospital Districts (up to $0.50)
	Metropolitan Parks Districts formed before January 1, 2002 (up to $0.50)

Sales Tax

Paid by the consumer, sales tax is a percentage of the retail price paid for specific classifications of goods and services within the State of Washington.

Governing bodies of cities and counties may impose sales taxes within their boundaries at a rate set by state statute and local ordinances, subject to referendum.

Until the 1990 Legislative Session, the maximum possible total sales tax rate paid by purchasers in cities was 8.1 percent. The 8.1 percent is allocated as follows: State, 6.5 cents on the dollar; counties, 0.15 cents; cities, 0.85 cents; and transit districts, a maximum of 0.6 cents (raised to 0.9 cents in 2000). Since then multiple sales options were authorized. Those applicable to Parks and Recreation include: counties may ask voters to approve a sales tax of up to 0.3 percent, which is shared with cities. At least one-third of the revenue must be used for criminal justice purposes.

Counties and cities may also form public facilities districts, and these districts may ask the voters to approve a sales tax of up to 0.2 percent. The proceeds may be used for financing, designing, acquisition, construction, equipping, operating, maintaining, remodeling, repairing, and re-equipping its public facilities.

Revenue may be used to fund any essential county and municipal service.

If a jurisdiction is going to change a sales tax rate or levy a new sales tax, it must pass an ordinance to that effect and submit it to the Department of Revenue at least 75 days before the effective date. The effective date must be the first day of a quarter: January 1, April 1, July 1 or October 1.

Business and Occupation Tax

Business and occupation (B&O) taxes are excise taxes levied on different classes of business to raise revenue. Taxes are levied as a percentage of the gross receipts of a business, less some deductions. Businesses are put in different classes such as manufacturing, wholesaling, retailing, and services. Within each class, the rate must be the same, but it may differ among classes. Cities can impose this tax for the first time or raise rates following referendum procedure.

B&O taxes are limited to a maximum tax rate that can be imposed by a city's legislative body at 0.2 percent (0.002), but grandfathered in any higher rates that existed on January 1, 1982. Any city may levy a rate higher than 0.2 percent, if it is approved by a majority of voters (RCW 35.21.711). Beginning January 1, 2008, cities that levy the B&O tax must allow for allocation and apportionment, as set out in RCW 35.102.130.

Admissions Tax

An admissions tax is a use tax for entertainment. Both cities and counties may impose this tax through legislative action.

Cities and/or counties may levy an admission tax in an amount no greater than five percent of the admission charge, as is authorized by statute (cities: RCW 35.21.280; counties: RCW 35.57.100). This tax can be levied on admission charges (including season tickets) to places such as theaters, dance halls, circuses, clubs that have cover charges, observation towers, stadiums, and any other activity where an admission charge is made to enter the facility.

If a city imposes an admissions tax, the county may not levy a tax within city boundaries.

The statutes provide an exception for admission to elementary or secondary school activities. Generally, certain events sponsored by nonprofits are exempted from the tax; however, this is not a requirement. Counties also exempt any public facility of a public facility district for which admission is imposed. There are no statutory restrictions on the use of revenue.

Impact Fees

Development impact fees are charges placed on new development in unimproved areas to help pay for various public facilities that serve new development or for other impacts associated with such development. Both cities and counties may impose this tax through legislative action.

Counties that plan under the GMA, and cities, may impose impact fees on residential and commercial development activity to help pay for certain public facility improvements, including parks, open space, and recreation facilities identified in the county's capital facilities plan. The improvements financed from impact fees must be reasonably related to the new development and must reasonably benefit the new development. The fees must be spent or encumbered within ten years of collection. Camas currently assesses a parks impact fee and also utilizes impact fee credits as a tool to work with local developers.

Real Estate Excise Tax

Excise tax levied on all sales of real estate, measured by the full selling price, including the amount of any liens, mortgages, and other debts given to secure the purchase. Both cities and counties may impose this tax through legislative action.

Counties and cities may levy a quarter percent tax (REET 1); a second quarter percent tax (REET 2) is authorized. First quarter percent REET (REET 1) must be spent on capital projects listed in the city's capital facilities plan element of their comprehensive plan. Capital projects include planning, acquisition, construction, reconstruction, repair, replacement, rehabilitation, or improvement of parks, recreational facilities, and trails.

The second quarter percent REET (REET 2) must also be spent on capital projects, which includes planning, construction, reconstruction, repair, rehabilitation, or improvement of parks. Acquisition of land for parks is not a permitted use of REET 2. Both REET 1 and REET 2 may be used to make loan and debt service payments on projects that are a permitted use of these funds. The City of Camas currently assesses both REETs and uses this funding for a variety of capital project needs.

Lodging Tax

The lodging tax is a user fee for hotel/motel occupation. Both cities and counties may impose this tax through legislative action.

Cities and/or counties may impose a "basic" two percent tax under RCW 67.28.180 on all charges for furnishing lodging at hotels, motels and similar establishments for a continuous period of less than one month.

This tax is taken as a credit against the 6.5 percent state sales tax, so that the total tax that a patron pays in retail sales tax and hotel-motel tax combined is equal to the retail sales tax in the jurisdiction. In addition, jurisdictions may levy an additional tax of up to two percent, or a total rate of four percent, under RCW 67.28.181(1). This is not credited against the state sales tax. Therefore, if this tax is levied, the total tax on the lodging bill will increase by two percent.

If both a city and the county are levying this tax, the county must allow a credit for any tax levied by a city so that no two taxes are levied on the same taxable event. These revenues must be used solely for paying for tourism promotion and for the acquisition and/or operating of tourism-related facilities. "Tourism" is defined as economic activity resulting from tourists, which may include sales of overnight lodging, meals, tours, gifts, or souvenirs; there is no requirement that a tourist must stay overnight.

Conservation Futures Tax (Clark County)

The Conservation Futures Tax (CFT) is provided for in Chapter 84.34 of the Revised Code of Washington. Clark County imposes a Conservation Futures levy for the purpose of acquiring open space lands, including green spaces, greenbelts, wildlife habitat and trail rights-of-way proposed for preservation for public use by either the county or the cities within the county. Funds are allocated annually, and cities within the county, citizen groups and citizens may apply for funds through the county's process. The CFT program provides grants

to cities to support open space priorities in local plans and is administered by the County's Legacy Lands Program in the Parks & Lands Division of Public Works.

FEDERAL & STATE GRANTS AND CONSERVATION PROGRAMS

RIVERS, TRAILS AND CONSERVATION ASSISTANCE PROGRAM

The Rivers, Trails and Conservation Assistance Program, also known as the Rivers & Trails Program or RTCA, is a technical assistance resource for communities administered by the National Park Service and federal government agencies so they can conserve rivers, preserve open space and develop trails and greenways. The RTCA program implements the natural resource conservation and outdoor recreation mission of NPS in communities across America.

RECREATION AND CONSERVATION OFFICE GRANT PROGRAMS

The Recreation and Conservation Office was created in 1964 as part of the Marine Recreation Land Act. The RCO grants money to state and local agencies, generally on a matching basis, to acquire, develop, and enhance wildlife habitat and outdoor recreation properties. Some money is also distributed for planning grants. RCO grant programs utilize funds from various sources. Historically, these have included the Federal Land and Water Conservation Fund, state bonds, Initiative 215 monies (derived from un-reclaimed marine fuel taxes), off-road vehicle funds, Youth Athletic Facilities Account and the Washington Wildlife and Recreation Program.

Aquatic Lands Enhancement Account (ALEA)

This program, managed through the RCO, provides matching grants to state and local agencies to protect and enhance salmon habitat and to provide public access and recreation opportunities on aquatic lands. In 1998, DNR refocused the ALEA program to emphasize salmon habitat preservation and enhancement. However, the program is still open to traditional water access proposals. Any project must be located on navigable portions of waterways. ALEA funds are derived from the leasing of state-owned aquatic lands and from the sale of harvest rights for shellfish and other aquatic resources.

Washington Wildlife & Recreation Program (WWRP)

Funding sources managed by the RCO include the Washington Wildlife and Recreation Program. The WWRP is divided into Habitat Conservation and Outdoor Recreation Accounts; these are further divided into several project categories. Cities, counties and other local sponsors may apply for funding in urban wildlife habitat, local parks, trails and water access categories. Funds for local agencies are awarded on a matching basis. Grant applications are evaluated once each year, and the State Legislature must authorize funding for the WWRP project lists.

Land and Water Conservation Fund (LWCF)

The Land and Water Conservation Fund (LWCF) provides grants to buy land and develop public outdoor facilities, including parks, trails and wildlife lands. Grant recipients must provide at least 50% matching funds in either cash or in-kind contributions. Grant program revenue is from a portion of Federal revenue derived from sale or lease of off-shore oil and gas resources.

National Recreational Trails Program

The National Recreational Trails Program (NRTP) provides funds to maintain trails and facilities that provide a backcountry experience for a range of activities including hiking, mountain biking, horseback

riding, motorcycling, and snowmobiling. Eligible projects include the maintenance and re-routing of recreational trails, development of trail-side and trail-head facilities, and operation of environmental education and trail safety programs. A local match of 20% is required. This program is funded through Federal gasoline taxes attributed to recreational non-highway uses.

Youth Athletic Facilities (YAF) Program

The YAF provides grants to develop, equip, maintain, and improve youth and community athletic facilities. Cities, counties, and qualified non-profit organizations may apply for funding, and grant recipients must provide at least 50% matching funds in either cash or in-kind contributions.

OTHER TOOLS & OPTIONS

Metropolitan Park District

Metropolitan park districts may be formed for the purposes of management, control, improvement, maintenance and acquisition of parks, parkways and boulevards. In addition to acquiring and managing their own lands, metropolitan districts may accept and manage park and recreation lands and equipment turned over by any city within the district or by the county. Formation of a metropolitan park district may be initiated in cities of five thousand population or more by city council ordinance, or by petition, and requires majority approval by voters for creation. Several years ago, the City started a preliminary look at the MPD as a tool for Camas Parks and Recreation. With some existing information, the City could continue evaluation of MPD along with other implementation tools to develop their long-term funding strategy.

Park and Recreation District

Park and recreation districts may be formed for the purposes of providing leisure-time activities and recreation facilities (parks, playgrounds, pools, golf courses, paths, community centers, arboretums, campgrounds, boat launches, etc.) and must be initiated by petition of at least 15% percent of the registered voters within the proposed district. Upon completion of the petition process and review by county commissioners, a proposition for district formation and election of five district commissioners is submitted to the voters of the proposed district at the next general election. Once formed, park and recreation districts retain the authority to propose a regular property tax levy, annual excess property tax levies and general obligation bonds. All three of these funding types require 60% percent voter approval and 40% percent voter turnout. With voter approval, the district may levy a regular property tax not to exceed sixty cents per thousand dollars of assessed value for up to six consecutive years.

Park and Recreation Service Area (PRSA)

A quasi-municipal corporation with independent taxing authority whose purpose is to finance, acquire, construct, improve, maintain or operate any park, senior citizen activities center, zoo, aquarium and/or recreation facilities; and to provide higher level of park service.

Sponsorships / Donations / Naming Rights

Business sponsorships for programs may be available throughout the year. In-kind contributions are often received, including food, door prizes and equipment/material. Naming rights could be considered for substantial gifts and may have time limitations, depending on local policy.

Interagency Agreements

State law provides for interagency cooperative efforts between units of government. Joint acquisition, development and/or use of park and open space facilities may be provided between Parks, Public Works and utility providers.

Private Grants, Donations & Gifts

Many trusts and private foundations provide funding for park, recreation and open space projects. Grants from these sources are typically allocated through a competitive application process and vary dramatically in size based on the financial resources and funding criteria of the organization. Philanthropic giving is another source of project funding. Efforts in this area may involve cash gifts and include donations through other mechanisms such as wills or insurance policies. Community fundraising efforts can also support park, recreation or open space facilities and projects.

ACQUISITION TOOLS & METHODS

Direct Purchase Methods

Market Value Purchase

Through a written purchase and sale agreement, the city purchases land at the present market value based on an independent appraisal. Timing, payment of real estate taxes and other contingencies are negotiable.

Partial Value Purchase (or Bargain Sale)

In a bargain sale, the landowner agrees to sell for less than the property's fair market value. A landowner's decision to proceed with a bargain sale is unique and personal; landowners with a strong sense of civic pride, long community history or concerns about capital gains are possible candidates for this approach. In addition to cash proceeds upon closing, the landowner may be entitled to a charitable income tax deduction based on the difference between the land's fair market value and its sale price.

Life Estates & Bequests

In the event a landowner wishes to remain on the property for a long period of time or until death, several variations on a sale agreement exist. In a life estate agreement, the landowner may continue to live on the land by donating a remainder interest and retaining a "reserved life estate." Specifically, the landowner donates or sells the property to the city, but reserves the right for the seller or any other named person to continue to live on and use the property. When the owner or other specified person dies or releases his/her life interest, full title and control over the property will be transferred to the city. By donating a remainder interest, the landowner may be eligible for a tax deduction when the gift is made. In a bequest, the landowner designates in a will or trust document that the property is to be transferred to the city upon death. While a life estate offers the city some degree of title control during the life of the landowner, a bequest does not. Unless the intent to bequest is disclosed to and known by the city in advance, no guarantees exist with regard to the condition of the property upon transfer or to any liabilities that may exist.

Gift Deed

When a landowner wishes to bequeath their property to a public or private entity upon their death, they can record a gift deed with the county assessors office to insure their stated desire to transfer their property to the targeted beneficiary as part of their estate. The recording of the gift deed usually involves the tacit agreement of the receiving party.

Option to Purchase Agreement

This is a binding contract between a landowner and the city that would only apply according to the conditions of the option and limits the seller's power to revoke an offer. Once in place and signed, the Option Agreement may be triggered at a future, specified date or upon the completion of designated conditions. Option Agreements can be made for any time duration and can include all of the language pertinent to closing a property sale.

Right of First Refusal

In this agreement, the landowner grants the city the first chance to purchase the property once the landowner wishes to sell. The agreement does not establish the sale price for the property, and the landowner is free to refuse to sell it for the price offered by the city. This is the weakest form of agreement between an owner and a prospective buyer.

Conservation and/or Access Easements

Through a conservation easement, a landowner voluntarily agrees to sell or donate certain rights associated with his or her property (often the right to subdivide or develop), and a private organization or public agency agrees to hold the right to enforce the landowner's promise not to exercise those rights. In essence, the rights are forfeited and no longer exist. This is a legal agreement between the landowner and the city that permanently limits uses of the land in order to conserve a portion of the property for public use or protection. The landowner still owns the property, but the use of the land is restricted. Conservation easements may result in an income tax deduction and reduced property taxes and estate taxes. Typically, this approach is used to provide trail corridors where only a small portion of the land is needed or for the strategic protection of natural resources and habitat. Through a written purchase and sale agreement, the city purchases land at the present market value based on an independent appraisal. Timing, payment of real estate taxes and other contingencies are negotiable.

Park or Open Space Dedication Requirements

Local governments have the option to require developers to dedicate land for parks under the State Subdivision Law (Ch. 58.17 RCW) and the State Environmental Policy Act (SEPA) (Ch. 43.21C RCW). Under the subdivision law developers can be required to provide the parks/recreation improvements or pay a fee in lieu of the dedicated land and its improvements. Under the SEPA requirements, land dedication may occur as part of mitigation for a proposed development's impact.

Landowner Incentive Measures

Density Bonuses

Density bonuses are a planning tool used to encourage a variety of public land use objectives, usually in urban areas. They offer the incentive of being able to develop at densities beyond current regulations in one area, in return for concessions in another. Density bonuses are applied to a single parcel or development. An example is allowing developers of multi-family units to build at higher densities if they provide a certain number of low-income units or public open space. For density bonuses to work, market forces must support densities at a higher level than current regulations.

Transfer of Development Rights

The transfer of development rights (TDR) is an incentive-based planning tool that allows land owners to trade the right to develop property to its fullest extent in one area for the right to develop beyond existing regulations in another area. Local governments may establish the specific areas in which development may

be limited or restricted and the areas in which development beyond regulation may be allowed. Usually, but not always, the "sending" and "receiving" property are under common ownership. Some programs allow for different ownership, which, in effect, establishes a market for development rights to be bought and sold.

IRC 1031 Exchange

If the landowner owns business or investment property, an IRC Section 1031 Exchange can facilitate the exchange of like-kind property solely for business or investment purposes. No capital gain or loss is recognized under Internal Revenue Code Section 1031 (see www.irc.gov for more details). This option may be a useful tool in negotiations with an owner of investment property, especially if the tax savings offset to the owner can translate to a sale price discount for the City.

Current (Open Space) Use Taxation Programs

Property owners whose current lands are in open space, agricultural, and/or timber uses may have that land valued at their current use rather than their "highest and best" use assessment. This differential assessed value, allowed under the Washington Open Space Taxation Act (Ch.84.34 RCW) helps to preserve private properties as open space, farm or timber lands. If land is converted to other non-open space uses, the land owner is required to pay the difference between the current use annual taxes and highest/best taxes for the previous seven years. When properties are sold to a local government or conservation organization for land conservation/preservation purposes, the required payment of seven years worth of differential tax rates is waived. The amount of this tax liability can be part of the negotiated land acquisition from private to public or quasi-public conservation purposes. Clark County has a current use taxation program that offer this property tax reduction as an incentive to landowners to voluntarily preserve open space, farmland or forestland on their property.

OTHER LAND PROTECTION OPTIONS

Land Trusts & Conservancies

Land trusts are private non-profit organizations that acquire and protect special open spaces and are traditionally not associated with any government agency. Columbia Land Trust is the regional land trust serving the Camas area, and their efforts have led to the conservation of more than 50,000 acres of forests, shorelines, parks and natural areas in the region. Other national organizations with local representation include the Nature Conservancy, Trust for Public Land and the Wetlands Conservancy.

Regulatory Measures

A variety of regulatory measures are available to local agencies and jurisdictions. Available programs and regulations include: Critical Areas Ordinance, Camas; State Environmental Policy Act (SEPA); Shorelines Management Program; and Hydraulic Code, Washington State Department of Fisheries and Department of Wildlife.

Public / Private Utility Corridors

Utility corridors can be managed to maximize protection or enhancement of open space lands. Utilities maintain corridors for provision of services such as electricity, gas, oil, and rail travel. Some utility companies have cooperated with local governments for development of public programs such as parks and trails within utility corridors.

Appendix G
Site Acquisition & Development Guidelines

ACQUISITION GUIDELINES

Planning and land acquisition for future parks is a recognized component in land use and urban growth management, since the provision of parks and open space is considered essential to the livability of urban areas. For the recreation resource planner, the land acquisition process is an important task for ensuring the availability of future recreation resources for the majority of the community. The established planning goals for a community's comprehensive plan recognize the development of parks and retention of open space with conservation values as a tool for managing the effects of increased density and fostering livability.

Specific Site Suitability for Developed/Active Parks

While existing neighborhood parks may range from 2.3 to 10 acres in size, some basic location and land characteristics influence how accessible, "developable" and convenient a potential site might be for a future public park. Evaluating a potential land parcel should include consideration of the following property features:

- Access and visibility to the property. An adequate amount of public right-of-way is needed to allow for creating bike/pedestrian pathways, at a minimum, and either on-street parking or a parking lot for park visitors who must drive a vehicle.
- Existing publicly owned lands, easements and right-of-way. Are there existing lands under public ownership that could be converted to public park use? What other public amenities are proximate and complementary to a future park development (e.g., schools, police stations, etc.)?
- Connectivity to trails, schools, parks, neighborhoods and connectivity of the trail links. Connections to and from related land uses can add value to a potential park location.
- Environmental constraints, field assessment (does not include Environmental Assessment level detail), regulatory and permitting requirements and GIS data for critical areas. Sensitive environmental lands should be protected, but often they are not the best sites for development of recreational amenities for public parks. Protected and conserved lands can provide complementary value to public parks, while the public park land can create a buffer for the conserved land.
- Topography. Existing landforms, whether flat or hilly, will influence the park's design and best fit for provision of recreational facilities.
- Technical analysis of park standards and development costs should be evaluated to help provide realistic site development costs. For example, existing road improvements within the public right-of-way or lack of public water and sewer may trigger additional park development costs.

Within identified neighborhoods that may lack or have limited access to public parks, potential properties should be evaluated for suitable site conditions for the development of future recreational amenities and/or access to natural resources and water.

Neighborhood/Community Park Site Suitability Criteria:

- Access / visibility
- Parcel size / configuration
- Contiguous public land / connectivity
- Extent of sensitive areas
- Cost factors (acquisition, development & maintenance.)
- Compatibility with surrounding uses
- Vacant land preference

Trail Site Suitability Criteria:

- Development feasibility
- Continuity / connectivity (“safe routes”)
- Natural, cultural, historic value
- Public ROW access
- Land costs / value

Urban Natural Areas Site Suitability Criteria:

- Ecological, cultural, historic value
- Continuity / connectivity
- Public right of way access
- Development pressure (threat of conversion)
- Acquisition costs, donations, grants, third-party support (i.e., land trusts), etc.

Site-Specific Concerns

- Once a targeted park land acquisition has been identified and evaluated with consideration to its potential suitability as a future pubic park, more specific assessments should be conducted to ensure a measure of known development variables for future park use.
- A boundary survey and review of the title is important to identify an existing encroachments, encumbrances or entitlements that need to be addressed or corrected prior to closing.
- Environmental constraints, such as wetlands, waterways, other sensitive habitats and any associated buffers, should be identified to determine their impact on developable park spaces.
- An environmental site assessment should be conducted to identify environmental conditions that could have resulted from a past release of hazardous substances and determine any potential mitigation requirements to protect public health. Additionally, environmental law typically leaves the burden of responsibility on the property owner, so conducting an environmental site assessment is important to protect the City’s liability.
- An archaeological assessment to review potential cultural resources may also help bring to light future park development costs and variables.
- Any underground tanks, wells, septic systems and existing structures should be evaluated for the need to remove, decommission, or demolish after closing of land sale.
- Preliminary analysis of O&M cost for holding property until development.

Design Standards for Environmental Site Assessment

Considering a current use of a property is typically not sufficient for evaluating potential environmental concerns. For example, a vacant lot may previously have been used for agricultural purposes and may contain pesticide residues in the soil, or a current retail building formerly may have housed an auto repair business with underground tanks. Additionally, properties that are considered low-risk, such as a residence, could have a leaking underground heating oil tank or other concerns. Therefore, conducting an environmental site assessment is an important step in purchasing and managing property.

Prior to purchasing or accepting ownership of a property, the City should conduct an environmental site assessment to determine if contaminated soil, sediment or groundwater could be present. This process typically begins with a Phase I Environmental Site Assessment (ESA) per ASTM E1527-13 to identify environmental conditions or other business risk issues that could impact site development, pose a liability to the City, or present a risk to human health or the environment. Depending on the results of the Phase I ESA, a subsequent Phase II ESA may be warranted to sample and test soil, sediment or groundwater for the presence of contamination.

For property currently owned by the City, conducting an ESA prior to redevelopment can help to identify issues that could affect building design or result in construction delays.

For property that will be leased by the City, conducting a baseline environmental assessment may be warranted to establish initial conditions prior to the City occupying the site.

PRESERVING FUNDING ELIGIBILITY

Public outdoor park and recreation areas and facilities are eligible for funding assistance through the Washington Recreation and Conservation Office (RCO). Land acquisition projects must be consistent with the outdoor recreation goals and objectives contained in the Statewide Comprehensive Outdoor Recreation Plan (SCORP) or the recreation elements of local comprehensive plans and local master plans. Acquisition of land and waters for public outdoor recreation areas and facilities, including new areas or additions to existing parks, forests, wildlife areas, open spaces and other similar areas dedicated to outdoor recreation are eligible for assistance through the RCO. To be eligible, the acquisition procedures set forth by the RCO should be closely followed.

DESIGN & DEVELOPMENT GUIDELINES

With planned park upgrades and the potential for development of park acquisitions, Camas would benefit from park design and facility standards that help unify the system's amenities, operations and maintenance going into the future. Standards can begin with the adoption of typical bench details and expand to incorporate graphic sign styles, materials, colors and specific site furnishings. With the desire for Camas to create a unifying identity and enhance park maintenance efficiencies, guidelines for park standards should be planned, endorsed and implemented.

If the City should annex its urban reserve area, the acquisition and development of additional parks will be necessary. There may be opportunities to partner with residential development projects for providing new parks to be dedicated to the City upon completion. The establishment of park design and development

standards with predetermined requirements for consistency and quality of site amenities would ensure that new parks could readily fit within on-going park operations and maintenance.

All newly developed parks and trails shall adhere to the Final Guidelines for Outdoor Developed Areas as set forth by the United States Access Board.

Design Standards for Parks

Public park space should be clearly identifiable and provide a safe and secure environment for outdoor recreation and enjoyment. To help communicate the identity, amenities and uses within the park, some unified design standards should be applied. These standards are intended to help with public access, communication of safety and appropriate behaviors, and efficiency in operations and maintenance without creating a park system of identical "cloned" urban parks. Standardizing the designs for park signage, benches, picnic tables, drinking fountains, lighting, bollards, irrigation systems and fencing can allow for easier and less expensive procurement, installation, maintenance and replacement. The visual character of unified park amenities can quickly convey to the park visitor that the space is part of an overall system of public spaces where they are welcome.

While sharing standard site furnishings and signage styles helps unify the system identity, each individual park should have its own unique character. The shape and size of the land, the layout of circulation and location of key features, the styles, types and colors of play equipment, the architecture of restrooms, picnic and other park structures should be specific to that park. Even though each park contains some standardized site furnishings, each park site master plan design should strive to create a sense of place that highlights the character of that park in its local context and for its primary purpose (such as passive park with natural area or active sports-oriented facility).

The following tables highlight the range and considerations of various amenities that may be provided within urban parks (community and neighborhood parks) and can provide guidance for negotiating facility development opportunities in situations when private entities propose park development in-lieu of payment or for other, alternative arrangements, such as density bonuses.

Figure G1. Minimum Site Design Considerations for Neighborhood Parks

Amenity	Considerations - where feasible
Playground	▪ Minimum of 4,000 sq.ft. play area ▪ Equipment should be suitable for and developmentally-appropriate for toddlers and elementary school-aged children ▪ Playground should be ADA Accessible and play equipment should be ADA Compliant
Loop Walking Path	▪ Minimum 8' wide ▪ ADA-compliant surface to accessible elements (benches, tables, play area) ▪ Pathway slope not to exceed 5% grade or no more than 8% for more than 30 lineal feet without switchbacks or railings
Picnic Tables	▪ Minimum of 2, Use standard ADA compliant picnic table style
Drinking Fountain	▪ Provide ADA-compliant standard fixture. Install water bottle fill station as appropriate
Benches	▪ Minimum of 2, Use standard ADA compliant bench style
Open Turf Area	▪ Provide at least 15% of total lawn area with irrigation, preferably adjacent to the play area
Trees & Landscaping	▪ Provide shade for portion of playground area ▪ New trees and shrubs should be irrigated for a minimum of 2 years until established
Bicycle Racks	▪ Minimum of 2, with capacity to serve 4 bikes
Trash Receptacles & Dog Waste Disposal Stations	▪ Minimum of 1

For community parks, any or all of the following outdoor recreation features should be considered in addition to the same amenities provided in neighborhood parks.

Figure G2. Minimum Site Design Considerations for Community Parks

Amenity	Considerations - where feasible
Parking	▪ Based on types of amenities and their parking quantity requirements ▪ Include requisite number of handicapped parking stalls at appropriate locations ▪ Consider need for parking provision at multiple access points, where appropriate
Loop Walking Path	▪ Provide a perimeter trail in addition to pathways accessing all major park amenities
Multiple Access Points	▪ Provide connectivity to neighborhoods, nearby trails and public rights-of-way
Restrooms	▪ Provide ADA-compliant standardized design facilities
Picnic Shelter	▪ Provide minimum of 1 group picnic shelter
Sports fields	▪ Type and quantity dependent on available space and current public demand for each sport facility. Also depends on proximity to similar amenities within the city and/or region
Sports courts	▪ Type and quantity dependent on available space and current public demand for each sport facility. Also depends on proximity to similar amenities within the city and/or region
Tree Canopy	▪ Target a 25-45% tree canopy dependent on other park amenities and feasibility
Open Grass Area	▪ Open play area with sun exposure ▪ Minimum target of 1 acre
Natural Areas	▪ Based on existing and restored environmental characteristics
Off-leash Dog Area	▪ Minimum target of 1 acre ▪ Fenced enclosure with double-gate access ▪ Provide doggy waste dispenser and trash receptacle at entrance

Figure G3. Design Considerations for Other Park Amenities

Amenity	Considerations
Picnic Shelter	▪ Minimum of 400 sq.ft.
Sport field	▪ Practice level for youth soccer, T-ball, baseball and/or softball
Sport court	▪ ½ court basketball court
Tennis court	
Alternative recreation court	▪ Such as bocce ball, pickleball, horseshoes, lawn bowling
Skate spot	▪ 600 to 1,200 sq.ft. with small ramps, bowls or features for beginners
Disc golf course	▪ Minimum 9 baskets
Splash pad	
Natural area	
Water feature	▪ Such as a passive water-based amenity that provides a visual focal point, i.e. fountains, ponds, or waterfalls
Restroom	
Utilities	▪ Automatic Irrigation, Electricity, Water
Parking	

Design Standards for Open Space & Natural Areas

Open space and natural areas are primarily intended to conserve places with ecological sensitivity or natural landscape value. Most natural areas have some space where low-impact recreational uses and trails can be accommodated without reducing the environmental integrity of the land or water resource. Since the open space can range from wetlands and riparian corridors to fields and forests, design standards are not applied uniformly across the site. Each natural landscape is treated according to its level of sensitivity, need for conservation/restoration and tolerance for outdoor recreational use. However, where passive recreation opportunities such as trails can be provided, the standardized designs for park benches, picnic tables, signs and other site amenities should be applied.

Design Standards for Special Use Facilities

Consideration should be given in the design and renovation of any special use facility as to how and how much the site and its amenities should be identifiable within the park system through the application of standardized park signage and site furnishings. For example, a future sport field complex could accommodate some of the standardized park benches, picnic tables and signage, but it would also require its own specialized features, such as bleachers, backstops, field lighting, score boards and other equipment, that are unique to the facility. Each master plan design for new facilities should give careful consideration as to how a unique sense of place and identity is conveyed while still communicating that the facility is part of a system of outdoor recreation accommodation provided by the City of Camas.

Design Standards for Trails

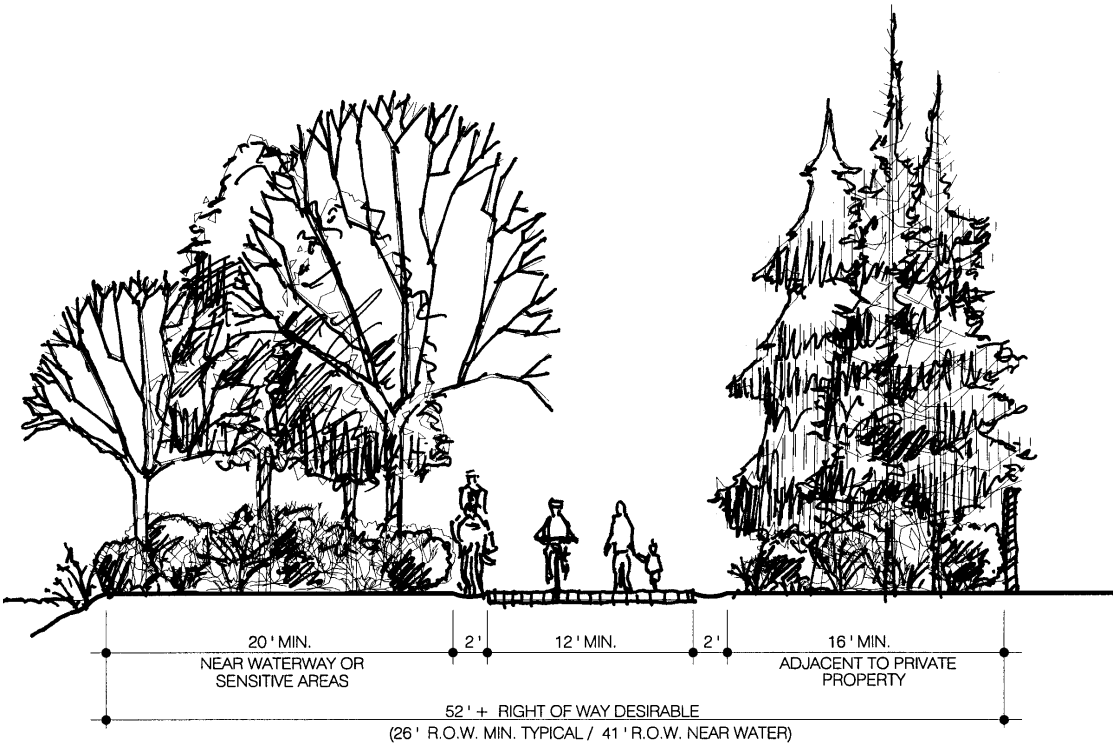
A successful trail system is integrated with other transportation alternatives to include a range of trail, sidewalk, bike path and connection opportunities designed to the human scale. The typical recreational trail hierarchy is aligned from regional shared-use trails to local neighborhood paths and park trails. Trail systems can also incorporate specially designated trails for single track mountain biking, primitive hiking and equestrian uses.

Designing the actual physical trail starts with overall purpose of the trail, connecting travelers from one location to another (point A to point B) or through a particular environment (loop trail through a park). With a clear purpose for the trail, an appropriate alignment can then be determined to help provide the desired outdoor recreation experience or transportation value. For example, regional multi-use shared trails should be designed to a minimum width of 12 feet. In expanding urban centers, providing a 16-foot trail width can help accommodate significant bike and pedestrian use as the community grows and linkages to public transit enable increased trail usage. The most heavily used urban trails benefit from the installation of permanent pavement to withstand heavy traffic in a variety of weather conditions.

It should be noted that changes in transportation engineering and trail construction methods may warrant the need to update trail design standards over time. Site furnishings along the trail are one method for standardizing trails as part of the outdoor recreation system provided by Camas. The same benches, picnic tables, bollards and other site furnishings used throughout Camas' park system could be installed along its trails to help unify the sense of place, reduce procurement costs and simplify maintenance.

The unifying standard for Camas' trail system can be visually expressed through a designed wayfinding plan. Linked with the park system wayfinding, the trail signage should provide identification, direction, destination, travel information and safety messaging, while clearly reinforcing Camas' sense of place.

Trails should be constructed according to City specifications. It is recommended that trail layout and surfacing materials be approved by the City and meet the following general requirements:



- Surfacing should be appropriate to the location; paved asphalt or concrete is recommended for upland areas, and wood chip, crusher waste or boardwalks are appropriate in lowland, wet or sensitive areas (City codes shall apply)
- Hard-surfaced trails should comply with ADAAG guidelines for slope and cross-slope; soft-surfaced trails should include properly placed and designed water bars or other surface water management techniques to minimize run-off and erosion.
- Entry signage should be provided at trailheads or access points, and boundary signage should be placed, as appropriate, to demarcate sensitive edges or private property boundaries.
- Trash receptacles should be provided at trailheads.

The four classifications of trails include: Regional, Local, Rustic, and Semi-Primitive. A primary distinguishing feature of City-owned trails is that these trails predominantly serve community-wide and regional purposes and receive this level of use. Local and secondary trails generally serve a local scale, at the neighborhood level. Such local and secondary trails will generally be owned and maintained by Homeowners Associations. While Regional and Local trails are designed as multiple use trails, Rustic and Semi-Primitive trails can be designed as single use trails.

Regional Trail

This trail type is designed to accommodate multiple uses (walking, running, bicycling) and connect to adjoining jurisdictions or destinations. The surfacing should be a minimum of 12 feet wide and be constructed of a hard surface material such as asphalt or concrete. Exceptions to surfacing materials may occur to mitigate impacts to critical or sensitive areas. Equestrian use could be permitted if an additional unpaved shoulder area is provided. The right-of-way required for regional trails should be 26 to 52 feet, depending on their location and surroundings. This type of trail is typically located off roadway surfaces and within its own corridor. A diagram of this trail standard is located in Figure G4.

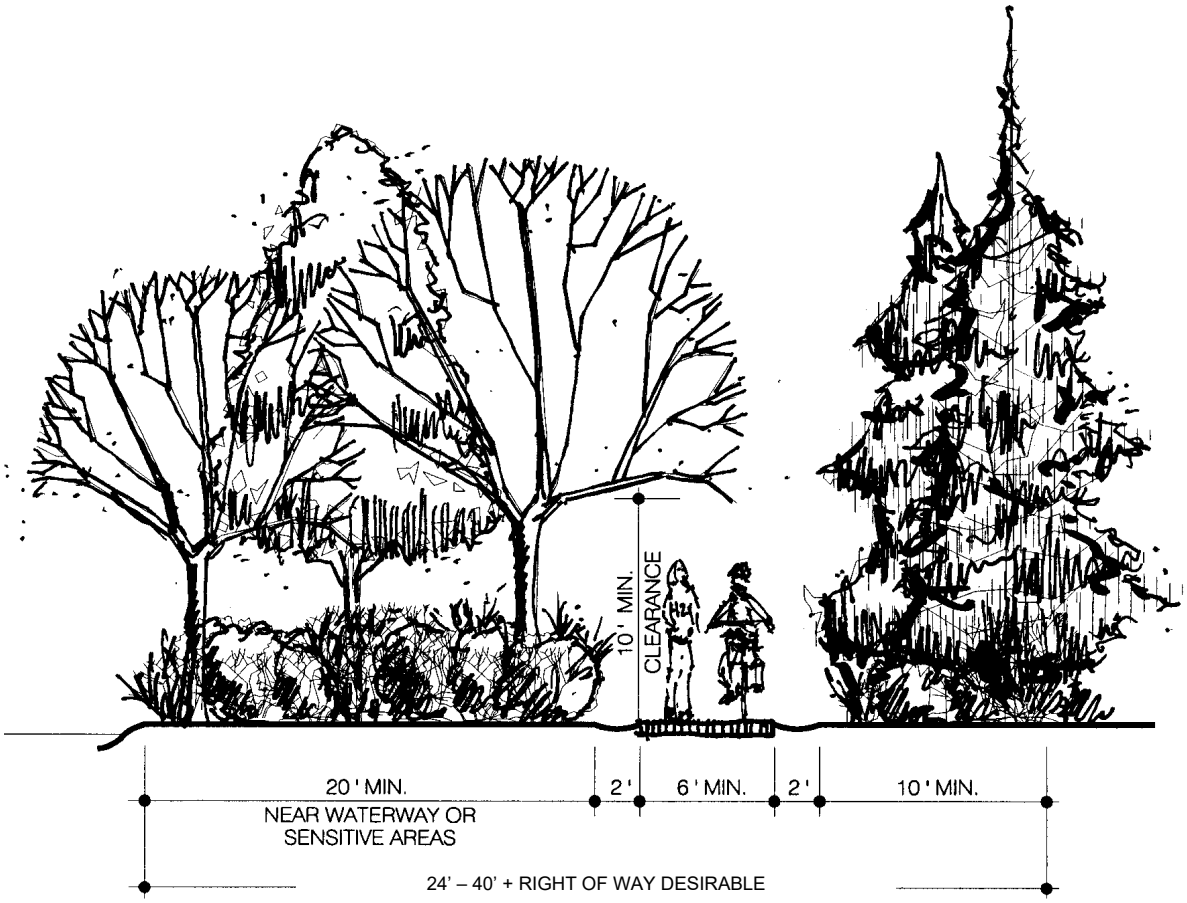


Figure G4. Regional Trail Cross Section

Local Trail

This trail type is designed to serve the local community and also provide access to the regional trail systems. It should be considered the "backbone" of the city's trail network. The trail width should range from six to ten feet depending on the use and the terrain involved. It can be designed to accommodate the same uses listed for the regional trail. The surface for this type of trail may be paved or crushed aggregate depending on the use. Exceptions to surfacing materials may occur to mitigate impacts to critical or sensitive areas. The right of way for the local trail can range from 24 feet to 40 feet and can also be located on-road or off-road. Figure G5 is a typical configuration of a local trail.

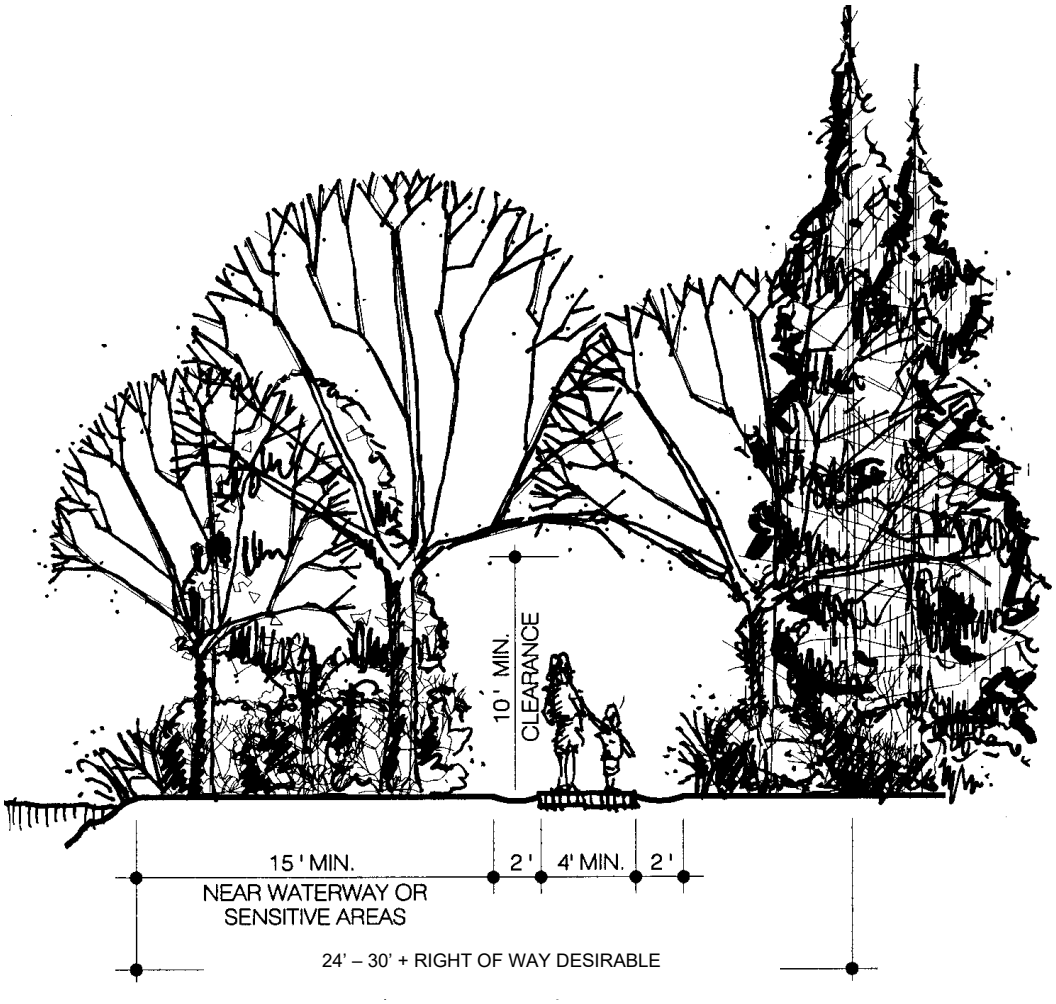

Figure G5. Local Trail Cross Section

Rustic Trail

This trail type provides access to local trails, and is more neighborhood-oriented. These trails will act as collectors for neighborhoods or developments and provide links to the community-wide trail system and other adjoining destinations. The rustic trail should be a minimum of four feet wide and be surfaced with stable accessible surfacing. The primary uses of a rustic trail are intended to be walking, bicycling and equestrian. The right-of-way widths desired for the rustic trail can range from 24 feet to 30 feet or more. These trails are always off-road in nature. Figure G6 details this trail classification.

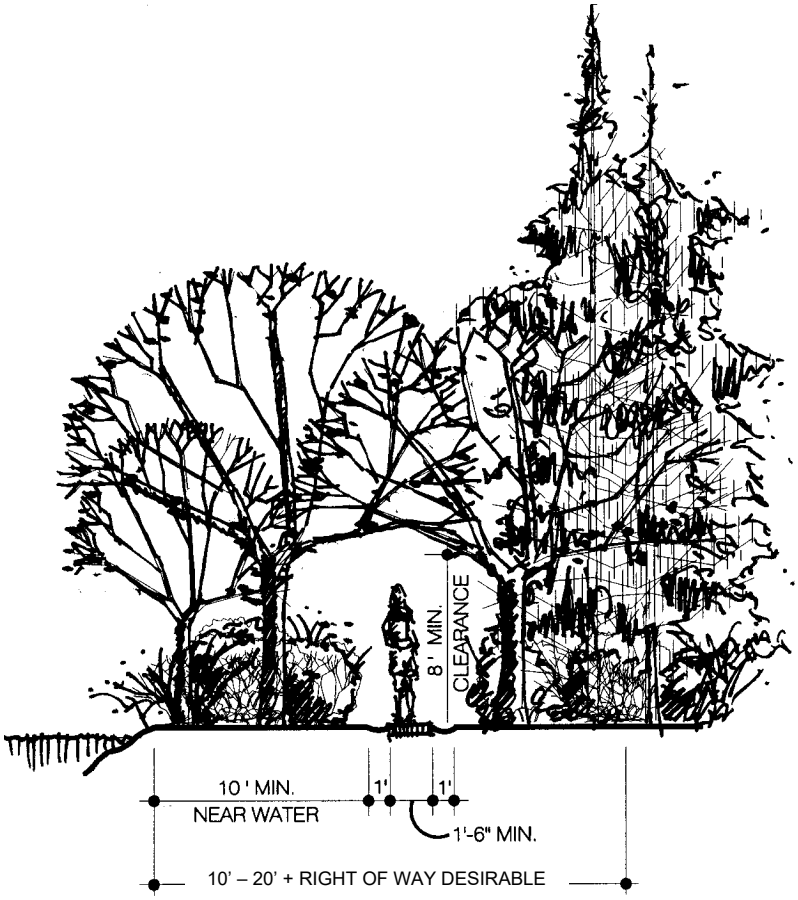

Figure G6. Rustic Trail Cross Section

Semi-Primitive Trail

This trail type is more specialized with regard to use, but it is more easily adaptable to the open space areas. It will serve in the more sensitive open space areas located within the city. It is designed to accommodate walkers, hikers, bicyclists, and equestrian users. It is typically two to four feet in width and is made up of compacted earth or other stable surfacing. The right-of-way width can range from ten to 20 feet. Typically, maintenance of these trails is minimal. Figure G7 below details the standards for this trail.

Figure G7. Semi-Primitive Trail Cross Section

Locating Trails in Sensitive (Critical) Areas

The large number of environmentally sensitive (critical) areas in Camas makes it likely that trails will be developed in some of these areas. The benefits of public access to natural areas (bird watching, nature appreciation, and environmental education) need to be balanced with the impacts of access.

Trails in environmentally sensitive areas will need to be carefully and appropriately located and designed. Exceptions to the trail improvement standards set forth in this Plan may be authorized in sensitive areas consistent with current best practices. This document recommends a thorough review and assessment of existing and proposed trail corridors, and careful placement of trails within sensitive areas to aid in minimizing the impacts. Guidelines for determining the suitability of trail locations in sensitive areas include the following:

1) Provide a minimum 20-foot wide vegetated buffer between wetland, sensitive area or water edge and the trail.
2) Construct boardwalks, railings, see-through fences and viewpoints to allow visual access to the areas and to keep trail users on the trail and away from the habitat.
3) Design wetland crossings for maximum protection of the wetland and locate them in an area suitable for public use.
4) Provide adjacent vegetation at access points that is dense enough to discourage off-trail travel. If necessary, install additional thick or thorny vegetation to prevent access.

5) Cover earthen based trails with dense turf where it crosses floodplains or other areas subject to periodic flooding to reduce puddling and walkers skirting the area.
6) Site trails away from active stream channels to prevent local bank erosion cause by trampling. In streamside locations where access is permitted or encouraged, provide access via boardwalks.
7) Locate bridge crossings in locations that will provide minimum impact to the water's edge and habitat while providing a rewarding experience for the trail user.

Recommended Trail Segments

The recommended trails plan provides a linked system based on a hierarchy of trail types. Linkages are provided at the neighborhood scale, at the community-wide scale, and regionally. The Potential Trails Map (Map 8) provides an overview of the segments, described in detail below. Proposed segments of the trail system are generalized to make connections or follow the direction of natural corridors. Final alignments are subject to change due to environmental conditions, development or alternate routes.

The following trail segment descriptions are excerpted from the 2014 PROS Plan.

Trail T-1

Trail T-1 runs along the west side of Camas, paralleling Parker Road. This trail segment provides a north-south connection and links two regional trails. About half of the alignment has been constructed. This segment passes from Prune Hill Park, to Ash Creek Park, past Sky Ridge Middle School and ending at its junction with T-3.

Trail T-2

Trail T-2 parallels the Columbia River. This regional trail is an extension of the Vancouver-Clark County trail system, and connects to neighboring Washougal's trail system. This trail provides visual access to the Columbia River, and makes an important regional connection.

Trail T-3

Trail T-3 is a regional trail running along the north shore of Lacamas Lake and connecting Lacamas Park, Camp Currie and the County's Green Mountain Trail heading north. Trails T-3 and T-4 make a loop around Lacamas Lake. This trail segment will include bridges or boardwalks across wetlands and water features in some locations. T-3 continues just north of Lacamas Park and then south, crossing T-4 at the Washougal River and continuing on to the Columbia River and trail T-2.

Trail T-4

Trail T-4 is the Heritage Trail, a regional trail running along the south side of Lacamas Lake and connecting Lacamas Park and Camp Currie. It passes through Heritage Park and will link to planned segment T-3, creating a loop around Lacamas Lake. T-4 links through Lacamas Park, continues into the Washougal River Greenway, and includes a bridge across the Washougal River to connect with T-17.

Trail T-5

Trail T-5 provides a loop around Prune Hill, with linkages to parks and neighborhoods. The northern half of the loop connects from Lake Road through the Open Space Network to the proposed Ash Creek Park. The southern half of the loop connects from Klickitat Park, continues through the Open Space Network, and connects Fallen Leaf Park. Camas has been completing pieces of trail T-5 as development has occurred along the alignment.

Trail T-6

Trail T-6 parallels Lake Road, connecting from T-1 to T-21. This segment has been partially constructed.

Trail T-7

Trail T-7 connects from T-5 through Grass Valley Park and parallels NW 38th Avenue toward the west boundary of Camas. The segment of the trail in the vicinity of Grass Valley Park has been constructed.

Trail T-8

Trail T-8 is a north/south connector that connects through the center of the T-5 loop. This trail connects through the Open Space Network and passes Dorothy Fox Elementary School and Dorothy Fox Park. The trail also includes several spur connections to T-9 and T-7 as well as a pedestrian bridge connection to T-9 across Ostensen Canyon.

Trail T-9

Trail T-9 connects from T-3/T-4 past Zellerbach Elementary School and Liberty Middle School (the renovated high school), through downtown, and then passes through the Benton Park and Ostensen Canyon sites. This trail then connects to trail T-8 at a bridge across Ostensen Canyon and at Dorothy Fox Park before turning south to reconnect to T-5.

Trail T-10

Trail T-10 includes a mini network of connections from neighborhoods to Klickitat Park and Prune Hill Sports Park. The trails also link to T-1, T-5 and T-11. This trail is owned and maintained by local Homeowners' Associations, is located largely within the Open Space Network, and is nearly complete.

Trail T-11

Trail T-11 is a loop that connects Klickitat Park to the overlook at SU-9.

Trail T-12

Trail T-12 connects from T-5 at Fallen Leaf Lake to a proposed neighborhood park.

Trail T-13

Trail T-13 is the trail network around Fallen Leaf Lake. This trail connects to Fallen Leaf Park as well as T-4 and T-5. The City has already completed several sections of this trail.

Trail T-14

Trail T-14 connects from T-3 and Lacamas Park to a planned neighborhood park, Lacamas Heights Elementary School, and Camas High School. T-14 also forms a loop with T-3 and T-27.

Trail T-15

Trail T-15 includes the Lacamas Park trail network. This system provides important community connections between T-3 and T-4.

Trail T-16

Trail T-16 provides a linkage from Louis Bloch Park to the Washougal River Greenway.

Trail T-17

Trail T-17 is the Washougal River Greenway trail system on the south river bank. This trail segment passes through the Washougal River Greenway, providing access to the river corridor for Camas, Washougal, and regional residents. This trail segment is joined to T-4 by a pedestrian bridge across the Washougal River to link the Greenway corridor and increase access. T-17 links to Oak Park, Goot Park, and T-2, the Columbia River trail.

Trail T-18

Trail T-18 follows a utility corridor from Washougal and meets up with Trail T-4 in the Washougal River Greenway. T-18 is also a proposed trail in the Washougal Comprehensive Park and Recreation Plan.

Trail T-19

Trail T-19 connects Lacamas Park trails to the north-south trail T-18 and to the Washougal trail system. This trail should be a jointly maintained connection between the two cities.

Trail T-20

Trail T-20 provides a secondary east-west connection between T-1 and T-21 in the northwestern corner of the City.

Trail T-21

Trail T-21 is a north-south connection on the western edge of Camas. It connects from T-4 south to T-1. East-west connections to T-21 are provided by trails T-6, T-7, T-20, T-22 and T-24.

Trail T-22

Trail T-22 includes the Leadbetter Corridor and connects T-6 east/west across T-1 to T-21.

Trail T-23

Trail T-23 connects through the open space network from the intersection of trails T-1 and T-22 to trail T-21.

Trail T-24

Trail T-24 connects trail T-23 with Prune Hill Sports Park and Trail T-1.

Trail T-25

Trail T-25 connects T-5 to Forest Home Park.

Trail T-26

Trail T-26 connects T-5 and T-8 to Grass Valley Park through a portion of the Open Space Network.

Trail T-27

Trail T-27 is the primary trail that will connect uses along the north shore of Lacamas Lake. This route will run parallel to the future realignment of Leadbetter Road and provide a continuous trail from the northern corner of the city towards Lacamas Park to the southeast.

Trail T-28

Similar to Trail T-32, Trail T-28 will link land uses on the north shore of Lacamas Lake. The City should design and construct this segment concurrent with future utility lines and pump stations planned to serve future uses.

Trail T-29

Trail T-29 will provide an alternative trail connection for residents of this future growth area.

Trail T-30

Trail T-30 will provide an alternative trail connection for residents of this future growth area.

Trail T-31

Trail T-31 will connect opposite sides of Camp Currie with a more direct route.

Trail T-32

Similar to Trail T-28, Trail T-32 will link land uses on the north shore of Lacamas Lake. The City should design and construct this segment concurrent with future utility lines and pump stations planned to serve future uses.

Figure G8 summarizes the recommendations for the Camas trail network.

Figure G8. Summary of Trail Recommendations (excerpted from 2014 PROS Plan)

Trail #	Name	Total Miles	Comments	City Maintained
T-1	West Camas Regional Trail	2.1	Completion/ Acquisition/ Development	✓
T-2	Columbia River Regional Trail	6.6	Acquisition/ Joint Development	✓*
T-3	East Camas Regional Trail*	7.9	Clark County Development	✓
T-4	Heritage Trail	1.8	Minor Additions/ Improvements/ Development of Washougal River crossing	✓
T-5	Camas Neighborhood Loop Trail	3.1	Additional Acquisition/ Development	✓
T-6	Lake Road Connector Trail	1.0	Completion/Upgrade to Standard	✓
T-7	West Camas Connector Trail	2.1	Completion/Upgrade to Standard	✓
T-8	Prune Hill Connector Trail	0.9	Completion/Upgrade to Standard	
T-9	Downtown Connector Trail	0.4	Completion/Upgrade to Standard	✓
T-10	Deer Creek Connector Trail	0.2	Completion/Upgrade to Standard	
T-11	View Ridge Connector Trail	0.3	Completion/Upgrade to Standard	✓
T-12	East Hilltop Connector Trail	0.2	Acquisition/ Development	✓
T-13	Fallen Leaf Lake Trails	1.8	Development/ Completion of Acquisition	✓
T-14	Lacamas Heights Connector Trail	1.1	Acquisition/ Development	
T-15	Lacamas Park Trails	3.7	No Changes	
T-16	Louis Bloch Connector Trail	0.3	Acquisition/ Development	
T-17	South Camas River Loop	3.3	Acquisition/ Development	✓
T-18	Washougal Connection	1.5	No Action	
T-19	Washougal Connection 2	0.6	No Action	✓*
T-20	Northwest Connector	0.8	Acquisition/ Development	
T-21	Westside Route	3.4	Acquisition/ Development	✓
T-22	Leadbetter Corridor	0.3	Acquisition/ Development	✓*
T-23	Natural Trail	2.6	Acquisition/ Development	
T-24	Prune Hill West Trail	0.9	Acquisition/ Development	
T-25	Forest Home Park Connection	0.8	Acquisition/ Development	
T-26	Grass Valley Link	0.9	No Changes	
T-27	North Camas 1	4.7	Acquisition/ Development	✓
T-28	North Camas 2	1.1	Acquisition/ Development	✓
T-29	Green Mountain 1	2.8	Acquisition/ Development	
T-30	Green Mountain 2	0.3	Acquisition/ Development	
T-31	Camp Currie Connection	0.3	Acquisition/ Development	✓
T-32	North Camas 3	0.8	Acquisition/ Development	✓
	TOTAL	58.6	Total City/Joint Maintained Trails	40.0 miles

*Jointly maintained

CRIME PREVENTION THROUGH ENVIRONMENTAL DESIGN (CPTED)

The inventory assessment highlighted an opportunity to consider incorporating crime prevention through environmental design (CPTED) principles to enhance park and trail safety and facilitate the monitoring of park uses and behaviors. CPTED applies four principles that are used to deter criminal behavior in outdoor environments:

- Natural surveillance
- Natural access control
- Territorial reinforcement
- Maintenance

CPTED natural surveillance ("see and be seen") asserts that sight lines for better visibility can deter undesirable behavior and increase the perceptions of safety and comfort by park patrons. Lowering understory vegetation or raising lower tree branches through intentional vegetation management can provide more clear lines of sight in and around trails and other areas of use. Providing clear visibility and reducing blind corners can also improve safety by limiting conflicts between different users (e.g. runners, cyclists, dog walkers), where unanticipated encounters may result in crashes or entanglements.

Natural access control in park design is often very subtle. Controlling where vehicles enter and exit park facilities through designed barriers, bollards, boulders, and post and cable fencing can protect park users and minimize park property damage from misguided vehicular traffic. Walkways, lighting, fencing and landscaping provide explicit direction for park users. The flow of users through a park will help decrease the opportunity for crime and improve clarity for the intended park behaviors.

Territorial reinforcement comes through clear demarcation of boundaries. For public parks, those boundaries between public and private lands, safe and unsafe areas, and special use, limited access or reserved sites can be delineated with the appropriate placement of fencing, signs, landscaping or other physical or visual design techniques.

Finally, clearly visible, high-quality maintenance is an important element of CPTED, as well as general public safety. CPTED recognizes the "broken window" theory where neglected and poorly maintained amenities are more attractive targets for vandalism or other criminal activity. Deferred maintenance can also result in park amenities that put users at risk. Broken pavement, worn decking, uneven playing fields and missing play safety surfacing can create injuries. Overall attention to CPTED principles can help ensure safer public park environments.

This project was a collaboration between the City of Camas staff and commissioners, the consulting team, the Camas community, and other Washington agencies. It was built upon previous plans and engagement processes in order to move community values and goals into implementation. A big thank you to everyone who contributed and gave the support needed to carry the work forward.

Project Introduction: 2024 Parks and Open Space Management Plan

POSMP Goal:

Optimize the management of our resources through data-driven decision making and operational efficiencies and effectiveness.

POSMP Objective:

The City of Camas aims to create a framework to help prioritize efforts in a way that **aligns with community, city, and funding resource goals and shared values**. Effectiveness in our own operations will allow for a focus on BMPs in order to set an example, provide clear guidance, and collaborate more with the community.

Executive Summary

The Camas Parks & Open Space Management Plan (POSMP) responds to the community's feedback in Camas' long-range Parks, Recreation and Open Space Plan by outlining a strategic vision for the thoughtful management of parks and open spaces within the City of Camas, ensuring that they continue to serve as resources for all users. Camas recognizes the vital role that parks and open spaces play in fostering community well-being, recreation and environmental sustainability. Camas' parks, open space, greenways and waterways are a critical component of the City's green infrastructure and play critical roles in supporting healthy, well-functioning ecosystems.

Scope of the POSMP

The POSMP took a multi-prong approach to understanding existing conditions and practices in order to provide data-based recommendations on how to align with the goals of the project and values of the community. Key aspects of this effort included:

- City-wide urban tree canopy analysis
- Sample public land tree inventory
- Operations, organizational, and financial assessment
- Project prioritization approach to align with community values
- Best practices and recommendations
- Planning recommendations

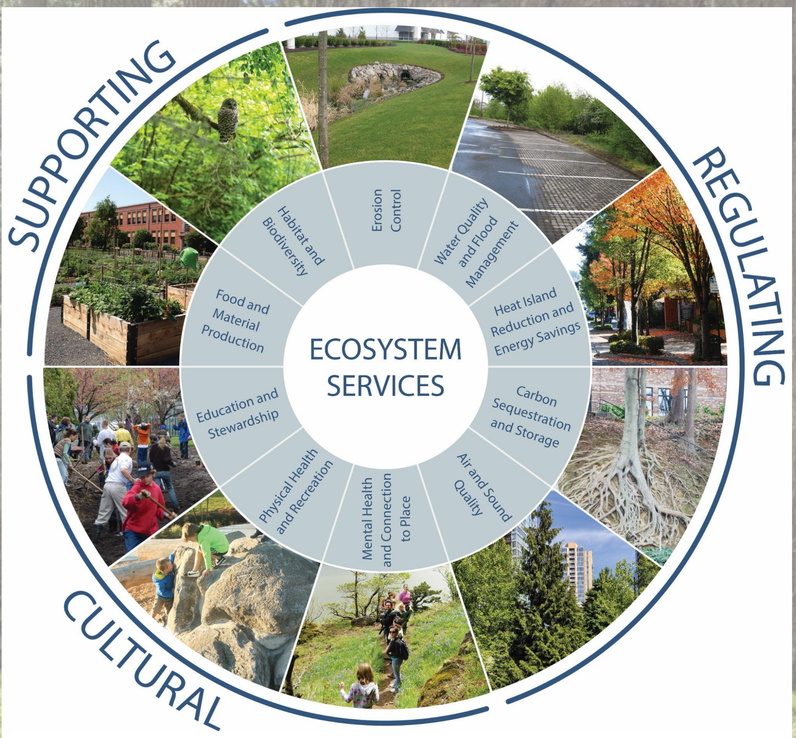
The project also engaged with the public through the Parks & Recreation Commission meetings, a public open house, online survey, and tree inventory training.

Key Takeaways

- Nature is a valuable, critical infrastructure that serves the community in many ways
- Management of Camas' Parks and Open Spaces should utilize a systems-based approach in order to optimize ecosystem performance long-term
- Retaining canopy and character will have to be a public:private partnership with alignment on goals and expectations

The 5 Camas Community Values

Equitable access



Asset protection and public safety

Preserve and enhance natural features

Outreach and education

Financial and resource allocation

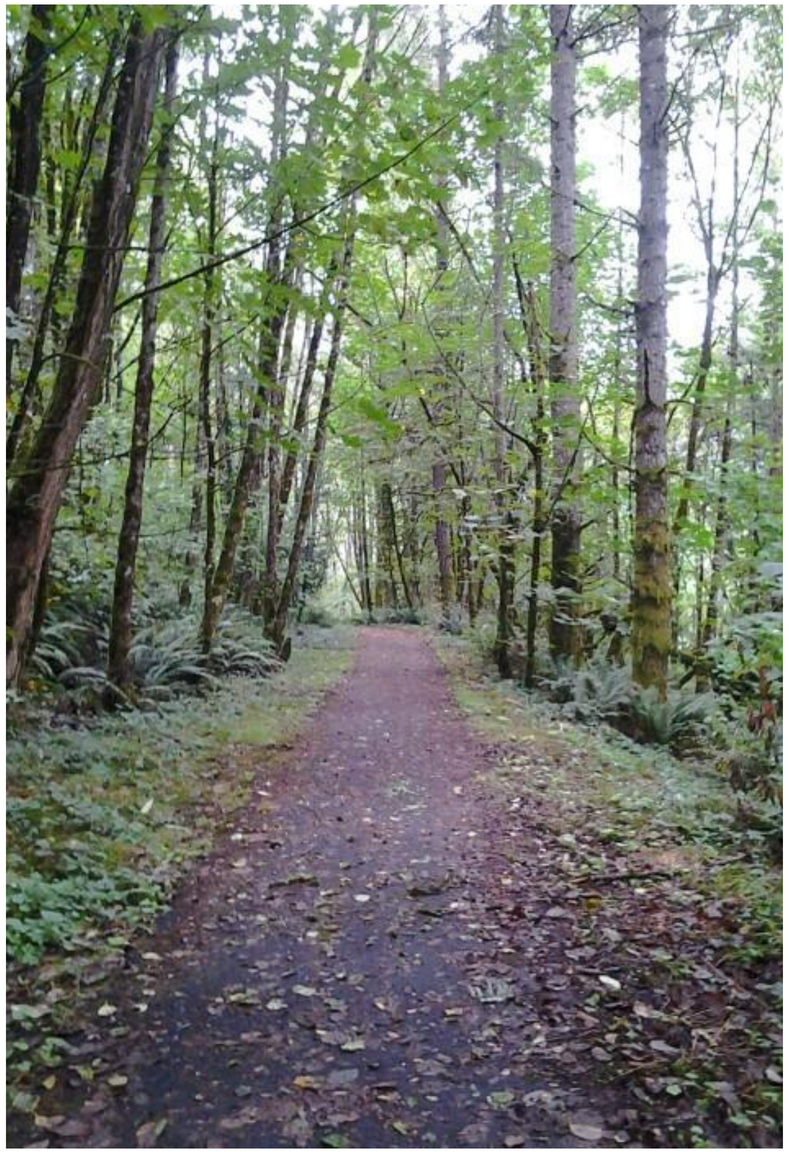
Collectively increase the resilience of parks, open spaces and natural ecosystems in Camas

Best practice and planning recommendations took into account the multiple values that natural systems can provide the community.

Goals of this effort

We recognize the intrinsic value of our **parks and open spaces as essential assets** that contribute to the City's character and residents' quality of life. Through this Parks and Open Space Management Plan, we can increase the resilience of open spaces that will enrich the lives of current and future generations in Camas.

Enhance external communication and collaboration



- Raise public awareness
- Encourage and support use of best management practices
- Make a Call to Action

Improve internal decision making

- Develop a clear inventory of existing conditions and best management practices
- Encourage and support use of best management practices
- Prioritize resource use with a science/ data-backed tool
- Identify opportunities for more investment

Collectively increase the resilience of parks, open spaces, and natural ecosystems

From challenges to opportunities

What challenges are we facing?

Tree canopy and open space service gaps

Without clear guidance and best management practices, coordinated management of open spaces is difficult. Gaps remain in the city that could serve the needs of those who need it most.

Climate change and extreme weather

Climate change and extreme weather events pose threats to ecosystem health and asset preservation. Longer term hazards and stressors not only impact the health of vegetation and habitats, but likely add risk to adjacent buildings and infrastructure.

Lack of data

There is a need for more comprehensive data on inventory, resources and best practices to help inform decision making on prioritizing work scope, resource allocation and funding.

Unclear guidance for private landowners

Lack of clarity around different planning documents and ordinances and the role and impact on private land owners. Limited resources limit the ability of consistent maintenance between public and private lands.

Lack of resources

Most resources are spent being reactive to ongoing safety issues and performing routine maintenance and upkeep across public lands. Proactive prioritization is needed in order to work toward the desired performance and use of parks and open space.

Community Values

Equitable access

Ensure that all community members have access to Camas' parks and natural resources and the benefits they provide.

Asset protection and public safety

Protect ecosystems, human health, safety and public and private assets through the management of natural systems to limit the effects of extreme weather, climate change and other potential impacts .

Preserve and enhance natural features

Maintain the existing natural character of Camas in ways that bolster community identity.

Outreach and education

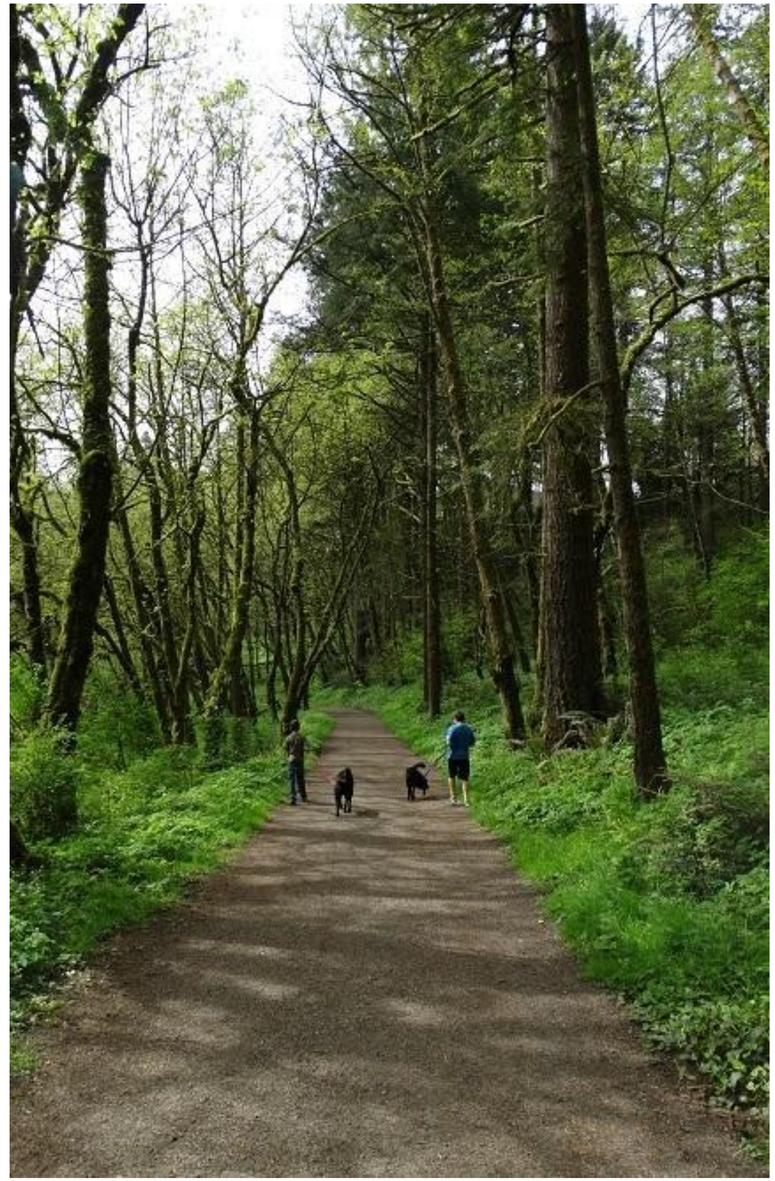
Provide opportunities for learning to gain efficiencies, institute best practices and engage the community.

Financial and resource allocation

Optimize value and resource use in order to best balance the long-term performance goals with immediate needs for parks and public open space.

We all have a role to play

How can I help my community?

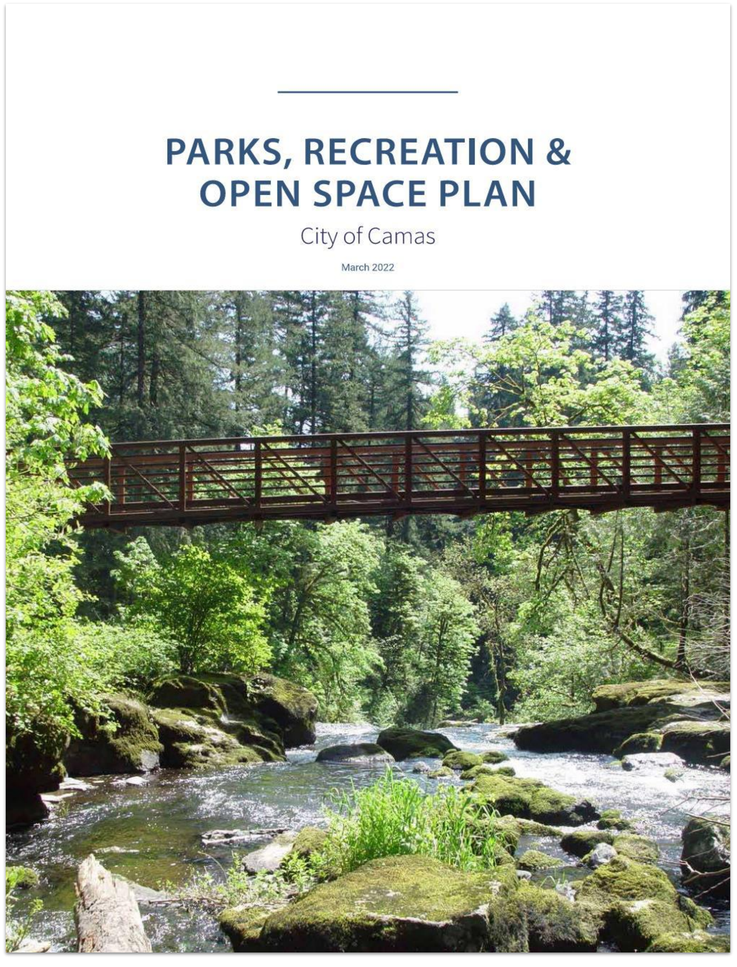


- Follow guidelines of Parks and Open Space Management Plan and other city codes and ordinances.
- Support trees and other natural systems on your properties and within your HOA.
- Volunteer your time and effort towards management of parks and open spaces through initiatives such as community tree inventory events.

How can the City of Camas help me?

- Provide clear incentives and guidelines for managing private open spaces.
- Lead by example through public land management efforts.

How can I help the City of Camas?



- Contribute feedback to shape resource priorities and next steps of the POSMP.
- Participate in the Comprehensive Plan update process

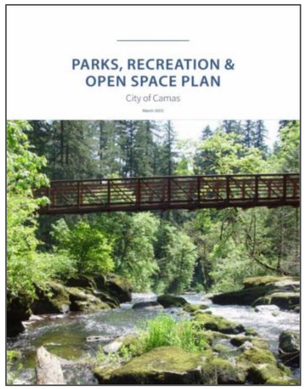
Setting the stage: Parks, Recreation & Open Space (PROS) Plan

Open space and stewardship

Camas' open space, greenways and waterways are a **critical component of the City's green infrastructure** and play critical roles in supporting healthy, well-functioning ecosystems.

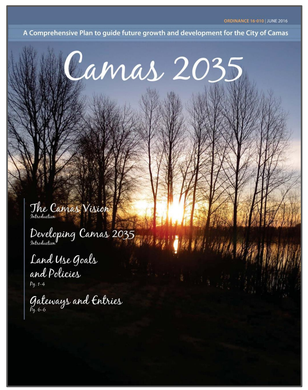
This Parks and Open Space Management Plan responds to the community's feedback in the **2022 PROS Plan** to:

1) **Maintain what we have**
2) **Fill gaps and improve trail connections**
3) **Develop and improve existing parks**



PROS Plan action

New plans should reflect the **realities of limited program funding** and the challenges presented by **climate change** to include the following considerations:



1. **Maintain the functional benefits** of open space vegetation.
2. Foster **resilient plant communities** that can recover from disturbances and adapt to climate change and its impacts, such as forest fires.
3. Implement work **based on the value** of these functional benefits, the community's priorities for the open space properties and the condition of the vegetation found there.
4. **Maximize the return** on available funding through volunteers, matching grants, and donations.

How does this plan align with existing practices and guidelines?

As part of the information gathering process, the team reviewed existing planning documents to understand the goals, challenges, and community feedback on how parks and open spaces are currently managed. They used this process to identify opportunities for improvements going forward to align better with city-wide goals.

2022 PROS Plan

2016 Comprehensive Plan

ORDINANCE NO. 18-014

AN ORDINANCE amending certain provisions of the Camas Municipal Code, repealing Chapter 16.31, and adding a new Chapter 3.54, relating to the Camas Urban Tree Program.

The Council of the City of Camas do ordain as follows:

Section I

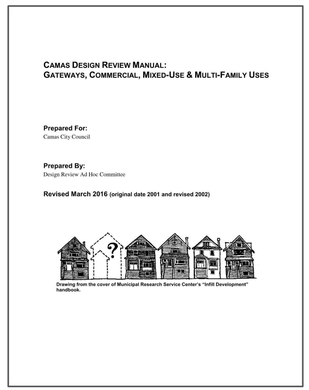
A new Chapter 3.54 of the Camas Municipal Code, entitled City Tree Fund is hereby adopted as follows:

3.54.010 City Tree Fund

A. There is created a city tree fund into which all penalties and revenues received for tree protection under Chapters 12.04 Sidewalk and Street Tree Maintenance: 16.51 General Provisions for Critical Areas; and Chapter 18.13 Landscaping shall be placed. In addition, the following sources of funds may be placed in the city's tree fund:

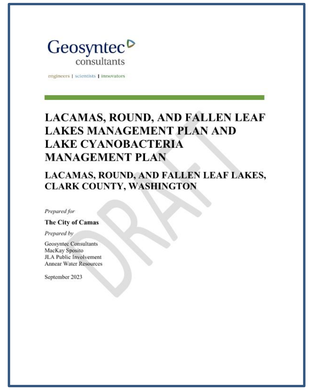
1. Donations and gifts;
2. Donations and grants for the purposes of the fund;
3. Sale of trees or wood from city property where the proceeds from such sale have not been dedicated to another purpose;
4. Fines and penalties imposed under Chapters 12.04, 16.51 and 18.13, or settlements in lieu of penalties.

B. The city shall use the city tree fund for the following purposes:



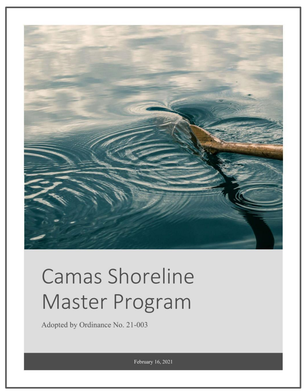
1. Acquiring, maintaining, and preserving areas of healthy soil and native vegetation within the city;
2. Planting and maintaining trees within the city to compensate for loss of canopy coverage;
3. Support community urban forestry education;
4. Support the management of urban forest areas to include eradicating aggressive non-native vegetation species;
5. Other purposes relating to trees as determined by city council.

3.54.020 Tree Removal Fine Table

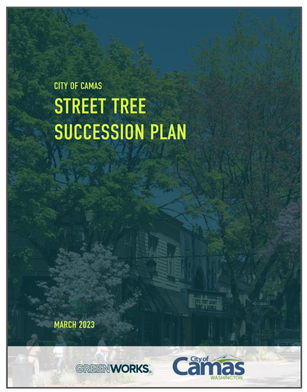


A.

Tree Removal Infractions (measured as diameter at breast height "dbh")			
2" to 6"	$250	20" - 36"	$750
7" to 12"	$375	28" - 36"	$875
13" - 18"	$500	Greater than 37"	$1,000
19" - 24"	$625		



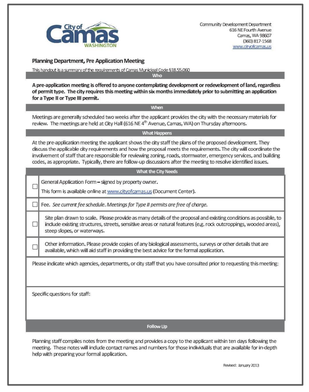
Tree Ordinance 18-014



2016 Design Review Manual

2023 DRAFT Lakes Management Plan

2021 Shoreline Master Program



2023 Street Tree Succession Plan (for Downtown Camas)

TREES FOR NARROW SPACES
(Plant 15'-25' apart, compatible with mature tree size)
Typical size at time of planting: 2" minimum caliper (B&B or container)

Common Name	Botanical Name	Height	Spread	Min. Planter Width (ft.)	Form	Remarks
Adirondack Crabapple	Malus 'Adirondack'	18	10	4	Columnar	Densely upright in an inverted cone. Medium-green foliage. White flower bright red fruit.
Amanogawa cherry	Prunus serrulata 'Amanogawa'	20	6	4	Columnar	Very narrow and upright structure, pale pink spring flowers.
American smoketree	Cotinus obovatus	30	30	4	Globe	Tolerant of hot and dry sites, bluish-green color, purple flower clusters.
Beauty plum semi-dwarf	Prunus cultivar'Beauty'	15	15	4	Globe	Large fruit early summer, needs regular pruning.
Big Cityplum	Prunus x cistena 'Schmidtcis'	14	12	4	Globe	Light pink and very fragrant spring flowers, dark purple foliage
Black hawk mountain ash	Sorbus aucuparia 'Black Hawk'	25	15	4	Columnar	Bright selection for hardiness and resistance to sunscald. Rounded with maturity
Black Hawthorne	Crataegus douglasii	25	20	4	Oval	Native to portland metropolitan region, has thorns
Butterfly Japanese Maple	Acer palmatum 'Butterfly'	12	6	4	Umbrella	Shifty upright in habit. Variegated pink, white, light green foliage with magenta tint in fall.
Callery Pear 'Capital'	Pyrus calleryana 'Capital'	35	12	4	Pyramidal	It is noted for its early profuse spring bloom, quality glossy green foliage and effect
Cernuscan Crabapple	Malus 'Cornuton'	20	15	4	Oval	Purple to bronze foliage in summer. Flower is rose red. Bright red fruit.
Chinese Pistache	Pistachio chinensis	25	25	4	Globe	Impressive red-orange fall color, attracts wildlife.
Chokecullo Crabapple	Malus hchinensis	30	15	4	Oval	Dark green foliage turns orange, red and purple in fall. Sparse fruiting. Disease free.
Cleveland Select Pear (Chanticleer)	Pyrus calleryana 'Chanticleer'	30	20	4	Pyramidal	Glossy green foliage. White flowers. Purplish-red foliage in fall.
columnar goldenchain	Laburnum anagyroides 'Calynarius'	20	10	4	Vase	Dense clusters of bright yellow flowers in spring
Columnar Siberian Crabapple	Malus baccata 'Columnaris'	30	10	4	Columnar	White flower, yellow-red fruit. Good or not in fall, resistant to vertictillium
Cornelian cherry dogwood	Cornus mas	20	20	4	Umbrella	

City of Camas Plant Materials — Page 1 — Latest Revision: May 2019

Camas Plant Materials

Camas Development Code

....and many more

Key Concepts

Active Recreation

Activities that require physical exertion and typical require specialty facilities or equipment.

Ecosystem services

The benefits that ecosystems provide to humans. This can include things like clean air and water, temperature regulation, and recreational opportunities.

Maintenance

Maintenance responds to immediate issues and addresses day-to-day conditions through routine tasks and activities.

Management

Management addresses long-term goals through strategic planning, decision-making, and resource allocation.

Nature-based solutions / Green Infrastructure

Approaches that use natural processes and ecosystems to address challenges or provide functions to humans.

Naturescaping

Naturescaping involves designing landscapes using native plants and natural elements to create habitats that support local wildlife and conserve resources.

Passive Recreation

Outside activities that utilize the natural environment for exercise, relaxation, or entertainment.

Quantitative vs qualitative metrics

Qualitative metrics describe qualities or characteristics, while quantitative metrics measure quantities or amounts. Both can be valid ways to understand value.

Resilient

The ability to withstand or bounce back from a variety of shocks and stresses.

Stewardship

Restoring and guiding natural processes and systems to enable them to regenerate and function mostly on their own.

Succession planning

Managing the growth and replacement of species to maintain a healthy ecosystem over time. Includes using a diversity of species and ages to provide variety.

Vulnerability

A vulnerable system is prone to adverse impacts from stressors such as climate change, human activity, or natural disasters.

Project Schedule

	2023				2024							
	September	October	November	December	January	February	March	April	May	June	July	August
City & Community Engagement												
Kickoff Meeting												
Interview Parks and Operations Staff												
Conduct Open House												
Conduct Community Survey												
Earth Day Tree Inventory												
Parks and Rec Commission Presentation												
Submit Draft Plan to DNR												
Present Draft Plan at Parks & Rec Commission												
City Council Adoption												
Gather Information												
Information Gathering and Mapping												
Assessments												
Financial Analysis, Operations Assessment, Management Practices												
Assess Strengths and Opportunities												
Recommendations for Improvements												
Plan Development												
Synthesize info into POSMP report												

Valuing Nature

This plan recognizes the value and multiple ways that natural systems contribute to the Camas community and underlines the importance for providing effective management practices to preserve and enhances those functions. It will look to identify and incorporate nature's value in prioritization, resource allocation, and ongoing management practices.

The Role of Natural Areas to Meet Our Needs

Parks and Open Spaces are critical infrastructure that provide a variety of benefits to our communities

Parks & Open Space contribute to human physical and mental health, economic wellbeing, climate mitigation and asset protection. Sometimes referred to as “Green Infrastructure” or “Nature-based solutions,” natural systems integrated into the built environment provide a variety of valuable services that make them a crucial part of the places we live, work, and play.

Mental Health and Connection to Place: Contributes to cognitive restoration, emotional connections and a sense of identity.

Physical Health and Recreation: Provides a venue for individual or group activities and exercise. Can contribute to safety and security.

Education and Stewardship: Provides learning opportunities, ways to contribute and a sense of community.

Food and Material Production: Plays host to a variety edible plants and berries, as well as raw materials that contribute to the economy.

Habitat and Biodiversity: Is home to or can support native or migratory fauna.

Erosion Control: Prevents degradation of soils and sedimentation.

Water Quality and Flood Management: Filters sediment, nutrients, and pollution and controls water temperature. Absorbs water during rain or snow events.

Heat Island Reduction and Energy Savings: Provides shade to surfaces and structures to reduce air and surface temperature and reduce glare.

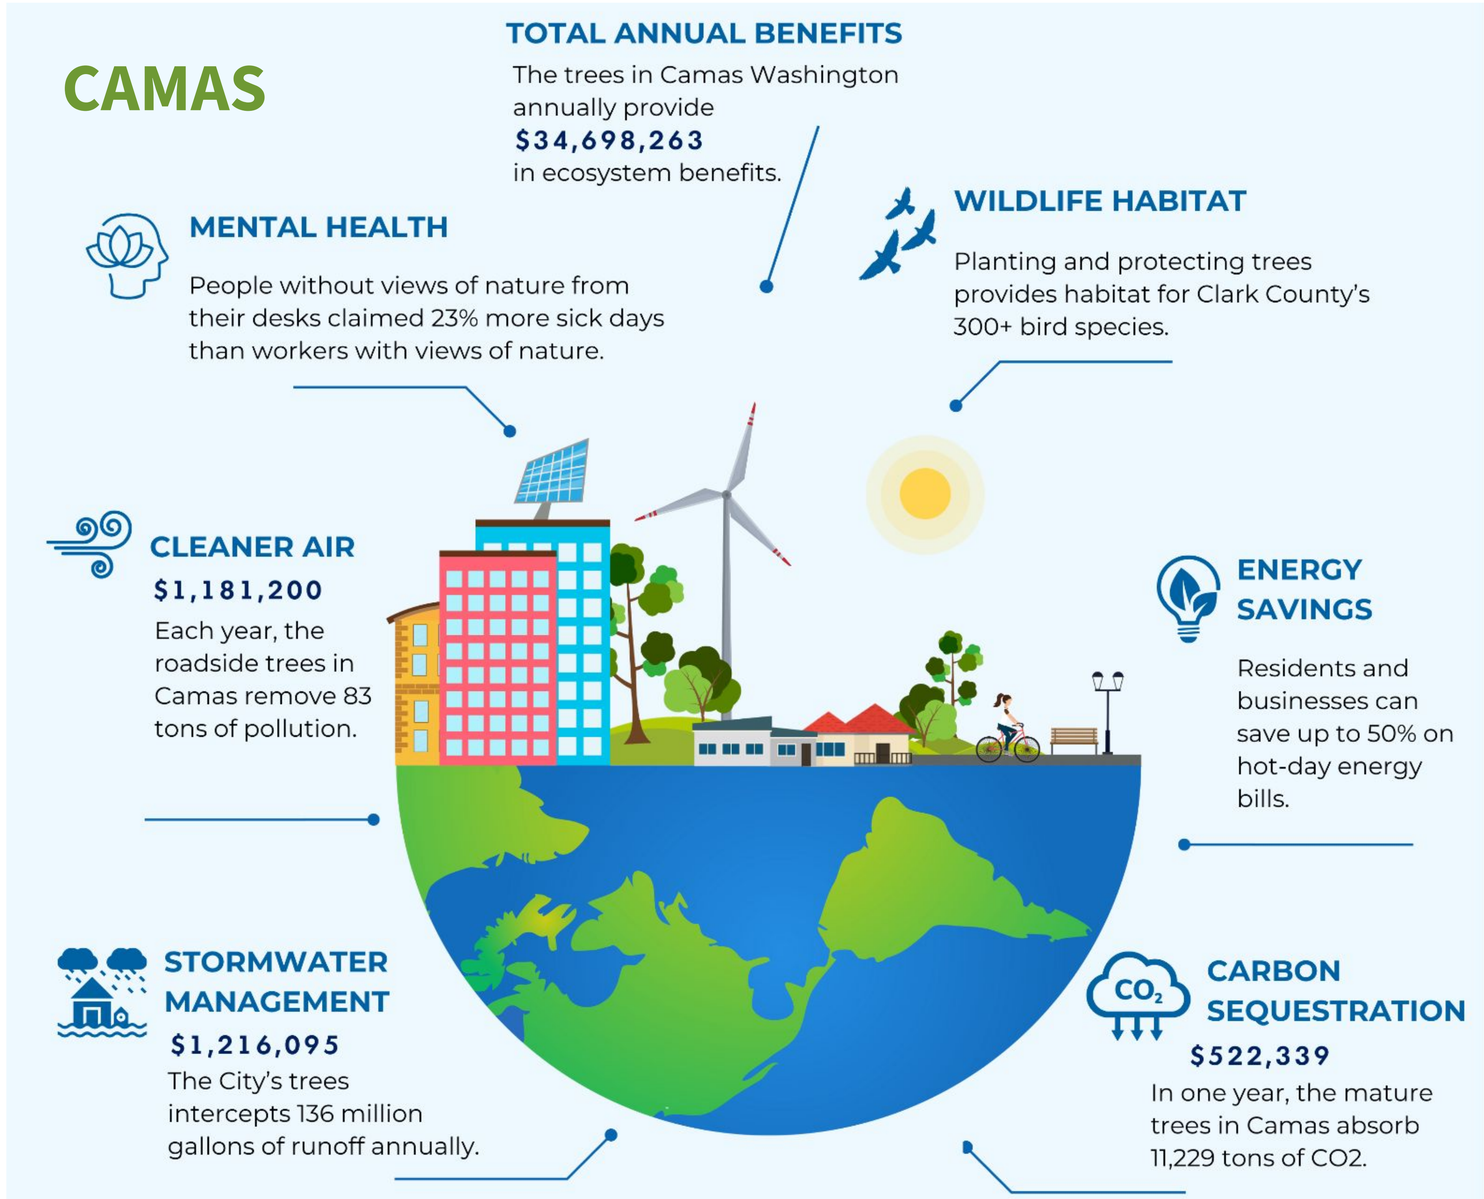
Carbon Sequestration and Storage: Absorbs carbon dioxide and stores it in vegetation and soil.

Air and Sound Quality: Captures gases and particulates to reduce them in the environment. Provide buffers to block or absorb noises and contribute to positive soundscapes.

National and Research Trends

The benefits of nature are being quantified across multiple sectors and entities

National trends around ecosystem service valuations have been undertaken by FEMA, NOAA, EPA, USFS, and a variety of public and private research institutions.



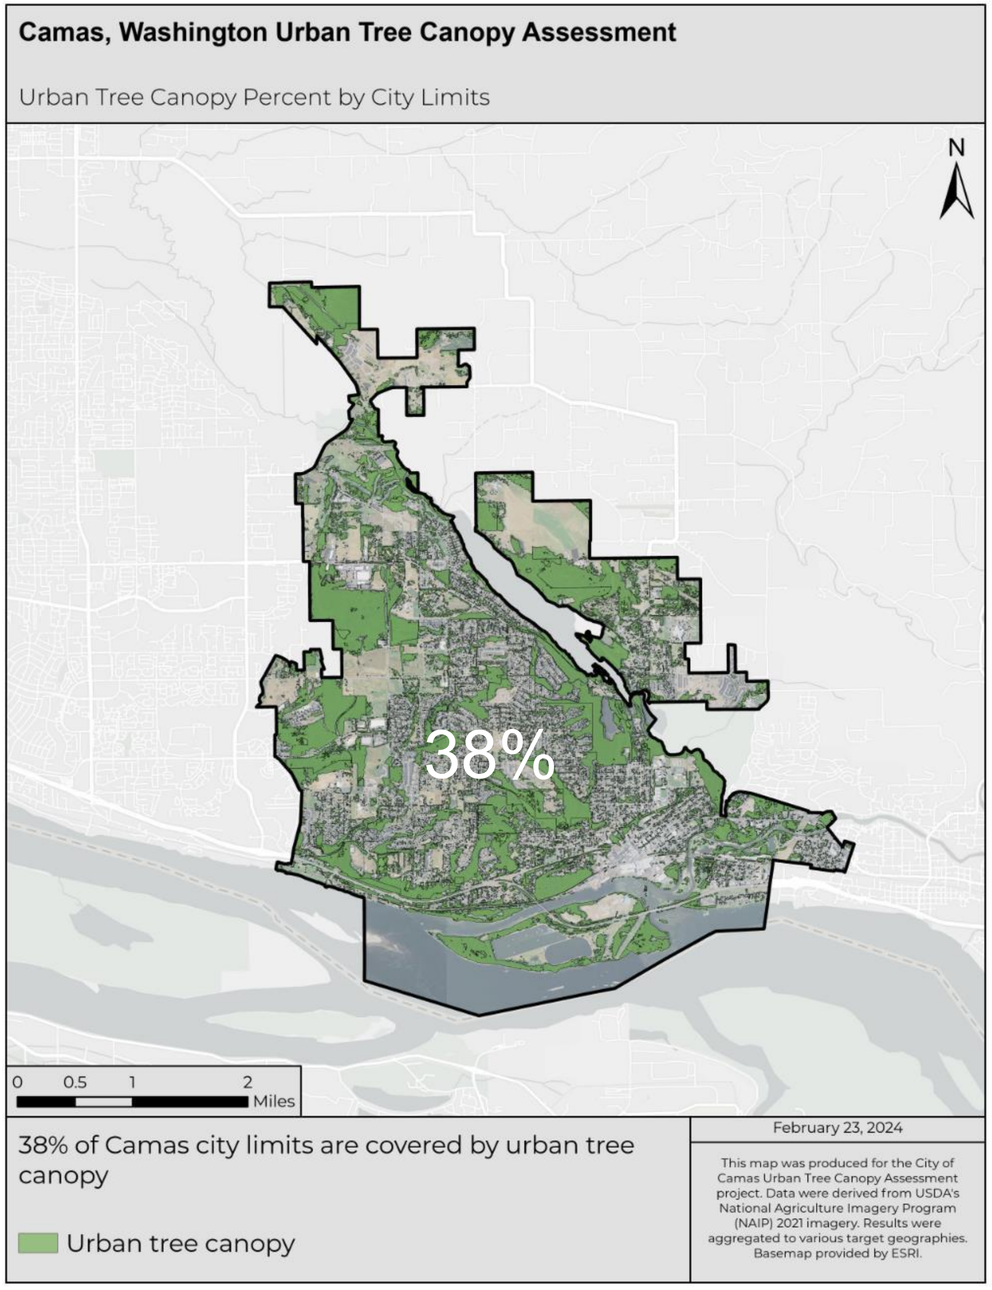
2022 Proposed Values	
Land Cover Category	Value (2021 USD/acre/year)
Forest	12,589
Urban Green Open Space	15,541
Rural Green Open Space	10,632
Riparian	37,199
Coastal Wetland	8,955
Inland Wetland	8,171

Source: FEMA Ecosystem Service Value Updates, June 2022

"Park access was associated with ***better mental health among children and parents***, and more parent physical activity and ***parent–child co-participation in outdoor activity during the COVID-19 pandemic***. Access to nearby parks may be an important resource to promote health and well-being, for both individuals and families."

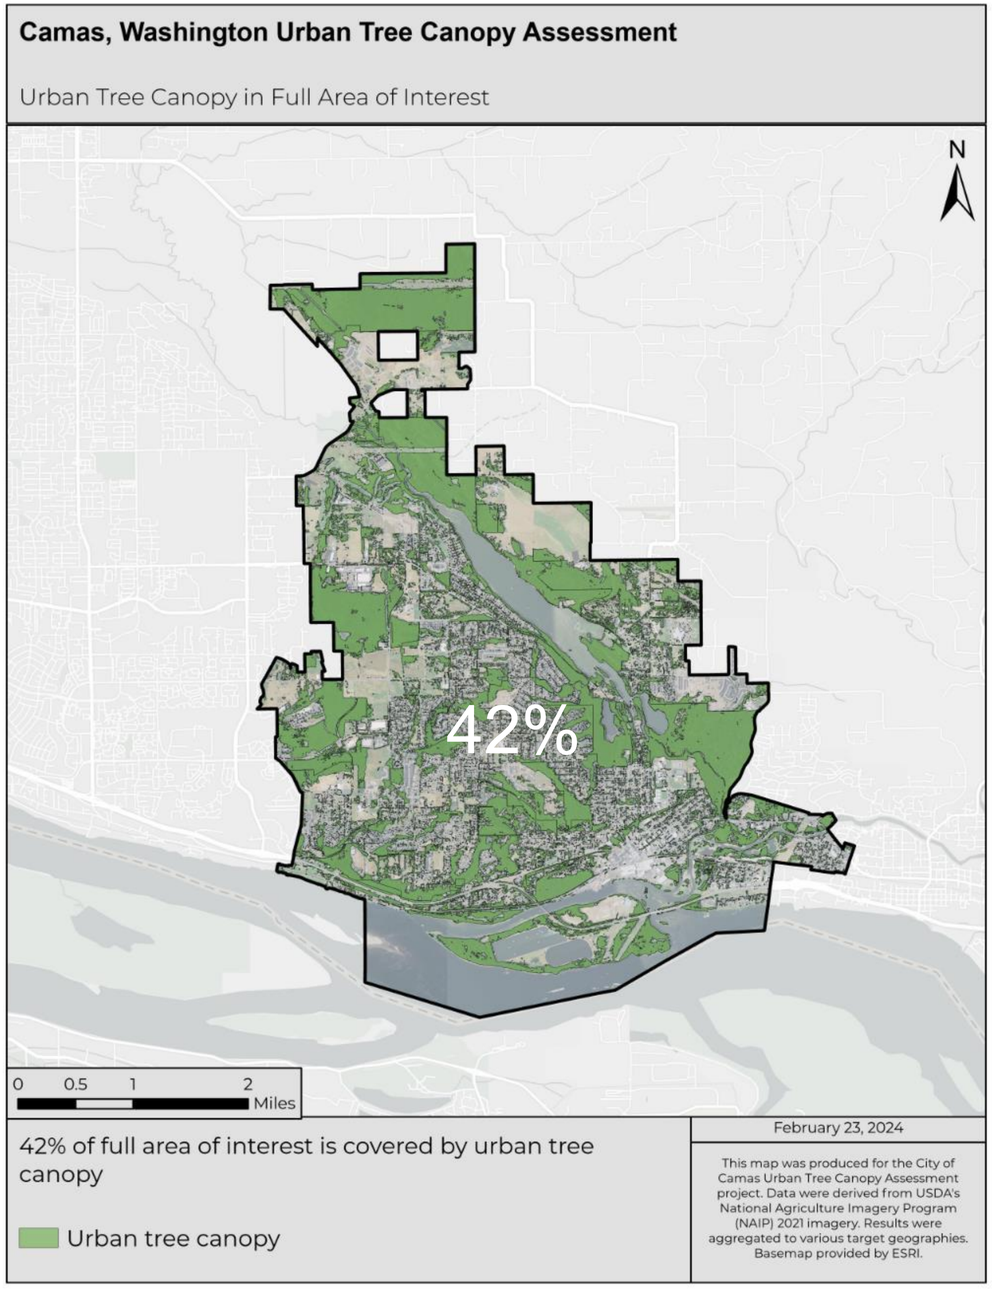
Hazlehurst, M.F., Muqueeth, S., Wolf, K.L. *et al.* Park access and mental health among parents and children during the COVID-19 pandemic. *BMC Public Health* 22, 800 (2022). https://doi.org/10.1186/s12889-022-13148-2

Mental, physical, and social health benefits of being in or having access to nature has been studied in hundreds of research papers.



The annual economic benefits of Camas' urban tree canopy were quantified based on a commonly used standard (right). These numbers do NOT include benefits to energy savings, mental and physical health, wildlife, and other ecosystem services. They are for the tree canopy only, and do NOT quantify the benefits provided by other natural features and systems like wetlands, understory vegetation, lawns, and lakes. The quantified benefits are over 10x the annual Camas Parks and Recreation Department budget.

Eco. Benefit	Description	Camas Citywide*	Urban Tract	Rural Tract	Units
Air Quality	Particulates intercepted	$347.53	$347.57	$17.85	$/year/acre
CO		$0.60	$0.60	$0.01	$/year/acre
NO2		$1.40	$1.40	$0.07	$/year/acre
O3		$39.71	$39.72	$1.87	$/year/acre
PM10		$31.16	$31.16	$0.74	$/year/acre
PM2.5		$274.50	$274.53	$15.15	$/year/acre
SO2		$0.15	$0.15	$0.01	$/year/acre
StormWater	Avoided runoff	$357.79	$357.83	$30.00	$/year/acre
Carbon Sequestration	Accumulated carbon	$153.68	$168.14	$145.75	$/year/acre
Total		**$859.00**	**$873.54**	**$193.60**	**$/year/acre**
Carbon Storage		$9,349.72	$8,166.75	$10,004.32	$/acre

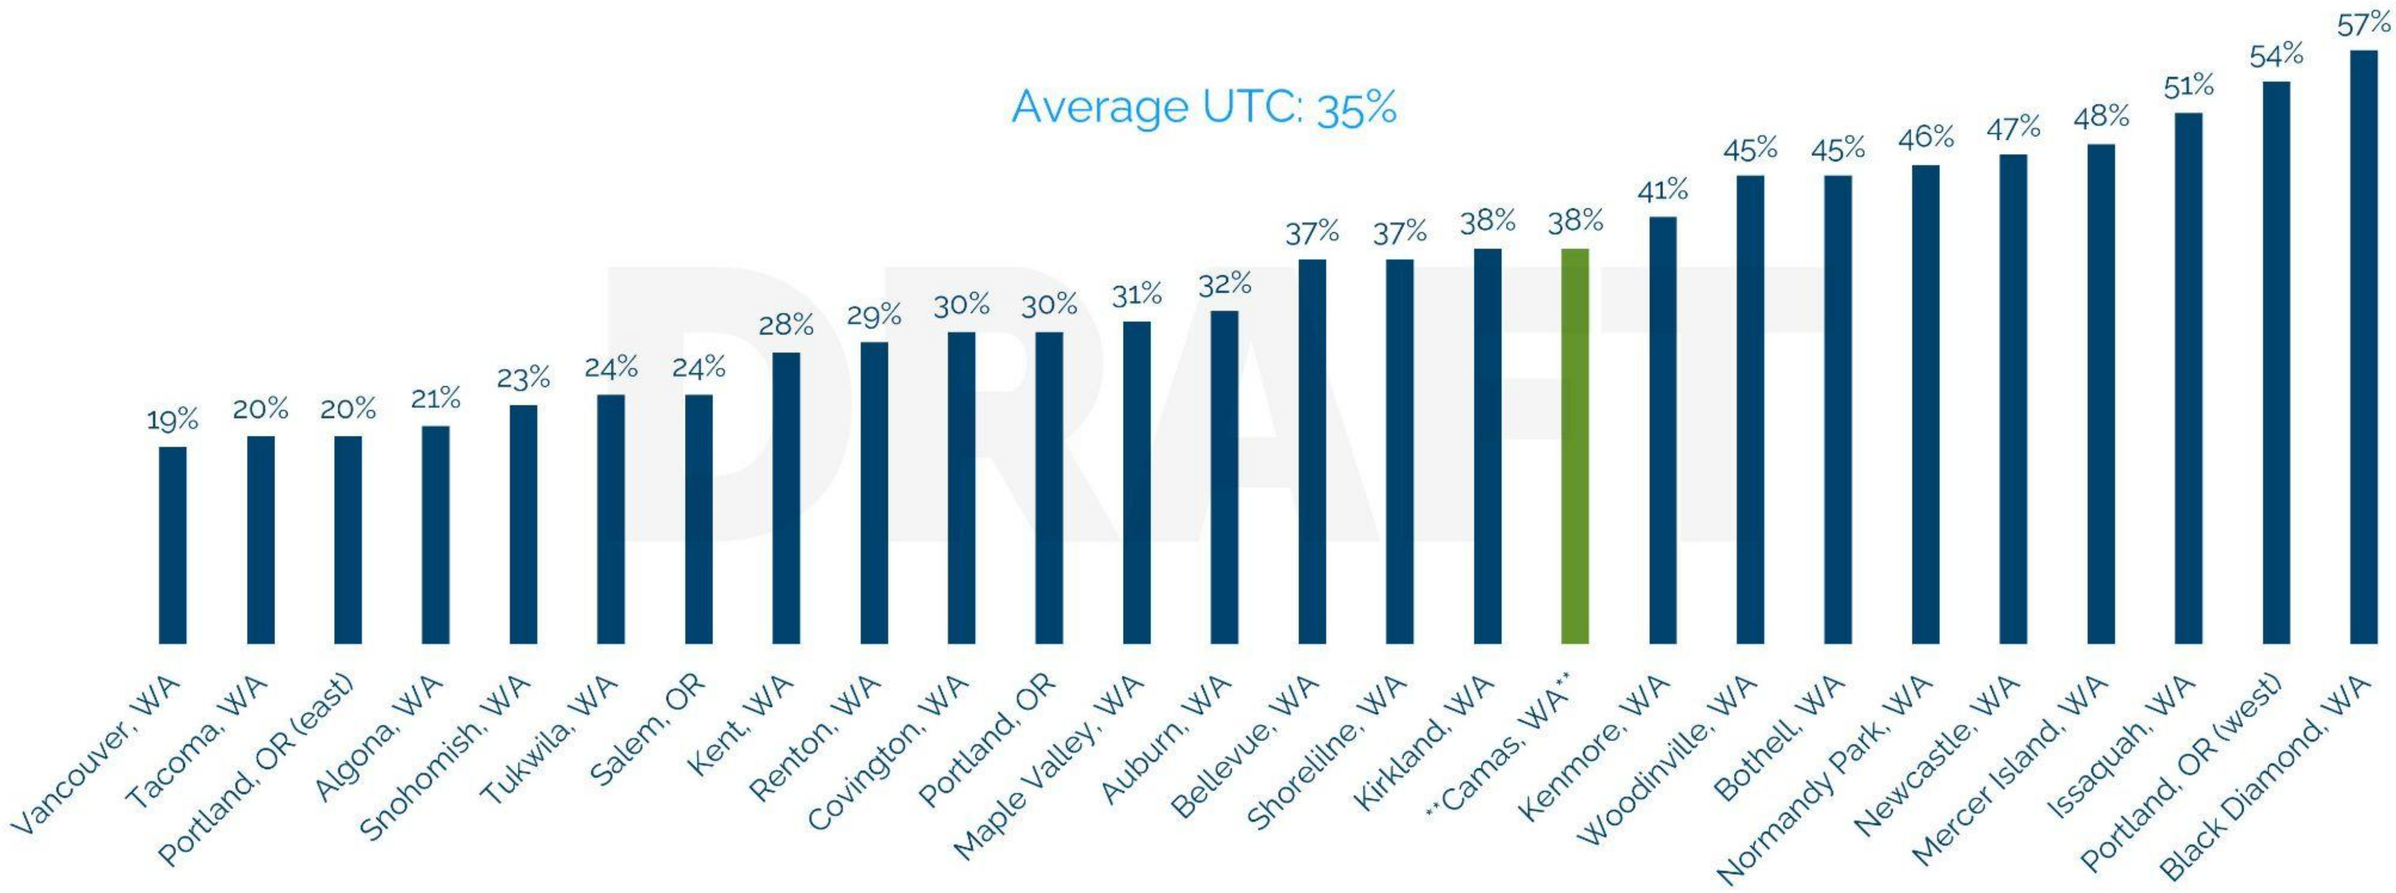


*Metrics are taken from iTree tool database. The tool classified a majority of the Camas area as "urban" which is reflected in the citywide calculations. With a more nuanced evaluation, some of the Camas land area may act as more rural, depending on the land use.

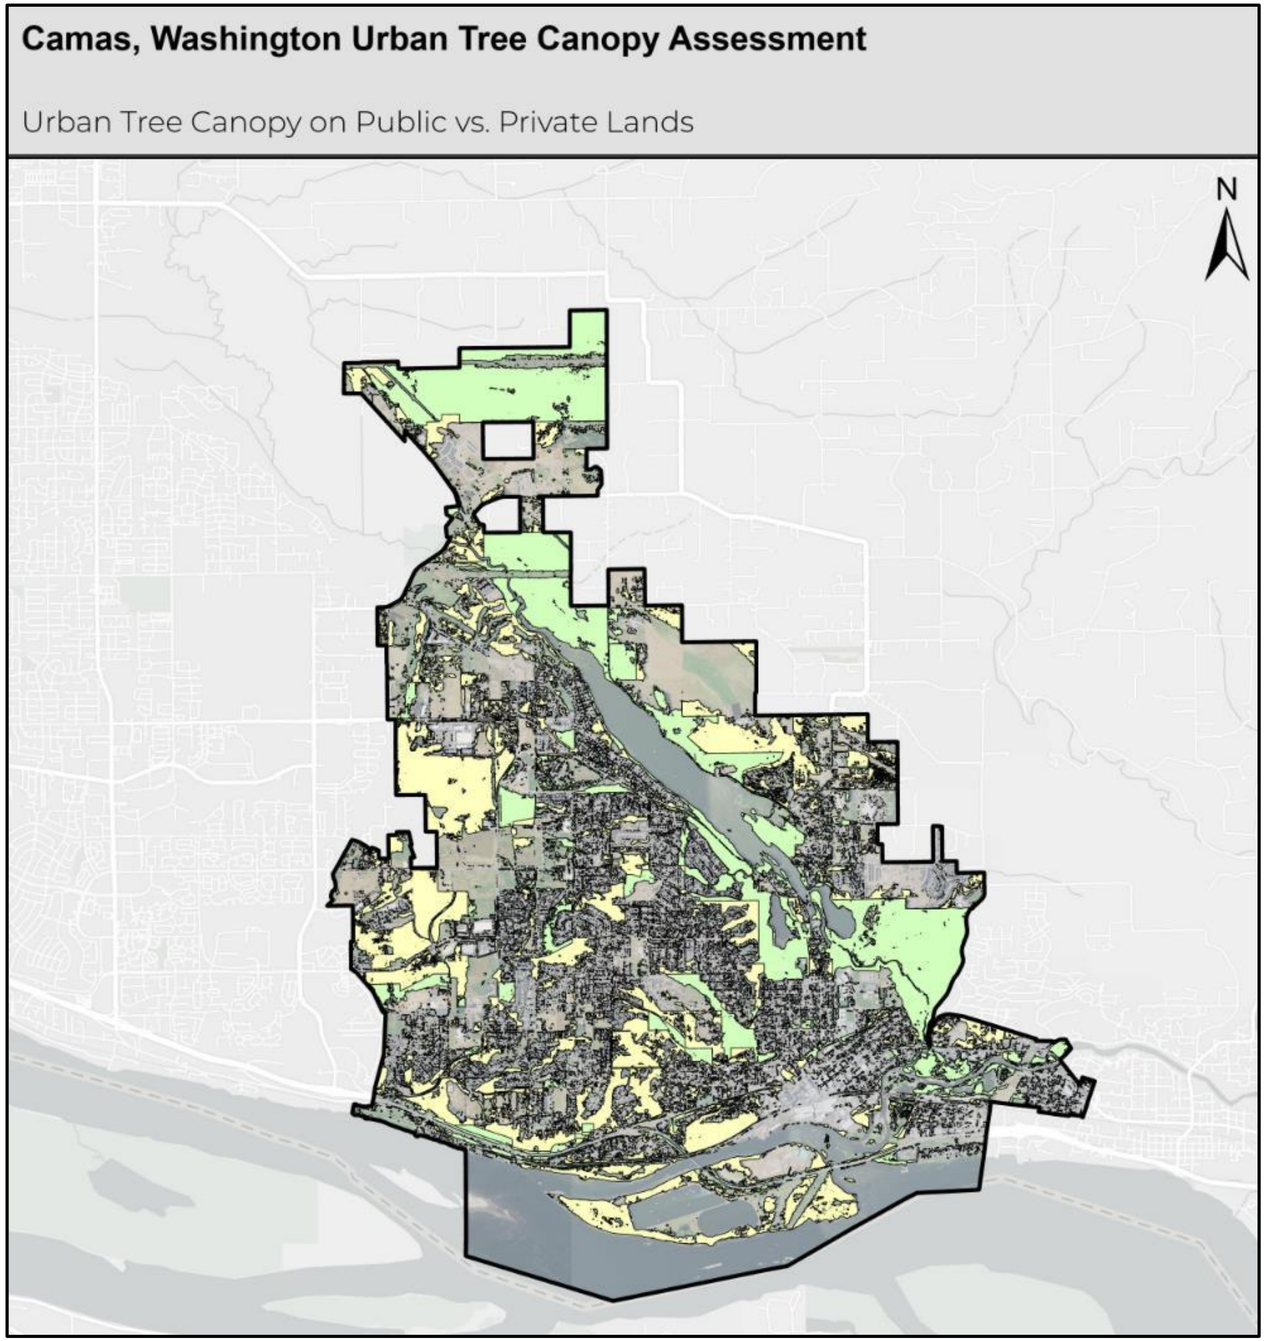
Tree Canopy Assessment

As part of the POSMP, the team analyzed the existing conditions of the city-wide tree canopy as a whole, as well as inventoried a group of individual trees. These assessments establish a data-backed baseline to measure future conditions in order to track progress against goals. They looked at current conditions, change over the last decade, and potential for canopy enhancements.

CITY LIMITS



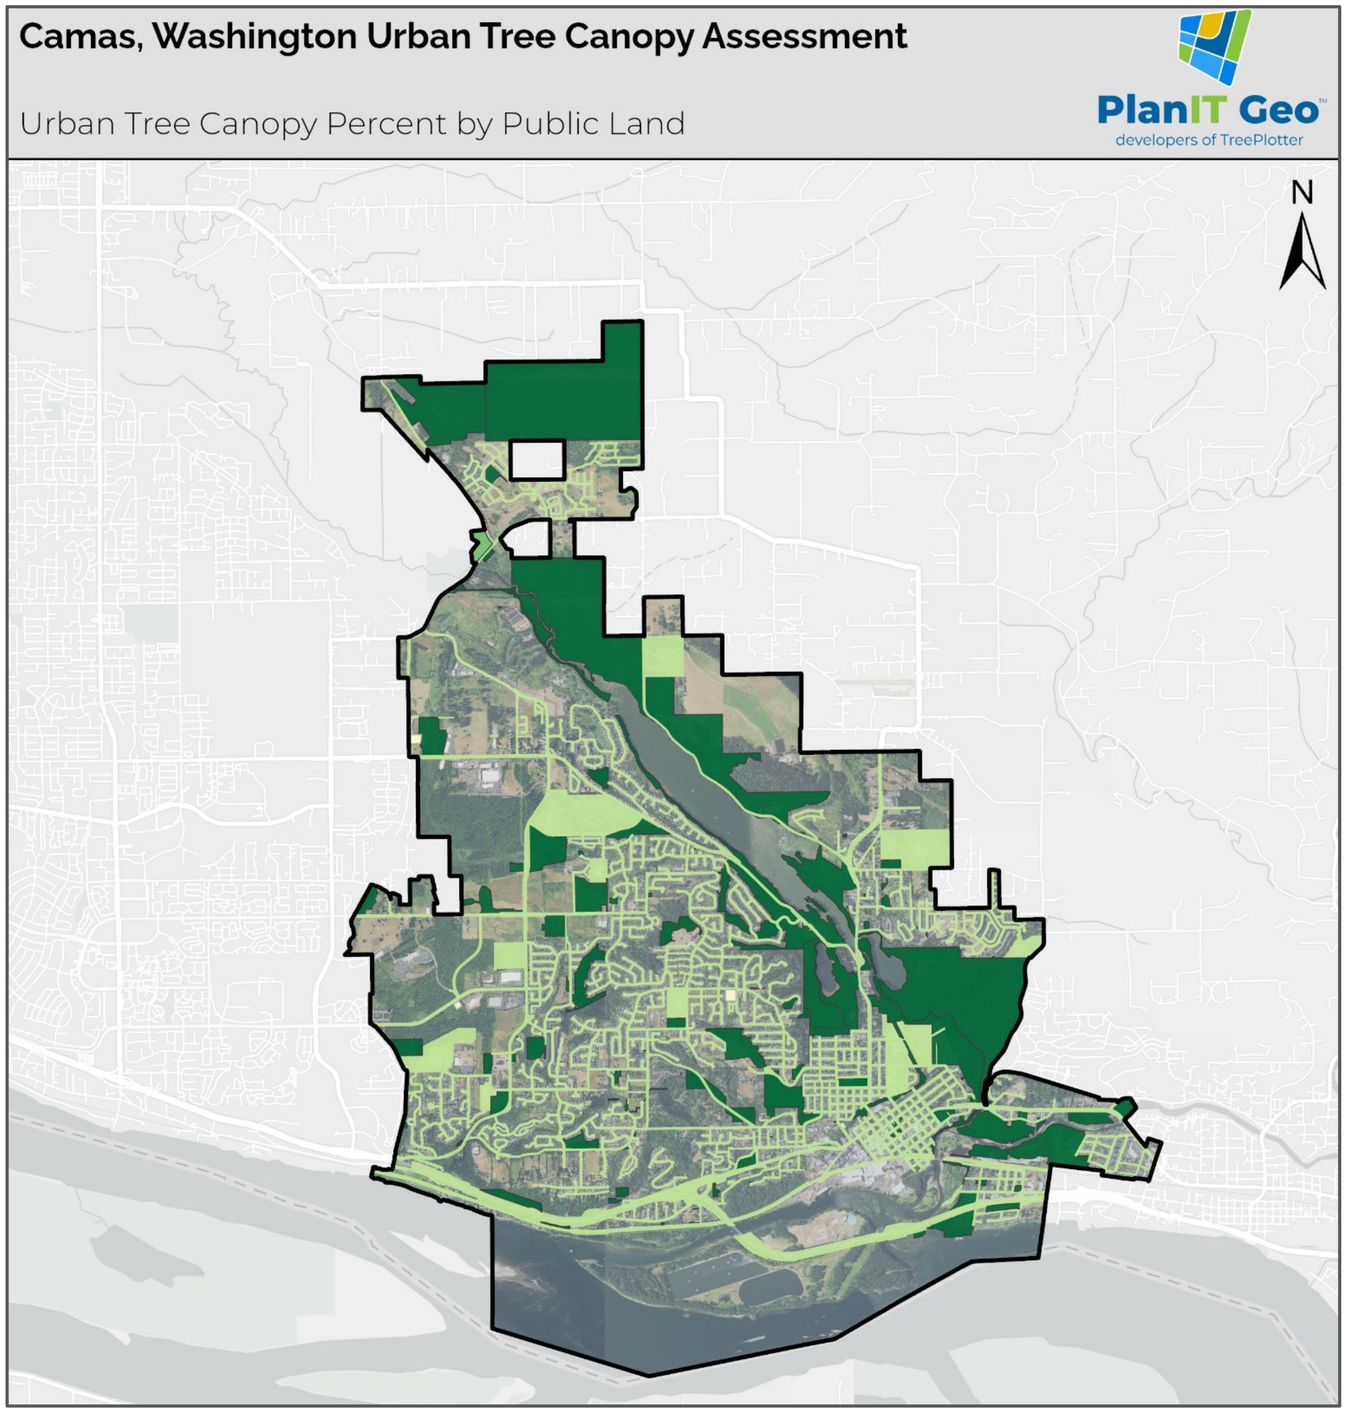
CITY LIMITS + COUNTY OPEN SPACE



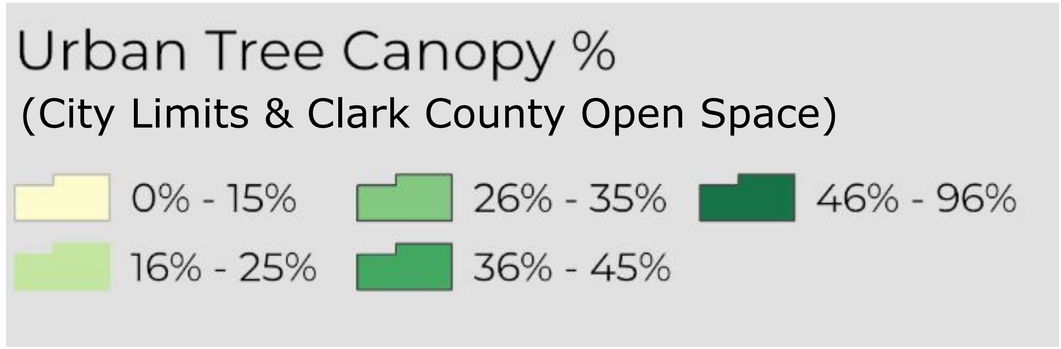
Land Type	Area
City Limits	3,399 acres
City Limits + County Open Space	4,205 acres

EXISTING

Percent canopy coverage within city limits as compared to other local communities.
Camas has more coverage than many urban areas, but less than more rural and suburban ones.

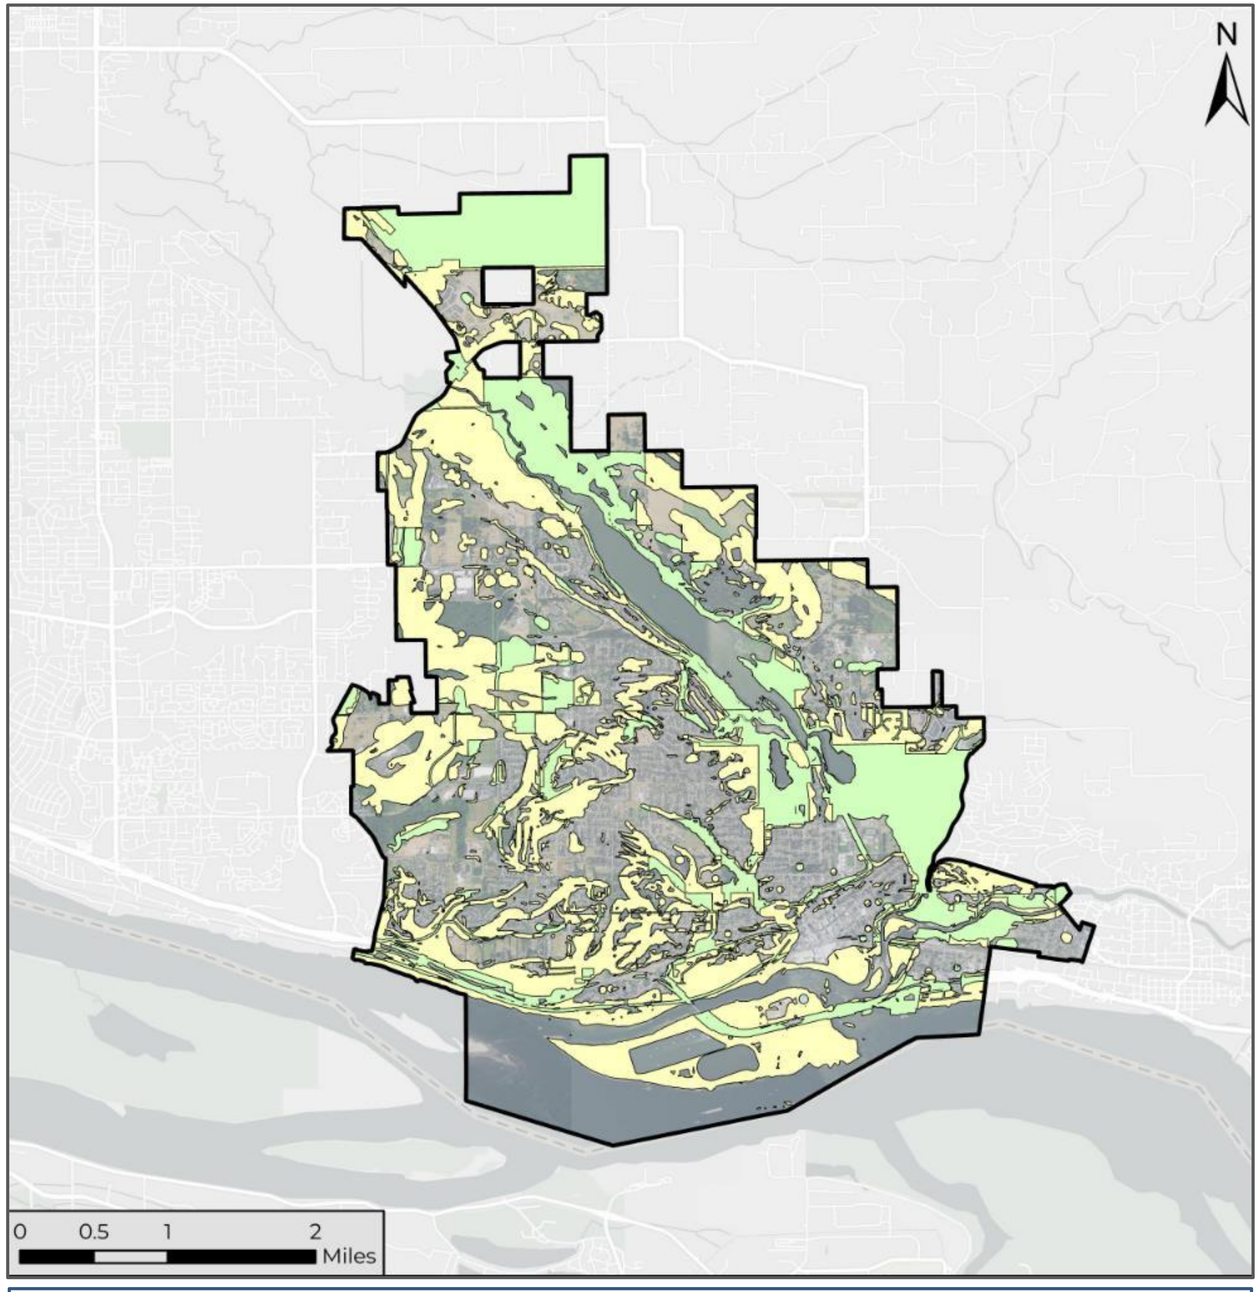


URBAN TREE CANOPY COMPARISONS



Land Type (City Limits & Clark County Open Space)	%	Area
Tree canopy on private lands	54.91%	2,293 acres
Tree canopy on public lands	45.09%	1,883 acres
All tree canopy (within POSMP area)	100%	4,176 acres

About half of all urban tree canopy in Camas is on private property.



EXISTING - URBAN TREE CANOPY

Much of the public tree canopy is concentrated around Lacamas Lake and Green Mountain. Developed parks and street trees provide coverage throughout the city.

EXISTING - PUBLIC LANDS

About half of all critical areas in Camas are on private property.

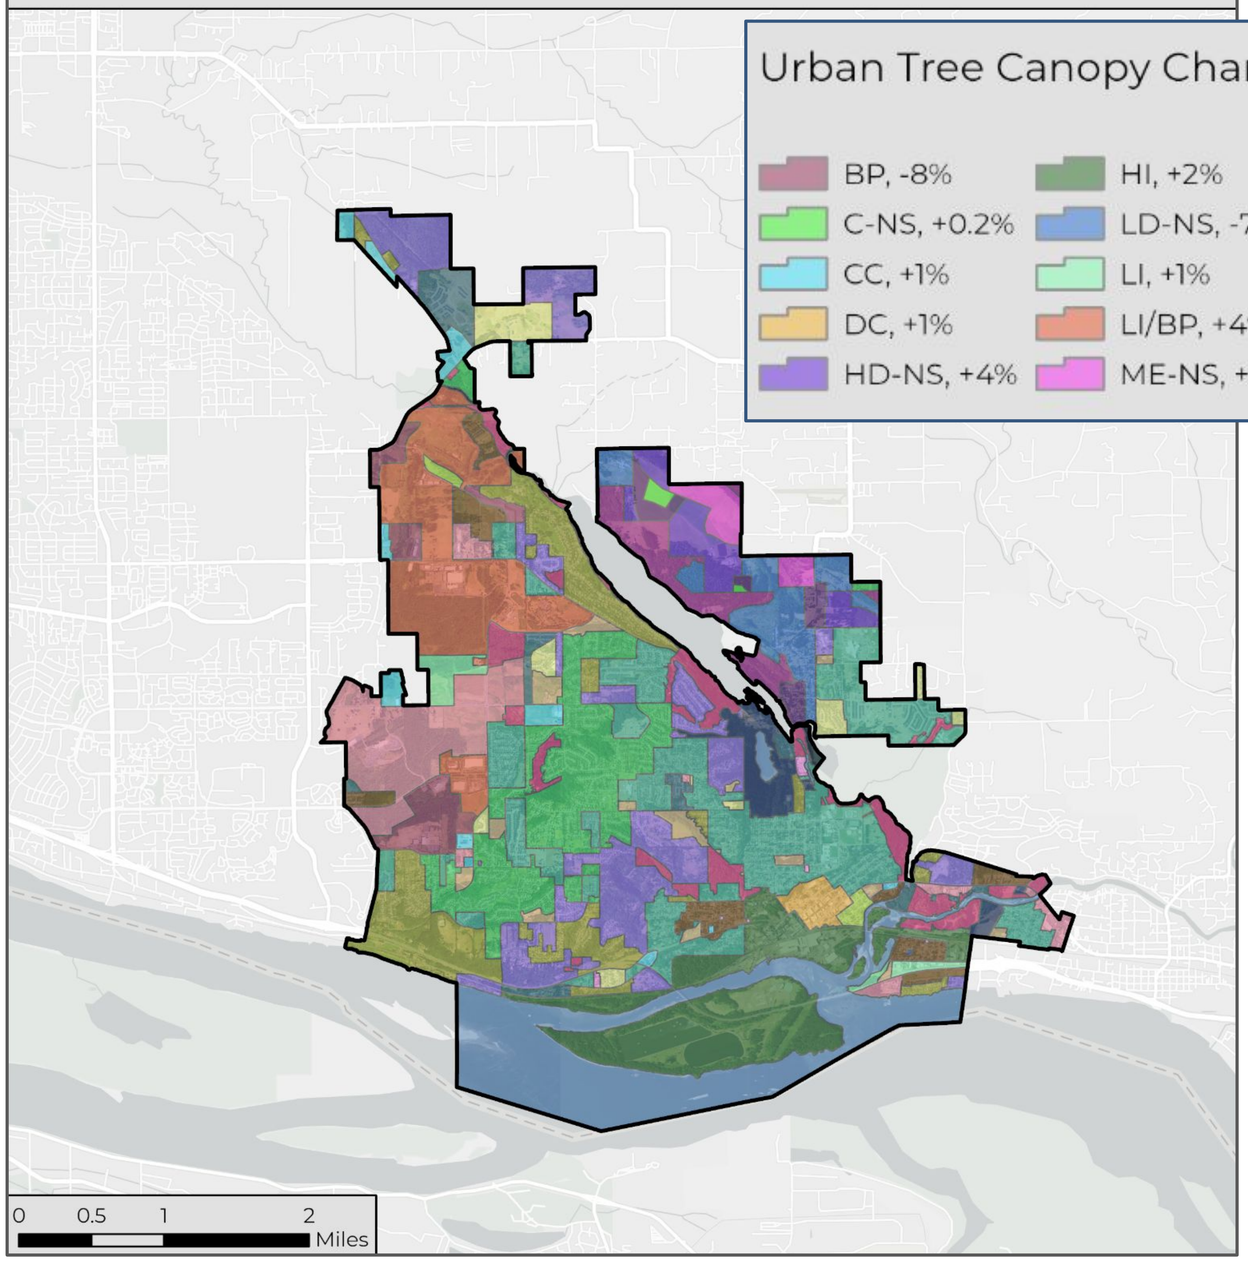
	Land Type (City Limits & Clark County Open Space)	%	Area
	Privately-owned critical lands (within POSMP area)	53.96%	3,425 acres
	Publicly-owned critical lands (within POSMP area, includes bodies of water)	46.04%	2,922 acres
	All critical lands (within POSMP area)	100%	6,347 acres

Wetlands | Steep Slopes | Sensitive Habitat

Shoreline Master Program:

The City finds that critical areas provide a variety of valuable and beneficial biological and physical functions that benefit the City of Camas and its residents, and/or may pose a threat to human safety, or to public and private property.

Goals:



1. Protect members of the public and public resources and facilities from injury, loss of life, or property damage due to landslides and steep slope failures, erosion, seismic events, or flooding;
2. Protect unique, fragile, and valuable elements of the environment, including ground and surface waters;
3. Direct activities not dependent on critical area resources to less ecologically sensitive sites, and mitigate necessary impacts to critical areas by regulating alterations in and adjacent to critical areas; and
4. Prevent cumulative adverse environmental impacts to critical aquifer recharge and frequently flooded areas.

EXISTING - CRITICAL AREAS

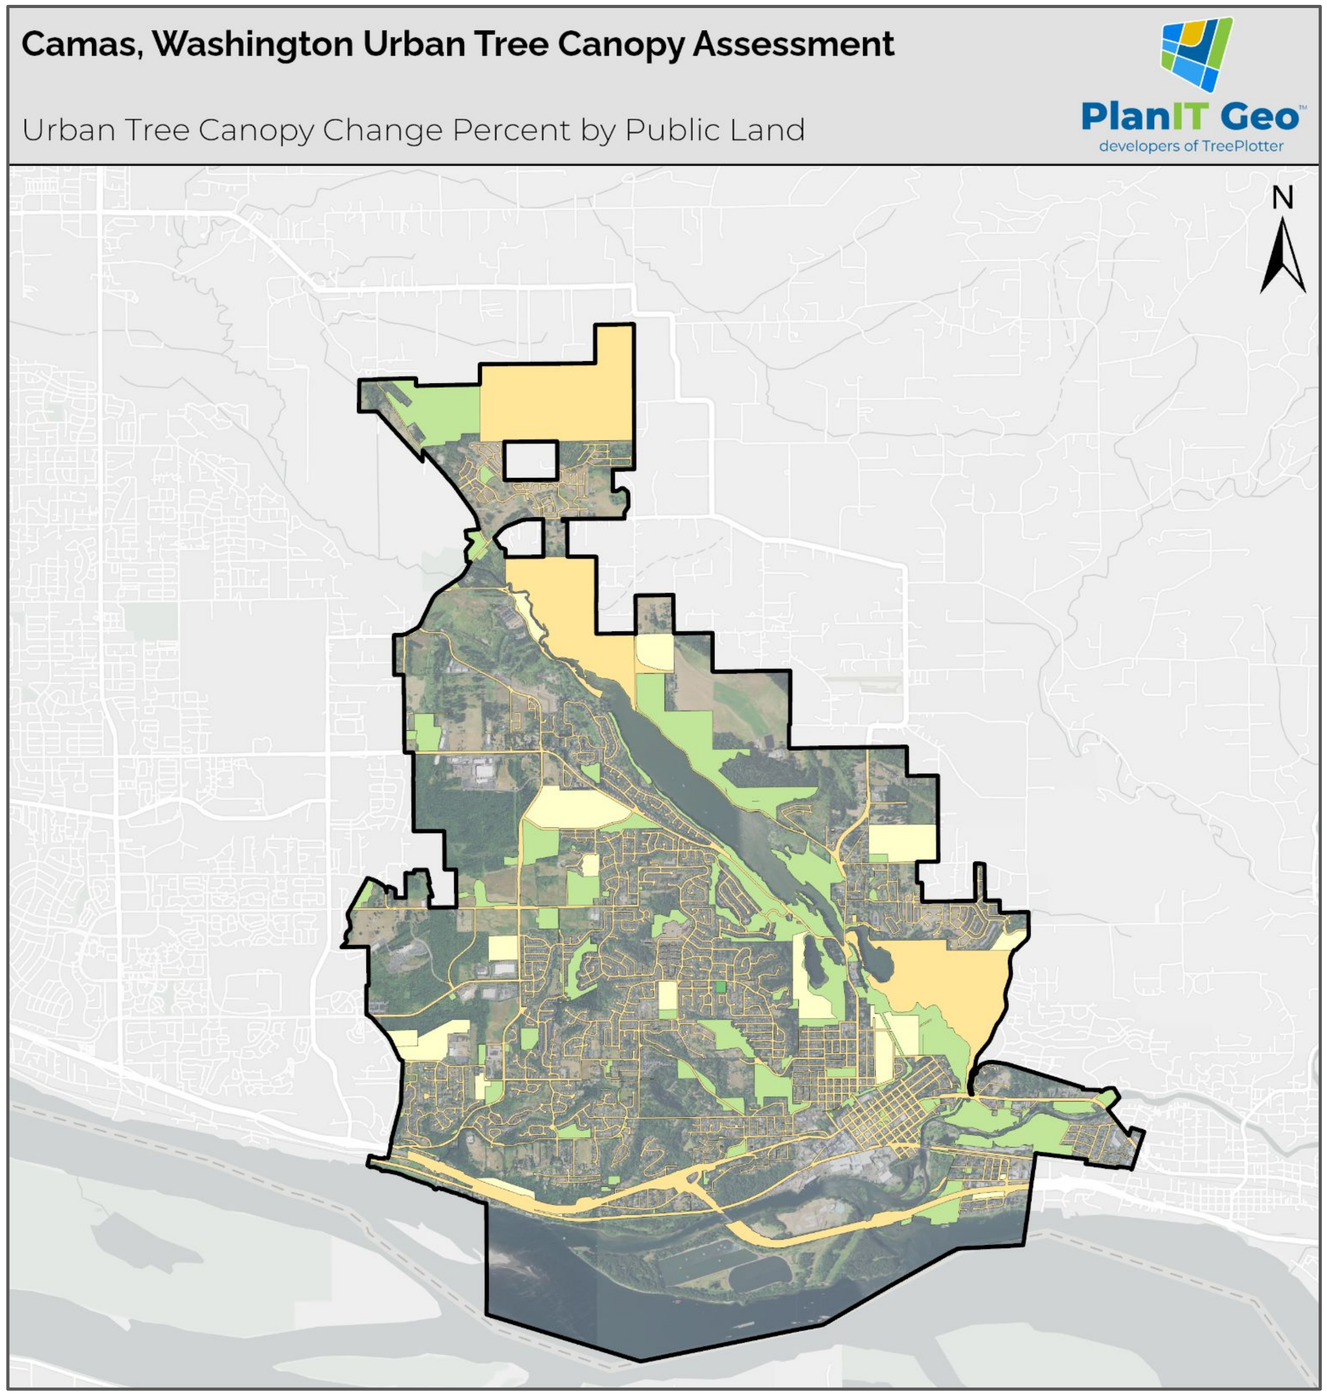
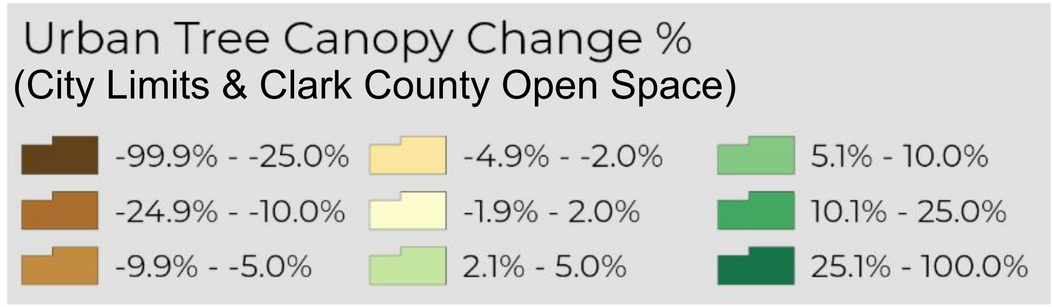
This analysis did not include an assessment of individual parcels or land types and their potential reasons for gain or loss.



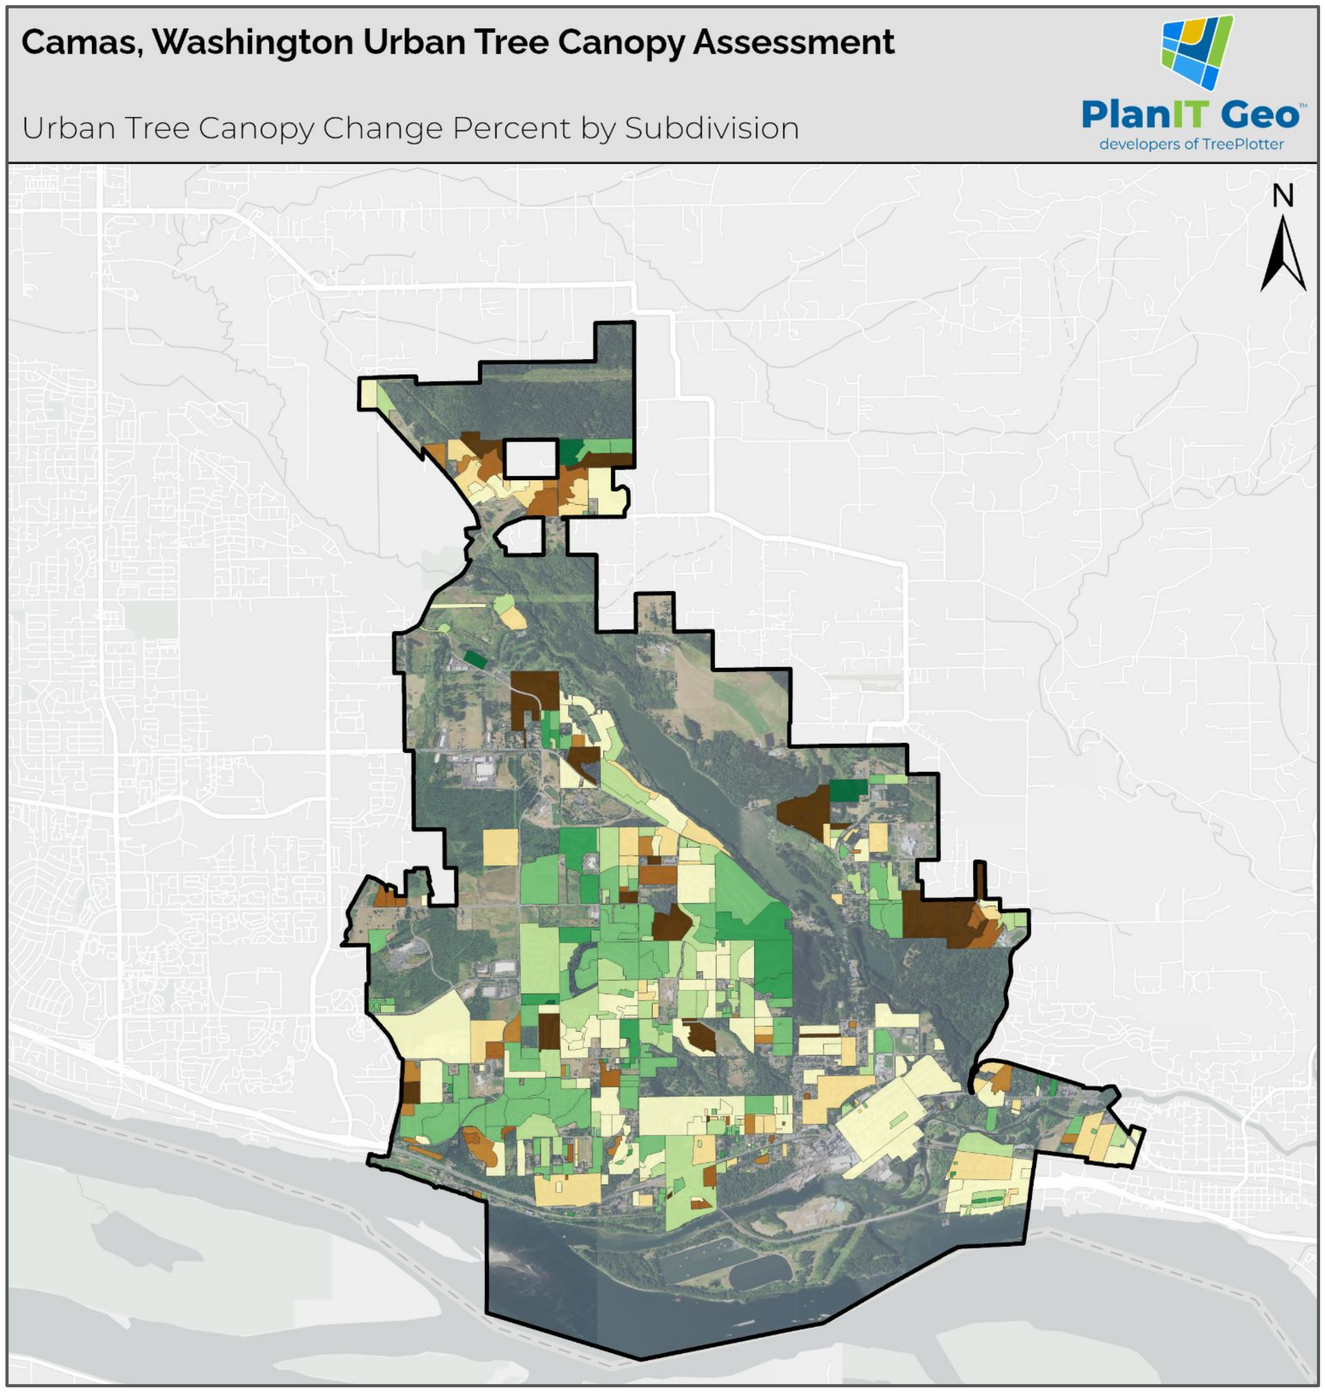
Common Reasons for %Gain



- Fallow field establishment
- Natural canopy expansion
- Restoration or infill

Common Reasons for % Loss

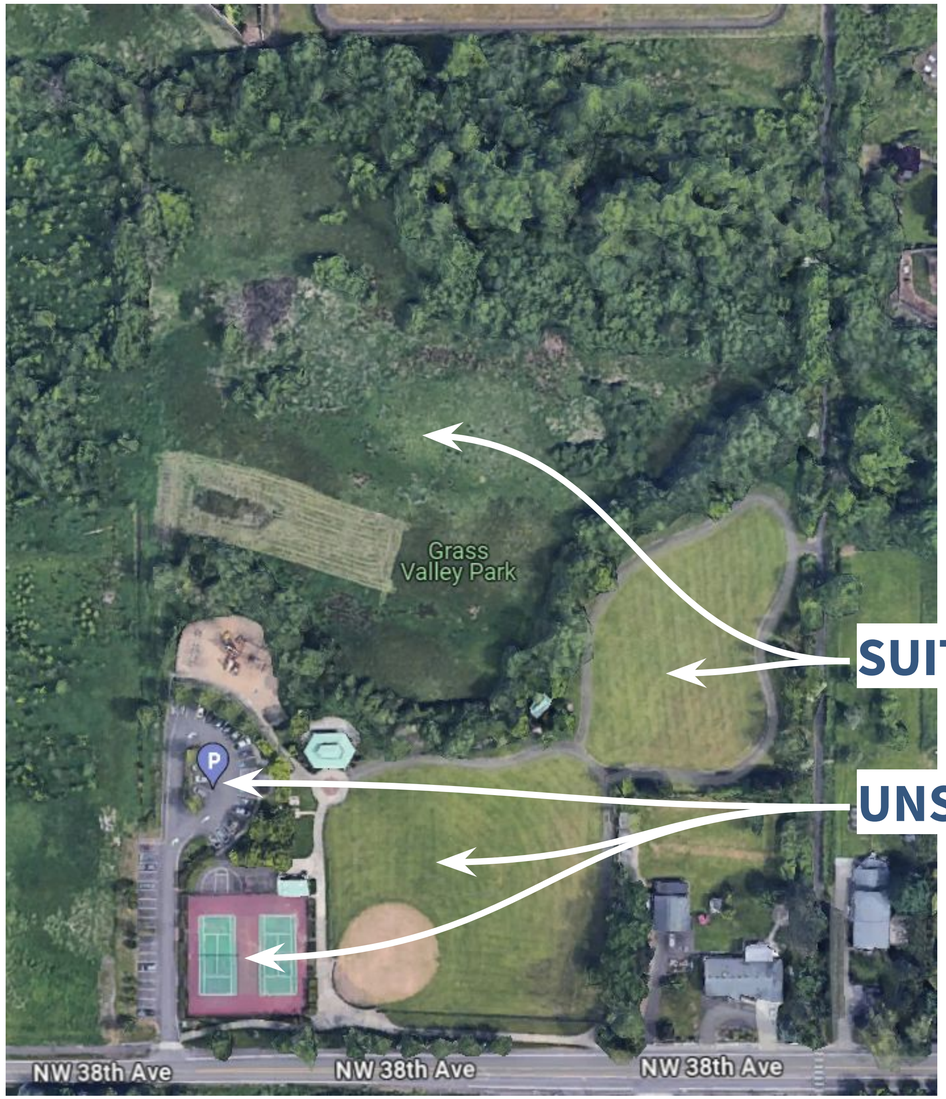
- Development
- Wildfire
- Expansion of land type
  - i.e. Right of Way added with small trees.



CHANGE (2011 - 2021)

Low to moderate gains and losses occurred on public lands

CHANGE (2011 - 2021): PUBLIC LAND



Urban Tree Canopy Change %
(City Limits & Clark County Open Space)

-99.9% - -25.0%	-4.9% - -2.0%	5.1% - 10.0%
-24.9% - -10.0%	-1.9% - 2.0%	10.1% - 25.0%
-9.9% - -5.0%	2.1% - 5.0%	25.1% - 100.0%

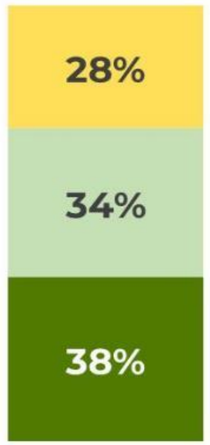
Biggest losses on subdivision land is likely due to private land development.

CHANGE (2011 - 2021): SUBDIVISIONS

All land areas in the City of Camas that were not currently tree canopy were classified as either possible planting areas (PPA) or unsuitable for planting.

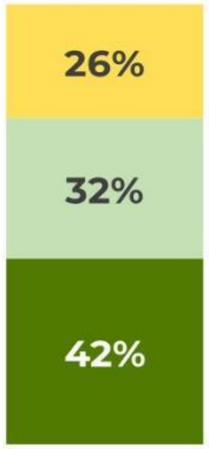
POTENTIAL PLANTING AREAS

- Lawn, open fields, or grass areas
- Shrub and ground cover vegetation
- Bare or fallow soils



UNSUITABLE AREAS

- Recreation fields
- Utility corridors
- Stormwater facilities
- Roadways
- Building Structures



POSSIBLE PLANTING AREA: EXAMPLE

46% - 98%

HOAs carry a lot of potential to contribute to canopy gain.

POSSIBLE PLANTING AREA: SUBDIVISIONS

An assessment was done to determine priority areas for future planting. It was based on the following factors, equally weighted, which align with many grant applications with equity requirements:

- **Low UTC** - areas currently low in canopy cover
- **High PPA** - areas currently high in possible planting area
- **Economic vitality** - average annual household income
- **Poverty %** - percentage of population living below poverty line
- **Vulnerable population %** - percentage of residents under 18 or over 65
- **% unemployed** - percentage of residents considered unemployed
- **Educational attainment** - percentage of the population w/o GED or HS diploma
- **People of color** - percentage of residents of color

DEMOGRAPHIC PRIORITY AREAS

Plan for Adaptability

Urban areas around the world are facing dramatically intensifying extreme weather and climate impacts including drought, long-term water shortages, flooding, extreme weather events, and prolonged heat. Urban trees can play a significant role in making Camas, Washington resilient to weather and climate extremes, and in protecting human and ecosystem health and safety.

Increased temperatures and prolonged heat have a dramatic effect on urban trees. Urban trees already face many struggles of the urban environment, including competition for space, elements of an urban environment, vandalism, and harmful pests and diseases. Some of Camas's established trees are unlikely to survive the changes in the climate and weather patterns over the next 50-75 years. Planting the right trees for Camas today and in the future will play a vital role in the resiliency of the City's urban forest as well as overall community sustainability.

In pursuit of a sustainable and resilient urban forest, the City of Camas may seek to apply climate adaptation strategies to urban forest management planning. Building toward this objective, the City maintains a recommended tree list of small, medium, and large trees and trees that are prohibited for planting in public areas or through private development projects as a requirement of City Code. The Camas Urban Forest Vulnerability Report provides a summary of the changing climate, an analysis of urban tree species vulnerability to changing climate, and considerations for new tree species to integrate into Camas's urban forest over time. See Appendix for full report.

Climate Change Vulnerability Ratings for Northwest Urban Trees

Table Key:					
Urban Adaptability:		**Zone Suitability:**		**Vulnerability:**	
+	High: Species may perform better than modeled	√	Suitable	▼	Low: Suitable zone, high adaptability
●	Medium	X	Not Suitable	●	Low-moderate: Suitable zone, medium adaptability
–	Low: Species may perform worse than modeled			⊖	Moderate: Suitable zone, low adaptability or zone suitable, high adaptability
				○	Moderate-high: Zone not suitable, medium adaptability
				△	High: Zone not suitable, low adaptability

*Invasive species

Example tree species list. See report for full list.

Measure What You Have

As part of assessing the urban tree canopy, this project inventoried over 9000 individual trees on public land across the city. This effort is a start to understanding the species and size diversity, health, and potential long- and short-term maintenance issues that may occur. The City will be adding to and managing this database in order to track changes over time in order to align more with the recommendations of this plan.

Visit [TreePlotter (pg-cloud.com/CamasWA/)](pg-cloud.com/CamasWA/) to see more details on the inventoried trees on Camas public lands. The first 9000 trees were prioritized to include downtown street trees, developed parks, and trail and open space corridors that might pose potential hazards to recreational uses. It also included a few sample Right of Way areas in residential neighborhoods.

Street Trees

While not all street trees were inventoried, a snapshot of the diversity in species and size provides an overview of the overall conditions and can set a baseline for tracking future conditions. Many new trees were recently added, so care should be taken to allow them to mature and adapt to a changing climate.

Richards, N. A. 1983. "Diversity and Stability in a Street Tree Population." Urban Ecology 7(2):159–171.

Richards, N.A. 1993. Reasonable guidelines for street tree diversity. Journal of Arboriculture 19:344–349.

Value & Resource Use

The POSMP used budget and spending data over the past several years to get a sense of existing resource allocation. These were compared to other local agencies and best practices to produce recommendations for re-aligning to meet Camas' Community Values.

Current Practices and Allocated Resources Assessment

Identifying gaps and opportunities in service delivery

In order to shift operations towards a long-term management and stewardship model, this plan summarized and assessed existing staffing, time and resource use, and relationships with other organizations. Understanding the gaps and strengths helped to focus recommendations on potential methods of improvements.

Best Practices focused on these three key areas. Finding a balance across these goals can lead to alignment with the priorities of this plan:

More efficient service delivery and resource allocation.
Changes to service delivery methods that reduce costs, level of staff effort, and timelines can more efficiently use public funding and resources, and typically lead to a greater quantity of services provided.

More equitable distribution of and access to services in the community.
A more equitable distribution of public resources can address deficiencies within communities that have been historically underserved by public programs, investments, and processes.

Higher quality ecosystem services and social benefits.
Public-sector agencies are recognizing parks, trails, and open space as critical infrastructure. Improving services in the context of natural resources can mean improving outcomes directly for the ecosystem (e.g. air and water quality) and social benefits (e.g. recreation and improved health outcomes).

Recommendations Summary

STRENGTHEN COLLABORATION WITH PARTNERS

- Create full time position focused on development, coordination, and implementation of a partnership and volunteer program that engages with HOAs, community-based groups, volunteers, and other government entities.
- Establish management standards that can give clear guidance to City staff and private landowners to help meet the goals of climate resiliency, best management practices, and effective resource allocation.
- Establish agreements with HOAs and other partners for collaborative management of ecosystem services and recreational resources.
- Create ongoing channels with state and county level partners.

ALIGN INTERNAL ORGANIZATION AND METRICS WITH POSMP FRAMEWORK

- Reorganize maintenance staff by land type and train or hire champions to provide overall stewardship practices and goals.
- Implement per-capita and/or per-acre spending targets and tracking metrics to ensure adequate funding levels for maintaining high-quality parks and recreation amenities that meet the needs of the community in Camas.

Service Delivery: Department Spending

In terms of spending per acre and level of service, Camas provides more acres per 1,000 residents than any comparable district while spending the second lowest amount per acre.

PARK PROVIDERS	POPULATION ESTIMATE	PARKS BUDGET	PARKLAND ACRES	PER-CAPITA SPENDING	PER-ACRE SPENDING	ACRES/1000 RESIDENTS
City of Tumwater	27,100	$7,608,421	514.5	$280.8	$14,788	19.0
City of SeaTac	31,740	$8,317,584	352	$262.1	$23,630	11.1
City of Port Angeles	20,240	$3,914,100	270	$193.4	$14,497	13.3
Park Districts of Si View	42,060	$6,250,632	890	$148.6	$7,023	21.2
PenMet Park District	40,000	$5,866,627	570.9	$146.7	$10,276	14.3
City of Camas	**27,420**	**$3,437,438**	**1,064**	**$125.4**	**$3,231**	**38.8**
City of Mercer Island	25,800	$2,127,581	479	$82.5	$4,442	18.6
City of Kenmore	24,230	$1,873,638	146	$77.3	$12,833	6.0
City of Longview	38,130	$2,170,690	488	$56.9	$4,448	12.8
City of Mountlake Terrace	23,810	$1,306,090	269	$54.9	$4,855	11.3
City of Maple Valley	29,250	$1,069,653	370.8	$36.6	$2,885	12.7

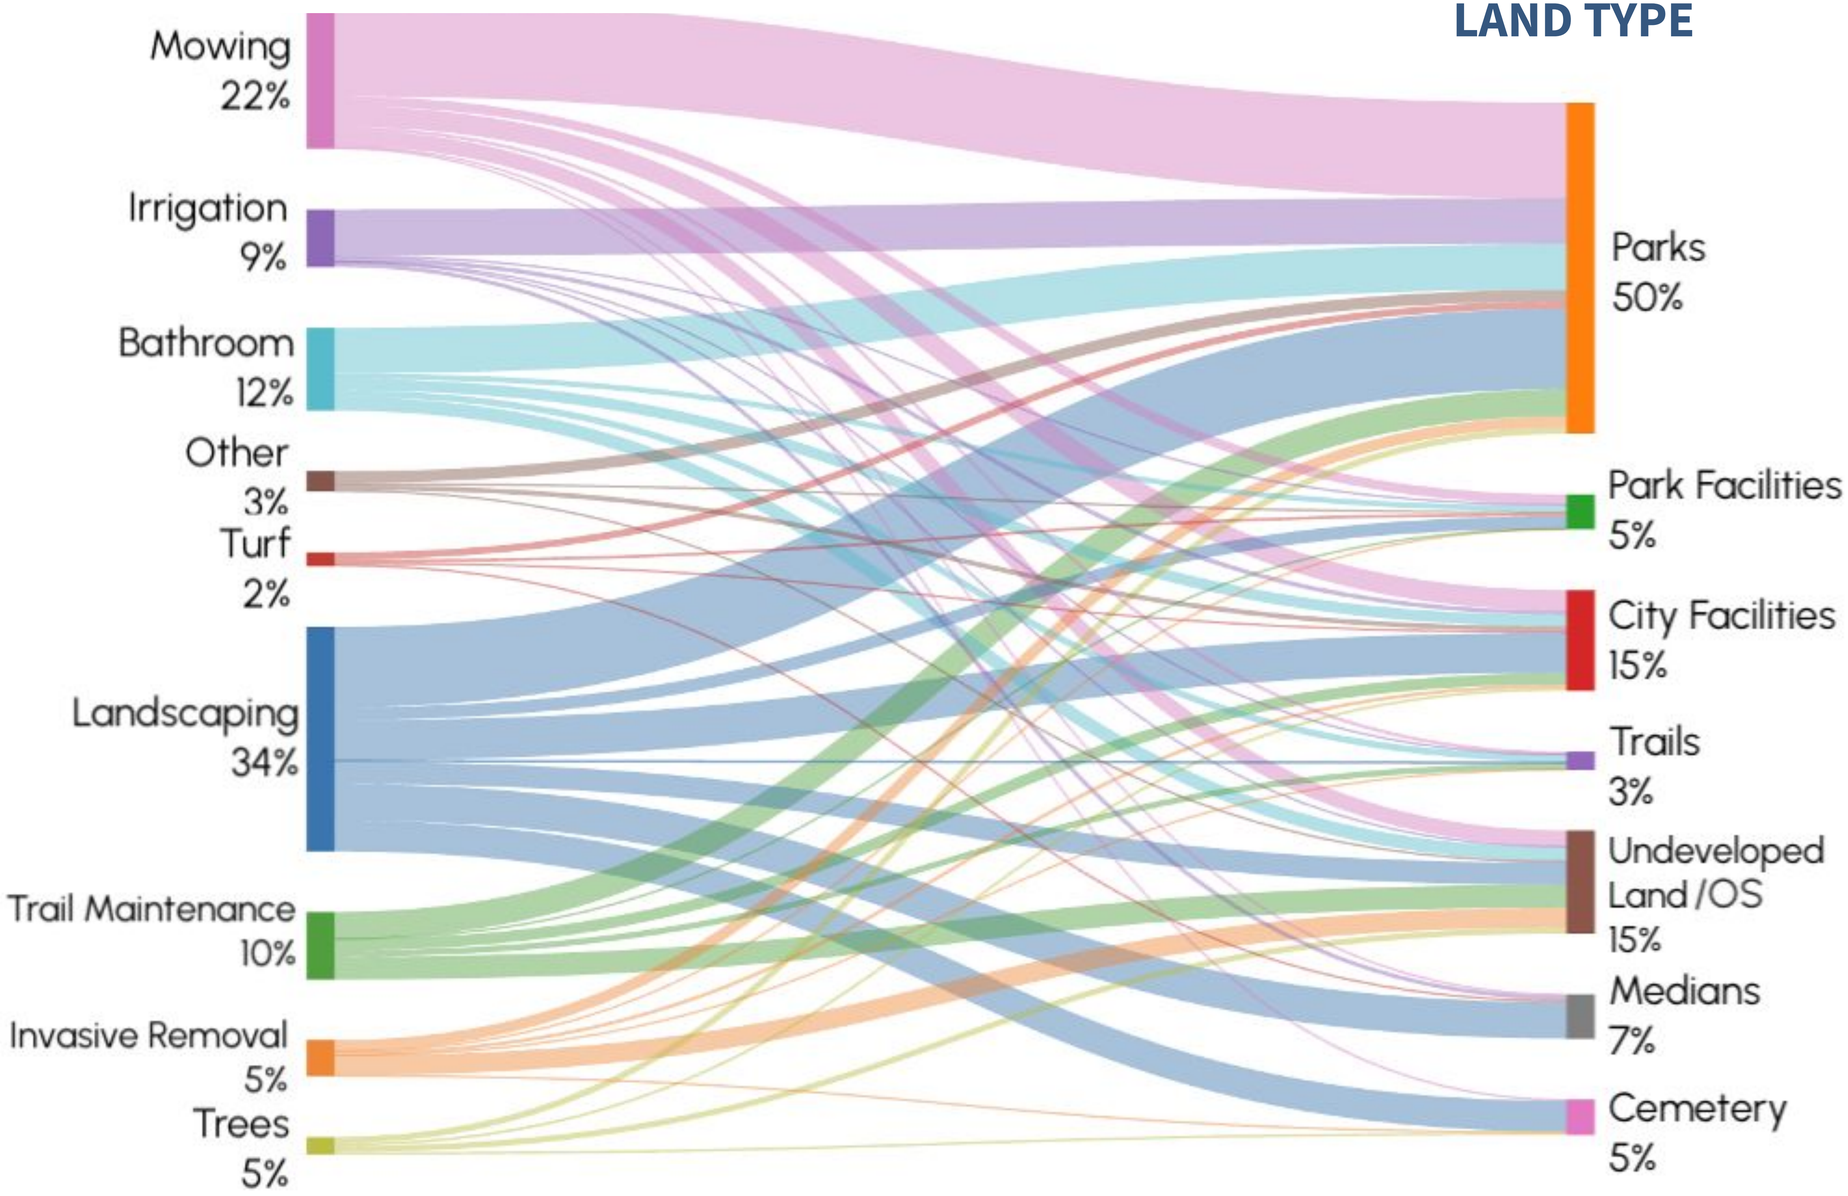
WA State Comparisons

In its 2022 Parks, Recreation, and Open Space (PROS) Plan, Camas identified comparisons with other cities in Washington with similarities to Camas to understand the variation in operations. The PROS Plan found that in 2018 data reviewed, Camas had considerably lower spending and operating budget on parks and recreation services compared with peer cities, allocating the equivalent of $78.65 per person. The PROS Plan used 2018 data to avoid pandemic distortions in local budget data. An updated comparison using 2023 data of park providers in Washington, Camas fell in the middle of per-capita spending looking at a broad section of cities but was still less than half of the cities with the greatest spending (the Cities of Tumwater and SeaTac). Total budget numbers include all O&M including recreational services.

Strengths, Weaknesses, Opportunities, and Threats

Summary of existing conditions to provide context for efficient service delivery related to operations and allocating resources

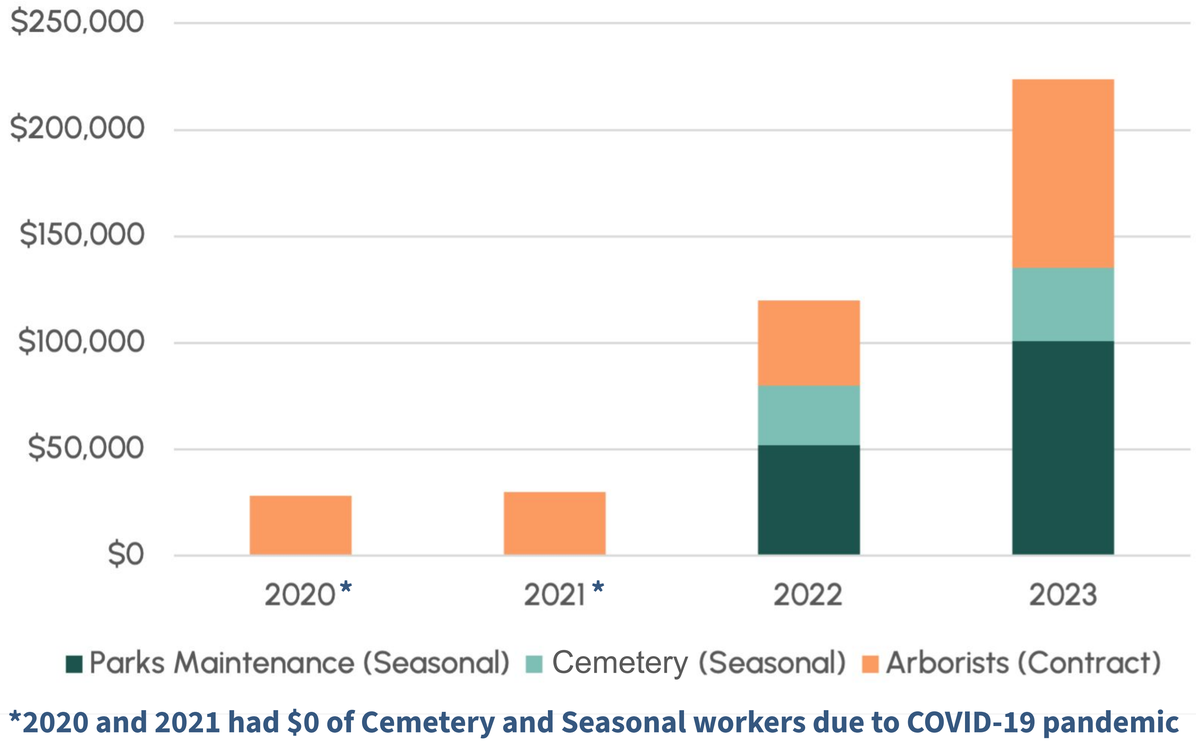
Strengths:
- Large and growing inventory of parks and open spaces
- High level-of-service acreage with 38.8 acres per resident (the highest among comparison districts analyzed)
- Skilled Parks and Recreation staff
- Diverse schedule of recreation activities for residents accessible for different ages
- Currently leveraging County resources to expand portfolio (Legacy Lands program) and other grant resources for capital projects
- Community member interest in parks and open space stewardship and greater involvement; existing Camas Parks Foundation and Ivy League for fundraising and invasive plant removal volunteers



Weaknesses:
- City subsidizes community use through low facility-rental fees and charges
- High amount of effort towards mowing/landscaping
- Significant time and resources spent on non-Parks and non-Open Space facilities
- Need for additional invasives removal in open spaces (citywide)
- Resources spent on reactive management to extreme weather events
- Lack of specialized stewardship experience for different land types or natural systems
- Lack of established standards, agreements or ongoing conversations with private entities (HOAs) about parks and natural system expectations

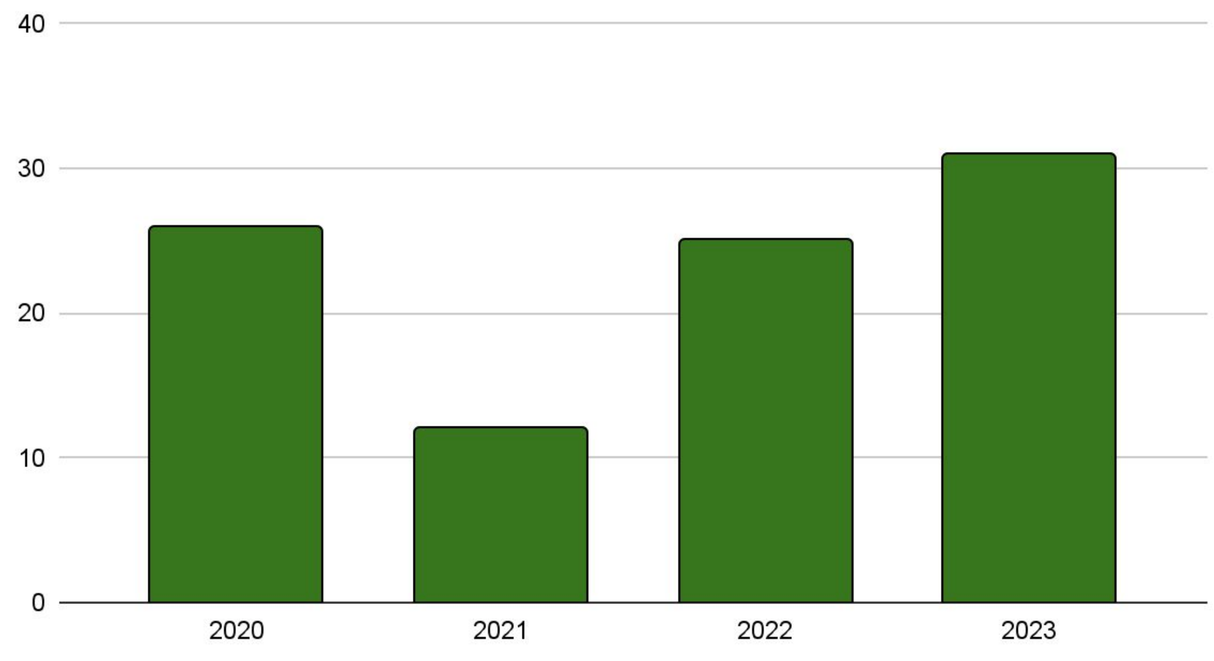
Opportunities:
- Increase staff capacity to grow partnerships with community-based groups and leverage potential volunteer efforts
- Identify opportunities for joint training for both staff and community members to improve knowledge and best practices
- Work with Homeowners Associations (HOAs) to collectively address natural area needs on private property (e.g. invasives removal, trail maintenance, replanting of native plants/trees)
- Identify best design practices that reduce need for ongoing maintenance to free up staff time to address long-term or proactive issues

Threats:
- Lack of additional external resources (grants) for maintenance and ongoing operations with new assets
- Low capacity at current staff levels to engage with volunteer/community partners
- Increasing need for more specialized contract services (e.g. arborists) to handle reactive issues
- Unpredictable weather patterns associated with climate change that create unexpected costs and maintenance needs and increase system-wide vulnerabilities.



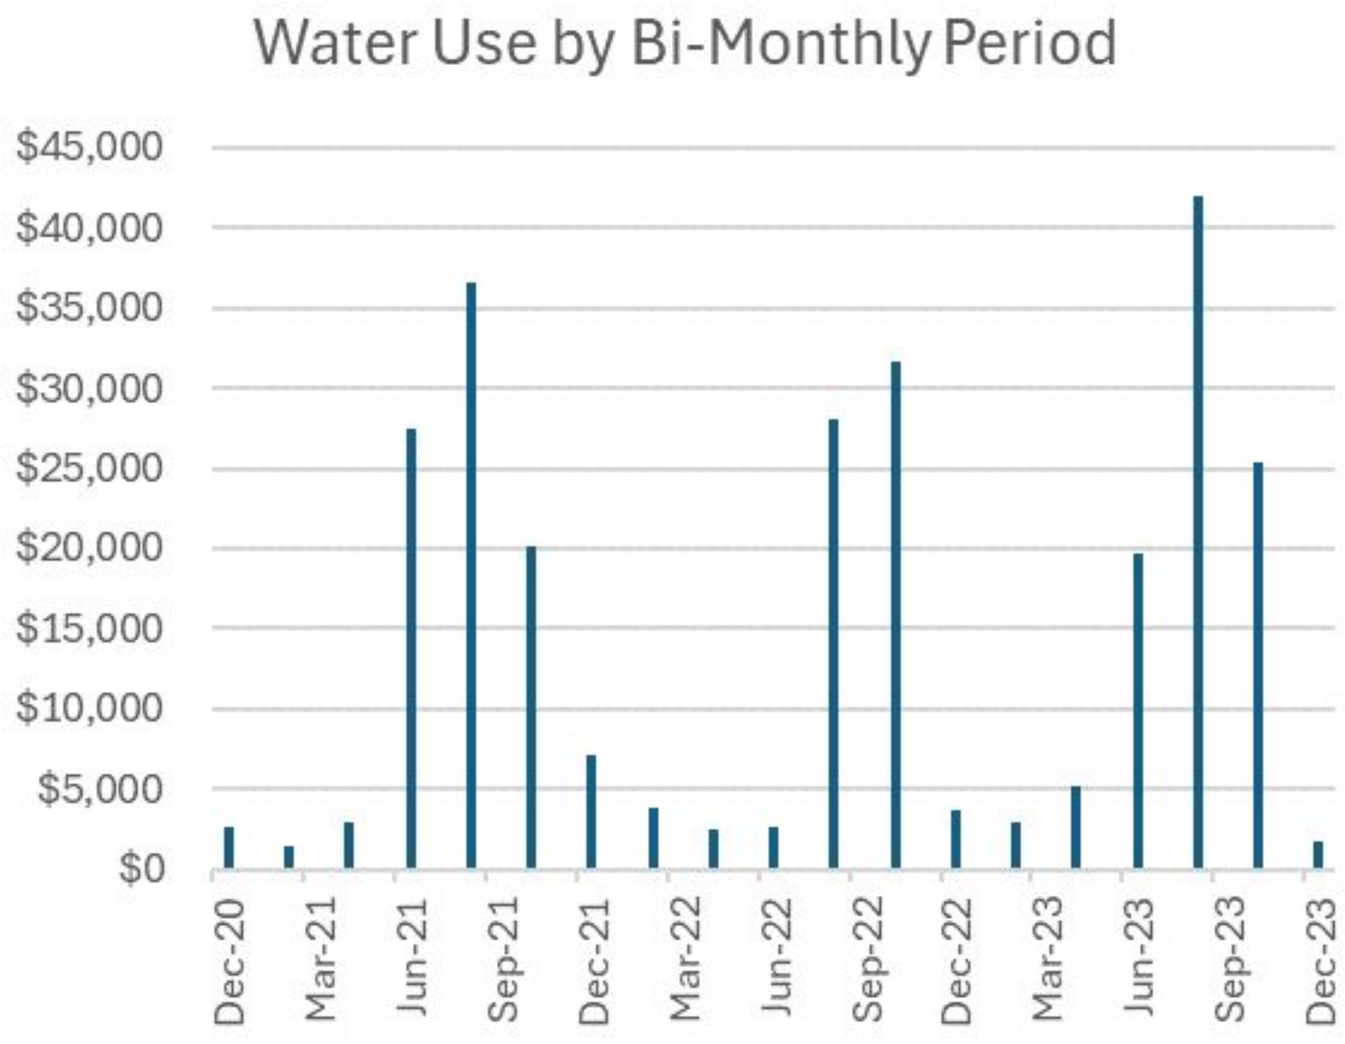
TIME SPENT PER ACTIVITY

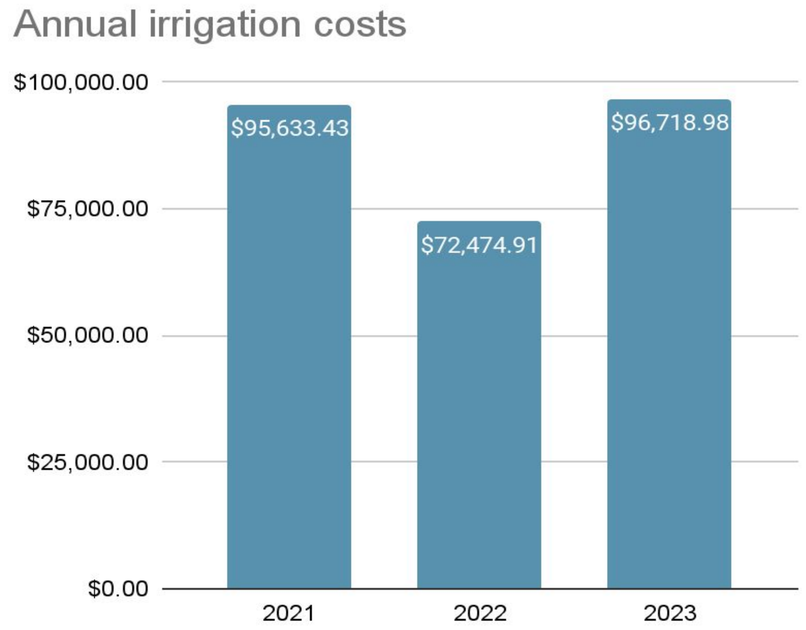
TIME SPENT PER LAND TYPE



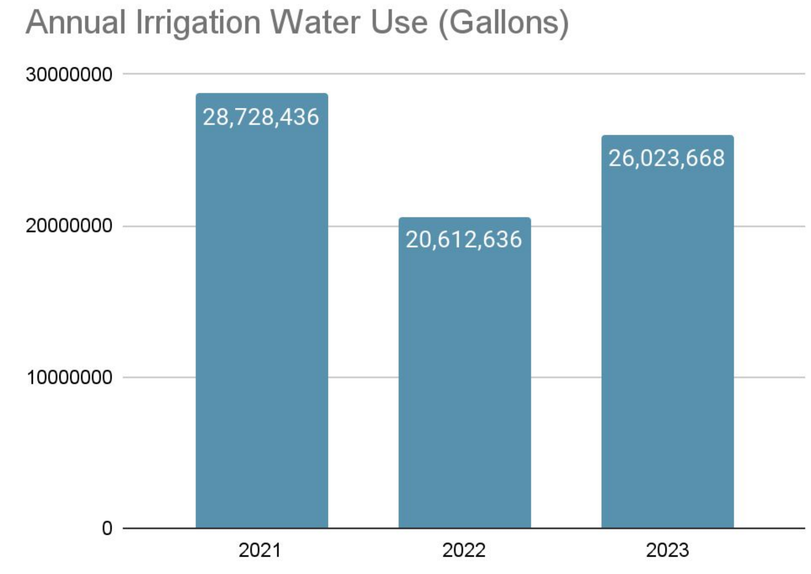
Parks and Recreation staff maintenance hours for the 2023 year were also assessed as part of this process in order to understand how time and resources were being prioritized. As the graph indicates, about a third of the time was being spent on maintaining lawns and irrigation, with another third on more detailed landscaping. About half of all time spent was on developed parks, while much of the time was also spent on non-Park facilities.

Annual Contract Employee Costs



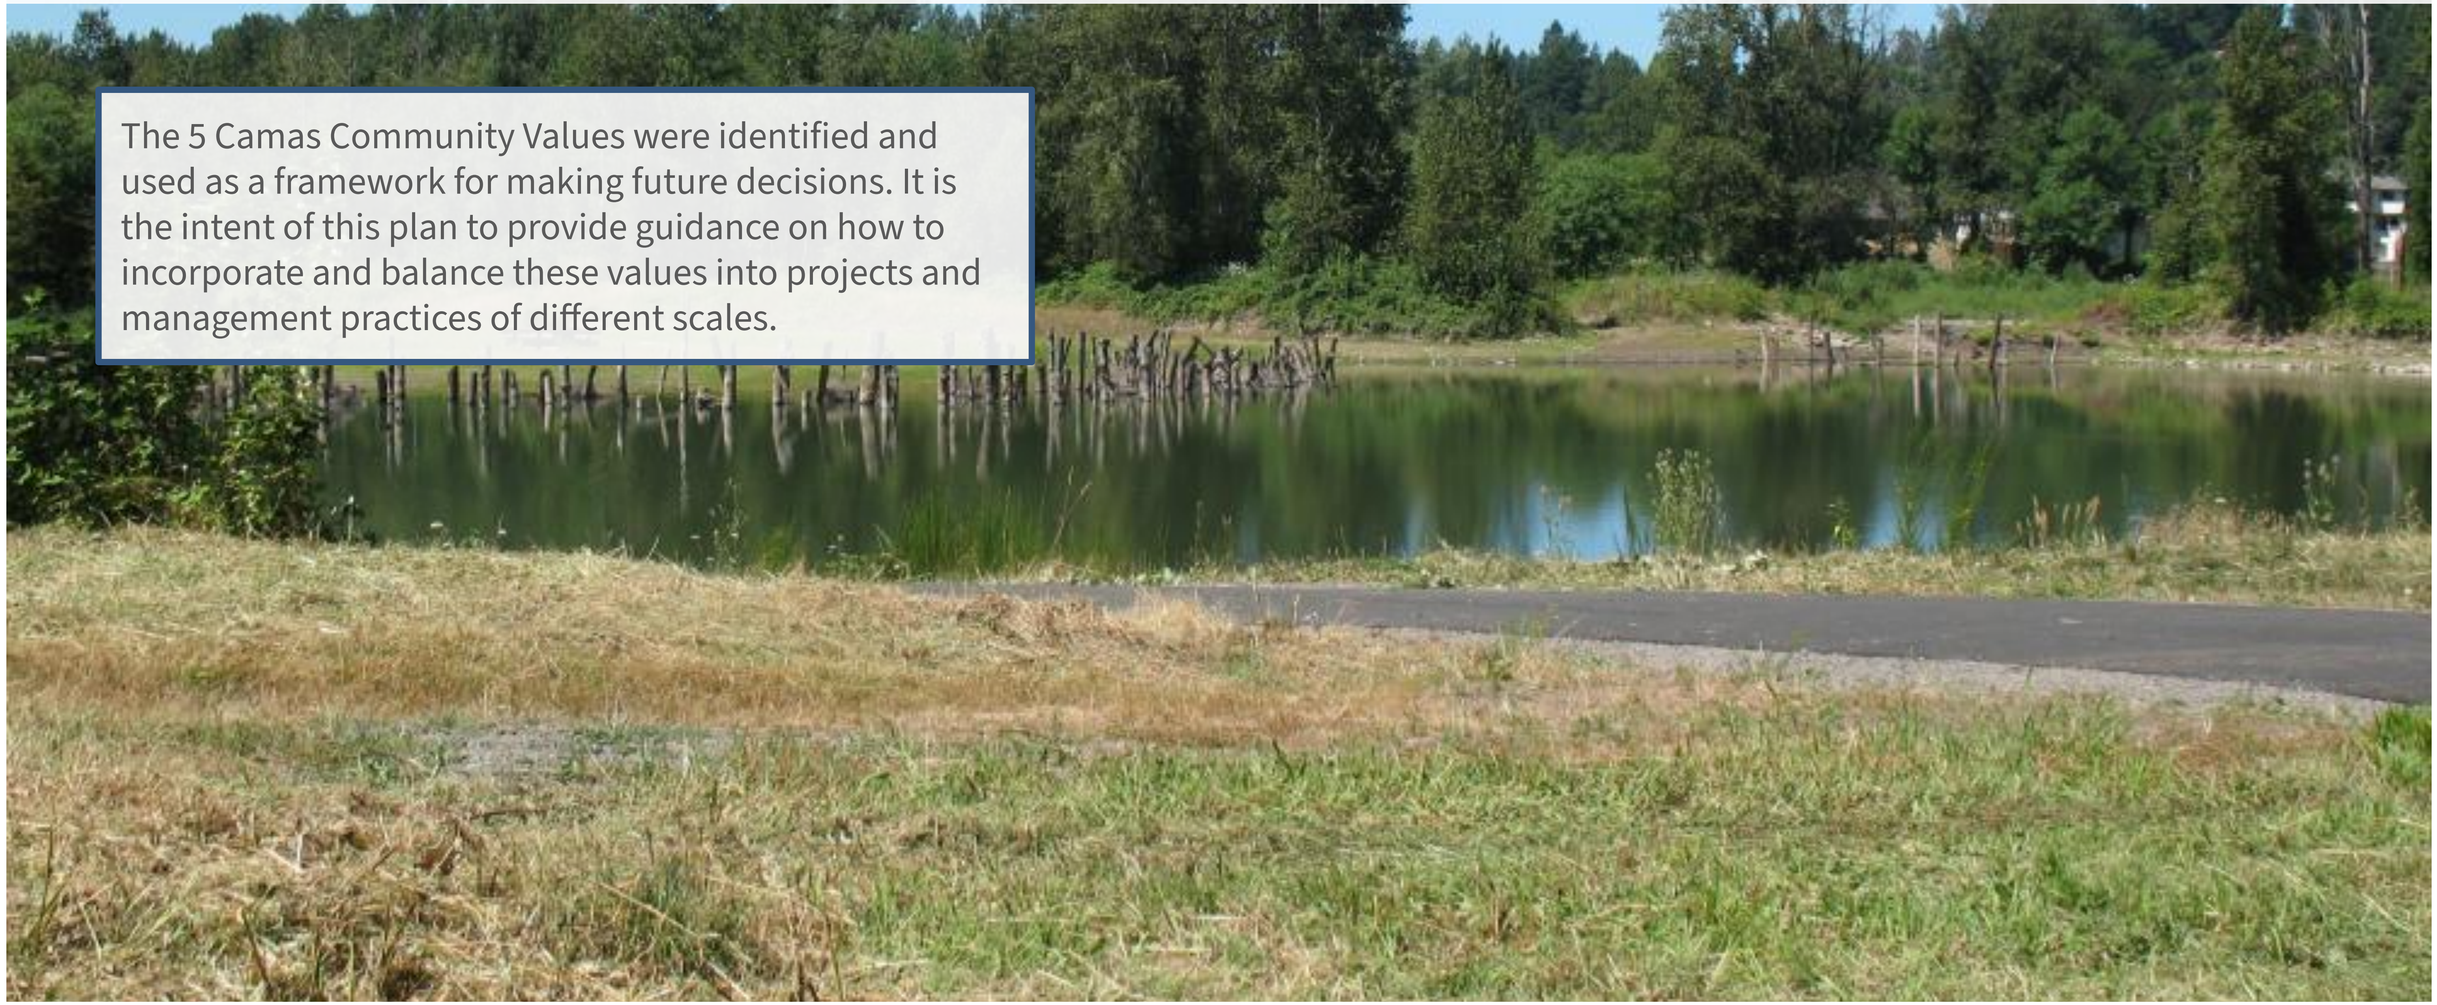


***2020 and 2021 had $0 of Cemetery and Seasonal workers due to COVID-19 pandemic**



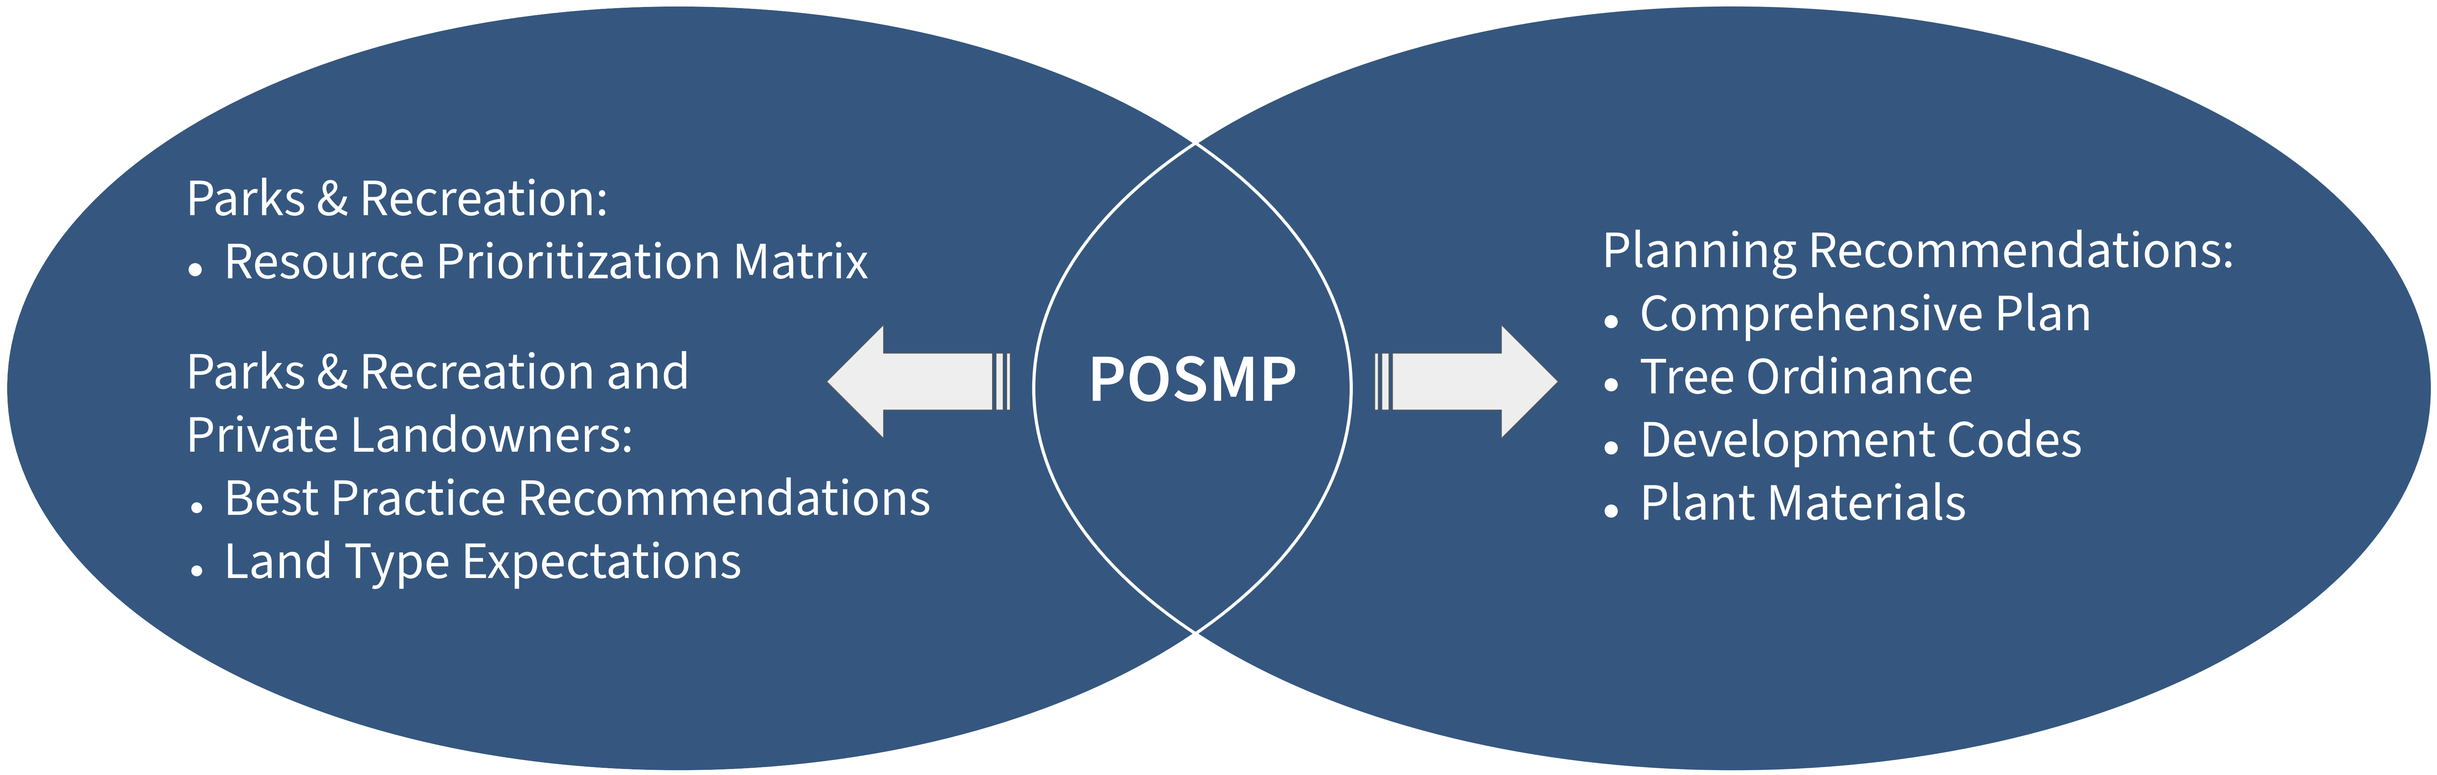
Number of Public Tree Requests

As extreme weather events and tree health and structural issues cause branch failures or risks, the number of public tree maintenance requests and other instances have increased. As public safety is a top priority, the city has been reactionary with the resources they have had, but mostly have contracted out arborists to handle these instances with costs increasing over the last several years.

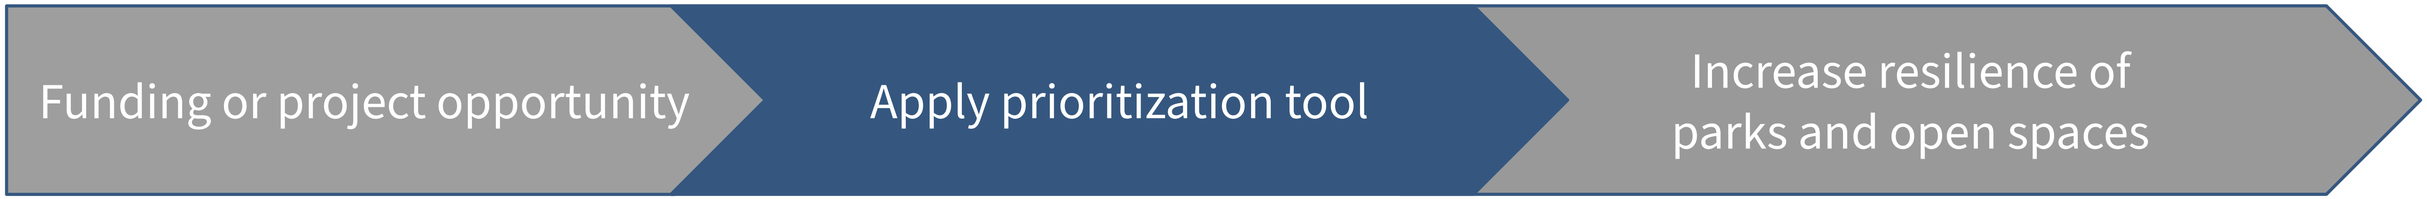


A significant portion of time and money goes into watering the public landscapes of Camas. The best practice recommendations look to find ways to reduce water use through use of native and adaptive vegetation.

ANNUAL IRRIGATION WATER USE: 2021-2023



Resource Prioritization



The 5 Camas Community Values were identified and used as a framework for making future decisions. It is the intent of this plan to provide guidance on how to incorporate and balance these values into projects and management practices of different scales.

Recommendations

Based on the community values and existing conditions analysis performed by this plan, several types of recommendations were developed in order to find better alignment between the POSMP goals and the public and private practices that influence the resilience of the Parks and Open Spaces of Camas.

Building a prioritization tool

How can we use our resources strategically to support our parks and open spaces when a funding source or project opportunity becomes available?

We can use a set of criteria to make good management decisions and prioritize opportunities.

By using a data-backed prioritization tool, we can effectively use resources and increase the resilience of our parks and open spaces.

Project Approach Matrix: Overview

Values	Goal
Financial and Resource Allocation	Optimize value and resource use in order to best balance the long-term performance goals with immediate needs for parks and public open space.
Outreach and Education	Provide opportunities for learning to gain efficiencies, institute best practices, and engage the community.
Natural Character	Maintain the existing natural character of Camas in ways that bolster community identity.
Equitable Access	Ensure that all community members have access to Camas' parks and natural resources and the benefits they provide.
Asset Protection + Public Safety	Protect ecosystems, human health, safety, and public and private assets through the management of natural systems to limit the effects of extreme weather, climate change, and other potential impacts .

Where most cities are required to focus and start from

Additional values Camas wants to incorporate into decision making and resource allocation

Legend

Establishes system-wide resilience

Considers connectivity and impacts to other sites or organizations

Makes site or process improvements

Status Quo Current practices

Roadblocks Obstacles to implementation

It is the intent of this tool to use these 5 community values as a guide to prioritize resources and projects in order to maximize the potential impact of the work. The following matrix should be used by each project team to initiate a conversation and develop an intentional approach for how each project is addressing these values. Each value can be addressed in a variety of ways to contribute to the project site, the surrounding area, and the system as a whole.

Community Value: Financial and Resource Allocation

Goal: Optimize value and resource use in order to best balance the long-term performance goals with immediate needs for parks and public open space.

Challenges with available resources have led to some misalignment between public expectations and the abilities of current staff to keep up with the needs across the management portfolio. These resource challenges have also been amplified as the City of Camas has acquired a substantial amount of land in the last 10 years. While additional funding opportunities may become available through the treatment of parks and open spaces as valuable infrastructure, decisions have to be made to shift time and resources to the most impact tasks in order to align with the community values and POSMP goals.

Key Opportunities for Allocating Resources

- **Incorporate the value of ecosystem services**
- **Expand decision making to intentionally incorporate the 5 community values**
- **Align goals with grant funding requirements**

Recommended Project Approaches

System	Connectivity	Local Improvements	Status Quo → Roadblocks	
• Do the goals and strategies open up opportunities for additional ongoing funding sources? • Does it reduce liability? • Can it utilize current practices or resources? • Are operational savings or ecosystem services quantified to support future assessments and tracking?	• Are off-site ecosystem services, trade-offs, or mitigation being considered? • Do the goals and strategies open up opportunities for supplemental grant funding?	• Does it reduce resource use or operational costs? • Are on-site ecosystem services included in the project goals and value discussions? • Does it reduce the need to hire outside vendors?	• Not currently funded or intentionally pursuing resources • Maintains status quo in funding for maintenance and operations • Is reactive to comprehensive ecosystem services.	• Increase maintenance costs or resource use. • Removes ecosystem services without mitigation.

Community Value: Outreach and Education

Goal: Provide opportunities for learning to gain efficiencies, institute best practices, and engage the community.

With so much natural land to manage, it will take public, private, and non-profit collaboration and efforts to meet the long-term management goals of the POSMP. The City is constantly looking for new partnering opportunities to improve skills, increase capacity, or supplement funding or resources. This plan also looks to provide alignment across organizations for goals and identify needs for training and knowledge gaps.

Priority Education and Training Needs

- **Tree hazard identification**
- **Tree pruning strategies**
- **Invasive identification**
- **Value of retaining existing mature trees and protecting natural systems**
- **Maintenance guidelines for HOAs**
- **Maintenance practices for residential wildfire prevention**
- **Maintenance for stormwater facilities**
- **Benefits of using native species vs ornamentals or lawns**
- **Pest management and chemical use**
- **Soil health**

Recommended Project Approaches

System	Connectivity	Local Improvements	Status Quo → Roadblocks	
• Does it enable a path for long-term community stewardship or collaborative partnerships? • Does it establish or implement a pilot program to test practices and capture learnings.	• Does it collaborate with outside organizations or volunteers? • Does it build public-private partnerships or shared knowledge, goals, or expectations?	• Does it include public educational opportunities to learn about a resource, site, or culture? • Does it adjust practices or provide training for staff or the public on innovative or Best Management Practice methods that improve performance?	• Utilizes existing internal staff to perform a routine task. • Supplement with contractor for tasks that require specific training and/or technical skills.	• Requires resources for extra staff training.

Community Value: Natural Character

Goal: Maintain the existing natural character of Camas in ways that bolster community identity.

The natural features of Camas contribute to a sense of beauty and place that makes it a great place to live, work, play, and visit. There are many different types of features, each requiring their own care, attention, and stewardship to maintain their character and functionality.

Types of Features

- Street Trees and Medians
- Park and Open Space Tree Canopy
- Habitat and Wildlife
- Creeks and Wetlands
- Bodies of Water and Shorelines
- Trails
- Forest Understory
- Meadows
- Wooded Hillsides
- Open Lawns
- Manicured Landscapes
- Sports Facilities
- Cemetery

Recommended Project Approaches

System	Connectivity	Local Improvements	Status Quo → Roadblocks	
• Does it incorporate and honor community connection to place? • Does it prioritize natural features over built ones? • Does it help to retain or enhance city-wide natural systems?	• Does it provide consistency that aligns with native ecosystems? • Does it consider impressions from arrival and departure?	• Does it preserve or protect significant natural features beyond code? • Does it replace or improve out of character or invasive landscapes?	• No additional considerations during planning or development to exceed existing code to benefit and/or preserve ecological systems.	• Does not align with the ecological or cultural context of Camas. • Removes significant features that have community value without mitigation.

Community Value: Equitable Access

Goal: Ensure that all community members have access to Camas' parks and natural resources and the benefits they provide.

Obstacles to resources can exist in many forms. Considerations should be made to avoid or remove barriers due to mode of transportation, connectivity, physical abilities, demographics, schedule, type of recreational activity, or feeling welcome or safe. All community members and guest of Camas should be able to experience and enjoy the natural environment and associated programming in ways that align with their needs and abilities.

Access for Who?

- **Children**
- **Parents**
- **Elderly**
- **Mobility impairments**
- **Sensory impairments**
- **Racial and Cultural Diversity**
- **Mixed-age groups**

Recommended Project Approaches

System	Connectivity	Local Improvements	Status Quo → Roadblocks	
• Does it fill a major gap or provide significant connectivity in the system. • Does it preserve large areas of natural resources in neighborhood of need?	• Does it support multi-modal transportation? • Does it provide connectivity between adjacent public and private lands?	• Does it maintain or enhance existing recreational amenities, programs, or resources? • Does it preserve recreational opportunities? • Does it improve site wayfinding?	• Service to neighborhood or demographic in need will be reactive and on an as needed basis.	• Is remote and does not serve a neighborhood or demographic in need. • Cuts off access to an existing resource.

Community Value: Asset Protection + Public Safety

Goal: Protect ecosystems, human health, safety, and public and private assets through the management of natural systems to limit the effects of extreme weather, climate change, and other potential impact.

Parks and open spaces are valuable infrastructure that can help mitigate effects of disruptions or stresses to the community. Projects should understand what potential vulnerabilities exist and plan on how to address them through planning, design, and management. Resources should ultimately shift from less reactionary to more preventative efforts

Key Assets to Protect

- **Community and Human Health**
- **Trails and Recreation Amenities**
- **Urban Tree Canopy**
- **Public Facilities and Private Structures**
- **Road and Utility Infrastructure**
- **Natural Ecosystems**
- **Habitat and Wildlife**

Priority Concerns

- **Water quality**
- **Hazard trees due to ice or wind storms**
- **Disease, pests, and invasive species**
- **Facility closure due to extreme weather**
- **Wildfire**
- **Drought**
- **Climate change**

Recommended Project Approaches

System	Connectivity	Local Improvements	Status Quo → Roadblocks	
• Does it significantly reduce the risk or liability of asset loss or damage due to stress or disruption? • Does it implement best practices to reduce or prevent long-term stressors, risks, or health issues?	• Does it assess the potential for risks to assets or humans across property lines? • Does it create collaboration between neighbors to address larger issues?	• Does it address a durability or wellbeing concern through routine maintenance and replacement program. • Does it eliminate a significant hazard or liability to human safety or health?	• Reactive to future disruptions, hazards or ongoing stressors to assets or people. • Reactive to addressing human safety and/or health needs.	• Takes priority. Reduces resources for other activities

Community Values: Project Approach Summary Matrix

	System	Connectivity	Local Improvements	Status Quo → Roadblocks	
Financial and Resource Allocation	• Do the goals and strategies open up opportunities for additional ongoing funding sources? • Does it reduce liability? • Can it utilize current practices or resources? • Are operational savings or ecosystem services quantified to support future assessments and tracking?	• Are off-site ecosystem services, trade-offs, or mitigation being considered? • Do the goals and strategies open up opportunities for supplemental grant funding?	• Does it reduce resource use or operational costs? • Are on-site ecosystem services included in the project goals and value discussions? • Does it reduce the need to hire outside vendors?	• Not currently funded or intentionally pursuing resources • Maintains status quo in funding for maintenance and operations • Is not intentional about valuing all ecosystem services. • Is reactive in responding to and mitigating hazards from extreme weather events and other effects of climate change.	• Increase maintenance costs or resource use. • Removes ecosystem services without mitigation.
Outreach and Education	• Does it enable a path for long-term community stewardship or collaborative partnerships? • Does it establish or implement a pilot program to test practices and capture learnings.	• Does it collaborate with outside organizations or volunteers? • Does it create new collaborations with outside organizations or volunteers? • Does it build public-private partnerships or shared knowledge, goals, or expectations?	• Does it include public educational opportunities to learn about a resource, site, or culture? • Does it adjust practices or provide training for staff or the public on innovative or Best Management Practice methods that improve performance?	• Utilizes existing staff to provide ad-hoc outreach and education to the public. • Supplement with contractor for tasks that require specific training and/or technical skills. • Partner with community and volunteer groups for invasive species removal.	• Requires resources for extra staff training. • Requires additional staff resources to provide and outreach and education program to the public.
Natural Character	• Does it incorporate and honor community connection to place? • Does it prioritize natural features over built ones? • Does it help to retain or enhance city-wide natural systems?	• Does it provide consistency that aligns with native ecosystems? • Does it consider impressions from arrival and departure?	• Does it preserve or protect significant natural features beyond code? • Does it replace or improve out of character or invasive landscapes?	• No additional considerations during planning or development to exceed existing code to benefit and/or preserve ecological systems.	• Does not align with the ecological or cultural context of Camas. • Removes significant features that have community value without mitigation.
Equitable Access	• Does it fill a major gap or provide significant connectivity in the system. • Does it preserve large areas of natural resources in neighborhood of need?	• Does it support multi-modal transportation? • Does it provide connectivity between adjacent public and private lands?	• Does it maintain or enhance existing recreational amenities, programs, or resources? • Does it preserve recreational opportunities? • Does it improve site wayfinding?	• Service to neighborhood or demographic in need will be reactive and on an as needed basis.	• Is remote and does not serve a neighborhood or demographic in need. • Cuts off access to an existing resource.
Asset Protection + Public Safety	• Does it significantly reduce the risk or liability of asset loss or damage due to stress or disruption? • Does it implement best practices to reduce or prevent long-term stressors, risks, or health issues?	• Does it assess the potential for risks to assets or humans across property lines? • Does it create collaboration between neighbors to address larger issues?	• Does it address a durability or wellbeing concern through routine maintenance and replacement program. • Does it eliminate a significant hazard or liability to human safety or health?	• Reactive to future disruptions, hazards or ongoing stressors to assets or people. • Reactive to addressing human safety and/or health needs.	• Takes priority. Reduces resources for other activities

Land Types and Minimal Expectations

There are many types of land that make up the parks and open spaces of Camas. Each type of land brings its own set of characteristics, values and management considerations.

Privately-owned properties

Privately owned properties play a key role in the parks and open space system by contributing to connectivity and management patterns within the larger landscape. Accountable management and stewardship of these lands are a crucial part of establishing a city-wide resilient system.

Homeowners associations

A homeowners association is an organization established within a residential community to manage and enforce rules and regulations. Homeowners associations manage common areas, which can include open spaces such as trails and stormwater facilities.

Minimum Maintenance Expectations: Alignment with expectations of other land types plus opportunity to partner with the City to improve overall ecosystem performance.

Private landowners

Private landowners own and manage significant portions of natural areas within or adjacent to critical areas. They are key partners in contributing to stewardship of our ecosystems.

Minimum Maintenance Expectations: Opportunity to align with the overall network and improve ecosystem performance.

Steep slopes

Hillsides having a 15 foot, or greater, vertical rise over 100 feet of horizontal run, or 15% slope

Minimum Maintenance Expectations: Human access should be limited and vegetation managed in order to minimize erosion. Development should be mindful of stability and impacts downslope, including beyond the property line.

Stormwater facilities

Stormwater facilities play a crucial role in managing runoff by capturing and treating rainwater to prevent flooding and pollution.

Minimum Maintenance Expectations: Facility inlets and outlets should be regularly cleaned of waste and sediment. Dead vegetation should be replaced in rain gardens. Grass should be mowed and saplings removed in detention ponds.

Open spaces

Open space is left primarily in its natural environment.

Minimum Maintenance Expectations: Maintenance of natural system functionality should take priority over recreational activities.

Publicly-owned properties

Publicly owned properties provide essential resources for conservation, recreation, and enjoyment. These properties often serve as the foundation for establishing protected areas and demonstrating best practices for management.

Trails

Pathways that provide access into natural areas and linkages across properties.

Minimum Maintenance Expectations: Safety hazards (including tree branches at-risk of falling) and waste should be removed. Uneven surfaces should be repaired.

Wetlands

Wetlands are transitional ecosystems that manage flood waters, create unique habitats and protect water quality. They are subjected to regulations by public agencies at the state, local, federal and tribal level.

Minimum Maintenance Expectations: Remove waste and invasive species. Prevent intrusion of contaminated water or excessive sediment.

Rights-of-way

A public right of way is land that is set aside for transportation purposes. This can include public roads, sidewalks, or medians.

Minimum Maintenance Expectations: Safety hazards (including tree branches at-risk of falling) and waste should be removed. Uneven surfaces should be repaired. Weeds should be removed or killed, and planting beds mulched. Dead plantings (especially trees) should be replaced.

Shorelines

Shorelines are linear spaces along bodies of water, managed in accordance with the state Shoreline Management Act.

Minimum Maintenance Expectations: Ensure access points are safe and devoid of hazards. Remove waste.

Parks

Parks are publicly accessible spaces that are developed to support recreational activities and programming.

Minimum Maintenance Expectations: Inspect equipment for safety. Assess and maintain trees and vegetation for health. Remove waste and repair furnishings. Maintain lawns to support recreational uses.

Recommendations

Best management practices for planning, operations, and site development were organized by system and aligned with each land type to provide guidance for moving beyond minimal expectations and towards systems-level resilience.

A systems approach

A systems approach to management involves understanding and optimizing the benefits each component can contribute to the overall community, while understanding potential trade-offs and synergies.

We are organizing the Management Plan Recommendations into these components in order to work towards giving each the attention they need to help the overall system thrive.

Best Practice Recommendations

In order to move beyond minimal expectations towards the goals of the city-wide system approach, the following recommendations are proposed to be considered for each project. Recommendations are organized by system and laid out by the template below. Utilizing these strategies can unlock the potential for more optimal management of resources that align with the 5 Camas Community Values.

HOW TO USE: Each project team should identify the applicable **Project Type** and **Land Types** that align with the project objectives and outcomes. The team should discuss and intentionally weigh the applicability of each relevant recommendation across the 7 systems as they apply to the project's goals, scope, and budget. A balance should be applied in order to equitably address the 5 Camas Community Values, and the Summary **Project Approach Matrix** should be referenced to ensure alignment.

Management practice	Land types	Outreach and Education	Natural Character	Financial and Resource Allocation	Equitable Access	Asset Protection + Public Safety
Best practices to unlock the most potential…		•••	•••	•••	•••	•••

Best management practices are listed here for the following **Project Types** for each system:

- **Operations & Maintenance -** Ways to manage established resources
- **Planning & Programming -** Ways to plan for future resources
- **Site Development -** Ways site design can impact management

The **Land Types** that can be managed using this practice are shown here using icons.

See Land Types page for descriptions and minimal expectations. These recommendations go beyond these expectations and work toward the community values at the site, organization, and system levels.

Each management practice is evaluated using the **Project Approach Matrix** and the alignment with each community value**.**

Water

Water is essential for life. Managing water in our parks and open spaces is vital for preserving natural ecosystems, ensuring access to clean water, and providing cooling and recreational opportunities for the community.

How does water impact us?

Stormwater
Stormwater management plays a crucial role in preventing flooding, recharging groundwater and mitigating pollution.

Irrigation
Irrigation is a valuable resource that provides a consistent water supply to vegetation when rainwater is scarce.

Water Quality
Water quality directly affects the health of humans, pets, vegetation, and wildlife.

Water Access
Water can be a calming presence and provide cool relief, a place for recreation, and sense of community - especially during extreme heat events.

What are the risks and concerns?

Flood Control
Floods can result in displacement of communities, damage to infrastructure, erosion and vegetation damage, and increased costs of living.

Drought
Droughts have adverse effects on ecosystems and communities such as tree and vegetation health, water scarcity, food shortages and economic losses.

Water Costs
High water costs can lead to disparities in water access, affecting both individual well-being and community development.

What are some key strategies?

Green infrastructure
Allowing rainwater to infiltrate the ground reduces runoff, prevents flooding and filters pollutants.

Stormwater facility sediment removal
Effective drainage systems ensure the longevity of stormwater infrastructure and prevent downstream pollution.

Water conservation practices
Reduce overall water consumption and promote efficient water use through use of native plantings, reduction in lawn, and efficient irrigation systems.

Engage Water
Improve access to water for drinking, cooling down, and supporting wildlife.

Privately-owned lands

Support water management through water-saving practices and integrating green infrastructure solutions.

Publicly-owned lands

Manage lands that absorb, celebrate, and provide access to clean and safe water.

Recommendations: Water

Operations & Maintenance

Management practice	Land types	Outreach and Education	Natural Character	Financial and Resource Allocation	Equitable Access	Asset Protection + Public Safety
Manage sediment before it impedes infiltration capacity. Remove sediments from drains, rain gardens, etc. annually, before the rainy season.		Opportunity to collaborate with HOAs.	Promote the use of green infrastructure.	Use resources proactively instead of reacting to stormwater facility failures. Improves natural infrastructure functionality.		Reduce flooding risks.
Apply filtration bags at storm drains before major storms, especially in the autumn to prevent leaves from clogging the system.				Reduce maintenance resources needed to clean out debris.		Reduce flooding risk.
Reduce chemical fertilizer and pesticide use to protect water quality downstream.	**All**	Opportunity to collaborate with private landowners.	Maintain healthy lakes, streams, and other bodies of water. Reduces potential damage to habitat and wildlife.	Reduce costs and labor for purchasing and applying chemicals.		Reduce risk of algal blooms and other water quality hazards.
Assess existing recreational water access points for safety, accessibility, and durability issues.			Increase engagement with natural water bodies for enjoyment.	Catch issues early to avoid full replacement of infrastructure.	Ensure recreational opportunities are maintained for all.	Reduce liability and risk of injury.
Designate lawn areas to go dormant during summer months to reduce water use.		Opportunity to educate public about water conservation practices.	Requires cultural shift in expectations to support desired uses.	Save on irrigation costs as well as mowing labor costs.		
Promote city-led inspection, guidelines, and education to private landowners and HOAs on ways to manage stormwater facilities.		Opportunity to collaborate with private landowners to improve system performance.	Promote the use of green infrastructure.	Improves natural infrastructure functionality.	Promote use of natural infrastructure on both public and private land.	Reduce flooding risk.

HOA · Private land · Steep slopes · Stormwater facilities · Open spaces · Trails · Wetlands · ROW · Shorelines · Parks

Recommendations: Water

Planning & Programming

Management practice	Land types	Outreach and Education	Natural Character	Financial and Resource Allocation	Equitable Access	Asset Protection + Public Safety
Size stormwater facilities to handle 100-year (1%) storms.				Reduce recovery costs and efforts to flooded areas.		Reduce flooding risk.
Ensure that shoreline and wetland trails account for future changes to water levels.					Protect future access to shorelines and wetlands.	Reduce potential for future damage.
Utilize water access to provide opportunities for cooling during hot days.					Ensure all community members have access to cooling resources.	Support public health.
Assess critical areas within the floodplain and ensure the plantings, soil, and materials can withstand flooding events.			Improve habitat and natural resources.	Save on rebuilding costs.		Plan for future floods to protect current resources.
See Lacamas, Round, and Fallen Leaf Lakes Management Plan for further actions						

HOA Private land Steep slopes Stormwater facilities Open spaces Trails Wetlands ROW Shorelines Parks

Recommendations: Water

Site Development

Management practice	Land types	Outreach and Education	Natural Character	Financial and Resource Allocation	Equitable Access	Asset Protection + Public Safety
Look for opportunities to use a captured or recycled water source for irrigation use.		Opportunity to collaborate with private landowners.		Reduce irrigation costs.		Preserve water resources during extended drought.
Divert water running perpendicular to pathways from uphill sources into culverts or other durable structures.				Reduce costs of replacing paths and trails.	Increase longevity of paths and trails.	Increase safety of paths and trails.
Use drought-tolerant and/or adaptive plant species and cluster plantings by water use to reduce over-watering.		Opportunity to collaborate with private landowners.	Native planting supports habitat and wildlife.	Reduce irrigation costs.		
Celebrate the experience of rain water through ground surface treatments, artwork, and daylit water conveyance channels.		Stormwater education opportunity.	Promotes nature engagement with all ages.	Reduces the need for underground utilities.		
Ensure runoff is minimized and all stormwater is treated and infiltrated on site when possible. Consider the use of pervious surfaces.	**All**		Reduces impacts to downstream habitats.	Reduce future costs of repairing erosion impacts.		Reduces risk to adjacent property owners. Replenish local groundwater.
Plant trees adjacent to stream banks to provide shade, keep the water cool and reduce erosion into streams.			Protects habitat. Increases tree canopy cover.			Reduces erosion risks.
Protect waterways by not installing wood chip mulch below the ordinary high-water mark.						Reduce impacts to water quality.
Incorporate water sources to provide wildlife with a place to drink or cool down.		Opportunity to collaborate with private landowners to provide habitat connectivity.	Promote wildlife viewing and enhance enjoyment of natural spaces.			
Provide access to emergency water to protect non-irrigated trees and vegetation from extreme heat events.			Preserves tree canopy.	Reduce replanting costs.		Protects vegetation during extreme heat events.

Operations

Effective operations through stewardship and conversation can ensure optimized use of public funding, foster community engagement, promote safety and accessibility, and enhance the experience of these spaces.

How do operations impact us?

Safety
Well-maintained parks and open spaces are accessible and safe.

Enhanced experience
Visitors and community members will have a better experience in spaces that are functional, safe and well-kept.

Longevity
Taking care of assets ensures that they are still around in the future.

What are the risks and concerns?

Resource availability
Scarcity of resources limits the ability to maintain infrastructure, provide adequate programming and ensure visitor safety.

Lack of specialty knowledge
The lack of specialty knowledge can result in ineffective decision-making as well as missed opportunities for enhancement of parks and open spaces. It can also pose safety risks.

Loss of Recreational Opportunities
Inability to meet all of the maintenance tasks may lead to closures or reduced usage in parks and open spaces.

What are some key strategies?

Partnerships
Work with businesses, nonprofits and other community groups to establish project/program goals and partnerships.

Volunteer Coordinator
Hire a volunteer coordinator in order to best utilize volunteer groups to help focus on Management Plan goals.

Community engagement
Foster community engagement and connection to place in order to support long-term stewardship, a sense of ownership and investment in public spaces.

Privately-owned lands

Private landowners can partner with the City and learn from each others' operations practices, benefitting from shared knowledge and resources.

Publicly-owned lands

Public entities can provide opportunities for the community to participate in maintenance and learn about best practices.

Recommendations: Operations

Operations & Maintenance

Management practice	Land types	Outreach and Education	Natural Character	Financial and Resource Allocation	Equitable Access	Asset Protection + Public Safety
Consider reorganizing maintenance staff by land or system type and training or hiring champions to provide overall stewardship strategies, practices and goals.	**All**	Provide specialized knowledge to staff to align with systems approach.	Preserve and enhance the natural elements, features, and systems that contribute to the community identity.	Take a proactive approach to management and land stewardship.		System knowledge helps to identify issues early and work towards preventative measures.
Consider performing observations, evaluations, and surveys to help determine how spaces are currently used and capture ideas for potential improvements.		Engages community members to help form future efforts and priorities.	Allow management to focus on efforts that support current uses.	Allocate resources strategically.	Facilitate use of spaces by Camas residents. Help identify obstacles to desired uses.	
Hire city urban forester to provide overall stewardship, strategy, monitoring, and education to staff and the community.	**All**	Can coordinate educational opportunities for staff and community.	Support long-term health of tree canopy.			Address hazard trees and mitigate risk.
Hire a volunteer and/or HOA coordinator to organize and focus non-profit and community groups to align with POSMP goals.	**All**	Improve coordination and knowledge sharing amongst public and private groups.		Increase capacity for maintaining natural resources.		
Explore more potential funding sources that promote natural resources, parks, and open spaces as valuable, resilient infrastructure.	**All**	Align with other agencies on the value that nature can bring to communities.		Increase funding sources.		Explore resilience funding to reinforce natural infrastructure.
Partner with the Landscape Architecture Foundation and/or other institutions to create case studies or research to support ongoing monitoring and data-collection.	**All**	Bolster data-backed research and education around natural systems.		Better inform decision making and resource allocation.		

Recommendations: Operations

Planning & Programming

Management practice	Land types	Outreach and Education	Natural Character	Financial and Resource Allocation	Equitable Access	Asset Protection + Public Safety
Work with local businesses, nonprofits and other community groups to establish project goals, programs and partnerships.	**All**	Align with other agencies on the value that nature can bring to communities.	Align on expectations and provide consistency across the community.			
Establish agreements with HOAs and other partners for collaborative management of ecosystem services and recreational resources.			Align on expectations.	Maintain and enhance performance of ecosystem services.	Maintain and enhance trail and open space access through HOAs.	
Create ongoing channels with state and county level partners. Align and integrate ecosystem services with other City, County and State department goals, initiatives, funding sources, plans, and projects.	**All**	Align with other agencies on the value that nature can bring to communities.		Incorporate the valuation of ecosystem services into project planning across Washington.		Improve preparedness for inclement weather, fire, and other potential hazards.
Considering partnering with Camas School District as well as regional universities for citizen science programs or ongoing environmental monitoring initiatives.	**All**	Build partnerships and collect metrics that can inform decision making.		Collect data that can lead to more efficient utilization of available resources.		
Provide more volunteer orientation sessions to help familiarize them with the natural systems and expectations.	**All**	Increase hands-on experience and nature immersion to improve knowledge of natural systems.	Create opportunities for more connection to place.			
Obtain Tree City USA certification from the Arbor Day Foundation and pursue Growth Awards through innovative urban forest management efforts.	**All**	Increase awareness of efforts and progress through 3rd party organizations.				
Identify opportunities for joint training for both staff and community members to improve knowledge and best practices.	**All**			Use resource effectively though consolidating training efforts and promoting best practices.		Strengthen safety by creating shared understanding of operational and emergency procedures.
Engage tribal communities to build long-term relationships and understand best land management practices that could be incorporated into operations.	**All**	Opportunity for staff to move towards a stewardship model of land management.	Could lead to improved habitat and restoration of native ecosystems.	Could lead to increased ecosystem service perform across systems.	Is inclusive of tribal groups, practices, and knowledge.	

HOA Private land Steep slopes Stormwater facilities Open spaces Trails Wetlands ROW Shorelines Parks

Recommendations: Operations

Site Development

Management practice	Land types	Outreach and Education	Natural Character	Financial and Resource Allocation	Equitable Access	Asset Protection + Public Safety
Provide staff review of design projects to identify potential maintenance efficiencies or improvements.				Ensure new designs align with maintenance expectations and capacity.		

Materials and equipment

Materials and equipment selection and maintenance directly impact the functionality, durability, safety and aesthetic quality of parks and open spaces.

How do materials and equipment impact us?

Circulation and Gathering
Hardscapes allow for vehicular parking, pathways and open spaces to support programming.

Aesthetics and Character
Materials and furniture contribute to the overall character of Camas' parks and open spaces. Color selection, materiality and finish can provide consistency or a unique sense of place for each site.

Places for Recreation and Rest
Playground equipment, benches and picnic tables provide places for both active and passive recreation.

What are the risks and concerns?

Heat island effect
The heat island effect, characterized by elevated temperatures in urban areas, underscores the importance of selecting materials that minimize heat absorption.

Safety
It is critical to select materials that minimize potential hazards, reduce the risk of accidents or injuries and ensure the well-being of users.

Wear and Tear
Many materials degrade over time due to outdoor exposure to sun, water, soil, and frequent use.

What are some key strategies?

Consistent sourcing
Utilize a short list of standard furnishings, materials and colors to simplify replacement and maintenance costs and provide a consistent character across spaces.

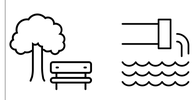
Durability
Selecting durable materials ensures long-term functionality and minimizes the need for frequent maintenance or replacement.

Universal access
Provide universal access to program areas and for equipment options for people of all ages and abilities.

Privately-owned lands ← → **Publicly-owned lands**

Private landowners can provide durable surfaces for any publicly accessible trails or amenities.

Public lands can provide durable and accessible products to ensure long-term use for all.



Recommendations: Materials and Equipment

Operations & Maintenance

Management practice	Land types	Outreach and Education	Natural Character	Financial and Resource Allocation	Equitable Access	Asset Protection + Public Safety
Continue to perform safety assessments annually to ensure that playground and other equipment is durable and safe for use.				Reduce liability risks.	Identify challenges to universal access and assess potential for universally accessible equipment.	Ensure safety of community members.
Provide recycling options next to all trash receptacles.		Support responsible habits for resource management.	Reduce impacts of landfills.			
Use materials for maintenance and repair of paving that reduce harm to environmental and human health, such as low-emitting sealants.		Set example of best practices.	Reduce risk of habitat contamination.			Protect health and safety of staff and end-users.
Pave existing highly-used soft-surface trails in popular areas.				Reduce liability from degradation.	Improve accessibility.	Provide long-term durability.

Recommendations: Materials and Equipment

Planning & Programming

Management practice	Land types	Outreach and Education	Natural Character	Financial and Resource Allocation	Equitable Access	Asset Protection + Public Safety
Provide universal access to program areas and equipment options for people of all ages and abilities.		Expand reach and impact of programming and educational signage.	Allow all community members to appreciate natural features and habitats of Camas.		Ensure that everyone can enjoy outside activities equitably.	
Design facilities to handle extreme events with minimal effects on continued functionality.		Promote disaster preparedness of community members.				Preserve building functionality overtime. Facilities could act as a resource for community members in an emergency event.

HOA Private land Steep slopes Stormwater facilities Open spaces Trails Wetlands ROW Shorelines Parks

Recommendations: Materials and Equipment

Site Development

Management practice	Land types	Outreach and Education	Natural Character	Financial and Resource Allocation	Equitable Access	Asset Protection + Public Safety
Use contrasting material at stair nosing to promote visibility.						Increase safety of stairs.
Use durable materials that can handle UV exposure and flowing and standing water.				Reduce replacement costs.		Increase resistance to wear and tear.
Consider the use of high albedo materials to reduce heat absorption. Manage potential glare impacts.						Reduce urban heat island effect.
Select exterior luminaires that reduce light pollution.			Preserve connection to the night sky and reduce impacts to habitat.	Reduce energy costs for illumination.		
Select nature-based play equipment, seating, and climbing areas.			Aligns with the natural character of developed playgrounds and parks.			
Utilize a short list of standard furnishings, materials and colors.			Provide a consistent character across spaces.	Simplify replacement and maintenance costs		

HOA Private land Steep slopes Stormwater facilities Open spaces Trails Wetlands ROW Shorelines Parks

Access and amenities

It is critical to ensure that people of all ages and abilities can access and enjoy the variety of parks and open spaces that Camas has to offer.

How do access and amenities impact us?

Equity
Managing parks and open spaces to ensure everyone can access and enjoy them creates inclusive spaces that benefit the entire community.

Program
Amenities provide essential infrastructure and resources to support visitor experience. This creates spaces where people can recreate and gather.

Wayfinding
Wayfinding bolsters sense of place by guiding visitors through the parks and open spaces, and facilitates meaningful interactions with natural and cultural elements.

What are the risks and concerns?

Safety
Inadequate or poorly maintained facilities can compromise visitor safety and lead to underutilization of the place.

Exclusion
Lack of access creates barriers that prevent community members from fully participating in recreational activities, limiting their ability to enjoy and benefit from parks and open spaces.

Lack of amenities
Inadequate amenities such as lack of seating or restroom facilities may deter visitors from diverse backgrounds, increasing disparities in access to parks and open spaces.

What are some key strategies?

Avoid hazards
Lay out pathways to avoid hazards and sensitive or protected areas, and reduce bike and pedestrian conflicts with vehicles.

Universal access
Incorporate universally accessible pathways, amenities, and access to the extent practicable.

Education
Provide educational, wayfinding, and interpretive signage. Use multiple languages to address potential language barriers.

Privately-owned lands

Private landowners can build partnerships to contribute and connect to the city-wide network of open spaces.

Publicly-owned lands

Public lands can ensure amenities accomodate the needs of all community members.

Recommendations: Access and Amenities

Operations & Maintenance

Management practice	Land types	Outreach and Education	Natural Character	Financial and Resource Allocation	Equitable Access	Asset Protection + Public Safety
Add or improve amenity spaces for gathering, playing or resting.		Increase community engagement.	Strengthen opportunities for connecting with natural spaces.		Prioritize in areas that lack similar amenity or feature.	Promote social and physical health.
Provide a higher level of maintenance to trailheads and main entrances to enhance visibility as well as visitor sense of safety.					Enhance visitor experience and attract new visitors.	Reduce crime and vandalism.
Utilize best management practices and caution when performing maintenance tasks that use excavation in areas with high probability of cultural, archeological, or historical resources.		Preserve and protect cultural resources.		Reduce project delays and costs.	Respect process and history of indigenous cultures.	
Improve ADA accessible pathways and access into parks and open spaces.		Increase community engagement.			Make parks and open spaces accessible to all by accommodating all levels of mobility.	Decrease risk of accidents and hazards.

Recommendations: Access and Amenities

Planning & Programming

Management practice	Land types	Outreach and Education	Natural Character	Financial and Resource Allocation	Equitable Access	Asset Protection + Public Safety
Provide low-impact access to natural areas and wetlands.		Opportunity for visitors to understand the value and purpose of natural resources.	Opportunity to experience wildlife and natural systems.		Diversify recreational opportunities.	Preserve critical areas from impacts of human use.
Identify public lands or facilities to act as community gathering and resource distribution in an emergency.		Increase community awareness and preparedness.		Increase eligibility for resilience-based grants.	Provides resources in an emergency where it is needed most.	Enhance emergency preparedness and increase community resilience
Incorporate universally accessible pathways, amenities and access to all program areas.					Expand user base and access.	Reduce liability risk.
Consider trail connectivity enhancements when planning subdivisions.			Provide increased opportunities for experience nature.		Increased recreational opportunities. Expand network connectivity.	
Consider multimodal transportation access when planning parks and trails.					Increased recreational opportunities.	Promote physical activity and public health.
Ensure that some amenities remain accessible year-round.		Increase community engagement.	Support experiences of natural systems in different seasons.	Maximize utilization of amenities and increase of rental revenue.	Opportunities to enjoy spaces all year.	
Develop a difficulty scale for trails and provide maps and/or signage to indicate appropriate skill levels - consider surface material, slope, and elevation gains.		Provide clarity on expectations and current conditions.			Ensure users are matched to the appropriate activities.	Protect health and safety of users.
Develop a consistent signage standard for use on public and private trails that define rules, etiquette, and trail conditions.		Ensure city-wide consistency on expectations, behavior, and management.	Provide consistent conditions and alignment on goals.			Protect health and safety of users.
Develop trail grade standards for both public and private lands that provide consistency of width, material, maintenance, and other supporting features.		Ensure city-wide consistency on expectations and management.	Provide consistent character and alignment on goals.		Ensure all trails are equitable and safe.	Protect health and safety of users.

Recommendations: Access and Amenities

Site Development

Management practice	Land types	Outreach and Education	Natural Character	Financial and Resource Allocation	Equitable Access	Asset Protection + Public Safety
Locate parking to minimize intrusion into open spaces and avoid pedestrian conflicts.			Maximize utilization of open space.	Reduced maintenance and infrastructure costs.	Provide safe and efficient access to recreation opportunities.	Increase pedestrian safety.
Provide educational and interpretive signage.		Promote stewardship and community engagement.	Share value of preserving natural systems and features.		Enhance visitor experience.	
Look for small opportunities to provide comfort or interest along trails - seating, potable water, fitness equipment, shade, etc.			Create moments to appreciate natural surroundings.		Increase utilization of parks and open spaces.	Improve public health and wellness.
Provide clear visibility and wayfinding at key intersections.		Provide orientation and promote options.			Enhance visitor experience.	Provide effective emergency response.
Place signs in and around open spaces and critical areas, clearly identifying permitted and restricted uses.		Clarifies intent of public spaces and balance between human uses and natural functions.	Protects sensitive areas and natural features.	Reduce costs for enforcement and repair of misused assets.	Enhance visitor experience.	Prevent property damage and liability claims.

HOA  Private land  Steep slopes  Stormwater facilities  Open spaces  Trails  Wetlands  ROW  Shorelines  Parks 

Soil

Implementing appropriate soil management practices is essential for supporting vegetation growth, regulating water infiltration and drainage, and influencing ecosystem health and resilience.

How does soil impact us?

Water infiltration and quality
Soils that can absorb and filter water help to mitigate flooding, reduce erosion, and support healthy ecosystems.

Tree and vegetation health and stability
By supporting nutrient cycling, supporting microorganisms, and providing space for root growth, soils are a critical part of plant health.

Carbon storage
Healthy soils are typically able to sequrester and store more carbon than the vegetation they support.

What are the risks and concerns?

Erosion
Erosion can degrade landscapes, disrupt pathways and trails, harm vegetation, increase sedimentation in water bodies and compromise ecosystem health and recreational opportunities.

Soil loss and Contamination
Loss of healthy topsoil through removal or pollution can harm plant health and soil microorganisms.

Compaction
Compacted soils have a decreased ability to infiltrate water. They also impact ecosystem health by limiting root growth of plants, especially when surrounded by hardscape and heavy foot traffic.

What are some key strategies?

Soil protection zones
Protect soil areas during construction and operations to reduce compaction or contamination.

Increase soil volumes for trees
Provide trees with adequate space for root growth to ensure long term health and stability.

Plantings
Use dense plantings to discourage walking through planting areas and reduce compaction. Amend soils as needed to ensure long-term health.

Privately-owned lands

Private landowners can restore soils after disturbance to provide long-term plant health.

Publicly-owned lands

Public lands can protect soils by limiting access through sensitive conditions.

Recommendations: Soil

Operations & Maintenance

Management practice	Land types	Outreach and Education	Natural Character	Financial and Resource Allocation	Equitable Access	Asset Protection + Public Safety
Consider natural and/or constructed bank stabilization techniques in conjunction with any crossing projects.			Preserve and protect natural resources.	Increase asset longevity and reduce replacement costs.	Enhance recreational opportunities and user experience.	Risk and liability reduction.
Establish soil protection zones during construction projects to minimize compaction of adjacent areas.			Preserve and protect natural resources.	Reduce soil restoration costs.		Minimize erosion and sedimentation risk.
Use a single access route to work zones and minimize trips through the access route in order to decrease soil compaction and erosion.			Preserve and protect natural resources.	Reduce restoration and maintenance costs.		Minimize erosion and sedimentation risk.
Limit access routes across steep slopes and install access routes parallel to slope contours and perpendicular to water flow.			Preserve and protect natural resources.	Reduce restoration and maintenance costs.		Minimize erosion and sedimentation risk.
Limit crew size in wet areas and establish a project staging area outside of the wet areas.			Enhance wetland and water quality.	Increase crew efficiency and productivity.		Protect critical areas and worker safety.
Identify and address potential hazards or erosion concerns, especially after large storm events.				Reduced replacement and maintenance costs.		Protect infrastructure and property.
Increase soil areas of existing street trees through hardscape removal.			Protect character of large mature trees.	Preserve ecosystem services from tree canopy in urban areas.		Protect critical urban tree canopy.

HOA Private land Steep slopes Stormwater facilities Open spaces Trails Wetlands ROW Shorelines Parks

Recommendations: Soil

Planning & Programming

Management practice	Land types	Outreach and Education	Natural Character	Financial and Resource Allocation	Equitable Access	Asset Protection + Public Safety
Prioritize the location of stormwater treatment facilities away from structures, at site low points, and where infiltration is likely to be effective.				Reduced stormwater management costs.		Reduce stabilization risks.
Use a phased approach to weed removal and restoration to minimize exposed soils and erosion.	**All**		Preserve aesthetic appeal of the space. Prevent return of invasive species.	Reduced stormwater management costs.		Mitigate erosion risks.
Find alignments that allow for <5% slopes for pathways through open spaces. Incorporate switchbacks when needed.					Provide accessible circulation.	Reduce bank destabilization risks.
Limit development and disturbance on steep slopes greater than 15%. Consider protecting them as publicly-owned critical areas.		Ensure land owners understand the potential risks and downstream impacts involved when building on steep slopes.	Preserve sensitive habitat areas.			Reduce bank destabilization risks.

HOA Private land Steep slopes Stormwater facilities Open spaces Trails Wetlands ROW Shorelines Parks

Recommendations: Soil

Site Development

Management practice	Land types	Outreach and Education	Natural Character	Financial and Resource Allocation	Equitable Access	Asset Protection + Public Safety
Maximize vegetated ground coverage as early as possible to reduce erosion impacts.			Preserve natural resources.	Cost savings on erosion control measures.		Protect infrastructure and property.
Use dense plantings, tree grates, other barriers, and/or signage to discourage walking through planting areas to avoid compaction, especially in high traffic areas.			Maintain attractive and well-preserved landscapes.	Reduce replanting and maintenance costs.		Protect long-term health of trees in urban spaces.
Utilize proper soil amendments to improve health and increase water storage. Perform a soil analysis as needed.		Develop an understand of soil health in public spaces.	Maintain healthy vegetation.	Reduced irrigation and maintenance costs.		Resist drought.
Allow for adequate soil volumes to support trees adjacent to hardscape paving. Allow for 8’ wide planting areas for large trees unless other measures are taken to provide the needed soil volumes and protection (see references).			Maintain mature tree canopy.	Reduce replacement costs.		Protect long-term health of trees in urban spaces.

HOA Private land Steep slopes Stormwater facilities Open spaces Trails Wetlands ROW Shorelines Parks

Vegetation and habitat

Proper vegetation management provides vital habitat, reduces risks, and contributes to the overall quality of Camas' natural aesthetic.

How does vegetation impact us?

Biodiversity
Plants support biodiversity by providing suitable conditions for a variety of organisms to thrive and serving as habitat for wildlife. Biodiverse ecosystems are more resilient and provide support for human health and wellbeing.

Ecosystem services
Healthy plant communities purify the air, water and soil, stabilize soils and regulate temperature.

Aesthetic appeal
Vegetation provides colors, textures and shapes throughout the landscape. Plants provide shade and can support recreational activity such as hiking, nature appreciation and birdwatching.

What are the risks and concerns?

Fire management
Vulnerability to wildfires increases the risk of harm to infrastructure, human communities and wildlife.

Invasive species
Invasive species compete with native plants and disrupt ecosystem processes. They also result in increased management costs to control their spread and mitigate ecological impacts.

Improper pesticide use
Improper pesticide use harms non-target organisms, can contaminate soil and water resources and have negative impacts to human health.

What are some key strategies?

Preserve and re-establish key plant communities
Prioritize native and adaptive plant species that enhance ecosystem resilience and biodiversity. Protect and create key forest structures that are important habitat features for multiple wildlife strategies.

Integrated pest management
Utilize established integrated pest management plans and prioritize no-chemical pest control options when appropriate. Prioritize careful removal of invasives.

Support pollinators
Integrate native pollinator restoration to the greatest extent possible. Convert passive turf areas to native naturescaping.

Privately-owned lands

Private landowners can shift plant species selection to more native palettes and minimize the use of chemical inputs. They can be aware of and implement fire management best practices around their homes and businesses.

Publicly-owned lands

Public lands can establish and protect large-scale and connected native and adaptive plant communities to provide long-term habitat opportunities.

Recommendations: Vegetation and Habitat

Operations & Maintenance

Management practice	Land types	Outreach and Education	Natural Character	Financial and Resource Allocation	Equitable Access	Asset Protection + Public Safety
Protect and create key forest structures (standing dead trees/snags, downed logs, old trees, open gaps) that are important habitat features for biodiversity.			Enhance natural character and provide homes for wildlife.	Decrease maintenance costs of removing forest structures.	Enhance recreation opportunities such as birdwatching.	Work with arborists and other specialists to ensure safety.
Develop an integrated pest management plan and prioritize non-chemical pest control options as appropriate. Include regular tree inspection for pests and disease to reduce spread.	**All**			Reduce pesticide costs and staff time.		Increase resilience of ecosystems and landscapes.
Ban the use of neonicotinoids.	**All**	Communicate the value of protecting pollinator health.	Protect wildlife health.	Reduce pesticide costs and staff time.		Protect public health and water quality.
Take precautions to avoid spreading noxious weeds or invasive species between work/restoration sites. Designate "haul and drag" routes for removing plant material to minimize disturbance.	**All**			Reduce future invasive species removal costs.		
Consider using a mulching mower and leaving plant material in place over winter.		Share strategies for different ways to provide habitat.	Provide winter habitat to support biodiversity.	Enhance the health of turf and reduce maintenance costs.		
Provide educational material for fire mitigation maintenance practices including minimizing fire fuels, species to avoid, spacing, materiality, and defensible space zones		Educate Camas residents about wildfire resilience.	Balance expectations around safety and vegetation density.			Increase resilience to wildfires, and reduce fire spread potential across natural areas.
Provide training or educational materials on invasive species identification, monitoring, and removal.	**All**	Educate Camas residents about invasive species management.	Reduce competition with native plant species	Weed removal reduces competition for water with desired vegetation, reducing water use.		Protect health and functionality of native ecosystems.
When manually removing noxious weeds or invasive species from areas near waterways, prevent sediment and vegetative debris from entering the waterway.			Enhance aesthetic appeal of recreation areas.	Reduce future invasive species removal costs downstream.		Protect native habitat.

Recommendations: Vegetation and Habitat

Planning & Programming

Management practice	Land types	Outreach and Education	Natural Character	Financial and Resource Allocation	Equitable Access	Asset Protection + Public Safety
Partner with local nurseries to find alignmentment with native plant lists, prohibited species, and plant availability.	**All**	Builds partners to support native and adaptive plant goals	Supports wildlife.		Increases availability of native plant species.	
Preserve and enhance large, connected patches of undeveloped native vegetation.			Preserve key habitat patches and corridors. Retain urban tree canopy.		Increase access to recreational opportunities.	Mitigate flood risk. Improve air and water quality. Reduce urban heat island effect.
Use succession planning to identify species that will thrive in Camas as the climate changes.	**All**	Identify climate-adaptive plantings to encourage use.	Ensure natural character of Camas persists for future generations.	Reduce long-term maintenance costs.		Reduce tree mortality, fall hazards, and wildfire fuels.
Perform a needs assessment based on surrounding neighborhood densities and service area to determine how much open lawn space is needed in developed parks to support the community.		Work with residents to understand use needs and balance of natural spaces.	Right size turf use to allow space for native plant communities.	Reduce the need for lawn care and water use for under-utilized turf.	Ensure communities have amenities that supplement home uses.	
Integrate native pollinator restoration into urban design and municipal open space plans.		Share value of support pollinators.	Increase aesthetic value of space. Encourage wildlife.	Reduce maintenance costs from water use.

Recommendations: Vegetation and Habitat

Site Development

Management practice	Land types	Outreach and Education	Natural Character	Financial and Resource Allocation	Equitable Access	Asset Protection + Public Safety
Support crime prevention through environmental design by planting trees with high canopy, preserving view corridors, and utilizing vegetation with transparency.			Balance expectations around safety and vegetation density.		Increase use of existing spaces.	Increase public safety.
Use plant stock from multiple seed zones for a given species to increase genetic diversity and enhance long-term survival.	**All**			Reduce long-term arborist and maintenance costs for removal and replacement.		Biodiversity provides resilience to pests and changing climate conditions.
Convert existing underutilized lawn area to native naturescaping (i.e. meadow or forest understory).		Share potential value for wildlife habitat.	Increase habitat and wildlife value.	Reduce maintenance costs.		
Provide interpretive signage for native/adaptive plantings or restoration areas.	**All**	Educate visitors about ecological best practices. Encourage native plant use on private property.				
Provide appropriate plant materials to shade stormwater facilities and other shallow water bodies to reduce temperature impacts downstream.			Preserve quality habitat in and around water bodies.	Reduce cost of downstream interventions to reduce stream temperature.	Enhanced recreational opportunities.	Mitigate urban heat island effects.
Integrate native flowering plants and habitat structure into vegetated stormwater infrastructure.			Increase aesthetic value of natural areas. Improve habitat.			
Increase turf diversity by seeding passive turf areas with drought-tolerant flowering perennials.			Increase aesthetic value of space.	Reduce water use.		

HOA Private land Steep slopes Stormwater facilities Open spaces Trails Wetlands ROW Shorelines Parks

Tree Canopy

The tree canopy is the keystone to the natural character of Camas while also providing essential ecosystem services to benefit the community.

How do trees impact us?

Shade and cooling
Trees help to mitigate the urban heat island effect and enhance comfort by providing shade and cooling.

Air and Water purification
Trees absorb pollutants and carbon dioxide, improving air and water quality as well as human health.

Natural character
Trees are a major contributor to the natural character of Camas and its location within the Pacific Northwest.

What are the risks and concerns?

Fall hazards
Unhealthy or storm-damaged trees may fall unexpectedly, potentially causing damage or injury.

Development
While new construction is needed to accommodate the growth of the Camas community, it sometimes comes at the cost of land clearing and canopy loss.

Disease, Pests, and Die off
Disease, pests, or extreme climate events can weaken the health of trees and reduce their resilience to other environmental stresses.

What are some key strategies?

Revise planning regulations
Adjust planning codes and work with private landowners and public property to at least maintain the amount of tree canopy city-wide as land continues to develop.

Training and education
Provide training and education for staff and the public on forestry and tree health.

Adaptive tree palette
Develop a plant palette and succession plan strategy to establish a diverse canopy that reduces vulnerabilities to climate change.

Privately-owned lands

Private landowners can preserve large clusters of mature trees and work with best practices to maintain their health and reduce hazards.

Publicly-owned lands

Public lands can provide opportunities to expand canopy coverage, transition to adaptive species, and improve the health of right of way trees.

Recommendations: Tree Canopy

Operations & Maintenance

Management practice	Land types	Outreach and Education	Natural Character	Financial and Resource Allocation	Equitable Access	Asset Protection + Public Safety
Remove or prune hazard or dead trees or branches where they pose a risk to safety or property damage.	**All**		Maintain tree canopy health.	Reduce liability.		Protect people and property from damage.
Ensure newly installed trees have a minimal watering period of two years to ensure establishment	**All**		Ensure succession and healthy establishment.	Reduce replacement costs.		
Replace trees adjacent to hardscapes when they get removed or die off. Consider removing some hardscape around tree well.			Retain Camas' identity as a tree-friendly city.	Preserve critical urban ecosystem services over time.		Ensure long-term resistance to natural hazards from canopy coverage.
Provide training for staff and public on forestry and tree health. Include protocols and procedures for public tree risk assessments, pruning, risk mitigation, and emergency preparedness and response.	**All**	Educate Camas residents and staff to promote tree health.	Maintain tree canopy health.	Increase maintenance capacity through partnerships.	Increase access to knowledge to be applied locally.	Identify issues before they become hazards.
Remove invasive species and provide training for the public on how to identify and remove invasive species.	**All**	Educate Camas residents about invasive species management.	Create healthier environment for native plants to survive.			
Utilize climate-adaptive species for new or replacement plantings.	**All**		Ensure long-term succession of healthy ecosystems.	Decrease long-term replacement costs.		Resist die-off from extreme weather and climate change.
Prioritize protection, maintenance, and restoration of at-risk species or plant communities.	**All**	Opportunity to partner with nonprofits or community stewardship groups.	Preserve most valuable ecosystems and habitat.			Ensures longevity for vulnerable resources.
Establish a free tree planting program to increase canopy coverage and promote community engagement.		Partner with nonprofit for funding and outreach.			Support tree canopy coverage in at-risk communities.	
Complete a comprehensive tree inventory of public trees and maintain and update data over time.		Support public education with data-backed assessments.	Identify trends to help preserve existing canopy.	Use data to track long-term health and influence decision making.	Identify gaps in canopy.	Identify trends and issues holistically.
Partner with HOAs to generate tree inventories to track health and adaptability over time.		Support public education with data-backed assessments.	Identify trends to help preserve existing canopy.	Use data to track long-term health and influence decision making.	Identify gaps in canopy.	Identify trends and issues holistically.

Recommendations: Tree Canopy

Planning & Programming

Management practice	Land types	Outreach and Education	Natural Character	Financial and Resource Allocation	Equitable Access	Asset Protection + Public Safety
Work with local nurseries to adjust supplies to meet future needs and remove invasives or problem species.	**All**	Increase public awareness about problem species. Look for opportunities to subsidize through partnerships.	Shift market to align with native natural character.		Increase availability of native trees for more land owners.	Reduce ecosystem impacts from invasives.
Introduce tree infill planting on public lands.			Offset canopy loss.	Mitigate ecosystem services lost from development.		
Align trails, pathways, and amenities to avoid impacting mature trees and other sensitive habitat.	**All**		Preserve key specimen trees that promote connection to place.	Reduce damage and replacement costs.		Protect existing resources.
Work with schools to identify opportunities for additional canopy cover or educational opportunities.			Promote natural identity in public areas		Provide canopy in public areas	
Require ecosystem service mitigation for reduction in tree canopy for new development.		Promote value that nature provides to built environment.	Relocate key natural features when lost.	Require compensation for loss of infrastructure	Retain natural systems on private lands.	Reduce stress on remaining natural infrastructure.
Develop succession plans to establish a species, age, and structurally diverse canopy that reduces vulnerabilities to climate change.	**All**		Ensure long-term succession of healthy ecosystems.	Decrease long-term replacement costs.		Resist die-off from extreme weather and climate change.
Reduce the required DBH size for preservation/significant tree designation. Pair with a heritage tree program that includes both public and private specimen.	**All**		Maintain a diversity of canopy ages and mature tree coverage.	Preserve ecosystem services performed by largest existing trees.		
Establish a tree canopy project preservation goal beyond code requirements for any project where existing canopy is above the city average			Offset canopy loss and preserves mature canopy coverage.	Reduce ecosystem services lost from development.		
Prioritize new tree plantings in areas that have low existing canopy coverage and a high possible planting area percentage.	**All**		Expand natural character across Camas.		Improve access to benefits of tree canopy.	Reduce heat island effect.

Recommendations: Tree Canopy

Site Development

Management practice	Land types	Outreach and Education	Natural Character	Financial and Resource Allocation	Equitable Access	Asset Protection + Public Safety
Introduce a minimum tree well size/width for when trees are planted adjacent to paved surfaces.			Maintain mature tree canopy over time.	Reduce replacement costs.		Ensure longevity of trees in urban areas.
Ensure pathways, gathering, and resting areas are shaded to reduce surface and air temperatures.			Provide enjoyment of natural areas in multiple seasons.		Support recreation for a variety of user needs.	Protect public health and safety.
Plant trees quickly after site disturbance, such as construction or invasive removal.	**All**		Reduce chance of invasive establishment.	Reduce erosion impacts and rework.		
Implement a species diversity requirement for new plantings.	**All**		Biodiversity supports wildlife.			Resist pests, disease, and climate vulnerability.
When feasible, use a soil cell system to provide more growing space for trees.			Maintain mature tree canopy over time.	Reduce replacement costs.		Ensure longevity of trees in urban areas.

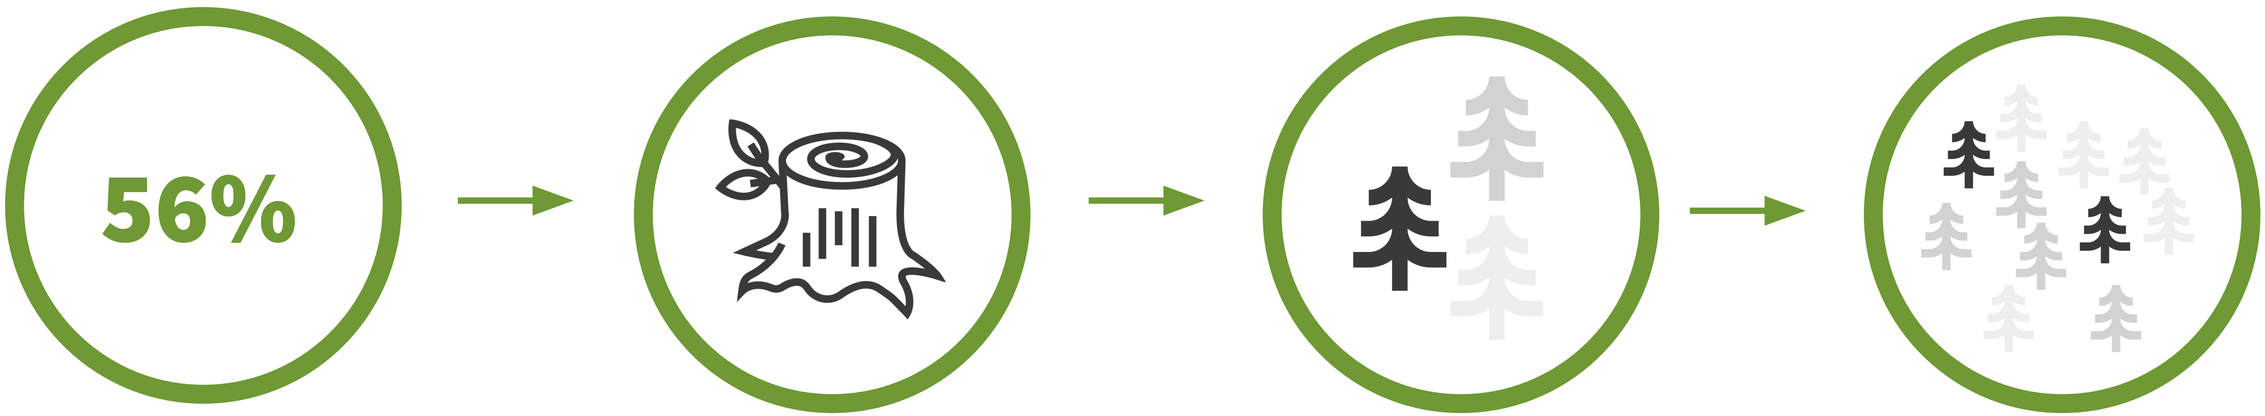
HOA Private land Steep slopes Stormwater facilities Open spaces Trails Wetlands ROW Shorelines Parks

Monitoring and Performance Metric Recommendations

What are realistic and implementable ways of measuring progress and success?

One of the goals of this plan was to establish a data-driven process to help make more-informed decisions. While decisions cannot be made on numbers alone, there are some ways to help better inform the process to understand how progress is being made towards the goals, priorities and values in the POSMP.

Recommended metrics to incorporate into Operational practices:



- Coordination with Comprehensive Plan and future PROS Plan updates
- Annual tracking and review of staff hour allocations by task and land type
- Annual tracking and review of water use
- Annual tracking and review of contract worker expenses
- Annual tracking and review of volunteer hours by project type or system (i.e. invasive removal)
- Perform city-wide canopy assessment every 10 years
- Maintain and expand tree inventory database
  - Completion of public tree canopy inventory
  - Coordination with HOA's and private land owners to perform tree canopy inventory
- Implement per-capita spending targets and tracking metrics to ensure adequate funding levels for maintaining high-quality parks and recreation amenities that meet the needs of the community in Camas.
- Require master plans and site development projects to propose site-base performance metrics to align with POSMP goals and prioritization criteria
  - Based on different land uses and ecosystem types
- Regular assessments of planted tree species should be conducted to identify any issues and take necessary corrective measures. This could involve adjusting watering schedules, providing additional care during extreme weather events, and replanting trees that fail to thrive.
  - Camas could establish a dedicated team or partner with existing organizations to monitor and manage the program. Utilizing technology like remote sensing and data analysis tools can aid in effectively tracking the health and progress of the planted trees. By continuously adapting to the changing environment, Camas can ensure the sustainability and success of its tree planting program, contributing to a greener and more resilient future for the City.

Planning Recommendations

In order to achieve alignment with the goals of this plan, updates to planning, code, and ordinance documents are recommended. These will help supplement the management practices on public land with adjustments to private development practices.

Planning Recommendation Path

The current city-wide tree canopy coverage is ~38%. As the population of Camas continues to grow, development could have significant impacts. If no changes to current regulations or practices are made, tree canopy losses will accumulate over time. Understanding existing code and development patterns reveals several opportunities to adjust planning approaches and change the trajectory.

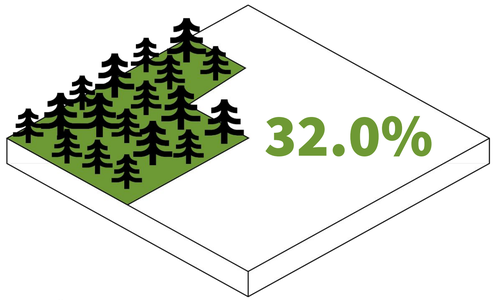
About half of canopy is on private lands

While the City can do their best to maintain and enhance canopy on public lands, it will take efforts on the private side to make sure city-wide canopy retains its value and benefits to the community.

Canopy on private lands is being lost

For example, residential lots had a net loss of tree canopy of **99 acres** from 2011-2021 (or a 5.8% loss in canopy area in those zones).

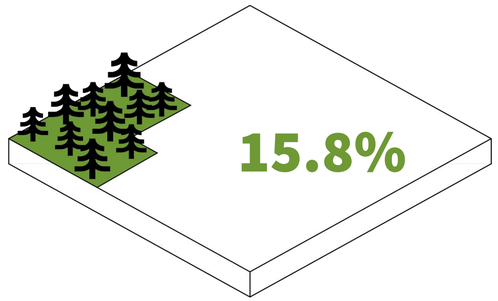
Tree ordinance requirements are not preserving existing canopy

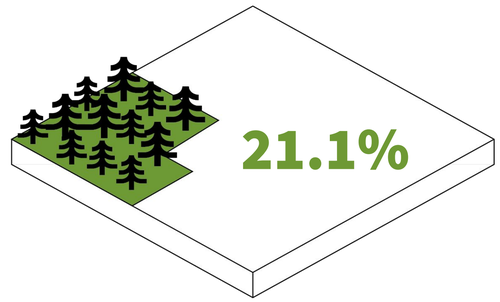


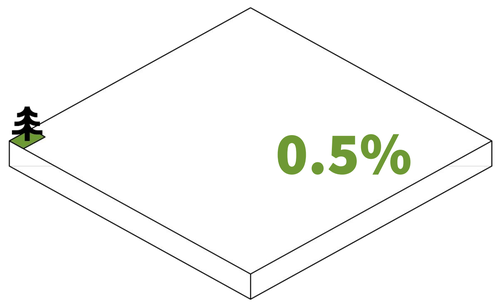
The current tree ordinance only replaces/preserves a portion of lost existing canopy because it allows the removal of large trees, while mitigating some losses with much smaller new trees (see next page).

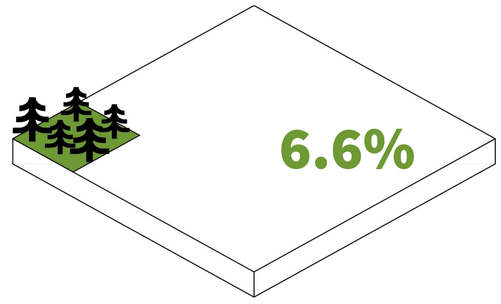
These losses will be compounded over time

As development on private land continues and canopy is lost, the canopy will see an immediate reduction in coverage and value. It will take decades for mitigation of removed trees with smaller trees to regain their benefit as mature trees.









Tree Density Requirements

Comparing existing conditions to tree code minimal requirements, there is potential for significant immediate tree canopy loss as lands develop. Mitigation with new trees will increase canopy over decades if species are adaptive and well maintained, but immediate ecosystem services are mostly lost with removal of existing mature trees.

City-wide Average Canopy Coverage of Existing Residential Zones (40 - 80 tree units per acre)

Many existing, undeveloped, private properties are at or above the city average for canopy coverage. If those developments stick to the code minimum, the chart to the right shows the best- and worst- case scenarios for immediate canopy coverage after development.

	Potential Development (per acre)	
	Standard tree code (20 units)	**North Shore tree code (30 units)**
Best-case immediate scenario	 **Maximum Immediate Canopy Coverage - Preserve a few large existing trees**	 **Maximum Immediate Canopy Coverage - Preserve a few large existing trees**
Worst-case immediate scenario	 **Minimum Immediate Canopy Coverage - (20) New 2” Trees**	 **Minimum Immediate Canopy Coverage - Half new 2” trees, half preserve existing**

Planning Recommendations: Tree Ordinance

Issues, Lack of Clarity or Misalignments with POSMP Goals	Recommendations	Notes
Tree Unit quantities do not relate to canopy area	Adjust tree units to reflect tree canopy area in addition to DBH	Adjust to give higher tree unit value to larger trees. This would only be effective if the total tree unit requirement is raised proportionately.
Tree Unit requirements are not defined for public parks	Define tree density requirement specifically for parks and open spaces. Units should be greater than other developed areas and align with canopy goals.	
Tree Unit requirements lower than existing conditions could result in significant canopy reduction over time	Increase total Tree Unit requirements to reflect canopy goals.	Could provide overlay zones in the Comp Plan for areas with existing higher coverage.
Preservation of significant trees is confusing and loosely defined and at only a higher DBH	Redefine significant tree size and require a higher tree unit replacement for damaged or removed significant trees. Develop a Heritage Tree Program that restricts all removal above a certain size for certain species. Require all properties (not just North Shore) to include the preservation of existing trees as a portion of the total Tree Unit requirement.	Replacement could be a 1:1 for DBH removed. If larger trees are used for replacement (not a requirement), extra care should be given to them for establishment as they are typically more challenging to keep alive.
Preservation or mitigation of native / adaptive species is not recommended or required	Give more value to native and adaptive species and/or prohibited/non-adaptive trees get a value of 0.	This could come in the form of a higher tree unit value or be part of a Heritage Tree program that values mature native trees.
No value or guidance is given regarding tree removal or preservation strategies for stability	Provide guidance and recommendation language on preservation and removal of clusters of trees.	The goal is to preserve clusters as-is to keep stability of the root system. If a tree needs to be removed in a cluster, it is recommended to leave the stump if possible.
Planter widths are given, but there is no guidance on soil volumes in Rights of Way. Many trees are planted in spaces that are too small to promote long-term health	Provide guidance and requirements on minimum soil volumes in Rights of Way	Require 8’ wide widths for all large trees unless other measures are taken to provide adequate soil volumes, stability, and protection.

Planning Recommendations: Plant Materials

Issues, Lack of Clarity, or Misalignments with POSMP Goals	Recommendations
Current Plant Materials List identifies species name, size, form, and some character descriptions (deciduous for some trees but not others). Some additional info would be helpful to align with code and POSMP goal expectations to help in decision making and long-term success.	Include more info for each species to help guide plant selection to meet planning development code and POSMP goals. Add the following columns for recommended plantings: • Evergreen • Drought-tolerance • Native • Sun exposure • Fire resistance/hazard • Climate change heat and hardiness vulnerability rating (per Urban Tree Canopy Vulnerability Report)
Private residents or developers may have a difficult time selecting the right tree species from a long list of options.	A tree selection tool could be developed that streamlines species that meet site-specific criteria in order to simplify decision making and ensure proper adherence to the criteria. Care should be taken to still promote diversity in selection.
Some species listed are projected to not adapt to climate change	Consider moving some or all of the non-adaptive, non-native species to prohibited list.
The shrubs, grasses, and groundcovers lists contain many non-native species and few native ones	Expand shrubs, grasses, and groundcovers lists to include native species and their benefits.
Some tree species listed will have a difficult time growing and staying healthy in the planter width allocated for them without many other supportive measures.	Revise planter widths for tree species as appropriate.

Planning Recommendations: Development Code

Issues, Lack of Clarity, or Misalignments with POSMP Goals	Recommendations
18.13.050 B provides a good list of the benefits of trees, but reads like tree species should be selected specifically for these functions.	Existing development code could be revised to clarify direction versus benefits, and be supported by additional information on species to help with selection. Clarify if evergreen requirement is for trees, vegetation, or both and how percentage requirements are counted (i.e. % species, % plants, % area coverage).
Parking lot are significant contributors to urban heat island effect and stormwater runoff.	18.13.060 H - Consider increasing planting and tree requirements to achieve a higher percent coverage. Reduce number of spaces between landscape dividers.
Desired ecosystem service mitigation may not be feasible on sites where building density is needed to support community needs.	18.13.052 C - Set up mitigation banks for invasive removal, wetland restoration, or tree planting if unable to meet requirements on-site.
It is common practice to use a small variety of trees in the right of way and in large developments. This can lead to vulnerability to pests and disease and does not align with habitat goals.	Include direction, requirements, or incentives for utilizing a variety of native tree species in rights of way or large development.

18.13.050 Standards for landscape, tree and vegetation plans.

A. The property owner shall be responsible for any future damage to a street, curb, or sidewalk caused by landscaping.

B. Landscaping and trees shall be selected and located to deter sound, filter air contaminants, curtail erosion, minimize stormwater run-off, contribute to living privacy, reduce the visual impacts of large buildings and paved areas, screen, and emphasize or separate outdoor spaces of different uses or character.

C. Landscape, Tree and Vegetation Plan must include a combination of trees, shrubs, and ground cover to achieve the purposes of this chapter.

1. Required landscaping shall be comprised of a minimum of sixty percent native vegetation (or adapted to northwest climate), or drought-tolerant vegetation, and fifty percent evergreen.

Existing code language

17.19.030F Tract, block and lot standards: Landscaping

2. The city council finds that the existing mature landscaping of trees, and shrubs provide oxygen, filter the air, contribute to soil conservation and control erosion, as well as provide the residents with aesthetic and historic benefits. For these reasons,the city encourages the retention of existing trees that are not already protected as significant trees under the Camas Municipal Code. Generally, the city may allow the tree requirements under subsection (F)(1) of this section to be reduced at the request of the developer, by a ratio of two new trees in favor of one existing tree, provided such trees have been identified on approved construction plans.

Existing code language

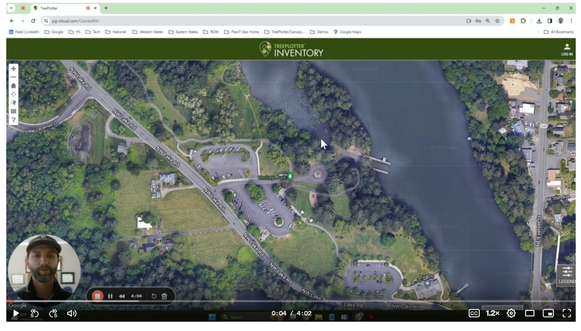
Planning Recommendations: Comprehensive Plan

Section	Recommendations
Natural Environment Element Overview	Revise Natural Environment element language to include the concept of natural systems as valuable infrastructure.
NE-1.1: Consider the immediate and long-term environmental impacts of policy and regulatory decisions.	Incorporate the use of ecosystem services as a reference point for these discussions and evaluations.
1.4.4 Natural Environment	Develop tree preservation overlay zones for priority canopy areas to be maintained ● Increase tree unit requirement ● Require preservation or steep mitigation for trees above **X** DBH
1.4.4 Natural Environment	Develop an urban forestry program that works to implement the best practice recommendations that are a part of this POSMP in order works towards system-wide stewardship and resilience.
3.4.2 Critical Areas	Consider designating large areas of connected tree canopy as critical areas to be preserved.
3.4.3 Shorelines	Consider adding a goal that addresses providing the community with safe and accessible ways to engage with shorelines that balances recreation with ecological needs.
3.4.4 Landscape Enhancement and Tree Preservation	Include heat island reduction, improved air quality, and stormwater management as additional added values for protecting the urban tree canopy.
3.4.4 Landscape Enhancement and Tree Preservation	Identify public lands that can act as mitigation banks to counteract canopy loss over time. Spread throughout the city to make sure replacement is within ½ mile of development site ● Prioritize more urban conditions to maximize ecosystem service value ● Provide incentives for private land to preserve existing or mitigate losses
4.4.4 Design and Low-Impact Development	Consider adding a goal that addresses tree canopy coverage, health, and replacement.
5.7.3 Park Impact Fees	Consider the Level of Service needed as large areas of land develop and population density increases (i.e. North Shore)
5.7.3 Park Impact Fees	Assess specialized amenities and programming as a system and consider repurposing land based on density and walkability vs driving - i.e. ball fields (specialized use) vs parks (universal use) near dense housing

Community Outreach

The planning process included outreach and education events in order to capture community feedback and raise awareness of the plan.

Public Participation & Education Strategy



The POSMP builds off of previous planning efforts in Camas around parks, open spaces, and recreation. Community feedback and priorities from efforts like the PROS plan were reviewed, summarized, and built upon to lead to the 5 Camas Community Values that provided a framework for this plan. The POSMP provides a pathway on how to prioritize and implement those values. Drafts of the plan and its strategies were reviewed with the Camas Parks and Recreation Commission 2/28/24 and 7/31/24) and City Council (5/6/24 and 8/5/24) to ensure alignment with other city goals and collect feedback.

Education, training, and public feedback was a key part of the plan development process. A project website was set up to keep the community informed about the process and engagement opportunities.

Camas Parks and Open Space Management Plan | Engage Camas

The team hosted an open house to share progress of the plan, answer questions, and collect feedback on the overall approach. There were interactive sessions that explained the system-based approach to management and gathered ideas around impacts, risks, and strategies to inform the best practices recommendations. Feedback was collected on the 5 Community Values in order to inform the project approach matrix. An online survey was set up and posted on the project website to duplicate these activities and a recording of the presentation was included to provide the background context.

Finally, a public tree inventory session* was co-hosted by the City of Camas, PlanIT Geo, and Washington Department of Natural Resources (DNR). It was held the day after the open house on Earth Day weekend to align with other community events. On-site training was provided on how to use the the inventory tool as well as education on tree health and maintenance. Plan IT Geo's arborists verified the data in order to include it in the city-wide inventory database for future use.

Camas Volunteer Inventory Training Video
provided to the community before the event through the website to prepare for the inventory.

*The original plan was to work with local students to provide education and a sample inventory. Due to the local teachers strike at the onset of the project, student availability and class curriculum didn't align with the time of year to perform the inventory. It was decided to open it up to the public later on in the project timeline.

This flyer was used to advertise the public events, as well as social media, and local newsletter postings.

Camas Parks and Open Space Management Plan

Community Open House

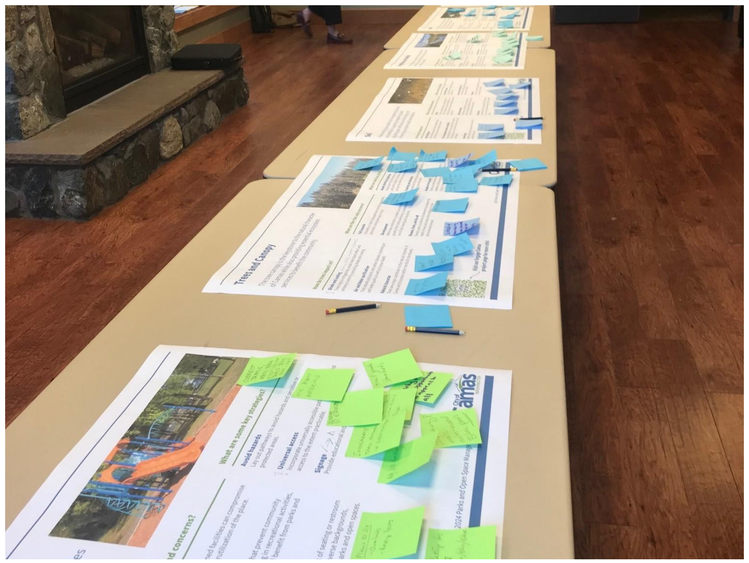
April 19th, 2024

Agenda

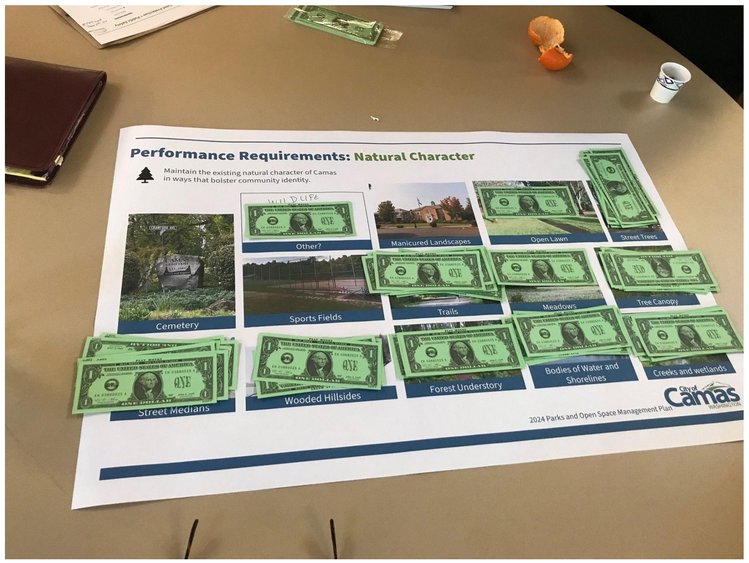
Presentation (30 minutes)

- Project overview and goals
- Tree Canopy Analysis
- Financial and Operations Assessment
- A Systems Approach, Valuing Nature
- Resource Prioritization

Activity #1 - Poster feedback (30 minutes)



Activity #2 - Table discussions (30 minutes)



Community Feedback

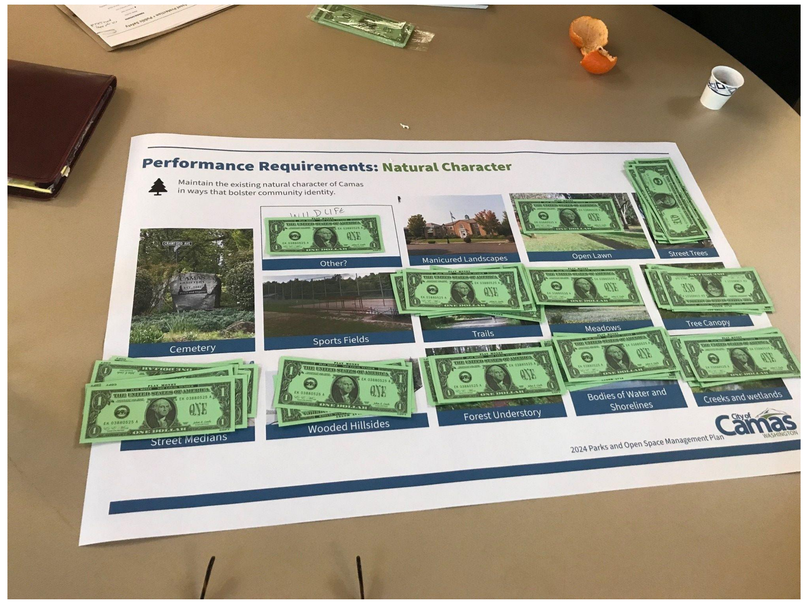
Community Open House

An open house was held at Lacamas Lodge on April 19, 2024. Participants provided feedback on the systems through discussions and through annotating posters. Group activities were used to obtain feedback on the performance requirements identified for the Parks and Open Space management plan.

Online survey feedback

An online survey was provided through Engage Camas. The survey was open until May 5, 2024. There were 9 survey responses. The survey questions explored the following:

- **Outreach & Education:** What are potential gaps in knowledge that require training for land management practices for public and/or private landowners?
- **Natural Character:** What does natural character mean to you and which features contribute most to the identity of Camas?
- **Equitable Access:** What are the biggest obstacles to access natural resources and park amenities?
- **Financial & Resource Allocation:** How else does nature benefit you and the community?
- **Asset Protection & Public Safety:** What are your priority natural impacts, human activity, and safety concerns that (will) have impacts on Camas?



- **Systems Approach:** Is there anything missing or other ideas to consider as it relates to the following systems?
  - Water
  - Operations
  - Materials & Equipment
  - Access & Amenities
  - Soil
  - Vegetation & Habitat
  - Trees & Canopy

Open House Feedback Summary

Key Takeaways:

- This will be a large change initiative for the city and community.
- Camas' natural resources, parks, and open space are a **valuable asset** and serve as **key infrastructure** to the city.
- Clear incentives, restrictions, and guidelines should be put in place for basic maintenance tasks, tree preservation, and appropriate planting practices.
- Program, amenities, and assets should be looked at from a system-wide perspective and located based on diversity of uses, population density, and adjacencies to other land uses and natural resources.
- There's a lot of potential in the volunteer organizations and HOA residents if organized and educated properly
- There was a long-term desire to progress from reactive maintenance to systemic stewardship.

Community Feedback: Performance Requirements

Online survey feedback

The ecosystem services graphic above identifies the many ways our parks and open space system provides benefits and value to our community. How else does nature benefit you and the community?

- Opportunities to learn more about nature
- Social/emotional wellbeing and resilience to stress, particularly stress from climate change
- Enhanced community connection
- Physical health
- Access to nature and developing sense of place
- Environmental benefits: carbon storage, cooling
- Economic benefits: tourism destination, attract investment

Community Feedback: Performance Requirements

Online survey feedback

What does natural character mean to you and which features contribute most to the identity of Camas?

- 5 mentions: Trails, Tree Canopy
- 4 mentions: Bodies of Water and Shorelines, Creeks and Wetlands
- 3 mentions: Forest Understory, Meadows, Street Trees
- Other comments:
  - Buildings and other urban features seen as elements that detract from the natural character of Camas.
  - Bike paths contribute to natural character of Camas, as do wooded hillsides that are not built upon.

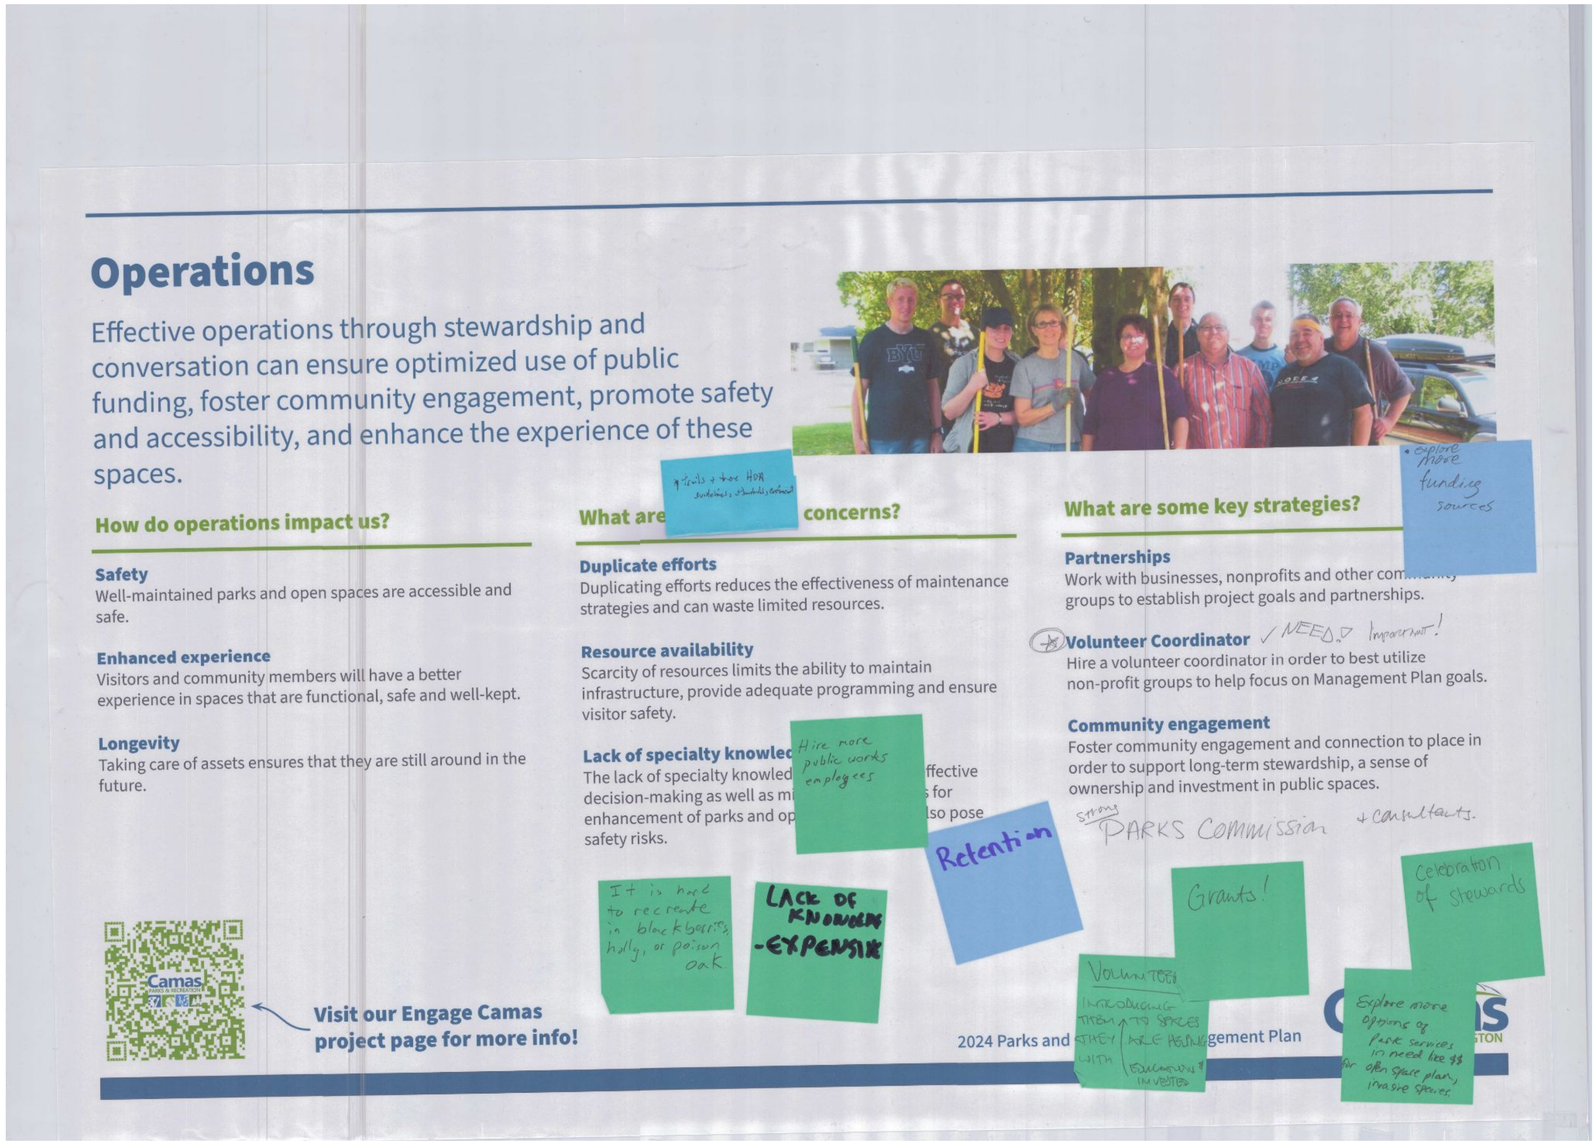
Community Feedback: Performance Requirements

Online survey feedback

What are your priority natural impacts, human activity, and safety concerns that (will) have impacts on Camas?

- Water quality was mentioned frequently in the survey results. Safe and clean household water was mentioned as a concern. Toxic bacteria in Lacamas Lake was also specifically mentioned as a concern.
- Wildfire was mentioned frequently in the survey results. Respondents noted that climate change brings increasing threat of wildfire, and that there is a need for education and management of fuels.
- Invasive species and their threats to tree health and native vegetation were mentioned. Blackberries were specifically mentioned as an invasive species of concern.
- Several respondents were concerned about the impacts of development; specifically, that development might come at a cost of investment in existing assets. There were additional concerns about the potential strains on existing infrastructure and natural ecosystems that might occur as a result of future development.
- Loss of outdoor programming and wilderness education was shared as a concern by several respondents.
- Climate change was mentioned as a major threat, including impacts such as extreme changes in heat and water availability.
- Tree canopy loss was also a concern mentioned repeatedly in the survey responses.

Community Feedback: Systems



Online survey feedback

Managing water in our parks and open spaces is vital for preserving natural ecosystems, ensuring access to clean water, and providing cooling and recreational opportunities for the community. Is there anything missing or other ideas to consider as it relates to water?

- Access to clean and safe water is critical.
- Increase outreach to homeowners and private landowners to educate them about best practices for managing water quality. Work with them to address water quality issues upstream of stormwater infrastructure.
- Consider reducing irrigation as well as reducing lawns.
- What long-term measures is Camas taking to enhance climate resilience, beyond just focusing on climate mitigation?
- Lacamas Lake water quality is a concern.
- Could a user fee at lakes and boat ramps provide fiscal support for maintaining water quality?

Community Feedback: Systems

Online survey feedback

Effective operations through stewardship and conversation can ensure optimized use of public funding, foster community engagement, promote safety and accessibility, and enhance the experience of these spaces. Is there anything missing or other ideas to consider as it relates to operations?

- Continue efforts to engage Camas citizens in stewardship events and parks cleanups - these have been successful so far.
- Consider partnerships with universities as well as local K-12 schools.
- Lots of support for a volunteer coordinator position. Are there other opportunities to support community volunteer efforts?
- Funding is a concern when it comes to implementing operational changes through the Parks and Open Space Management Plan.

Community Feedback: Systems

Materials and equipment

Materials and equipment selection and maintenance directly impact the functionality, durability, safety, and aesthetic quality of parks and open spaces.

How do materials and equipment impact us?

Circulation and Gathering
Hardscapes allow for vehicular parking, pathways and open spaces to support programming.

Aesthetics and Character
Materials and furniture contribute to the overall character of Camas' parks and open spaces. Color selection, materiality and finish can provide consistency or a unique sense of place for each site.

local sourcing?

Places for Recreation and Rest
Playground equipment, benches and picnic tables provide places for both active and passive recreation.

ACTIVE & PASSIVE RECREATION - DEFINE

What are the risks and concerns?

Heat island effect
The heat island effect, characterized by elevated temperatures in urban areas, underscores the importance of selecting materials that minimize heat absorption.

Safety
It is critical to selec[illegible]inimize potential hazards, reduce the[illegible] injuries and ensure the well-being of us[illegible]

INCREASE LEVELS OF RISK FOR DIFFERENT LEVELS - ATHLETIC SETTING - BASKETBALL BLACK

Durability
Selecting durable materials ensures long-term functionality and minimizes the need for frequent maintenance or replacement.

What are some key strategies?

Consistent sourcing
Utilize a short list of standard furnishings, materials and colors to simplify replacement and maintenance costs and provide a consistent character across spaces.

Permeability –
Pervious materials allow water to infiltrate the surface and reduce flooding and erosion.

Universal access
Provide universal access to program areas and for equipment options for people of all ages[illegible]nd abiliti[illegible]

--logical connectivity

LONGEVITY OF TRAILS - PREVENT EROSION RESHAPE

Visit our Engage Camas project page for more info!

2024 Parks and Open Space Management Plan

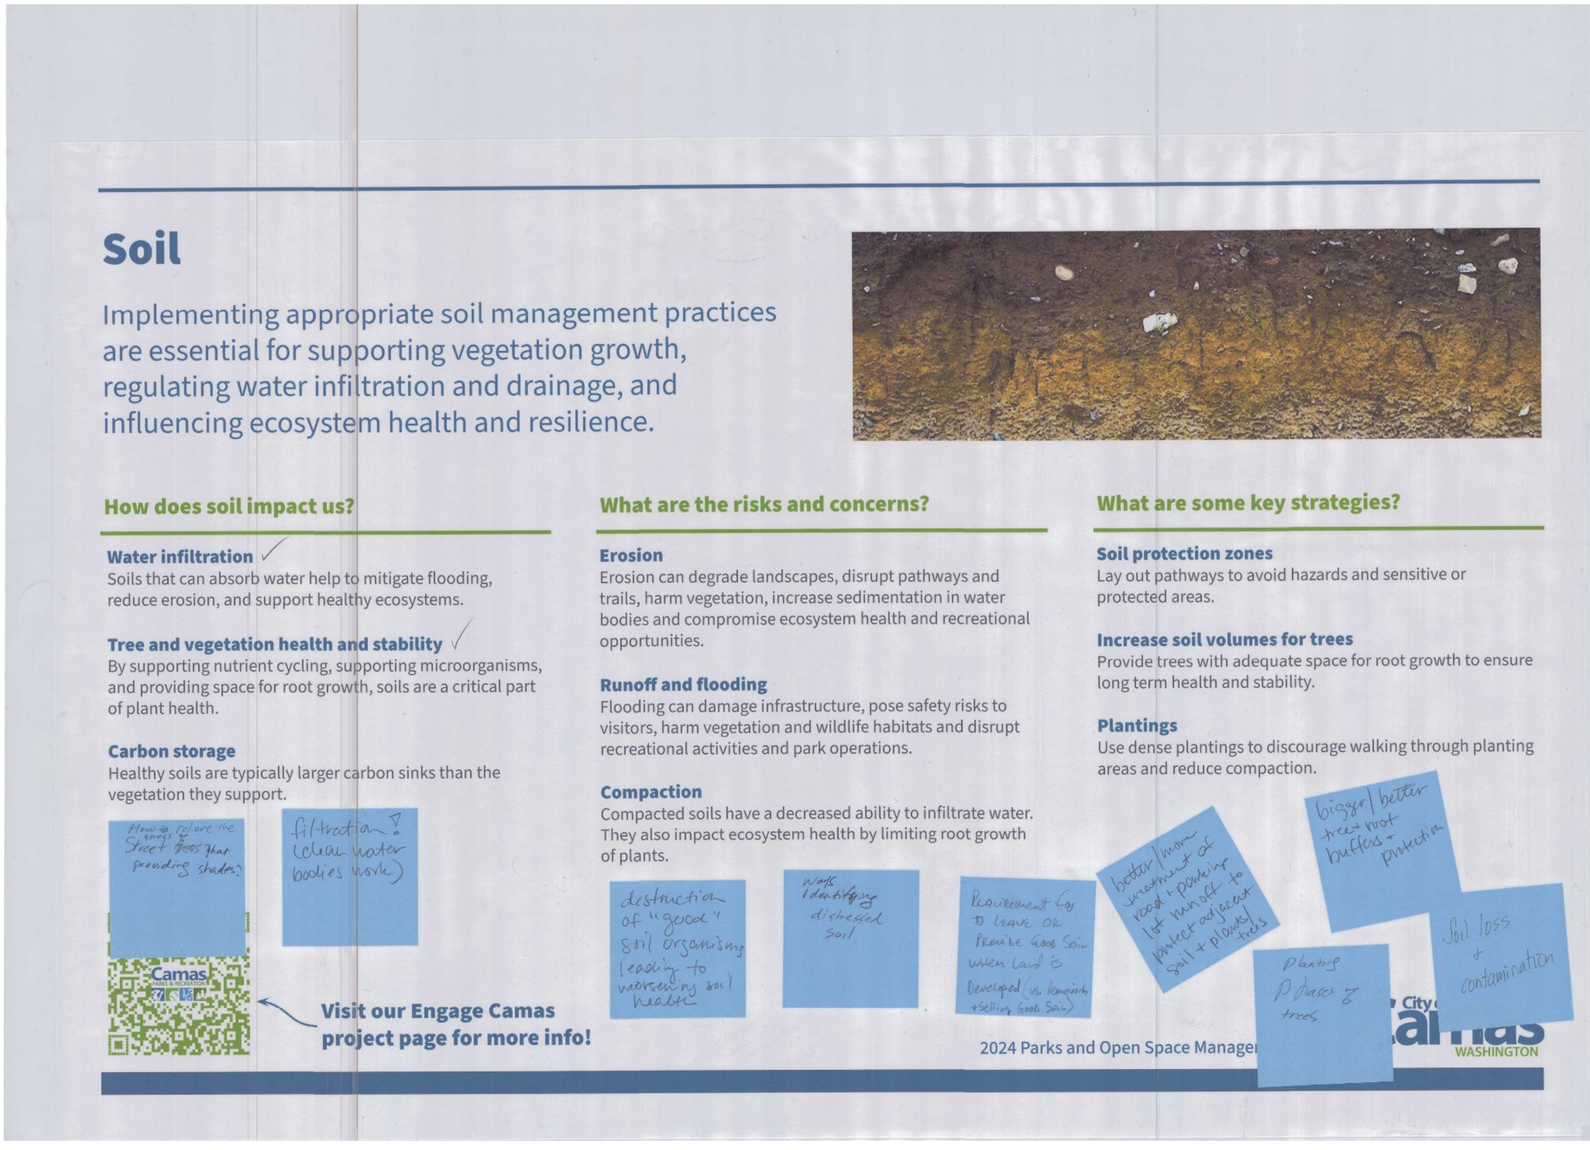
City of Camas WASHINGTON

Online survey feedback

Materials and equipment selection and maintenance directly impact the functionality, durability, safety, and aesthetic quality of parks and open spaces. Is there anything missing or other ideas to consider as it relates to materials and equipment?

- Prioritize access when selecting materials. Camas has a large aging population, so this will continue to be a critical consideration.
- Retain natural character to the greatest extent possible, balancing this with needs for equitable access. Incorporate naturescaping and sustainable materials.
- Consider paving high-use trails to decrease degradation and enhance access in the long term.
- Maintain existing materials and equipment to a sufficiently high standard.

Community Feedback: Systems

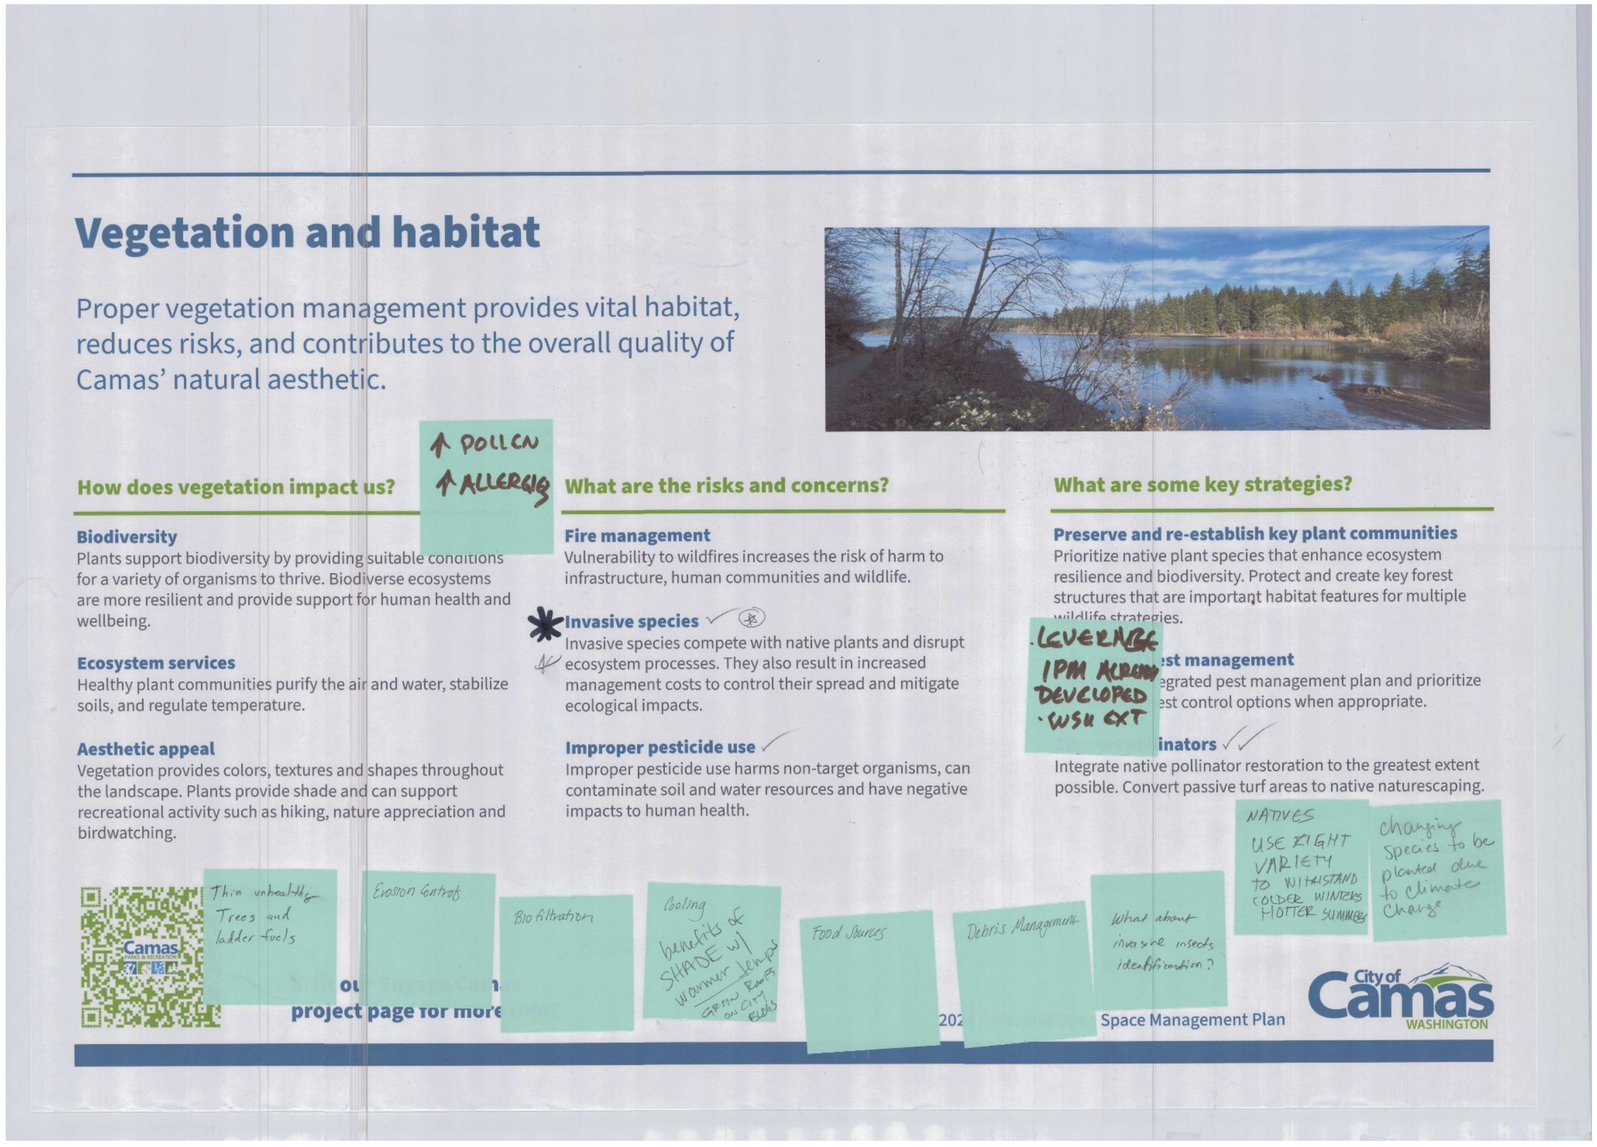


Online survey feedback

It is critical to ensure that people of all ages and abilities can access and enjoy the variety of parks and open spaces that Camas has to offer. Is there anything missing or other ideas to consider as it relates to access and amenities?

- Providing more information on amenity options as well as their costs and benefits would increase buy-in from the community.
- Safety and vandalism are concerns.
- Consider signage options that can be used by individuals with vision limitations.
- Explore ways that signage can be integrated into the existing natural character, as well as ways that signage can complement opportunities for education and outreach.
- Improve connections and wayfinding through the City.
- Incorporate universal access into parks and amenities.
- Ensure that people of all backgrounds can feel welcome in parks and open spaces.

Community Feedback: Systems

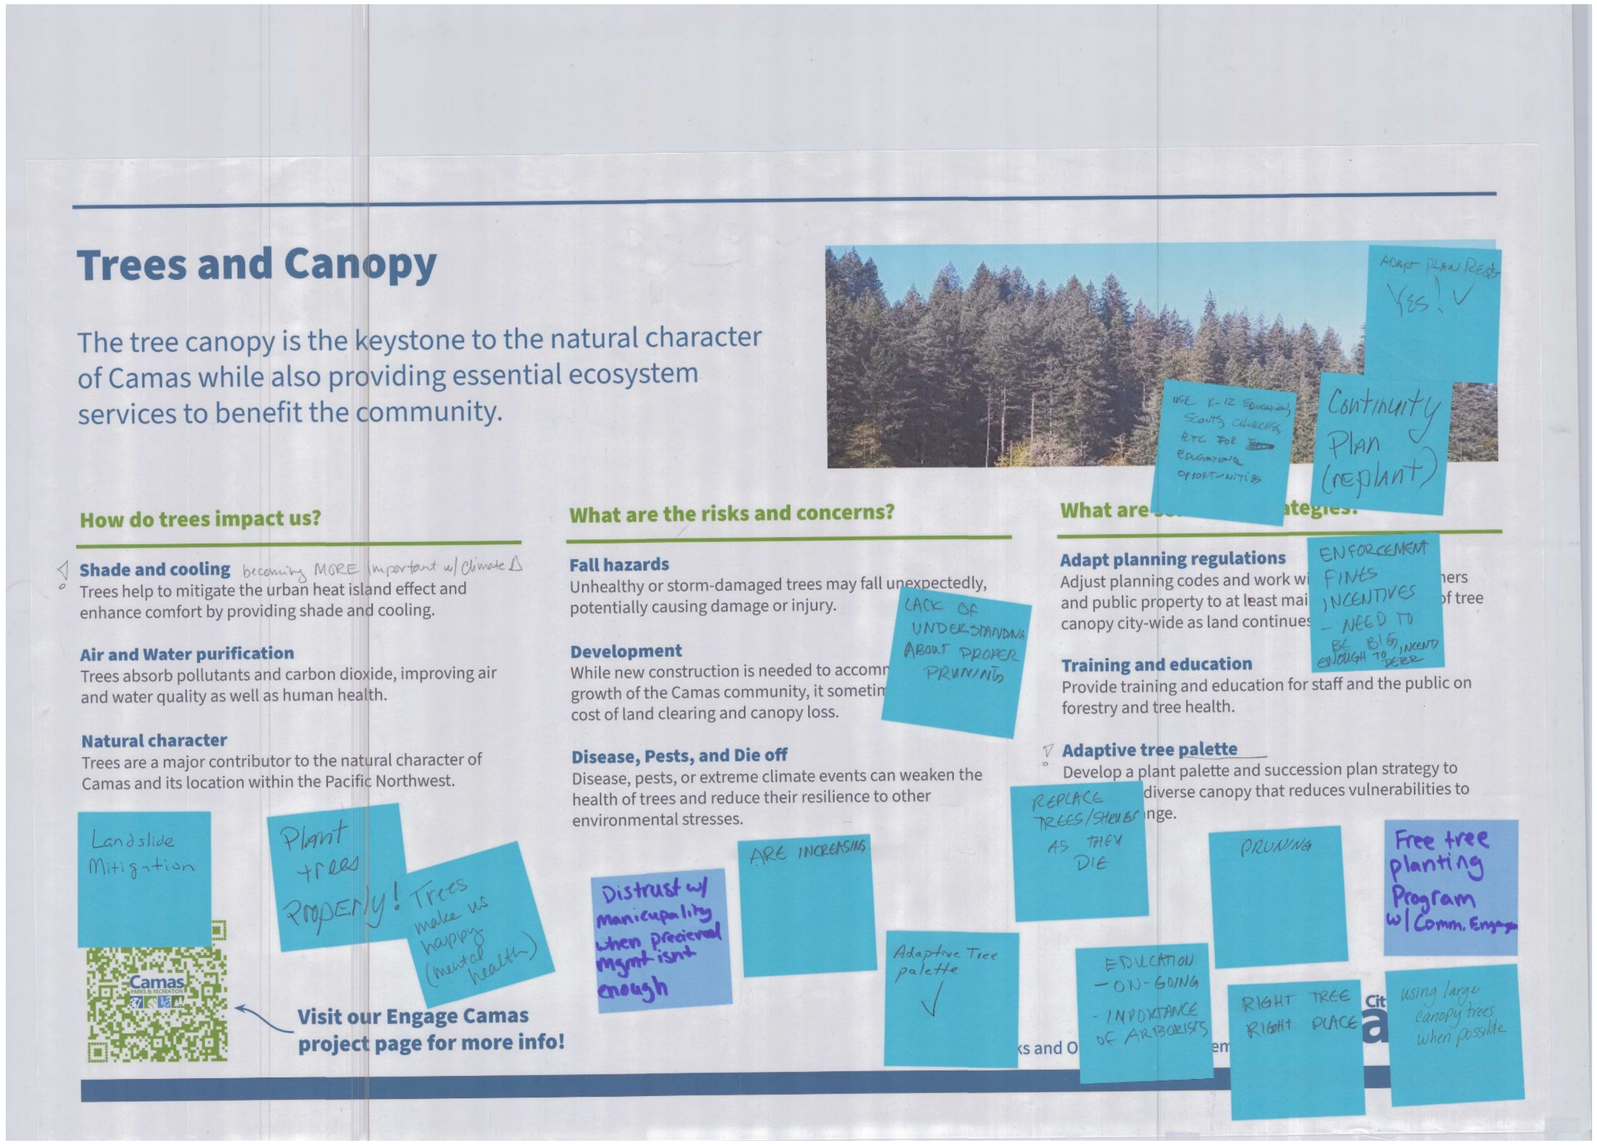


Online survey feedback

Implementing appropriate soil management practices are essential for supporting vegetation growth, regulating water infiltration and drainage, and influencing ecosystem health and resilience. Is there anything missing or other ideas to consider as it relates to soil?

- Enhanced wayfinding and signage could help keep people and trails and reduce compaction in sensitive areas.
- Consider long-term resilience when selecting and placing plantings.
- Enhance planting vaults for street trees.
- Support composting. This could include a City compost facility as well as infrastructure for residents in apartment complexes and new developments who wish to compost.

Community Feedback: Systems



Online survey feedback

Proper vegetation management provides vital habitat, reduces risks, and contributes to the overall quality of Camas' natural aesthetic. Is there anything missing or other ideas to consider as it relates to vegetation and habitat?

- Emphasize wildfire prevention and management practices.
- Consider changing maintenance practices such as reducing mowing frequency or leaving areas unmowed.
- When selecting plants, account for the impacts of climate change - "native species" may need to be redefined.
- What efforts are being made to reintroduce native plants that have been previously displaced?
- Establish a maintenance schedule that allows for proactive management of vegetation.

Community Feedback: Systems

Online survey feedback

The tree canopy is the keystone to the natural character of Camas while also providing essential ecosystem services to benefit the community. Is there anything missing or other ideas to consider as it relates to trees and canopy?

- Wildfire is a major threat to trees and canopy.
- How will environmental justice be incorporated into how the City manages trees and canopy?
- Seek guidance of foresters or forest management experts to balance selective thinning of trees with the need to preserve biodiversity.
- Canopy is a huge part of what makes Camas a wonderful place.
- Provide clearer guidance to private landowners about managing trees and use tree permits to avoid unnecessary removal of trees.
- Use planning and code to shift development away from sites that require land clearing and to prioritize retention of existing mature trees.
- Young trees used in mitigation plantings cannot replace the many benefits of mature trees.
- Trees in sidewalk strips have been removed by homeowners because of their impacts on the sidewalk. Permeable sidewalks and more planning for trees could address this problem.

Table 1: Stewardship calendar

STEWARDSHIP CALENDAR	1 JAN	2 FEB	3 MAR	4 APRIL	5 MAY	6 JUNE	7 JULY	8 AUG	9 SEPT	10 OCT	11 NOV	12 Dec	NOTES
planting considerations:													
primary planting season	go	go	go	go	go	stop	stop	stop	stop	stop	stop	stop	optimal planting is when plants are dormant during the rainy season
wetland planting season	stop	stop	stop	stop	proceed with care	go	go	go	go	stop	stop	stop	applies to soils that dry out during part of year
wetland planting season	stop	stop	stop	stop	stop	proceed with care	proceed with care	go	go	go	go	stop	applies to soils that are saturated year-round
wildlife considerations:													
primary bird nesting season	go	go	go	go	go	stop	stop	stop	stop	stop	stop	go	includes majority of songbird species; some birds nest later into end of August
early bird nesting season	go	go	proceed with care	proceed with care	proceed with care	stop	stop	stop	stop	go	go	go	includes larger species such as herons, geese, raptors, and hummingbirds
duck nesting season	go	go	go	stop	stop	stop	stop	stop	go	go	go	go	avoid shoreline/adjacent areas
amphibian reproduction	stop	stop	stop	stop	stop	stop	go	go	go	go	go	stop	applies to sites with 10 cm standing open water, avoid 25 feet from waters edge
professional crew considerations:													
steep slope work	stop	stop	stop	stop	proceed with care	proceed with care	go	go	go	go	stop	stop	do not carry out activities that have potential for soil disturbance in winter without BMPs in place
knotweed herbicide treatment	stop	stop	stop	stop	stop	stop	stop	go	go	stop	stop	stop	early or late applications may be acceptable to avoid impacts to pollinators
ivy herbicide treatment	stop	stop	stop	stop	proceed with care	proceed with care	proceed with care	go	go	stop	stop	stop	early applications may be acceptable, but not as effective for long-term control
blackberry herbicide treatment	stop	stop	stop	stop	proceed with care	proceed with care	proceed with care	go	go	stop	stop	stop	do not make applications to fruiting vegetation

Legend: go; proceed with care; stop

2.6.8 City of Camas 2019 Water System Plan Update (Carollo Engineers) 2-18
2.6.9 Jones and Boulder Creek Watershed Forest Management Plan 2-19
2.7 Policies, Criteria, and Standards 2-19
2.7.1 Service Policies and Standards 2-20
2.7.2 Coordination with Other Agencies 2-23
2.7.3 Environmental Policies and Criteria 2-23
2.7.4 System Reliability and Maintenance Policies and Standards 2-24
2.7.5 Financial Policies 2-25
2.7.6 Design Standards 2-30
2.7.7 Distribution System Criteria and Standards 2-30

CHAPTER 3 EXISTING SYSTEM

3.1 Introduction 3-1
3.2 Pressure Zones 3-1
3.3 Sources of Supply 3-7
3.3.1 Surface Water Sources 3-8

3.3.2 Groundwater Sources 3-8
3.4 Water Treatment 3-9
3.4.1 Surface Water 3-9
3.4.2 Groundwater 3-9
3.4.3 Groundwater Under the Direct Influence of Surface Water 3-10
3.5 Storage Facilities 3-11
3.5.1 Butler Reservoir 3-11
3.5.2 Gregg Reservoir 3-12
3.5.3 Lacamas Reservoir 3-14
3.5.4 18th Avenue Reservoir 3-14
3.5.5 Lower Prune Hill Reservoirs 3-15
3.5.6 Upper Prune Hill Standpipe and Reservoir 3-16
3.6 Pipe Network 3-18
3.7 Pressure Reducing Stations 3-18
3.8 Booster Pumping Stations 3-20
3.8.1 Butler Booster Pump Station 3-22
3.8.2 New Gregg Booster Pump Station 3-22
3.8.3 Forest Home Booster Pump Station 3-24
3.8.4 Lower Prune Hill Booster Pump Station 3-25
3.8.5 Lacamas Booster Pump Station 3-26
3.8.6 Angelo Booster Pump Station 3-27
3.8.7 Upper Prune Hill Booster Pump Station 3-28
3.8.8 Crown Road Booster Pump Station 3-29
3.8.9 Green Mountain Estates Booster Pump Station 3-30
3.8.10 Francis Road Booster Pump Station 3-31
3.9 Interties 3-32
3.10 Supervisory Control and Data Acquisition 3-34

CHAPTER 4 OPERATION AND MAINTENANCE

4.1 Water System Management and Personnel 4-1
4.1.1 Public Works Director 4-1
4.1.2 Capital Engineering 4-1
4.1.3 Utility Manager 4-1
4.1.4 Water System Operators 4-2
4.1.5 Emergency Public Communication 4-2
4.2 Operator Certification 4-3
4.2.1 Professional Growth and Training 4-3
4.3 Customer Complaint Response Reporting 4-5
4.4 Record Keeping and Reporting 4-5
4.5 Routine System Operating Procedures and Preventative Maintenance 4-5
4.5.1 Routine Operating Procedures 4-6
4.5.2 Preventative Maintenance 4-6

4.6 Facility Maintenance 4-7
4.6.1 Booster Pump Stations and Supply Wells 4-7
4.6.2 Reservoirs 4-7
4.6.3 Recommended CIP Summary 4-8
4.7 Sanitary Survey 4-10
4.8 Emergency Response Program 4-10
4.9 Cross-Connection Control Program 4-10
4.10 Pipeline Repair and Replacement 4-13
4.10.1 Pipe Material and Age 4-14
4.10.2 Useful Life 4-14
4.10.3 Remaining Useful Life Analysis 4-14
4.10.4 Pipeline Repair and Replacement Program 4-15
4.11 Operations and Maintenance Improvements 4-15

CHAPTER 5 WATER REQUIREMENTS

5.1 Historical Water Use 5-2
5.1.1 Historical Accounts 5-2
5.1.2 Large Users 5-4
5.1.3 Historical Consumption 5-4
5.1.4 Water Use per Account and Equivalent Residential Units 5-7
5.2 Seasonal Demands 5-9
5.3 Historical Production 5-11
5.3.1 Distribution System Leakage and Non-Revenue Water 5-11
5.3.2 Historical Average and Maximum Demands 5-14
5.4 Demographic Forecast 5-15
5.4.1 Land Use 5-16
5.4.2 Demographic Projections 5-19
5.5 Projected Number of Accounts 5-22
5.6 Projected Water Demand 5-22
5.6.1 Potential Range in Future Water Demand 5-22
5.6.2 Large Users Demand Forecast 5-24
5.6.3 Projected ERUs 5-25
5.6.4 Projected Average Day and Maximum Day Demands 5-25

CHAPTER 6 WATER USE EFFICIENCY 6-1

6.1 WUE Program Background 6-1
6.1.1 Current WUE Program 6-1
6.1.2 Distribution System Leakage 6-2
6.1.3 Historical Effectiveness of Current Water Use Efficiency Program 6-3
6.2 Future WUE Program 6-4
6.2.1 Mandatory Measures 6-4
6.2.2 Future WUE Program Supply-Side Measures 6-7
6.2.3 Future WUE Program Demand-Side Measures 6-7

6.2.4 Projected Demands with Water Use Efficiency Goals 6-7
6.2.5 Future WUE Program Effectiveness 6-8
6.2.6 Budget 6-9
6.3 Water Shortage Plan 6-9

CHAPTER 7 WATER QUALITY

7.1 Introduction 7-1
7.2 Overview of Regulatory Requirements 7-1
7.3 Source Water Quality 7-4
7.3.1 National Primary and Secondary Drinking Water Standards 7-4
7.3.2 Inorganic Chemicals 7-4
7.3.3 Volatile Organic and Synthetic Organic Compounds 7-6
7.3.4 Radionuclides 7-8
7.3.5 Arsenic Rule 7-8
7.3.6 PFAS NPDWR 7-9
7.3.7 Washington State Action Levels for PFAS 7-12
7.3.8 Manganese 7-14
7.3.9 Surface Water Treatment Rules 7-15
7.3.10 Groundwater Rule 7-17
7.3.11 Unregulated Contaminant Monitoring Rule 7-19
7.4 Distribution System Water Quality 7-21
7.4.1 Total Coliform Rule 7-21
7.4.2 Stage 1 Disinfectants and Disinfection Byproducts Rule 7-22
7.4.3 Stage 2 Disinfectants and Disinfection Byproducts Rule 7-23
7.4.4 Lead and Copper 7-24
7.5 Water Quality Monitoring Program 7-26
7.5.1 Consumer Confidence Report 7-26
7.5.2 Public Notification Rule 7-26
7.5.3 Operator Certification 7-27
7.6 Future Regulatory Requirements 7-28
7.6.1 Unregulated Contaminant Monitoring Rule (UCMR 6) 7-29
7.6.2 Fifth Regulatory Determination 7-29
7.6.3 Sixth Contaminant Candidate List 7-29
7.6.4 Contaminants of Emerging Concern 7-29
7.6.5 Microbial and Disinfection-by-Products 7-31
7.7 Summary and Recommendations 7-32
7.7.1 Recommendations for Compliance with PFAS MCLs 7-32

CHAPTER 8 WATER RESOURCES 8-1

8.1 Water Right Analysis 8-1
8.1.1 Water Rights Summary 8-2
8.1.2 Water Rights Analysis 8-4

8.2 Ability to Pump 8-5
8.2.1 MDD Ability to Pump 8-6
8.2.2 ADD Ability to Pump 8-7
8.3 Water Supply Strategy 8-8
8.3.1 Lower Washougal Wellfield Expansion 8-9
8.3.2 Secure Additional Water Rights 8-9
8.3.3 Develop Wells for Existing Water Rights 8-11
8.3.4 Continue Water Use Efficiency Program 8-11
8.3.5 Summary of Improvements 8-12
8.4 Groundwater Management 8-14
8.4.1 Wellhead Protection Program 8-14
8.4.2 Wellhead Protection Area 8-15
8.4.3 Existing and Potential Contamination Hazard Identification 8-15
8.4.4 Contingency Planning Tasks 8-15
8.4.5 Management Strategies and Implementation Tasks 8-16

CHAPTER 9 DISTRIBUTION SYSTEM ANALYSIS

9.1 Introduction 9-1
9.2 Distribution System Model Analysis 9-1
9.2.1 Modeled Improvement Projects 9-1
9.2.2 System Criteria 9-3
9.2.3 Peak Hour Flow Evaluation 9-5
9.2.4 Fire Flow Evaluation 9-12
9.3 Pumping Analysis 9-18
9.3.1 343 Pumping Area 9-18
9.3.2 455 Pumping Area 9-19
9.3.3 542 Pumping Area 9-20
9.3.4 544 Pumping Area 9-21
9.3.5 695 - Green Mountain Estates Pumping Area 9-21
9.3.6 Francis Road Pumping Area 9-22
9.4 Storage Analysis 9-22
9.4.1 Components of Storage 9-23
9.4.2 Storage Recommendations 9-27
9.5 Limiting Capacity Analysis 9-29
9.6 Summary of Recommendations 9-30

CHAPTER 10 CAPITAL IMPROVEMENT PLAN

10.1 Introduction 10-1
10.1.1 Capital Project Categories 10-1
10.1.2 Capital Project Types 10-1
10.1.3 Capital Planning Periods 10-2
10.1.4 Capital Project Cost Allocation 10-2

10.2 Cost Estimating Assumptions 10-2
10.2.1 Cost Estimate Level 10-2
10.2.2 Baseline Unit Cost 10-2
10.2.3 Cost Estimates Elements 10-3
10.2.4 Pipeline Unit Costs 10-3
10.2.5 Pump Station Costs 10-4
10.2.6 Well Costs 10-4
10.2.7 Reservoir Costs 10-4
10.2.8 Additional Costs 10-5
10.3 CIP Development and Implementation 10-5
10.3.1 Recommended Distribution Projects 10-6
10.3.2 Recommended Transmission Pipeline 10-7
10.3.3 Recommended Annual Repair and Replacement Programs 10-7
10.3.4 Recommended Pump Station Projects 10-8
10.3.5 Recommended Storage Projects 10-10
10.3.6 Recommended Supply and Treatment Projects 10-11
10.3.7 Recommended General Projects 10-13
10.4 CIP Program Summary 10-14
10.4.1 CIP Project Summary 10-17

Appendices

APPENDIX A ADOPTING RESOLUTION
APPENDIX B SEPA - AGENCY COMMENTS
APPENDIX C NOTICE OF DETERMINATION OF NON SIGNIFICANCE
APPENDIX D AGENCY COMMENT LETTERS AND RESPONSES
APPENDIX E LOCAL GOVERNMENT CONSISTENCY DETERMINATION

EXECUTIVE SUMMARY

ES.1 Introduction

This Water System Plan Update (WSPU) updates the City of Camas' (City) 2019 WSPU. It was developed collaboratively by City staff, Carollo Engineers (Carollo), Strata Geosciences, and FCS Group. This WSPU documents the water system's current status and evaluates the water City's future needs. The data used for this WSPU was current as of 2024. The WSPU was developed between November 2024 and September 2026 for approval in 2026. This WSPU will be used as a guide for maintaining and improving the water system in the short-term over the next 10 years, while also providing a framework for the 20-year, long-term planning horizon.

The purpose of this WSPU is to document changes to the City's water system, identify required system improvements, and appropriately outline capital improvement projects to meet future water demands. Maintaining a current Water System Plan is required to meet the regulations of the Washington State Department of Health (DOH) and the requirements of the Washington State Growth Management Act. The WSPU complies with the requirements of DOH as set forth in the Washington Administrative Code (WAC) 246-290-100, Water System Plan.

This WSPU contains timeframes, which are the intended framework for future funding decisions and within which future actions and decisions are designed to occur. However, these timeframes are estimates and depending on factors involved in the processing of applications and project work, as well as the availability of funding, the timing may change. The framework presented in this WSPU does not represent actual commitments by the City.

Key points of the WSPU including analysis results and recommendations are summarized below, with more details provided in the specific chapters.

ES.2 Planning Considerations

Chapter 2 summarizes the City's water planning considerations that influence the WSPU, including background on the study area, policies, criteria, and related documents. The City maintains a Duty to Serve customers within the retail water service area (RWSA):

> *The City will exercise reasonable diligence and care to furnish and deliver a continuous and sufficient supply of pure water to the customer, and to avoid any shortage or interruption of delivery of the same. The City will meet all regulatory requirements for management of its water system and provision of water to its customers, including water quality, system pressure, and adequate supply. The City will conserve and protect groundwater resources to provide safe, clean, high-quality drinking water to residents.*

The City's Retail Water Service Area is shown in Figure ES.1. Retail service area is the specific area, defined by the municipal supplier, where the supplier has a duty to provide service to new service connections, as set forth in Revised Code of Washington (RCW) 43.20.260, if:

1. Its service can be available in a timely and reasonable manner;
2. The municipal water supplier has sufficient water rights to provide the service;
3. The municipal water supplier has sufficient capacity to serve the water in a safe and reliable manner as determined by the department of health; and
4. It is consistent with the requirements of any comprehensive plans or development regulations adopted under chapter 36.70A RCW or any other applicable comprehensive plan, land use plan, or development regulation adopted by a city, town, or county for the service area and, for water service by the water utility of a city or town, with the utility service extension ordinances of the city or town.

Water system planning is based on a careful analysis of a water utility's responsibility to comply with applicable regulatory requirements while providing service to existing and future customers. These laws are monitored and enforced by a number of federal, state, and local agencies. The WSPU incorporates several regional and local plans of the southwest region of Washington, such as Clark County, that affect the water utility.

The City has adopted many resolutions regarding water system planning that are included in the City Code. The City manages its water utility in accordance with established water system policies. The policies provide a consistent framework for the design, operation, maintenance, and service of the water system for appropriately implementing programs, designing new infrastructure, and serving additional customers. The Plan summarizes many of these policies and provides criteria needed to evaluate the water system.

ES.3 Existing System

The City owns and operates a multi-source municipal water system- summarized in Chapter 3 - which includes supply, treatment, storage, and distribution of potable water to residential and commercial customers. The City currently obtains its water from 10 groundwater wells and two surface water sources that are treated to provide high quality water to customers. The City owns over 159 miles of pipelines in its water transmission and distribution system. Service is provided to customers across 26 pressure zones, 10 booster pumping stations, and seven storage facilities with a combined total of 9.95 million gallons (MG) to provide storage for normal and emergency conditions, such as fire suppression. Additionally, distribution system includes numerous meters, isolation valves, and hydrants. Major elements of the water system are shown in Figure ES.2.

ES.4 Operations and Maintenance

The water system is operated and maintained (O&M) by the City staff, with contractors providing services that City staff are not trained or equipped to perform. O&M of the water system requires the combined effort of the Public Works Department, Engineering Department, and Finance Department. The City's water system operators are experienced and well trained, exceeding the minimum state requirements (WAC 246-292-050). The City provides opportunities for staff professional growth and training to maintain up-to-date knowledge. The City has a well-operated and maintained system, as documented in Chapter 4. Additionally, the City has updated their system wide O&M manual as part of this WSPU, which describes the assets, operations, and preventative maintenance for each of their major distribution system facilities.

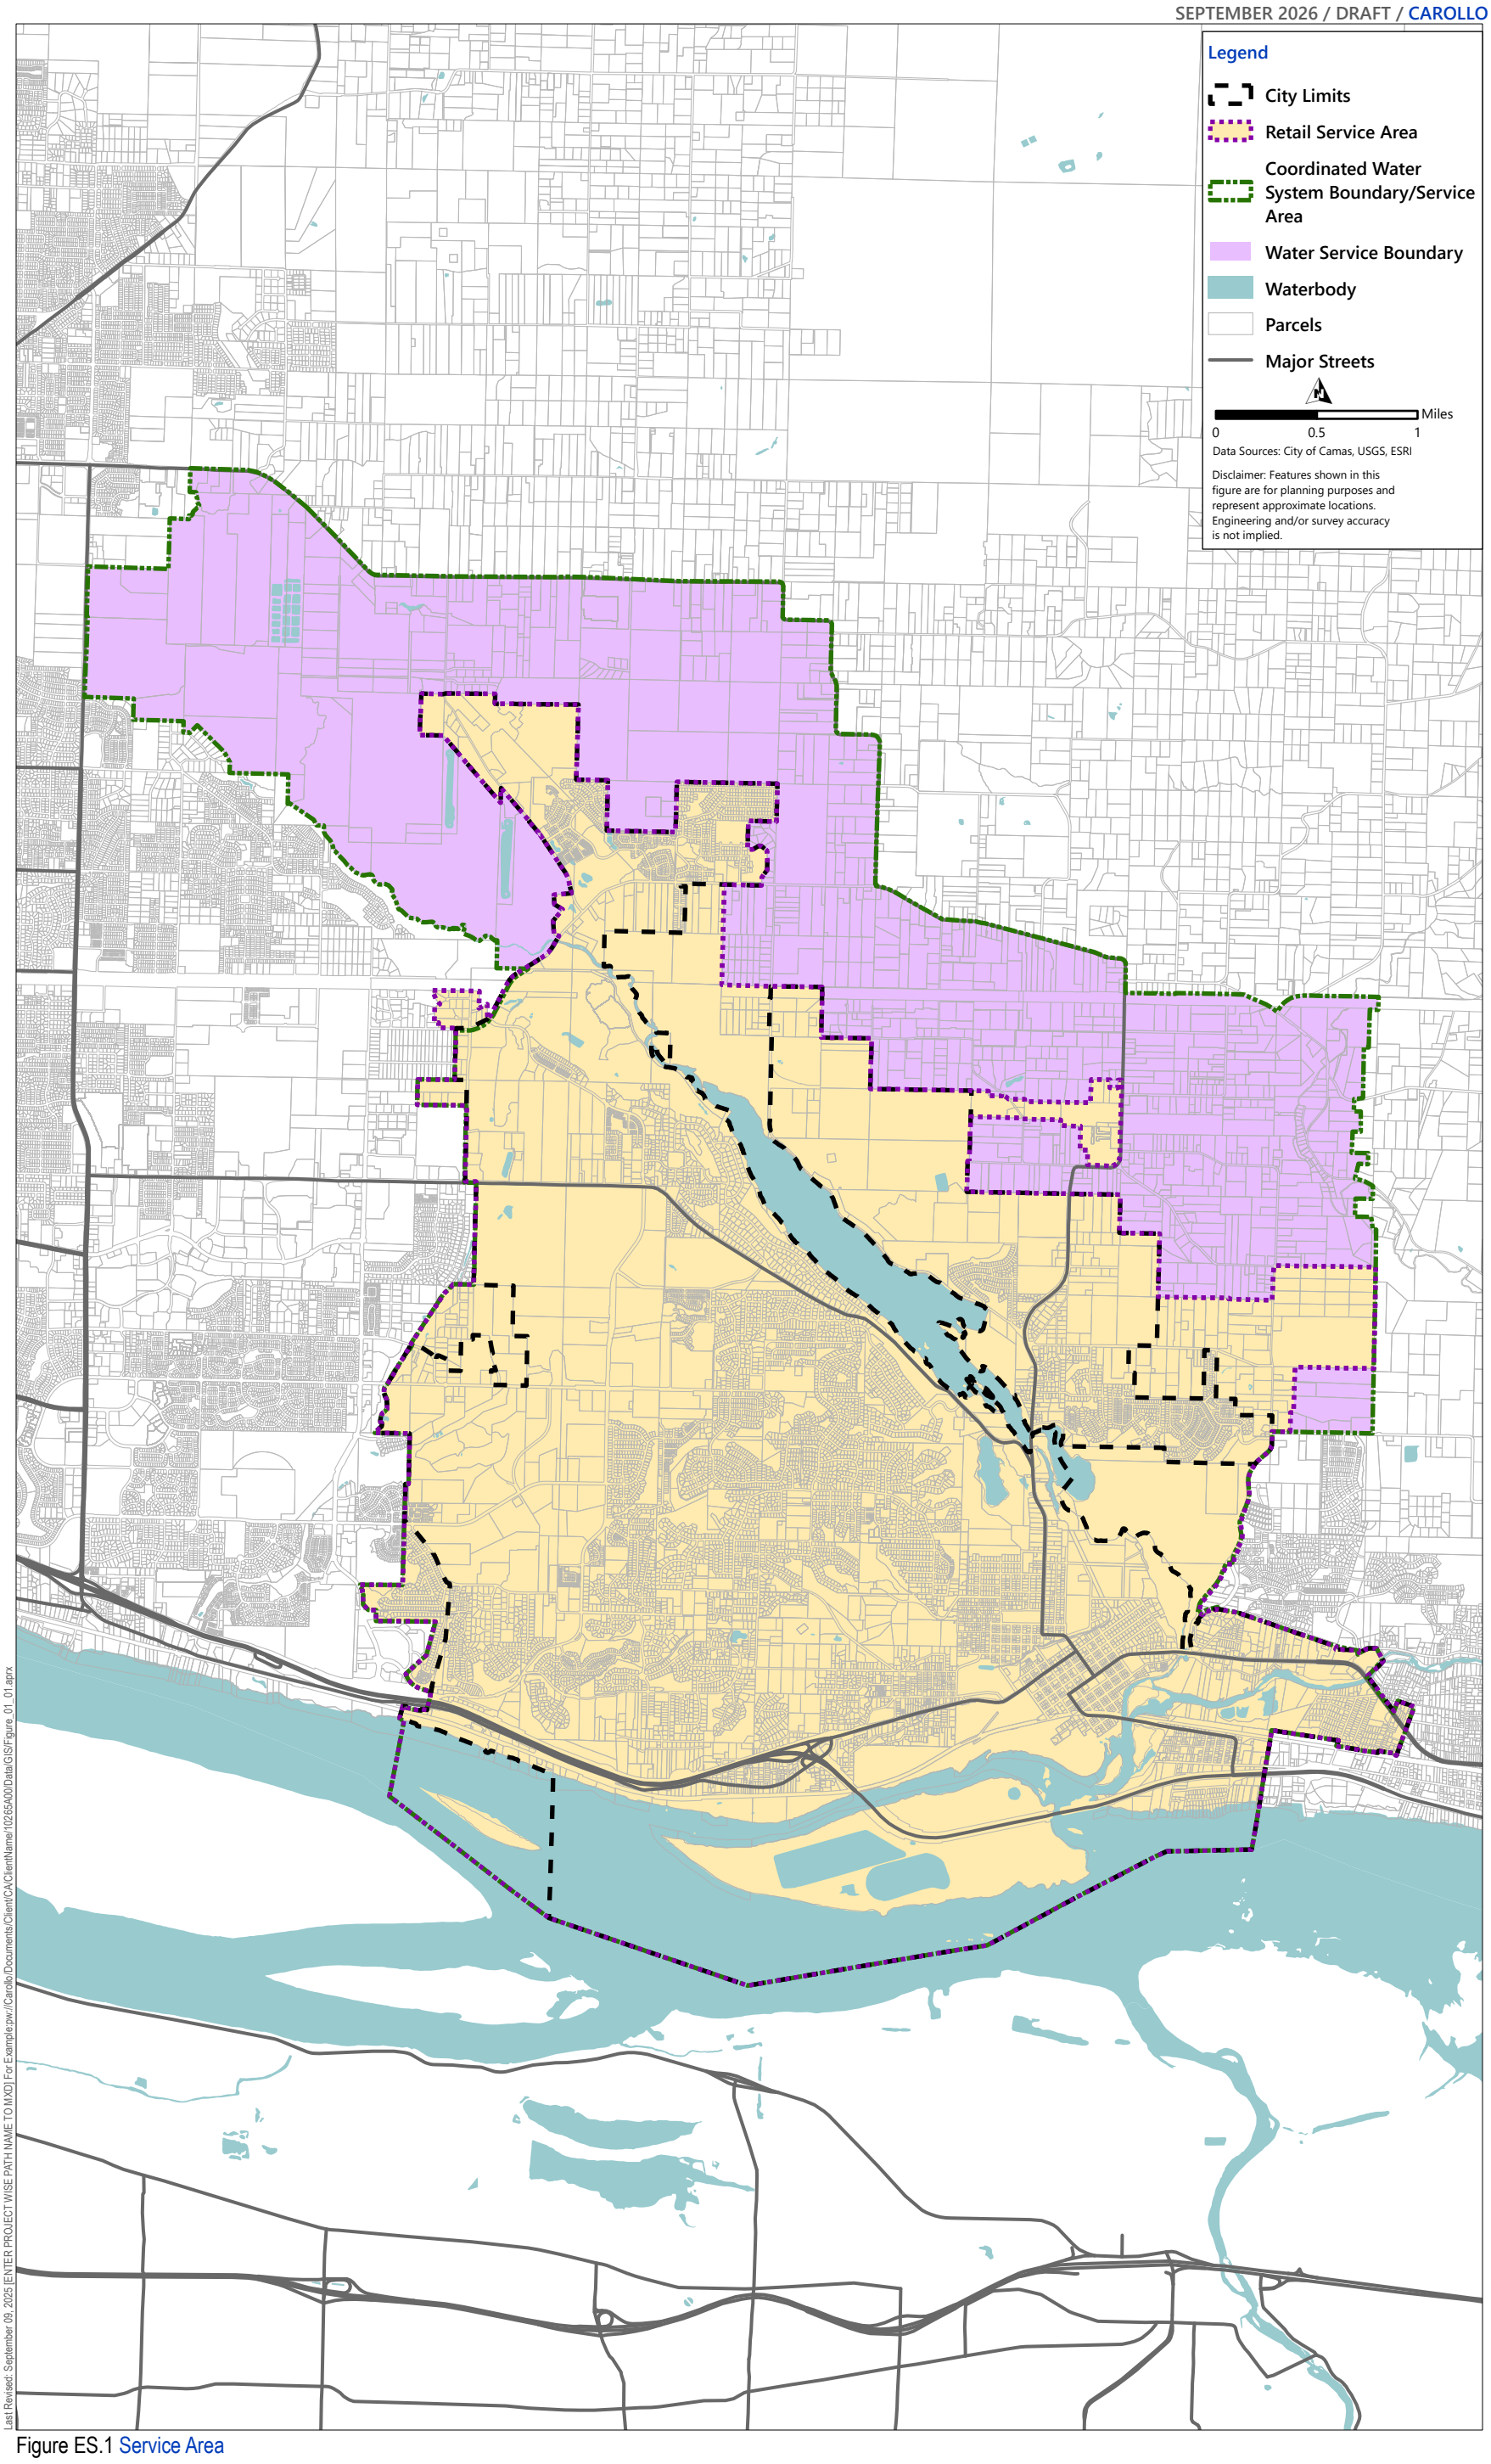

Figure ES.1 Service Area

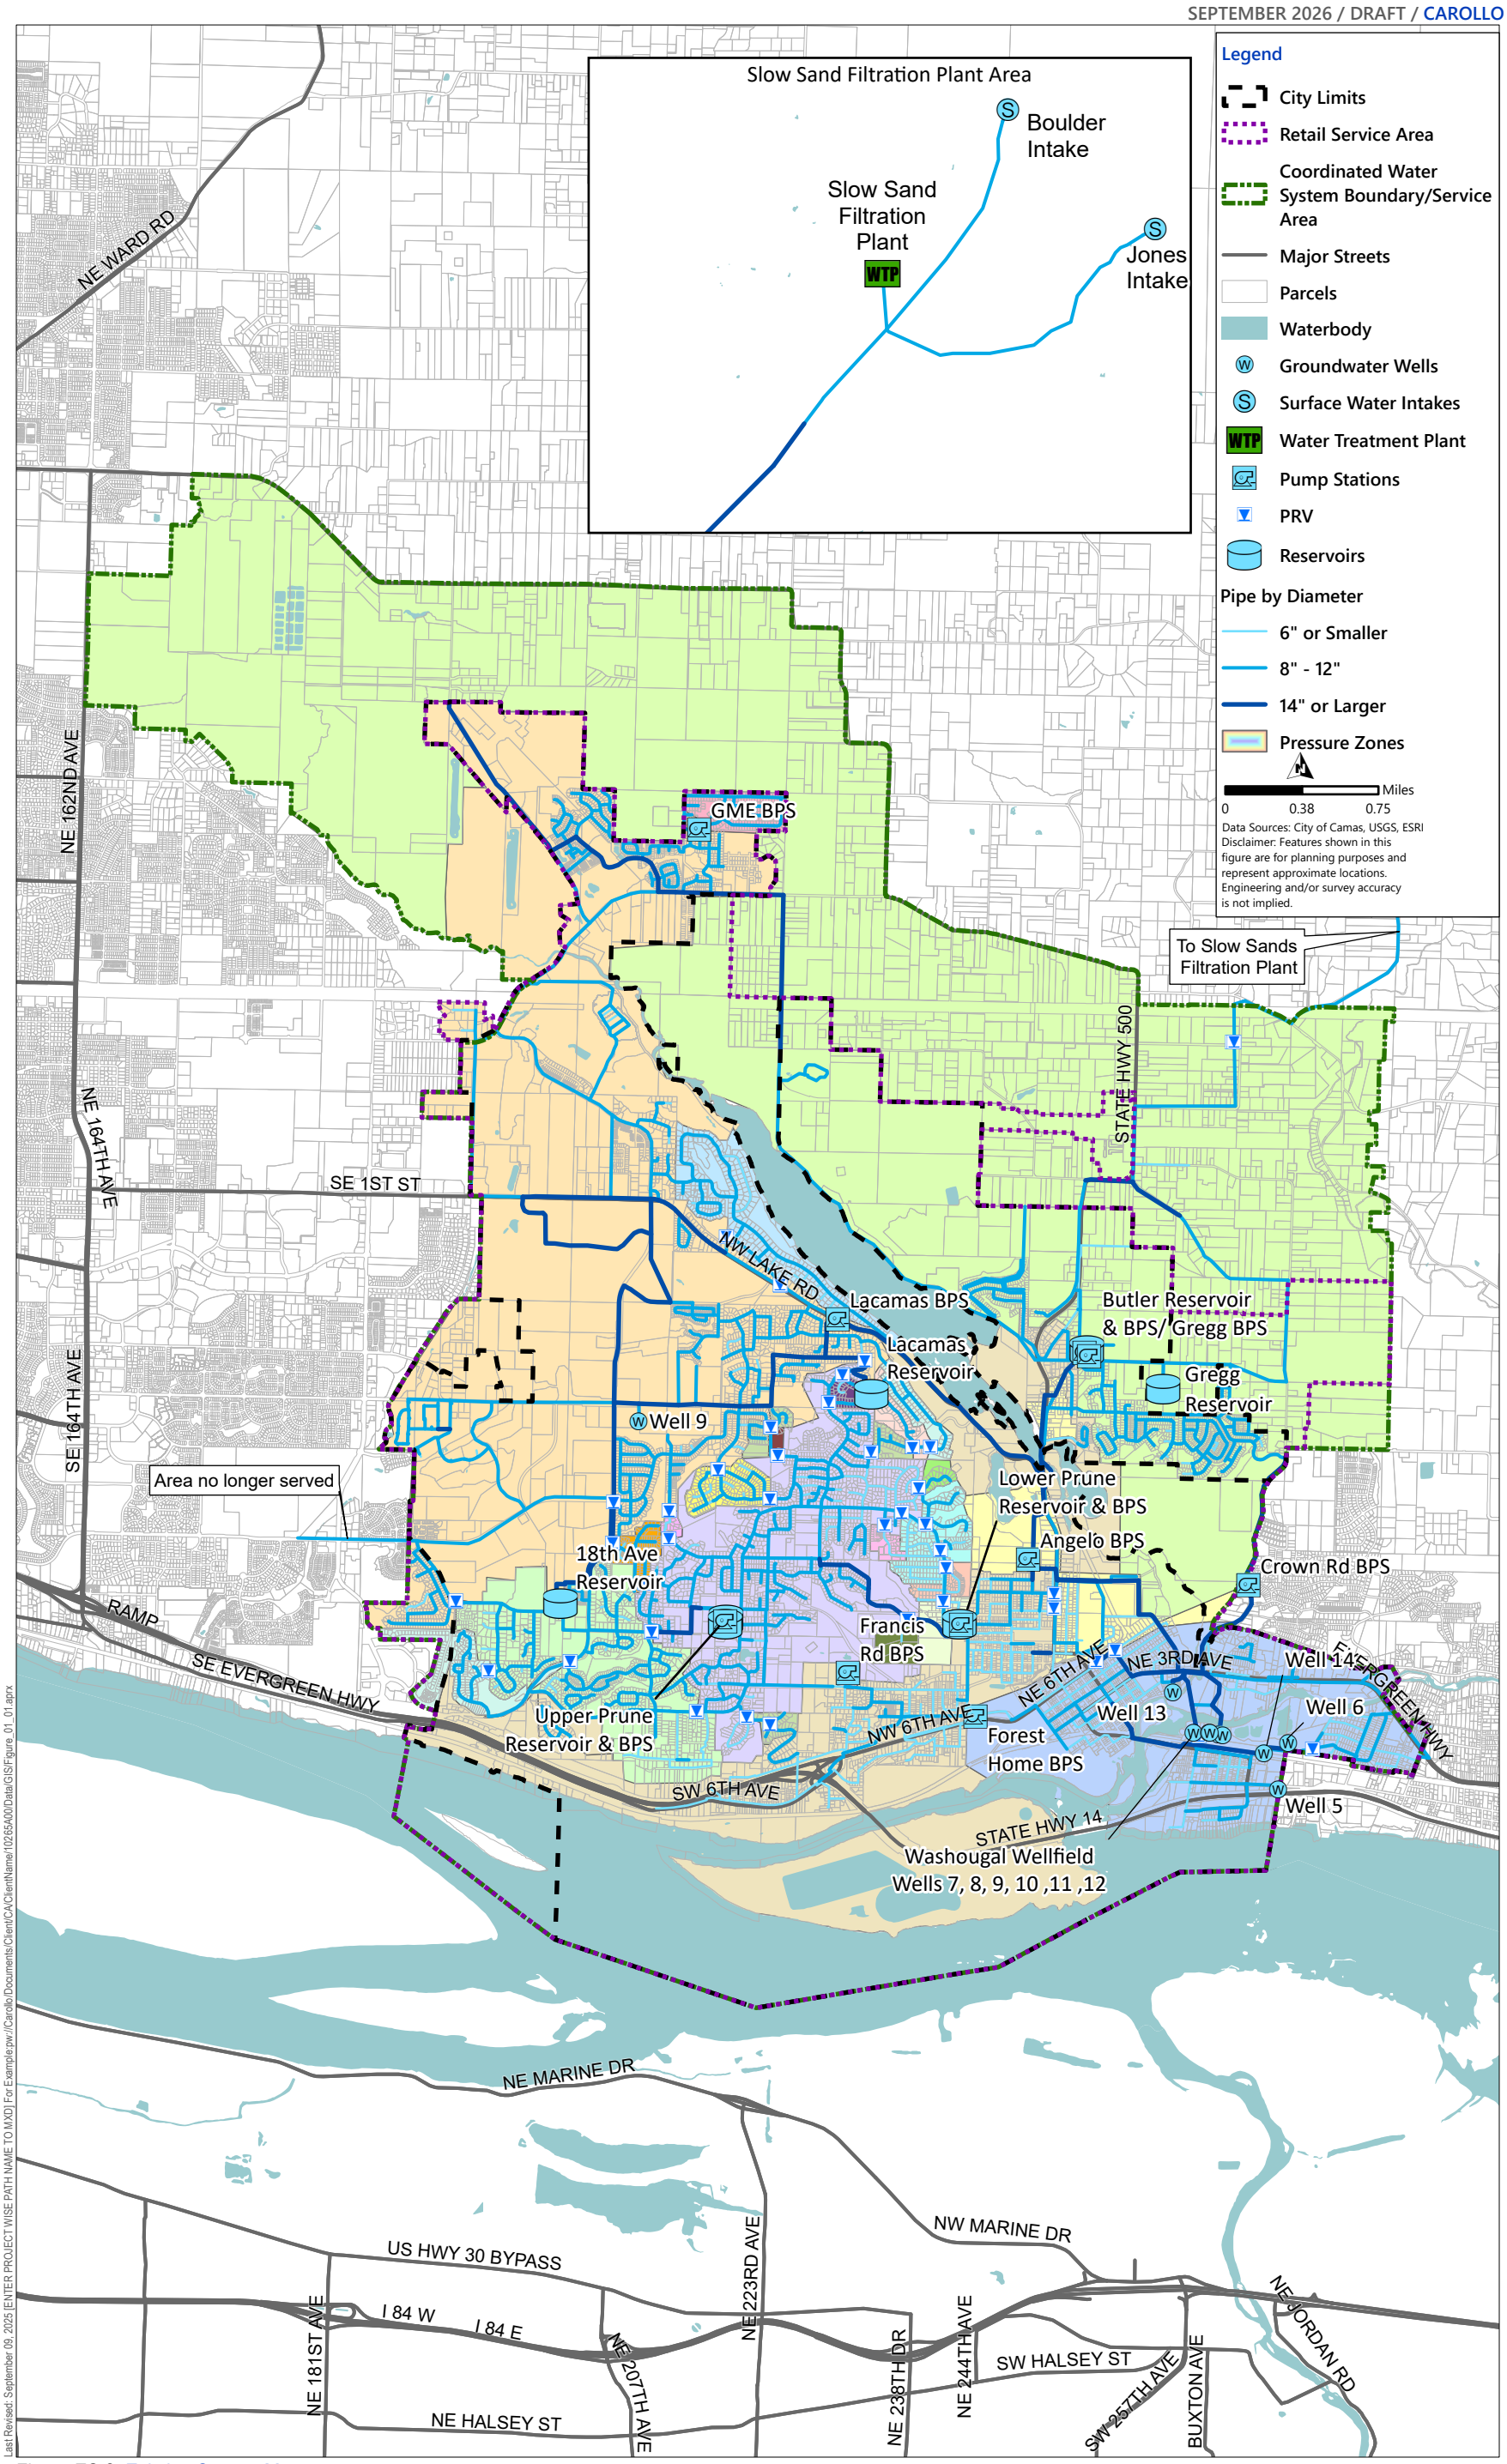

Figure ES.2 Existing System Map

ES.5 Water Requirements

Projecting realistic future water demand is necessary for planning infrastructure projects and securing adequate water supply to meet future growth. Chapter 5 projects the water system requirements, i.e., demand, for the next 20 years. Demographic projections were used to predict where and how much growth will occur in the water system based on the City's comprehensive planning. The resulting future accounts were converted to projected demands using the historical water use patterns and parameters.

Three future water demand scenarios (low, medium, and high) were projected for the planning period between 2026 to 2046 for the City's established RWSA. The medium scenario's predictions most closely resemble the City's future demands, while the low and high demand projection scenarios provide a range within which the City's future water demands are expected to fall. The medium scenario was used for the distribution system analysis in Chapter 9, which identifies future pumping, storage, and distribution system requirements. The high scenario was used for the supply evaluation in Chapter 8, which identifies future water rights and supply capacity requirements. Demand projections were expressed as average day demand (ADD), and maximum day demand (MDD). The ADD is typically used in operational evaluations. The MDD represents the single largest day water demand during the year and is a key parameter for infrastructure sizing.

Figure ES.3 is a chart of the system-wide demand projections for the 20-year planning period. By 2036, the City's ADD is projected to be between 6.2 and 7.4 million gallons per day (mgd) and with MDD projected to be between 11.6 and 15.1 mgd for the low and high scenarios, respectively. By 2046, the City's ADD is projected to be between 7.4 and 9.6 mgd and with MDD projected to be between 14.2 and 20.2 mgd for the low and high scenarios, respectively.

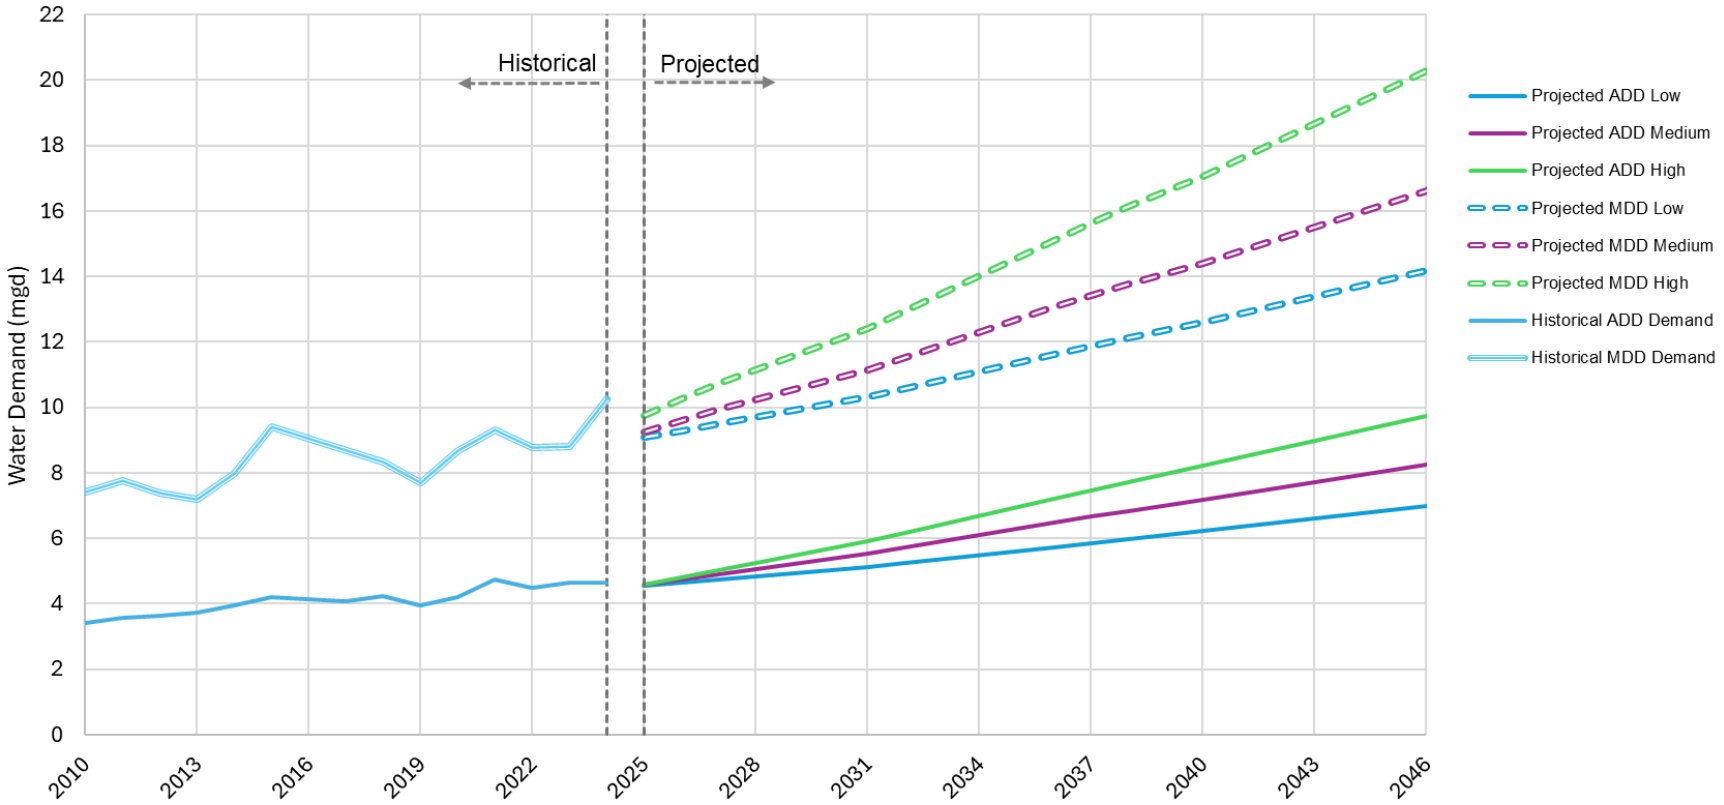

Figure ES.3 Average and Max Day Demand Projections

ES.6 Water Use Efficiency

In 2003, the Washington State Legislature passed the Engrossed Second Substitute House Bill 1338, known as the Municipal Water Law or the Water Use Efficiency (WUE) rule, to address the increasing demand on Washington's water resources. This law established that all municipal water suppliers (MWS) must use water more efficiently in exchange for water right certainty and flexibility to help them meet future demand.

Table ES.1 summarizes the mandatory WUE measures the City completes. As part of this WSPU, the City has completed a Water Loss Control Action Plan (WLCAP) as historical billing data has indicated that distribution system leakage (DSL) is above the DOH standard of 10 percent. Background of the City's current and future WUE programs are detailed in Chapter 6.

Table ES.1 WUE Mandatory Measures

WUE Mandatory Measure	Status
Must implement the following WUE measures:	
Install production (source) meters	Implemented
Install consumption (service) meters	Implemented
Perform meter calibration	Implemented/Ongoing
Implement a WLCAP to control leakage if exceeds 10%	Ongoing
Educate customers about water efficiency at least once per year	Implemented/Ongoing
Must evaluate or implement these WUE measures:	
Evaluate rates that encourage water demand efficiency	Implemented
Evaluate reclamation	Implemented

ES.7 Water Quality

The City is defined as a Group A - Community Water System and must comply with the drinking water standards of the federal Safe Drinking Water Act and its amendments, as regulated by the United States Environmental Protection Agency. The DOH adopted the updated federal standards under WAC 246-290, of which the most recent version became effective June 17, 2025.

The quality of the City's drinking water is of primary concern to the City. As described in Chapter 7, the City is in compliance with all monitoring and reporting requirements. Additionally, the City publishes an annual consumer confidence report that keeps their customers informed of the quality of their water. Based on available water quality, the City has not had issues meeting current regulatory requirements and does not anticipate any issues meeting future regulatory requirements with the exception of per- and polyfluoroalkyl substances (PFAS). Preliminary risk assessments and mitigation screenings indicate uncertainty about PFAS impacts on the City's water supply. As a result, the City will likely need some form of treatment to meet future maximum contaminant levels. To support planning and budgeting, source development and PFAS mitigation will be incorporated into the Capital Improvement Plan (CIP), detailed in Chapters 8 and 10. These projects typically require significant capital investment and will guide the City in securing necessary funding sources.

ES.8 Water Resources

An evaluation was conducted on the City's current water resources to identify deficiencies and propose improvements related to the City's water supply. Chapter 8 outlines the City's sources of supply and existing water rights and makes recommendations for future supply-related improvements. The City expects to have sufficient annual water rights (Qa) and physical capacity to serve projected High scenario ADD over the 20-year planning period. However, to serve project High scenario MDD, the City will need to acquire additional instantaneous water rights (Qi) and increase physical supply capacity as shown in Figure ES.4.

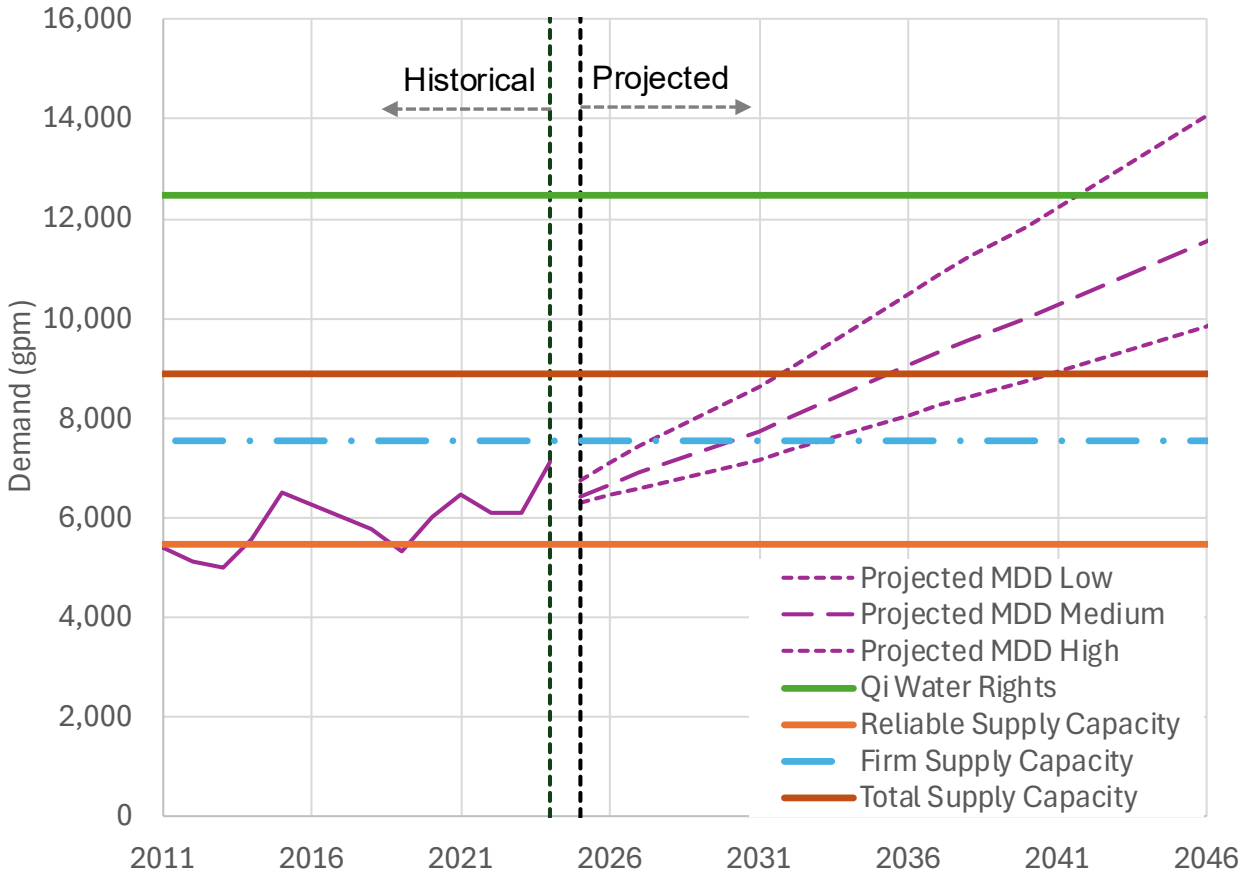

Figure ES.4 MDD Ability to Pump

To address supply related deficiencies, a water supply strategy was developed and is comprised of four parts:

- Lower Washougal Wellfield Expansion.
- Construct Wells for Existing Water Rights.
- Secure Additional Water Rights.
- Continue a WUE Program.

The City anticipates additional supply capacity may be available in the Lower Washougal Wellfield. As such, the water supply strategy focuses efforts on acquiring additional water rights and developing additional physical supply in the Lower Washougal Wellfield (LWWF). However, the development of physical capacity in the LWWF will be dependent on the availability of additional water rights for the wellfield. Should additional water rights in the LWWF be unavailable, a water resources decision making framework summarizes potential next steps to address the City's supply capacity deficits. Both the water supply strategy and water resources decision making framework are further discussed in Chapter 8.

ES.9 System Analysis

The City's water system was evaluated for its ability to meet both DOH and City specific performance criteria under existing, 2031, 2036, and 2046 demand projections. The distribution system analysis identified existing and potential future system deficiencies in the City's water system. Based on the results of the analysis, improvements were recommended to address these deficiencies. Capacity of the pipelines within the distribution system were evaluated under peak hour demands (PHD) and MDD + fire flow (FF) using the City's updated and calibrated hydraulic model. Evaluations of storage reservoirs, booster pump stations and supply sources were conducted in Microsoft Excel. The supply evaluation is discussed previously in Section ES.8. The system analysis identified a number of recommended improvements for pump stations, storage reservoirs, distribution system pipelines and pressure zones, which are shown in Figure ES.5.

ES.9.1 Distribution System Model Analysis

Under projected 2046 demands, several areas of low pressure and fire flow deficiencies were identified. In general, the majority of these deficiencies occurred on dead-end mains or areas of high elevation. These deficient areas will be addressed through distribution pipeline and booster pump station projects, which are outlined in Chapter 9. Additionally, within the planning period the City expects development in their North Shore area. Future pipelines were sized for this development and included in the distribution system model analysis.

ES.9.2 Pumping Analysis

To evaluate pump station capacities, the City's water distribution system was divided into seven different pumping areas containing nine total pump stations. The 343 pumping area is supplied by groundwater wells and although not considered a pump station, was evaluated under both supply specific and pumping criteria. Three pumping areas were flagged as deficient and three different pump station projects are described in Chapter 9 to meet future pumping capacity needs. The 343 pumping area was identified as deficient, however these deficiencies are related to the City's water supply capacity and are described in Chapter 8.

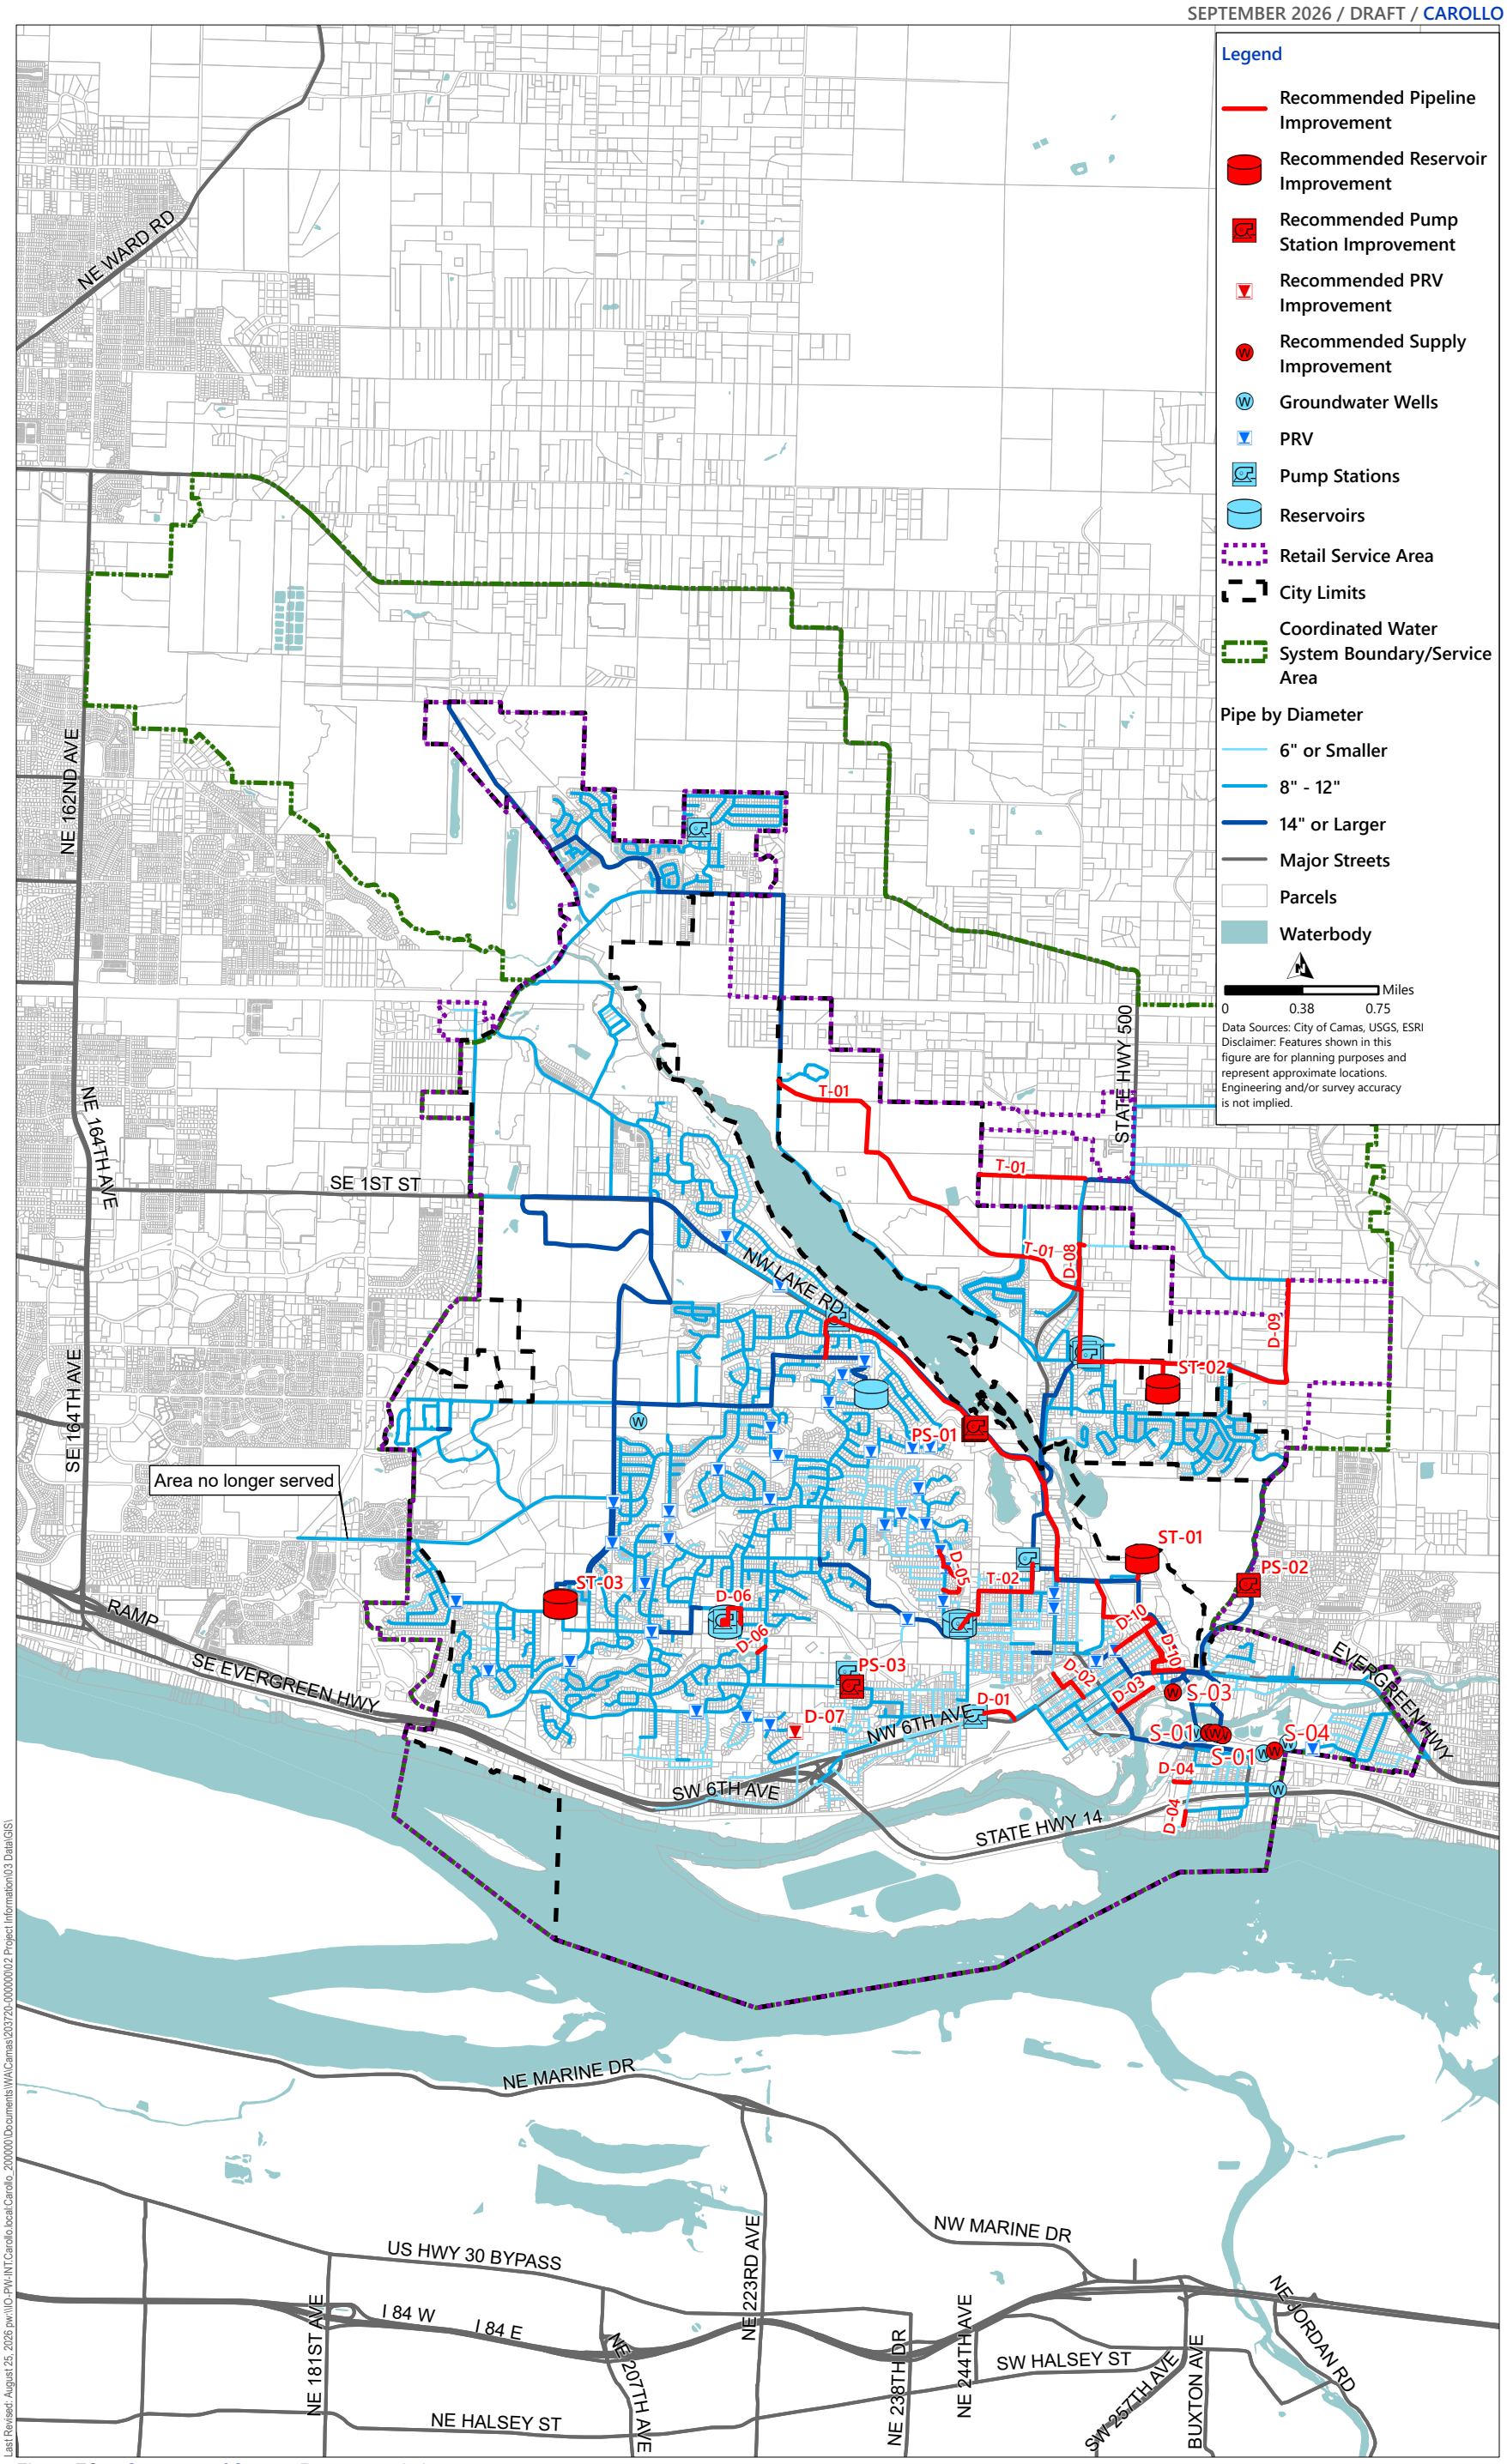

Figure ES.5 Summary of System Recommendations

ES.9.3 Storage Analysis

The City's reservoir storage requirements depend on the water system's configuration, seasonal and daily variations in water-use patterns, and the reliability of various water system components. Water storage volumes are comprised of five components:

- Operational storage.
- Equalizing storage.
- Fire-suppression storage (FSS).
- Standby storage (SS).
- Dead storage.

DOH requires that operational and equalizing storage are available to all customers at a residual pressure of at least 30 pounds per square inch (psi) under PHD flow conditions. The City has an increased level of service goal to provide standby and fire suppression storage to all customers at a residual pressure of at least 30 psi under MDD, which is above the DOH requirement of 20 psi. Therefore, all reservoir volumes above the 30 psi hydraulic grade line are considered available storage. Dead storage is the volume in the reservoir that cannot be used to serve the highest customer in the storage area with a pressure of at least 30 psi. The City also combines fire and standby into a single band for planning (i.e., nesting) and only the larger of the two volumes is used for analysis.

To evaluate storage capacities, the City's distribution system was divided into five different storage areas containing 26 total pressure zones. A summary of existing storage and storage needs in the 5-, 10-, and 20-year planning periods is shown in Table ES.2. Storage deficits were identified in the 343, 542, and 544 storage areas. Additional storage will be needed in these storage areas to address the deficits. All recommended storage projects are summarized in Chapter 9.

Table ES.2 Storage Requirements by Planning Year

Storage Area	Total Available Storage at 30 psi (MG)	2031		2036		2046	
		Required Storage (MG)	Storage Surplus/Deficit (MG)	Required Storage (MG)	Storage Surplus/Deficit (MG)	Required Storage (MG)	Storage Surplus/Deficit (MG)
343	1.20	1.20	0	1.22	-0.02	1.24	-0.04
455	1.50	0.5	1.0	0.51	0.99	0.52	0.98
542	0.05	1.05	-1.0	1.11	-1.06	1.33	-1.28
544	3.46	2.87	0.59	3.25	0.21	4.09	-0.63
852	2.42	1.85	0.57	1.91	0.51	2.06	0.36

Notes:
MG - million gallons.

ES.10 Capital Improvement Plan

The City's CIP summarizes the recommended improvements over the 10- (short-term) and 20-year (long-term) planning period with the purpose of providing the City with a guideline for the planning and budgeting of their water system. The improvements developed in the CIP address the deficiencies identified as part of the supply and distribution analysis described above in Sections ES.8 and ES.9.

The CIP is projected to cost approximately $317 million over the course of the next 20 years. Tables ES.3, ES.4, and ES.5 summarize the CIP projects by project category, priority and allocation, respectively. Figures ES.6, ES.7, and ES.8 summarize the percent of each project identified by project category, priority, and allocation, respectively. Additionally, Figure ES.9 presents a breakdown of annual costs for the City's CIP for each year of the 20-year planning period. Specific project details are discussed further in Chapter 10. The cost allocation designation differentiates how CIP projects may be funded. In general, CIP projects needed to support future growth and development are funded by developers and connection fees while projects needed to support existing infrastructure deficiencies or repair and replacement are funded by existing rate payers.

The WSPU's CIP projects are categorized as follows:

- Distribution System Improvements (D).
- Transmission Pipeline (T).
- Annual Repair and Replacement Programs (R).
- Pump Station (PS).
- Storage (ST).
- Supply and Treatment (S).
- General (G).

The CIP cost estimates presented in this chapter are consistent with American Academy of Cost Engineers Class 5 estimates, which are considered planning level estimates. Actual costs may vary from -50 percent to +100 percent of the estimated cost. These costs were determined based on the City and Carollo's perception of current conditions at the project locations.

Table ES.3 CIP Summary Table by Cost Category

Project Category	Total Cost	Average Annual Cost	Percentage
Distribution System	$4,340,000	$220,000	1.4%
Annual Programs	$87,000,000	$4,350,000	27.4%
Transmission Pipeline	$23,200,000	$1,160,000	7.3%
Pump Station	$42,020,000	$2,100,000	13.3%
Storage	$63,800,000	$3,190,000	20.1%
General	$1,500,000	$80,000	0.5%
Supply and Treatment	$95,130,000	$4,760,000	30.0%
Total Cost	**$317,000,000**	**$15,860,000**	**100.0%**

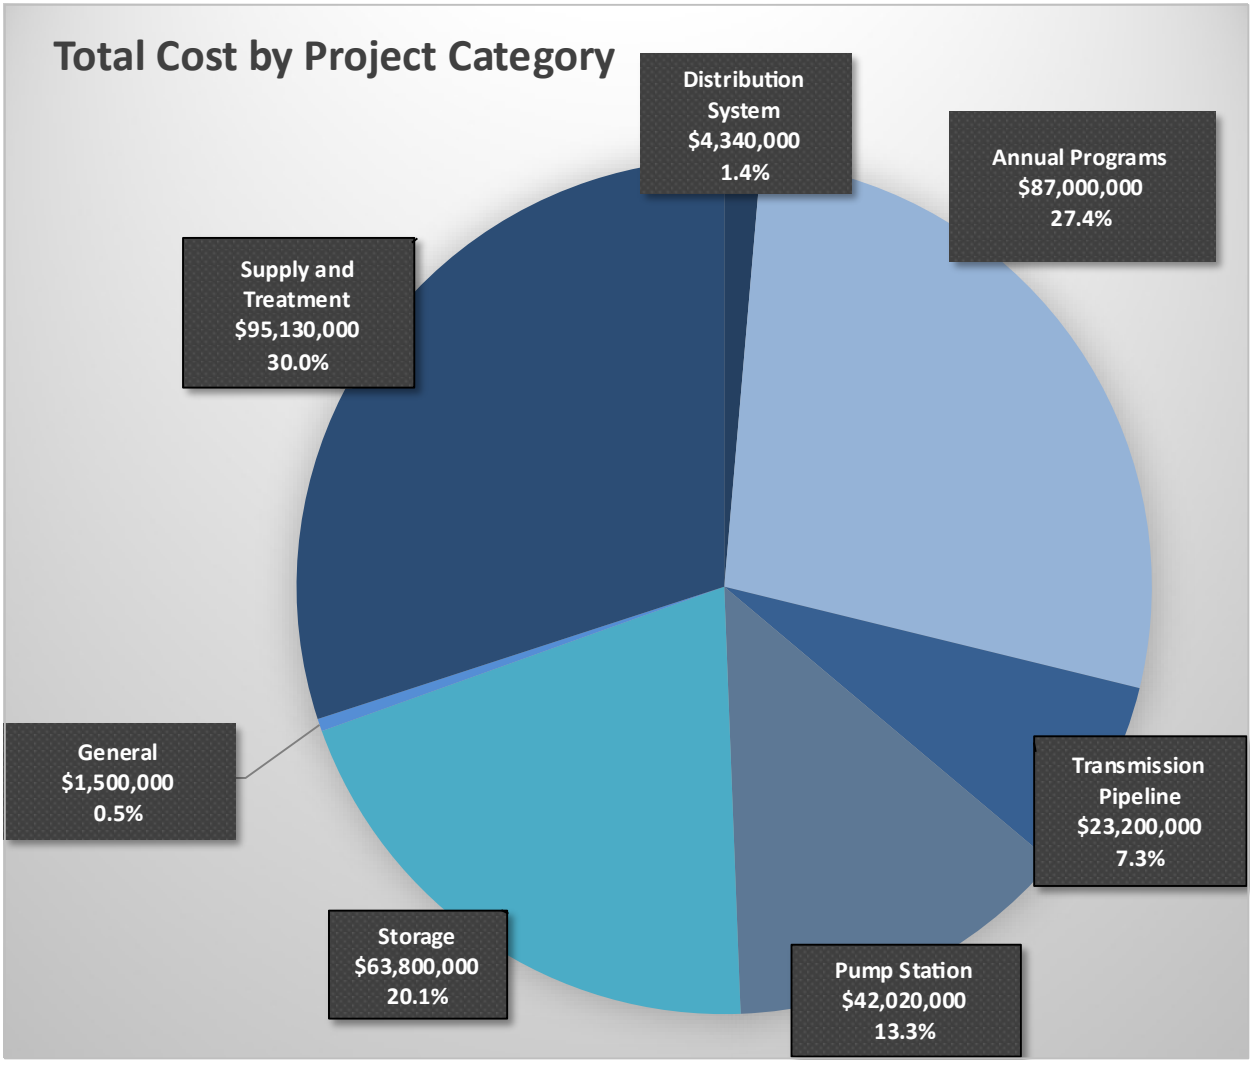

Figure ES.6 CIP Summary Table by Project Category

Table ES.4 CIP Summary Table by Project Priority

Project Priority	Total Cost	Percentage
0-10 years	$177,000,000	55.8%
10-20 years	$53,000,000	16.7%
Annual	$87,000,000	27.4%
Total Cost	**$317,000,000**	**100.0%**

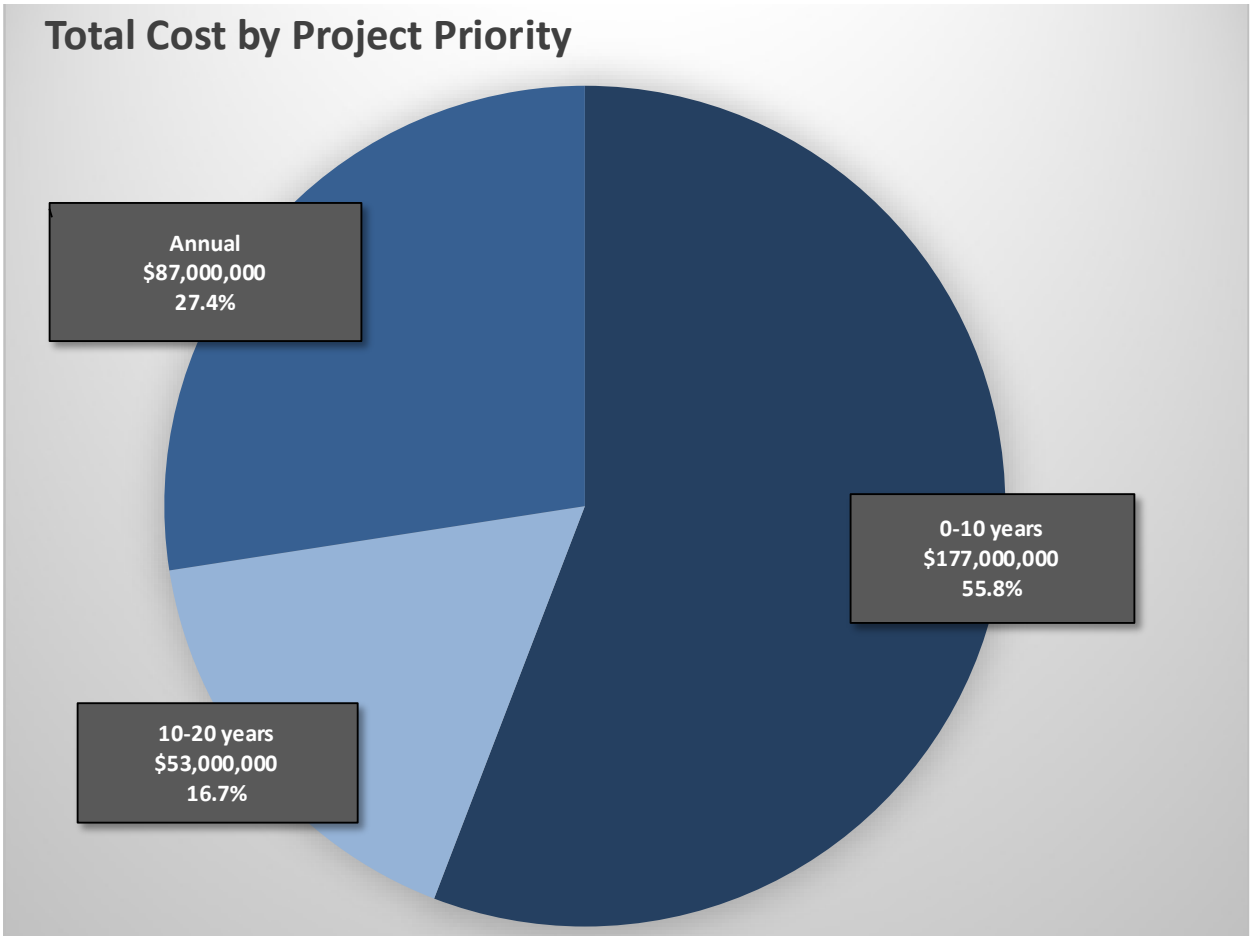

Figure ES.7 CIP Summary Table by Project Priority

Table ES.5 CIP Summary Table by Cost Allocation

Cost Allocation	Total Cost	Percentage
SDC	$148,900,000	47.0%
Rates	$168,100,000	53.0%
Total Cost	**$317,000,000**	**100.0%**

Notes:
SDC - system development charges.

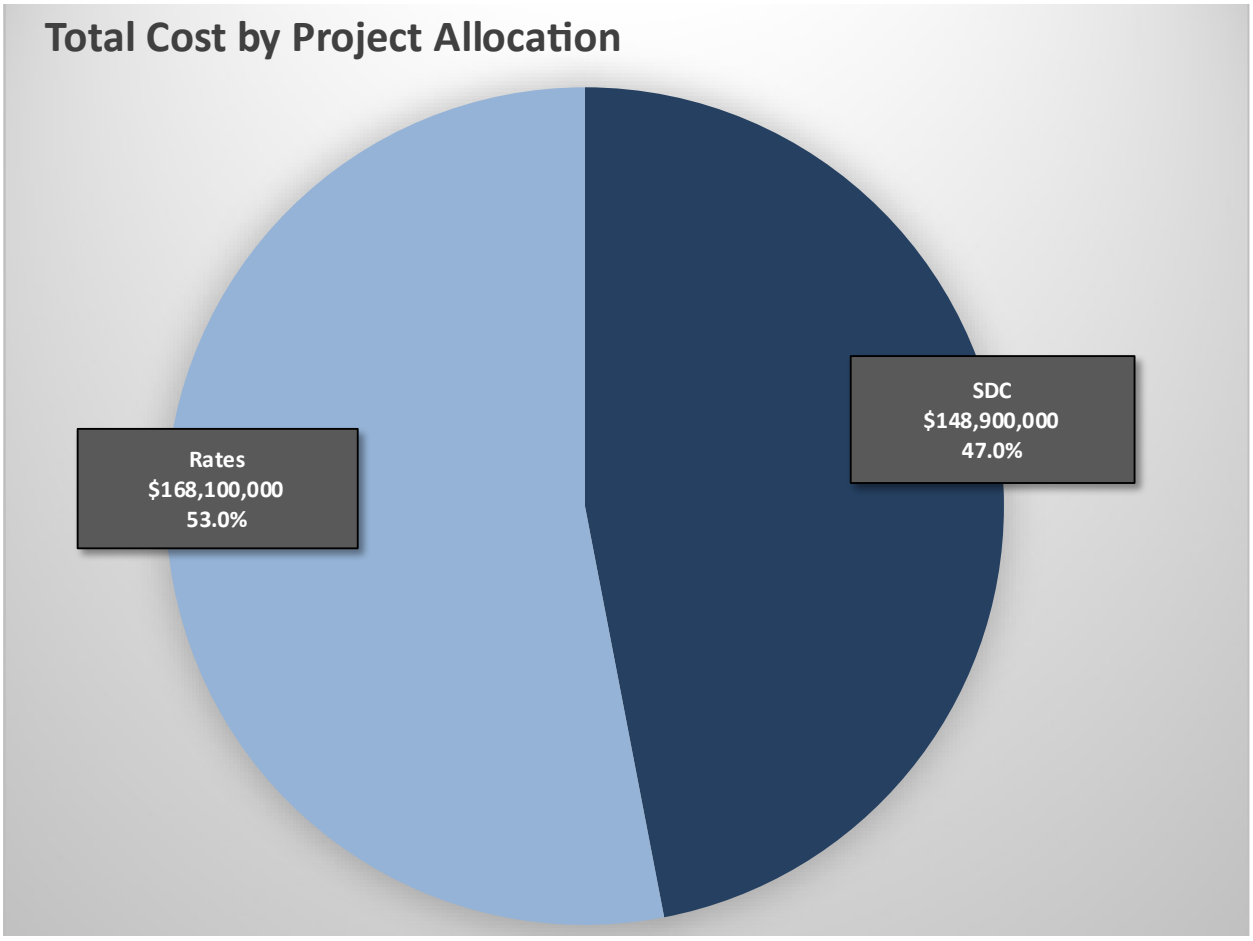

Figure ES.8 CIP Summary Table by Cost Allocation

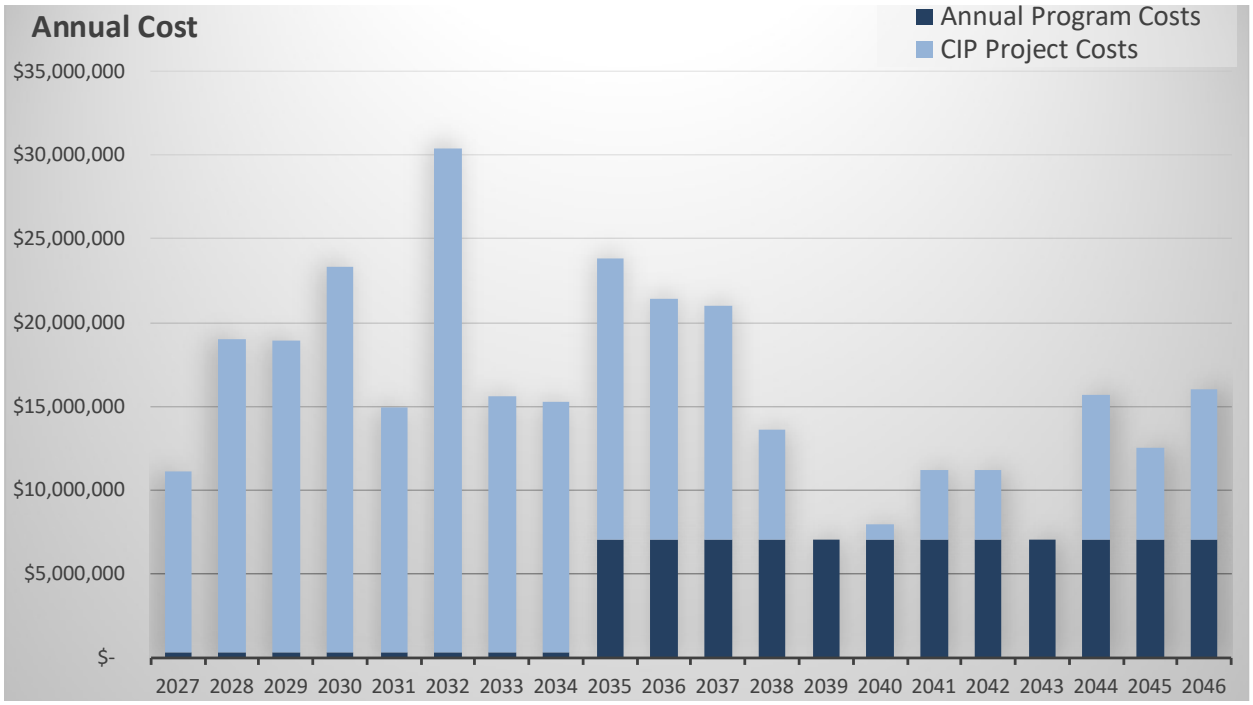

Figure ES.9 CIP Annual Cost

The major projects to be completed in the next several years of this WSPU include the following:

- Well 8, 11, and 12 expansion, and PFAS treatment of LWWF.
- 343 Zone storage improvements.
- 544 Pumping area improvements (with 343 zone transmission pipeline).
- 542 Zone storage improvements (and pipelines).
- North Shore transmission pipeline.

ES.11 Financial Plan

This chapter is still in progress and is not included in this draft of this WSPU.

CHAPTER 1 INTRODUCTION

1.1 Purpose

This Water System Plan Update (WSPU) updates the City of Camas' (City) 2019 WSPU. It was developed collaboratively by City staff, Carollo Engineers (Carollo), Strata Geosciences, and FCS Group. This WSPU documents the water system's current status and evaluates the City's future water needs. The data used for this WSPU was current as of 2024. The WSPU was developed between November 2024 and September 2026 for approval in 2026. This WSPU will be used as a guide for maintaining and improving the water system in the short-term over the next 10 years, while also providing a framework for the 20-year, long-term planning horizon.

The purpose of this WSPU is to document changes to the City's water system, identify required system improvements, and appropriately outline capital improvement projects to meet future water demands. Maintaining a current Water System Plan is required to meet the regulations of the Washington State Department of Health (DOH) and the requirements of the Washington State Growth Management Act. The WSPU complies with the requirements of DOH as set forth in the Washington Administrative Code (WAC) 246-290-100, Water System Plan.

This WSPU contains timeframes, which are the intended framework for future funding decisions and within which future actions and decisions are designed to occur. However, these timeframes are estimates and depending on factors involved in the processing of applications and project work, as well as the availability of funding, the timing may change. The framework presented in this WSPU does not represent actual commitments by the City.

1.2 Authorization

Recognizing the importance of planning, developing, and financing water system facilities to provide reliable service for the existing customers and to serve anticipated growth, the City initiated the preparation of this WSPU. In November 2024, the City selected the Carollo team to assist in the preparation of the WSPU in accordance with applicable rules and regulations governing planning for water utility systems.

1.3 Objectives

This WSPU has been prepared to serve as a guide for the planning and design of future water system facilities. Identified in this WSPU are system improvements intended to meet the needs for expected growth in the City. Specific objectives of this WSPU are addressed within individual chapters presented herein and include the following.

- Develop a document that can be updated periodically as additional information on the water system is obtained.
- Planning Considerations (Chapter 2): Establish the study area, policies and criteria, standards, and documents relating to water service within the City's water system.

- Existing System (Chapter 3): Document the existing water system supply, storage, and distribution facilities.
- Operations and Maintenance (Chapter 4): Provide a comprehensive review of operations and maintenance of the City's water system facilities.
- Water Requirements (Chapter 5): Identify and estimate the effect of future land uses and population trends on the water system. Document historical water use and project future demands based on growth projections.
- Water Use Efficiency (Chapter 6): Determine the City's current and proposed actions to comply with conservation planning requirements and to promote using water efficiently.
- Water Quality (Chapter 7): Summarize water quality regulations, monitoring, and reporting requirements. Evaluate the City's historical water quality against regulatory requirements, summarize violations, and recommend improvements, if necessary to meet anticipated or future water quality regulations.
- Water Resources (Chapter 8): Conduct a water supply evaluation that describes the City's available sources of supply and existing water rights. Develop a water supply strategy with recommendations to develop the supply capacity needed to satisfy the City's future water system demands. Update the wellhead protection plan for the City's groundwater supply sources.
- Distribution System Analysis (Chapter 9): Evaluate the capacity of the distribution system using the City's updated and calibrated hydraulic model. Conduct a desktop analysis to evaluate the capacity of storage reservoirs and booster pump stations against DOH criteria. Summarize existing and potential future system deficiencies in the City's distribution system and offer recommended improvements to the system.
- Capital Improvement Plan (Chapter 10): Develop a program of capital improvements, including priorities for design and construction.
- Financial Analysis (Chapter 11): Develop a plan for financial backing of required system improvements.
- Prepare the WSPU in accordance with the DOH Water System Plan Checklist in Section 1.8 to comply with all requirements of DOH and WAC.

Additionally, the DOH Project Approval Application (PAA) Form for this WSPU is included in Appendix F.

1.4 Location

The City is located in Clark County, WA and is considered part of the greater Portland, OR metropolitan area. The City is bordered to the south by the Columbia River, the west by the City of Vancouver, WA water system, the City of Washougal, WA water system to the east, and unincorporated Clark County to the north.

1.5 Ownership and Management

The City owns and manages its water system for municipal water supply purposes, including a broad range of water uses, including residential, commercial, industrial, irrigation, and government. The DOH water system identification number for the City's system is 108002.

The City is governed by a mayor and seven council members, all of which are elected officials and manages its water system through its Public Works Department. The Public Works Director is hired by the mayor and city administrator and oversees the entire Public Works Department, which is divided into two branches: Engineering and Operations. Daily maintenance and operational responsibilities fall under the Water Division of the Operations branch within the Public Works Department.

Contact information for the City's Public Works Department is provided below:

- Public Works Address: 616 NE 4th Avenue, Camas, WA 98607.
- Operations Center Address: 1620 SE 8th Avenue, Camas, WA 96807.
- Email: publicworks@cityofcamas.us.
- Phone: (360) 817-1563.

1.6 Environmental Assessment

The State Environmental Policy Act (SEPA), chapter 43.21C Revised Codes of Washington (RCW), requires all governmental agencies to consider the environmental impacts of a proposal before making decisions. A SEPA Checklist and determination of non-significance (DNS) have been prepared for this WSPU in Appendix B and C. The City anticipates the WSPU does not have probable significant adverse impacts on the environment in accordance with the DNS under WAC 197-11-340(2). Many of the projects proposed within the WSPU will require subsequent project specific environmental review and SEPA checklists as part of their design process.

1.7 Approval Process

This WSPU is required to meet state, county, and local requirements. The City will submit the WSPU to DOH, Clark County, and adjacent utilities as part of the Agency Review process. See Appendix D for Agency comment letters, responses, and approvals. As required by WAC 246-290-108, a local government consistency review checklist has been prepared and is included in Appendix E. The Adopting Resolution will be included in Appendix A, upon City Council approval of the WSPU.

1.8 DOH Water System Plan Checklist

To assist in review of the WSPU, the DOH Water System Plan checklist from the pre-plan agreement meeting in May 2025 is provided in Table 1.1 with references to the required information. A copy of the checklist will be provided in Appendix G.

Table 1.1 DOH Water System Plan Checklist

Required	Content Description	WSPU Location
(✓)	Project Approval Application (PAA, DOH Pub 331-149 F)	Appendix F
(✓)	Signed and dated stamp from a Professional Engineer licensed in the State of Washington	
Description of Water System		
(✓)	Ownership and management, including Satellite Management Agency (SMA), if applicable	1.5, 2.2.2
(✓)	System history and background	2.2.1
(✓)	Related Plans	2.6
(✓)	Service area and land uses: ▪ Service area map including retail service area, service area, future service area, water rights place of use. ▪ DOH Pub. 331-432 – Service Area Guidance ▪ Existing zoning map(s) for all jurisdictions within future service area ▪ Future land use map(s) for all jurisdictions within future service area (Coordinated Water System Plan [CWSP] Counties Only)	2.2.3
(✓)	Service area and other applicable policies	2.7
(✓)	Duty to serve statement for the retail service area ▪ How does the system define “timely and reasonable”? ▪ Are there appeals processes for when a customer disagrees with a timely and reasonable determination?	Table 2.3
(✓)	Consistency with the watershed plan for Salmon/Washougal Water Resource Inventory Areas (WRIA) No. 28	2.6.8
Basic Planning Data		
(✓)	Existing population, service connections, and equivalent residential units (ERU) ▪ ERUs must be based on full-time residential connections only	Chapter 5
(✓)	Existing production/usage: monthly/annual per source, annual usage by customer class, distribution system leakage (DSL) ▪ Authorized Use and DSL, rather than “unaccounted-for water”. ▪ Additional information is available in our WUE Guidebook, Chapter 6, beginning on page 28 (PDF page 33)	5.1
(✓)	Season variations in use by customer class (1000+ connections)	5.2
(✓)	Water supply characteristics	3.3
(✓)	Water supply reliability evaluation: Include depth-to-water measurements	3.3
(✓)	Interties: agreements, existing/proposed, emergency, metering	3.9
(✓)	Plan approval period and 20-year projections for: Population, service connections, and ERUs (recommend 13- and 23-year)	5.5, 5.6
(✓)	Projections and land use discussion	5.4
(✓)	Future water demand without water use efficiency savings	5.6
(✓)	Water rights self-assessment: Consult with the Department of Ecology (Ecology) prior to plan submittal ▪ Describe water rights and complete water rights self-assessment form for existing, plan approval period, and 20 years.	**Need to complete**
System Analysis		
(✓)	Provide assumptions and basis of analysis:	
(✓)	System design standards	9.2.2
(✓)	Policies on operations and expected level of service (such as standby storage, pumping restrictions and emergency back-up power)	9.3, 9.4
(✓)	Fire flow requirements and if nesting is allowed. May need confirmation from local fire authority.	9.2.2.2, 9.4.1.3, Figure 9.2,
(✓)	Asset Management Inventory: text description and facilities map of major assets, asset management table or spreadsheet	Chapter 3
(✓)	Asset condition assessment and criticality ratings (recommended) – RCAC Template (optional format)	Chapter 3
(✓)	Water quality analysis	Chapter 7
(✓)	Capacity analysis (Must include WSDM Worksheet 4-1, ERU Capacity Summary)	9.5
(✓)	Hydraulic analysis	9.2
(✓)	Summary of system deficiencies	9.6
Water Use Efficiency (WUE)		
(✓)	Metering Program: sources, services, and non-emergency interties	6.1.1.1
(✓)	Distribution System Leakage (DSL) ▪ Summarize DSL and compare to WUE annual reports; discuss DSL calculation methodology, leak detection plan	6.1.2
(✓)	Water Loss Control Action Plan (WLCAP) ▪ If DSL exceeds 10 percent (3-year average), submit the WLCAP per WAC 246-290-820(4) ▪ Include implementation schedule and budget items, as applicable	Appendix O
Water Use Efficiency (WUE) Program		
(✓)	▪ Describe the current WUE program	6.1
(✓)	Updated WUE goal(s). Document public adoption process (include public notice, signed minutes, signed resolution). ▪ Consider doing this after DOH review of first draft	At a later date
(✓)	Describe measure(s) that will be implemented to achieve the goal(s). Include schedule and costs in the budget – 10,000 to 49,999 connections requires 9 additional measures	6.2
(✓)	Describe the process used to evaluate WUE measure(s) you did not implement	6.2
(✓)	Describe or provide an example of yearly consumer education (cannot count as a measure)	6.2
(✓)	Estimate projected water savings from selected WUE measure(s)	6.2.4
(✓)	Describe process that will be used to determine effectiveness of the WUE program	6.2.5
(✓)	Additional WUE for systems with 1000+ Connections ▪ Estimate water saved from implemented WUE measure(s) during the previous plan approval period ▪ Water demand forecast (if all cost-effective WUE measure(s) are implemented) ▪ For WUE measure(s) evaluated but not implemented: » Quantitative evaluation of WUE measure(s) cost-effectiveness, including marginal costs of water production » Evaluate WUE measure(s) for cost-effectiveness if shared with other systems » Quantitative/qualitative evaluation of measure(s) to determine cost-effectiveness from societal perspective ▪ Explore reclaimed water opportunities	Appendix P

Required	Content Description	WSPU Location
Source Water Protection		
(✓)	Sanitary Control Area (SCA): description of physical and legal protections for each groundwater source, including deeds, covenants, easements, restrictions, fencing, signage, etc.	8.4
(✓)	Wellhead protection program/update: must include updated Time-of-Travel map, contaminant source inventory, and notifications ▪ WAC 246-290-135: Source Water Protection ▪ 331-106 Wellhead Protection Requirements	8.4
(✓)*	Watershed control program for all surface water/GWI sources ▪ Include watershed and other information relative to the City's two emergency surface water sources (Boulder and Jones Creek)*	8.4
Operation and Maintenance (O&M) Program		
(✓)	Water system management and personnel, including operator certification and Cross-Connection Control Specialist (CCS)	4.1, 4.2
(✓)	Operations and preventative maintenance schedule	4.5
(✓)	Comprehensive water quality monitoring: ▪ Water Quality Monitoring Schedule (WQMS) ▪ Provide Lead and Copper Rule (LCR) and disinfection byproduct (DBP) monitoring schedule(s), map(s), and letters ▪ Coliform monitoring plan, including addresses and map. Update for Revised Total Coliform Rule (RTCR)	Chapter 7
(✓)	Emergency response program, including Water Shortage Response Plan per WAC 246-290-420 ▪ Consider Tier 1 Public Notification process, and multiple channels for notification	4.8
(✓)	Cross-connection control (CCC) program ▪ Systems with 1000+ connections: provide a copy of your CCC annual summary report form	4.9
(✓)	Sanitary survey findings	4.7
(✓)	Recordkeeping, reporting, and customer complaint program	4.4
(✓)	Water treatment (surface, disinfection, contaminant) operations	4.6
(✓)	Summary of O&M deficiencies; include cost in budget	4.11
Distribution Facilities Design and Construction Standards		
(✓)	Project review procedures	Appendix X
(✓)	Policies and requirements for outside parties	Appendix X
(✓)	Design and construction standards for distribution-related projects	Appendix X
(✓)	Construction certification	Appendix X
Capital Improvement Program (CIP)		
(✓)	CIP summary and schedule for the plan approval period (discuss prioritization, project assessment and value planning) ▪ Include any items that were identified as required for addressing capacity-related deficits	Chapter 10
(✓)	20-year (minimum) CIP for projects beyond the plan approval period	Chapter 10
Financial Program		
(✓)	Financial viability (discuss full cost of service, cost recovery, reserves)	Chapter 11
(✓)	Summary of past income and expenses, sufficient to establish trends (previous plan approval period or minimum 3 years)	Chapter 11
(✓)	Balanced operational and capital budget projections for plan approval period	Chapter 11
(✓)	Show operational, capital, and emergency reserve goals. Describe the revenue requirements to achieve them. Demonstrate annual progress toward goals.	Chapter 11
(✓)	Debt-financed capital improvements	Chapter 11
(✓)	Water rate evaluation: ▪ Describe current rate structure: Block rate based on meter size and rate class. (Not inclining block rate.) ▪ Evaluate the feasibility of implementing a rate structure that encourages water demand efficiency. ▪ Evaluate rate affordability and customer assistance programs. Provide rate that would be unaffordable, income below which current and future rates are unaffordable, and programs available for low income customers.	Chapter 11
Miscellaneous Documents		
(✓)	Updated Water Facilities Inventory (WFI) with authorized signature	Appendix R
(✓)	Local Government Consistency Determination Forms: City and County planning departments.	At a later date
(✓)	Informational meeting for the consumers (include public notice and signed minutes)	At a later date
(✓)	Adjacent utilities notice, review, and comment of draft Water System Plan. Attach notice and comments received.	At a later date
(✓)	SEPA: Signed Environmental Checklist and Threshold Determination. The water system is lead agency.	At a later date
(✓)	Agreements: SMA, intertie, service area, franchise, wheeling, mutual aid, inter-local and other agreements	Appendix H
(✓)	Correspondence	
(✓)	Supporting documents	
Miscellaneous Documents - Post DOH Review		
(✓)	Plan approval by water system governing body. Include signed meeting minutes or signed resolution. NOTE: DO NOT approve the plan until after the draft review is completed and you have received authorization to proceed with approval from the Regional Planner.	At a later date

CHAPTER 2 PLANNING CONSIDERATIONS

2.1 Introduction

The objective of this chapter is to document the City water system planning considerations that influence the WSPU including background on the study area, policies, criteria, and related documents.

2.2 Study Area

The study area for this WSPU encompasses the municipal boundaries of the City covering all residential, commercial, and industrial zones. It also extends to adjacent regions within the retail water service boundary, which are anticipated to be incorporated due to comprehensive land use changes over the next 20 years as shown on Figure 2.1.

2.2.1 Water System History

The first known settler, David Parker, came to the City in 1845. In 1883 the Lacamas Colony Company of Portland purchased 2,600 acres encompassing Lacamas, Round, and Dead Lakes (renamed as Fallen Leaf Lake), the stream connecting them to the Columbia River, and constructed dams for hydropower for new flour and paper mills, a sawmill, and a furniture factory in the area. The City was incorporated in 1906. In 1913, the City's first water system was storing Jones Creek supply in Butler Reservoir. The system has continued to expand and adapt to new challenges and regulations, as described in Table 2.1. This WSPU provides a roadmap to continue to provide high-quality water into the future.

Table 2.1 Water System Historical Timeline

Water System Historical Timeline	
1845	Camas first settled
1913	Jones Creek Intake constructed
1913	0.6 MG Butler Reservoir, South Half
1923	0.6 MG Butler Reservoir, North Half (1.2 MG total)
1931	Boulder Creek Intake constructed
1935	0.5 MG Lower Prune Hill Reservoir
1936	Wells 1 and 2 constructed
1945	Well 3 constructed
1948	Butler BPS - 800 gpm
1949	Forest Home BPS- 450 gpm
1952	Chlorination Plant - injects chlorine into water from Jones Creek and Boulder Creek before it goes to the Filter Plant
1959	Well 4 constructed
1965	Filter Plant - 1,200 gpm - filters water from Jones Creek and Boulder Creek intakes
1965	10th Street BPS

Water System Historical Timeline	
1968	Well 5 constructed
1969	Well 6 constructed
1971	Well 7 constructed
1971	1.5 MG Lower Prune Hill Reservoir
1971	0.75 MG Upper Prune Hill Reservoir
1971	Lower Prune Hill BPS - 500 gpm, 500 gpm, 750 gpm
1977	Well 8 constructed 1,350 gpm
1978	0.1 MG Gregg Reservoir
1978	Old Gregg BPS - 500 gpm
1988	SCADA System installed
1993	2.0 MG La Camas Reservoir
1993	La Camas BPS - 500 gpm, 500 gpm, 1,500 gpm
1998	Forest Home BPS Upgrade - 1,000 gpm
1999	Butler BPS Upgrade
2000	Well No. 9 constructed - 650 gpm
2001	Angelo BPS constructed - 3,000 gpm capacity
2001	Lower Prune Hill BPS Upgrade - 1,000 gpm replacement pump
2002	Upper Prune Hill Reservoir (2.4 MG) and BPS (2,900 gpm capacity) construction
2002	New Gregg Zone BPS Constructed, 1,500 gpm
2002	Lower Prune Hill Upgrade, 2,000 gpm
2002	Jones and Boulder Creek intake metering
2002	Chlorine and CT improvements
2002	Well 1 and 2 abandoned
2003	Well 3 decommissioned
2003	Well 11 (1,200 gpm) and Well 12 (900 gpm) constructed, Washougal Wellfield Chemical Feed Facility installed
2003	New Gregg BPS - 1,500 gpm
2004	Well 10 constructed - 900 gpm
2007	Well 4 decommissioned
2008	Well 13 constructed, 1,325 gpm
2008	Washougal River 24-inch pipe crossing installed
2008	Ostenson Canyon Pipeline installed
2008	City and Ecology sign agreement regarding use of service water sources and increased water rights associated with groundwater
2009	Well 14 constructed - 1,000 gpm
2009	Sodium hypochlorite disinfection system installed at Well 5 and 9
2011	Crown Road BPS installed - 1,600 gpm
2015	Slow Sand Filtration Plant constructed

Water System Historical Timeline	
2021	2.0 MG 18th Avenue Reservoir constructed
2026	Lower Prune Hill Reservoir and BPS replaced and upgraded

Notes:
BPS - Booster Pump Station; CT - contact time; gpm - gallons per minute; MG - million gallons; SCADA - supervisory control and data acquisition.

2.2.2 Ownership and Management

The City's water system is owned and operated by the City. The City is governed by a mayor and seven council members, all of which are elected officials. The Public Works Director is hired by the mayor and city administrator, and oversees the entire Public Works Department, which is divided into two branches: Engineering and Operations. Water system responsibilities fall under the Water Division of the Operations branch within Public Works.

The City has both surface water and groundwater sources. The surface water sources, Boulder and Jones Creeks, are located on the south side of Larch Mountain, northeast of Camas. The ground water sources include nine wells near the Washougal River, and one well in Grass Valley. The City treats all of its water with chlorine for disinfection and fluoride. Water pressure and fire flows are maintained throughout the service area with seven distribution reservoirs, 10 BPS, and over 159 miles of piping to serve their approximately 29,000 and growing customers.

2.2.3 Service Area

In accordance with the Municipal Water Law, the City is required to designate a retail service area within that it has a duty to serve all customers meeting the City's stated conditions of service - the City's service policies are summarized in Table 2.3 - and also designate a service area. The City's retail water service area and service area are shown in Figure 2.1. The City is temporarily serving the area northwest outside of the service area boundary under an agreement with the City of Vancouver (Vancouver), until Vancouver installs its own pipeline. Additional details of this interlocal agreement are provided in Appendix **[X]**. The retail water service area is largely defined by the City's urban growth boundary. The City's service area, defined by the Clark County CWSP, expands the retail service area to the urban growth boundary. The Regional planning does not anticipate the entire service area to develop during the planning period (next 20-years); however, the City reserves the first right of refusal for providing water service to developments in its service area.

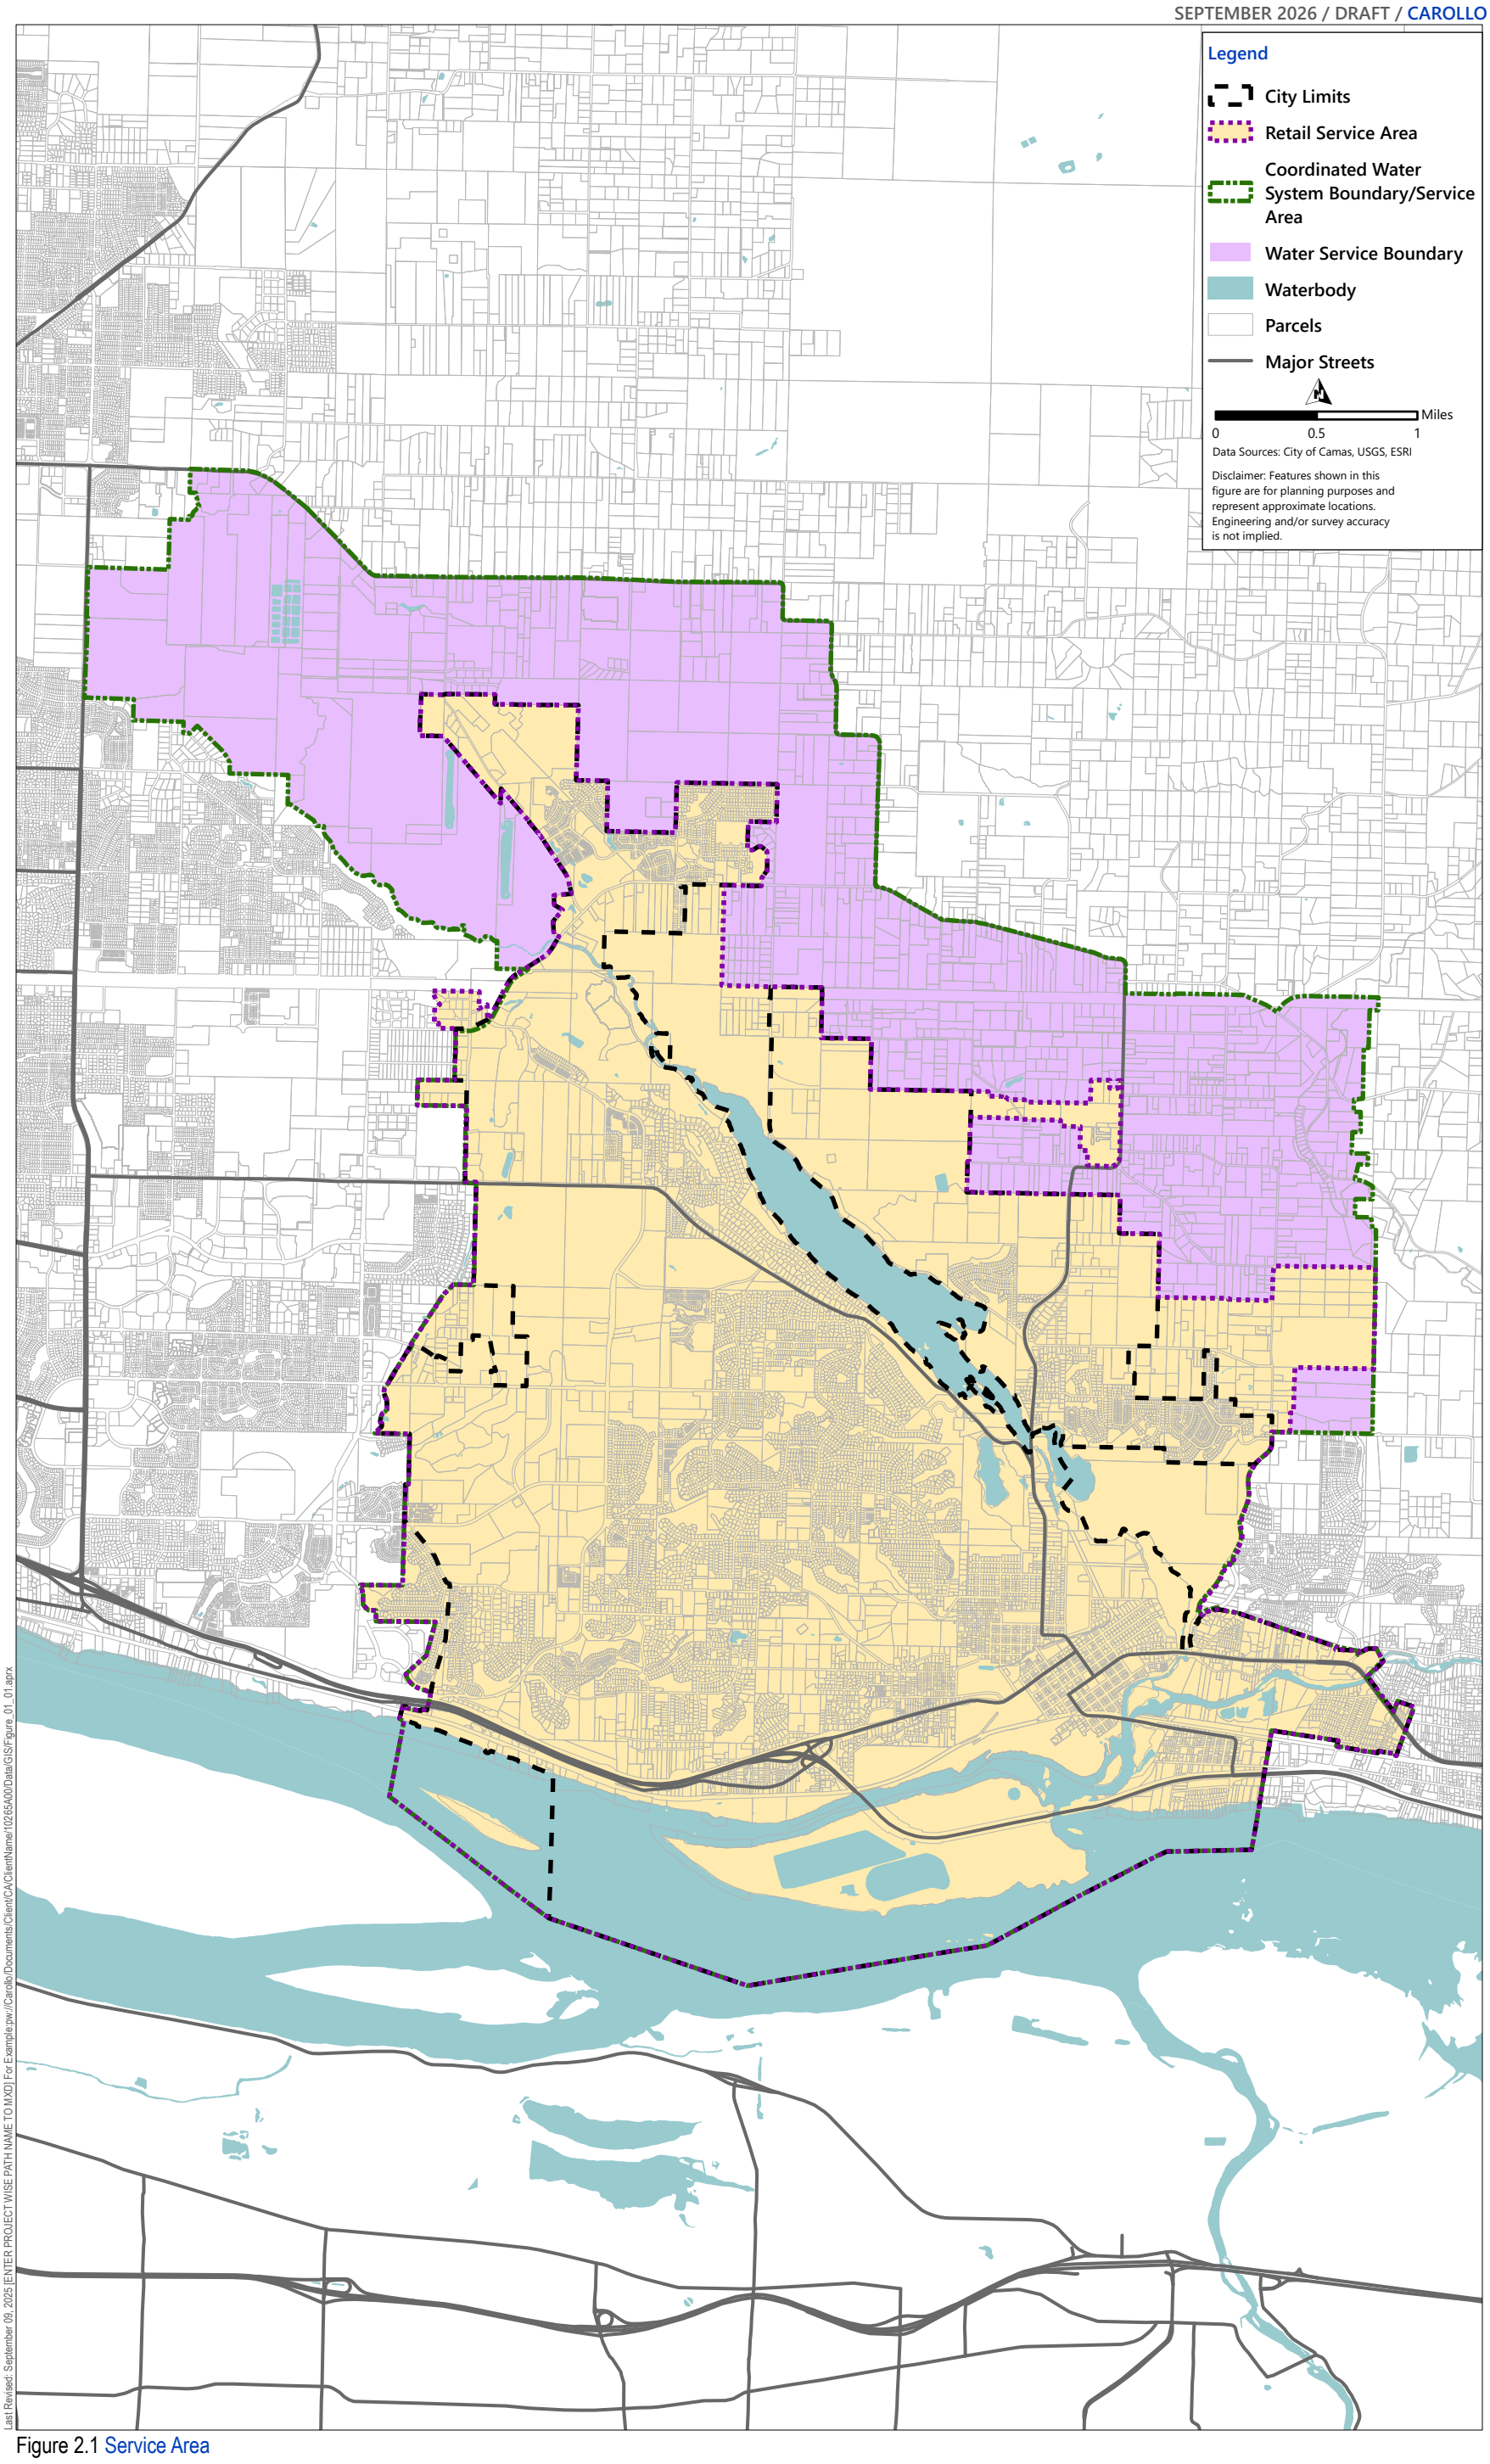

Figure 2.1 Service Area
CITY OF CAMAS
WATER SYSTEM PLAN UPDATE

2.2.4 Regional Environment

2.2.4.1 Climate

The climate in the City and the surrounding greater Clark County area is influenced by the Coast Mountain Range to the west and the Cascade Mountain Range to the east. The Coast Mountain Range provides some limited protection from the direct influence of the Pacific Ocean. Moist heavy air from the Pacific is cooled as it rises over the Coast Mountain Range and releases moisture as rainfall. The air is further cooled as it approaches the Cascade Mountain Range, resulting in moderate rainfall for lower lying area, and heavier precipitation along the west slopes of the Cascades. This results in a large variation of rainfall across the county. The Cascade Mountains also provide a barrier against continental air masses originating over the Columbia Basin to the east.

According to the Weather Atlas, Clark County has wet, mild winters and warm, dry summers. The City of Camas receives an average of about 37 inches of precipitation annually, while the northeastern portion of the county can receive averages approximately 150 inches per year, based on the data from the Washington Department of Transportation (WSDOT). Approximately 80 to 85 percent of the precipitation occurs between the months of October and May, and the City receives 173 days of sunshine per year.

Based on data from National Oceanic and Atmospheric Administration (NOAA), the average January temperature across Clark County between 2000 and 2025 was 40.2 degrees Fahrenheit, increasing to a 78-degree high in July. Winter storms come generally from the southwest, with infrequent snowstorms originating from the Gulf of Alaska. Fall and winter storms can be accompanied by high winds, resulting in power outages.

2.2.4.2 Topography

Clark County is located in the Willamette-Puget Trough, a geographic basin formed by the Cascade and Coast Mountain Ranges. The county is bounded on the south and west by the Columbia River, on the north by the Lewis River, and on the east by the foothills of the Cascades. The City itself resides in the Southeast side of the county, with Vancouver to the west and Washougal to the east.

The ground slope and natural drainage features within the City play a significant role in the planning and design of the water distribution storage facilities. The elevation within the City ranges from about 20 feet above sea level along the shores of the Columbia and Washougal Rivers, to approximately 752 feet (NGVD 29) at the Upper Prune Hill Standpipe located at the top of Prune Hill. The terrain in the City includes a flat plateau in the Downtown area and generally increasing elevations to the North, except where Lacamas Lake forms a valley through the City as shown in Figure 2.2.

2.2.4.3 Surface Water

The surface water features within the City urban growth area (UGA) boundary include the Columbia River, Washougal River, Little Washougal River, Lacamas Creek, Lacamas Lake, Fallen Leaf Lake, and Round Lake. The City also owns the majority of the watershed for the Jones and Boulder Creeks north of the City's intakes for these sources. Jones and Boulder Creek are tributaries of the Little Washougal River, which is a tributary of the Washougal River. The basin characteristics for the creeks, streams, and rivers discussed below were obtained from stream gauging published by the U.S. Geological Survey.

The Columbia River begins in Canada, enters the United States in northeastern Washington, continues traveling southwest through eastern Washington, where it travels over a series of dams until it empties into the Pacific Ocean. The Columbia River forms the border between the states of Washington and Oregon from the point where it crosses the 46th Parallel until it empties into the Pacific Ocean. The Columbia River drainage area is approximately 241,000 square miles, with an average flow of 603,000 cubic feet per second (cfs).

The Washougal River flows southwest from the Cascade Mountains to the City, where it empties into the Columbia River. The Washougal River drainage basin is approximately 108 square miles in size and historical records report average flows at approximately 9,000 cfs.

The Little Washougal River, of which Jones and Boulder Creeks are tributaries, flows to the southwest out of the Cascade Mountains. The Little Washougal turns to the southeast before it crosses into the City UGA and empties into the greater Washougal River. The Little Washougal drainage basin covers approximately 23 square miles with historical average daily peak flows of approximately 1,317 cfs.

Lacamas Lake is over 60 feet deep in places. It receives flow from Lacamas Creek and Dwyer Creek. The Lake then discharges into Lacamas Creek, which flows into the Washougal River. The water level is controlled by dam located at the south end of the lake. Round Lake is a reservoir and is a smaller part of Lacamas Lake, separated from Lacamas Lake by Everett Street.

2.2.4.4 Critical Areas

Critical areas within the City include those classified as Critical Aquifer Recharge Areas, Fish and Wildlife habitat conservation areas, frequently flooded areas, geologically hazardous areas and wetlands. Given its importance to the water system, the City's Critical Aquifer Recharge area map is included as Figure 2.3. Please refer to the City's website for the up-to-date description and mapping of its Critical Areas.

2.2.4.5 Geology

The Clark County area exhibits traces of its geologic history, including repeated inundation by fluctuating sea levels during glacial epochs, the sedimentary processes of repeated flooding of the Columbia River, volcanic activity, periodic earthquakes, and other tectonic activity. The geologic units in Clark County reflect this varied history and can be placed into two general categories: older consolidated rocks and volcanic rocks. These include Columbia River Basalts and Skamania and Goble volcanic series, and sedimentary rocks incorporating unconsolidated gravels, silts, sands, and clays created by glacial and alluvial processes.

The main geological feature of Camas is Prune Hill, which is an extinct volcanic vent that much of the residential area resides on. Prune Hill is at the Northwest end of Camas, and the City elevation drops off to the west and the Columbia River Gorge to the south. Lady Island, in the Columbia River Gorge, is separated from the mainland by the Camas Slough, and is mostly used for industrial purposes.

2.3 Legislation, Regulations, and Permits

Water system planning is based on a careful analysis of a water utility's responsibility to comply with applicable regulatory requirements while providing service to existing and future customers. These regulatory requirements are the result of a number of state and federal laws. These laws are monitored and enforced by a number of federal, state, and local agencies.

In this section, the various state and federal legislation that may affect City operations are discussed, as well as other relevant permits, programs, and regulations.

2.3.1 Federal Clean Water Act

The Federal Water Pollution Control Act is the principal law regulating the water quality of the nation's waterways. Although originally enacted in 1948, it was significantly revised in 1972 and 1977, when it was given the common title of the "Clean Water Act." (CWA) The CWA has been amended several times since 1977. The 1987 amendments replaced the Construction Grants program with the State Revolving Fund (SRF) which provides low-cost financing for a range of water quality infrastructure projects.

A CWA Section 401 Water Quality Certification is required for any activity that may result in discharge to surface waters including excavation activities that occur in streams, wetlands, or other Waters of the United States. In Washington State, CWA Section 401 responsibility has been assumed by Ecology, and is required for projects with CWA Section 404 Permits.

Section 404 of the CWA regulates discharges of fill or dredged materials in wetlands, including any related draining, flooding, and excavation. Pipeline and pump station projects in wetlands will require a Section 404 Permits, in addition to any related local permits. CWA Section 404 Permits require Endangered Species Act (ESA), Section 7 consultation with the United States Fish and Wildlife Services (USFWS) and the National Marine Fisheries Service (NMFS) as a result of recent listings of salmonids. Biological Assessments, Biological Opinions, and their review have significantly lengthened the time required for issuance of CWA Section 404 Permits.

The Navigable Water Protection Rule (NWPR), implemented by the United States Environmental Protection Agency (USEPA) and the United States Department of the Army (Army) recognizes and outlines four clear categories of waters that are considered “waters of the United States”. These four categories protect the nation’s navigable waters and the core perennial and intermittent tributary systems that flow into those waters. These categories are territorial seas and traditional navigable waters (TNW), tributaries, lakes, ponds, and impoundments or jurisdictional waters, and adjacent wetlands.

2.3.2 Safe Drinking Water Act

The Federal 2.3.2Safe Drinking Water Act (SDWA) was passed in 1974 and amended in 1986 and 1996. The DOH adopted the federal standards under WAC 246-290, which became effective April 27, 2003. All public water systems as defined by the USEPA are affected by the SDWA. A public water system is defined as one that serves piped water to at least 25 people, or 15 connections for at least 60 days per year. The SDWA contains regulations regarding water quality, sampling, treatment, and public notification requirements that are applicable to the City. Water quality regulations are discussed further in Chapter 7.

The American Water Infrastructure Act (AWIA) was signed into law on October 23, 2018, and amended sections of the SDWA. Under Section 2013 of the AWIA, water systems serving more than 3,300 people are

required to develop or update risk and resilience assessments (RRA) and emergency response plans (ERP). An RRA looks at risks to a system and a system's resilience to those risks. An ERP covers strategies to improve system resilience as well as plans, actions, and procedures to be implemented to mitigate or lessen the impact of an emergency event. Submission cycles for RRAs and ERPs are every five years, and the deadlines are based on the size of the population served by the water system. The next five-year RRA submission cycle deadline for the City is June 30, 2026, and the ERP update deadline is December 31, 2026. It is important to note that ERP certifications are due six months from the date of the RRA certification.

2.3.3 Endangered Species Act

The purpose of the 1972 ESA is to "provide a means whereby the ecosystems upon which endangered species and threatened species depend may be conserved…" In pursuit of this goal, the ESA authorizes USFWS and NMFS to list species as endangered or threatened, and to identify and protect the critical habitat of listed species. USFWS has jurisdiction over terrestrial and freshwater plants and animals such as bull trout and cutthroat trout, while NMFS is responsible for protection of marine species including anadromous salmon. Under the ESA, endangered status is conferred upon "any species within the foreseeable future throughout all or a significant portion of its range." The ESA defined critical habitat as the "geographical area containing physical and biological features essential to the conservation of species."

The Table 2.2 lists the Evolutionarily Significant Units of salmonid species present in the Camas area listed, or proposed for listing, under the authority of the ESA.

Table 2.2 Evolutionarily Significant of Listed Salmonid Species

Species	Listing Status	Date Listed
Columbia River Bull Trout	Threatened	June 1998
Lower Columbia River Chinook	Threatened	March 1999
Lower Columbia River Chum	Threatened	March 1999
Lower Columbia River Coho	Threatened	June 2005
Lower Columbia River Steelhead	Threatened	March 1998

Once a species is listed as endangered or threatened, the ESA makes it illegal for the government or individuals to "take" a listed species. "Take" has been interpreted by the federal courts to include "significant modification or degradation of critical habitat" that impairs essential behavior patterns. For species listed as endangered, the blanket prohibitions against "take" are immediate. However, threatened species may be protected through a more flexible Section 4(d) rule describing specific activities that are likely to result in a "take."

Since 2007, The City has updated its ordinance on critical areas and has adopted the Shoreline Master Program (SMP). These updates helped to clarify the specific activities in Section 4(d) and to increase the focus on migratory species.

2.3.4 Reclaimed Water Standards

The standards for the use of reclaimed water are outlined in the Revised Code of Washington (RCW) Section 90.46 and in a separate document published by Ecology and DOH entitled "Water Reclamation and Reuse Standards." Reclaimed water is "the effluent derived in any part from sewage from a

wastewater treatment system that has been adequately and reliably treated, such that it is no longer considered wastewater and is suitable for a beneficial use or a controlled use that would not otherwise occur" (Water Reclamation and Reuse Standards). The legislature has declared that "the utilization of reclaimed water by local communities for domestic, agricultural, industrial, recreational, and fish and wildlife habitat creation and enhancement purposes (including wetland enhancement) will contribute to the peace, health, safety, and welfare of the people of the State of Washington."

2.3.5 National Environmental Policy Act

The National Environmental Policy Act (NEPA) was established in 1969 and requires federal agencies to conduct environmental review or assessments of projects to determine impacts on all projects requiring federal permits or funding. If the project is determined to be environmentally insignificant, a Finding of No Significant Impact is issued, otherwise an Environmental Impact Statement (EIS) is required. City activities requiring CWA Section 404 permits fall under the jurisdiction of NEPA.

The National Historic Preservation Act (NHPA) regulates federal activities with the potential to impact materials of historic, cultural, or archaeological significance under Section 106, which requires consultation with affected Native American Tribes and the Washington State Department of Archaeology and Historic Preservation. Documentation of this consultation is included in NEPA Environmental Reports and Assessments. Recent decisions by the United States Army Corps of Engineers (Corps) require an independent NHPA Section 106 consultation process for projects permitted by the Corps, which can result in significant delays to project implementation.

The State of Washington regulates state funded projects with the potential to impact material of historic, cultural, or archaeological significance under Governor's Executive Order 05-05, which requires consultation with the Department of Archaeology and Historic Preservation and affected Tribes similar to the NHPA Section 106 process.

2.3.6 State Environmental Policy Act

The SEPA that environmental issues are taken into consideration during the planning and process for Non-Federal projects. An EIS is required if a project will have a significant adverse environmental impact. The EIS looks at potential environmental problems that would be caused by the project; ways the project could be changed to minimize the impact; and mitigation options. The City is currently pursuing alternate source of supply, which may require an EIS depending on the type of projects that are involved. Most projects, including water right applications and transfers, typically do not require an EIS. A SEPA checklist is prepared, and a Determination of Non-significance is issued instead. This WSPU will fall under the SEPA Checklist Non-Project Action requirement. The water system projects listed in the capital improvement plan will each be completed under a separate SEPA checklist. A SEPA checklist and DNS for the WSPU is indicated in Appendix B.

2.3.7 Growth Management Act

The Washington State Growth Management Act (GMA) was enacted in 1990 and requires certain local governments to plan for the population growth that will occur over the next 20 years within an established UGA. The GMA also requires cities to classify critical areas (wetlands, aquifer, recharge areas, fish and wildlife habitat areas, geologically hazardous areas, and frequently flooded areas) and to establish

development regulations to protect these areas. Clark County is updating its current plan, which will be adopted in December 2025, to extend through 2045. The update will include changes regarding population and employment growth for the next 20 years.

2.3.8 Shoreline Management Act Permit

A Shoreline Permit is required on all projects of $8,500 or more that are located on the water or shoreline area. Shorelines are lakes of reservoirs of 20 acres or greater, streams with a mean annual flow of 20 cfs or greater, marine waters, and an area within 200 feet of the ordinary high water mark. Areas within the City that are classified as shoreline are those areas along Lake Lacamas, Washougal River, Little Washougal River, and Columbia River.

2.3.9 Floodplain Development Permit

Local governments that are participating in the National Flood Insurance Program are required to review projects (including water system facilities) in a mapped flood plain and impose conditions to reduce potential damage from flood water. A Floodplain Development Permit is required prior to construction.

2.3.10 Hydraulic Project Approval

Under WAC 220-110, the Washington State Department of Fish and Wildlife requires a hydraulic project approval (HPA) for activities that will "use, divert, obstruct, or change the natural flow or bed" of any waters of the state. For City activities such as pipeline crossings of streams or outfall and intake improvements, an HPA will be required, and must include provisions necessary to minimize project specific and cumulative impacts to fish.

Because of ESA listings throughout Washington, the Washington State Department of Fish and Wildlife and the NMFS revised the Hydraulic Code to protect species listed as threatened or endangered. The revisions to the code specifically aimed to "incorporate up-to-date fish science technology, simplify the permitting of certain types of projects, improve procedural and administrative requirements to better align with statutory changes and, establish a structure for adaptive management that responds to changing science and technology and/or the results of effectiveness monitoring".

If NMFS determines that the revisions are sufficient to protect listed species, the State hopes the revised Code will constitute an accepted Habitat Conservation Plan under Section 10 of the ESA. If the Habitat Conservation Plan is approved, NMFS may issue an Incidental Take Permit allowing incidental take of a listed species if the permittee has complied with the Habitat Conservation Plan. This Incidental Take Permit expires after an agreed upon period of time, and may then be revised by NMFS.

2.3.11 Local Permits

The City has agreements with Clark County for the construction and maintenance of facilities in their respective rights-of-way. Under these agreements, an Encroachment Permit is issued that specifies construction standards such as traffic control, work hours, and safety issues, as well as design and restoration standards.

2.4 Water Rights

A water right is the legal authorization to use a specified amount of public water for a certain beneficial purpose. Washington State law requires that permission in the form of a water right permit or certificate be granted for most appropriations of public water. Water rights are issued by Ecology and are required to ensure proper allocation and management of water resources. The following sections provide definitions of key terms with regards to water rights.

2.4.1 Water Right Claim

A water right claim is a statement of claim to water use that began before the State Water Codes were adopted and is not covered by a permit or certificate. A claim may represent a valid water right if it describes the use of a surface water source that began before 1917 or the use of groundwater source that began before 1945. It can also represent a water right claim that was filed with the State during an open filing period designated under RCW 90.14 or is covered by the groundwater exemption.

2.4.2 Water Right Permit

A water right permit is issued by the State for water right applicants to begin developing their water right. A water right is developed when the applicant follows the provisions outlined in their permit such as using the water for the purposes and limits stated in the permit. A water right permit will remain in effect until the water right certificate is issued, if all terms of the permit are met, or the permit is canceled.

2.4.3 Water Right Certificate

A water right certificate is issued by Ecology to certify that the water user has the authority to withdraw a specific amount of water under certain conditions. The conditions are based on the beneficial use of the water under the water right permit. The water right certificate is a legal document recorded at the county auditor's office. Issuance of the water right certificate is the final step in obtaining a water right.

2.5 Regulatory Agencies

The above regulations, permits, and programs are administered by various local, state, and federal agencies. The history, purpose, and authority of these agencies are discussed below.

2.5.1 United States Environmental Protection Agency

The stated mission of the USEPA is to protect human health and to safeguard the natural environment upon which life depends. The USEPA's purpose includes protecting all Americans from significant human health risks, ensuring that national environmental efforts are based on the best available scientific information, ensuring that federal laws are enforced fairly, and that the environmental protection contributes to making our communities and ecosystems diverse, sustainable, and economically productive. Ecology currently administers the SRF loans for the USEPA.

2.5.2 United States Fish and Wildlife Service

Under the ESA, USFWS is responsible for the protection of all non-marine life including birds, mammals, and non-anadromous fish, including bull trout and sea-run cutthroat. Although USFWS may choose to invoke the blanket prohibitions of Section 9, the "threatened" status of Bull Trout allows more flexibility to establish regulations designed to protect these species. These regulations, known collectively as Section 4(d) rule, online activities likely to result in a "take" of a threatened species, as well as exempted activities.

2.5.3 The National Marine Fisheries Service

Under the ESA, the NMFS is responsible for the protection of marine life, including anadromous salmon such as the Columbia River Chinook, Chum, and Steelhead. When a species is listed as "endangered" the prohibitions against "take" of the species are immediate under Section 9 of the ESA of the Act. Although NMFS may choose to invoke the blanket prohibitions of Section 9, the "threatened" status of the Columbia River Chinook, Coho, Chum, and Steelhead allows more flexibility to establish regulations designed to protect these species. These regulations, known collectively as a Section 4(d) rule, outline activities likely to result in a "take" of a threatened species, as well as exempted activities. The final 4(d) Rule was adopted on June 20, 2000.

2.5.4 United States Army Corps of Engineers

Under Section 404 of the CWA, the Corps is authorized to regulate discharge of fill and dredged material to waters of the United States, including wetlands. A similar review process is employed for projects with the potential to impact navigable waters, including the Columbia River, under Section 10 of the Rivers and Harbors Act of 1899. This process applies to any work on outfalls to the Columbia River. The Corps employs a system of General or Nationwide Permits for blanket authorization of activities such as utility lines that have minimal adverse impact on the environment. In situations where projects are large and complex, or adverse impact is probable, the Corps may issue an Individual Permit after reviewing an alternatives analysis. Enforcement actions may be brought by the Corps or the USEPA. Activities subject to Corps jurisdiction require NEPA and ESA review and consultation.

2.5.5 Washington State Department of Health

DOH has three primary functions: to regularly assess the State's health needs and resources; to develop and implement sound public policy; and to ensure the capacity of public health agencies to manage daily operations and respond to public health emergencies. The DOH was granted full authority and responsibility for the regulation and enforcement of the SDWA by the federal government in 1976. DOH also publishes guidelines for the preparation of water system plans, water conservation programs, design and drinking water quality standards, and watershed control programs. Water system comprehensive plans must be reviewed and approved by DOH. Construction plans and specifications must also be reviewed by DOH unless they are the transmission or distribution improvements included in the Water System Comprehensive Plan, CIP.

2.5.6 Washington State Department of Ecology

The mission of the Ecology Water Quality Program is to protect, preserve, and enhance the State's surface and ground water quality and to promote the wise management of water for the benefit of current and future generations. Ecology performs various functions under State and federal authority and has both local and regional offices. Ecology oversees the allocation of water rights.

2.5.7 Washington State Department of Fish and Wildlife

Under the updated Hydraulic Code Rules WAC 220-660, and RCW 75.20, any form of work that uses, diverts, obstructs, or changes the natural flow or bed of any fresh water of the State requires hydraulic project approval from the Department of Fish and Wildlife. Approval would be required for all City construction projects that cross or otherwise take place in streams or shorelines.

2.5.8 Watershed Resource Inventory Area

Under WAC 173-500-040, Washington State was divided into 62 geographic areas, defined on the basis of surface water resource. These 62 geographic areas are defined as WRIA. The purpose of WRIA is to implement effective planning involving all jurisdictions that fall within WRIA, including county, city, and other local, state, and national agencies.

The City and the Jones and Boulder Creek watersheds reside within WRIA 28. The City owns and controls a majority of the Jones and Boulder Creek watersheds, Figure 1.2, which are both tributaries of the Washougal River. The City is an active participant in regional watershed planning efforts.

2.5.9 Local Health Departments

The Clark County DOH is the local health department governing the City. In general, local health departments may adopt and enforce local regulations when they are consistent with and more stringent than state regulations.

2.5.10 County Planning Policies

City planning policies should be consistent with those of Clark County. Accordingly, this WSPU will require approval by Clark County.

2.6 Related Planning Documents

The City recognizes that planning activities of governmental entities can affect the water utility. These include several regional and local plans of the southwest region of Washington, such as Clark County. Some related plans affect how Camas operates its water system and how it plans to meet future growth. The following section summarizes these related plans.

2.6.1 Clark County Coordinated Water System Plan

Amended and adopted in 2012, the CWSP serves as a primary planning document for water purveyors within Clark County. Since the adoption of the 2012 CWSP, an addendum was incorporated in 2021 to reflect a 2017 interlocal agreement between the Cities of Camas and Vancouver. This agreement adjusted

the water services boundaries and water service shut-offs provisions, as referenced in Exhibit 2 of the 2012 CWSP. The CWSP was developed to fulfill the requirements of the 1977 Public Water System Coordination Act (RCW 70.116) and the 1971 Water Resource Act (RCW 90.54). The plan is in accordance with the Lewis and Salmon-Washougal Water Resources Management Program rules (WAC 173-527 and WAC 173-528). These acts work together to create a framework for water utilities, which allows for coordinated planning and construction programs among adjacent water utilities. Also, these acts allow utilities in a specified geographical area to reserve water rights required to meet projected municipal and industrial needs for a 50 year period. In order for reservation of water rights and coordination of water system planning to occur, a CWSP is required to be developed.

A Clark County Water Utility Coordinating Committee was created in 1977 and requested that the DOH assess the need for a designation of a Critical Water Supply Service Area. Such designation represents the first step toward the development of a CWSP. The assessment, which was completed in 1980, addressed problems within the county related to inadequate water quality, unreliable service, and the lack of coordinated planning by the water utilities. Based on the findings of the assessment, the County Commissioners declared Clark County a Critical Water Supply Service Area. Following that determination, development of the 1983 CWSP was initiated.

The Coordination Act requires that the CWSP be reviewed and updated by the water utility coordinating committee, if the water utility coordinating committee feels it necessary; the last major update occurring in 2012. The update serves as the regional supplement to local water system plans that have been or will be approved by DOH.

The 2012 CWSP:

- Addresses local legislative and CWSP policies.
- Updates water utility service area boundaries.
- Requires consistent water utility design standards.
- Adopts a utility service review procedure.
- Establishes a satellite system management agency.
- Assesses water resources.
- Reviews water supplies.

The 2012 CWSP addressed recent changes to Washington State's satellite system management agency regulations and the Lewis and Salmon-Washougal Water Resources Management Program rules.

2.6.2 Clark County Comprehensive Plan (2015-2035)

In response to rapid growth and growth-related pressures in the late 1980s, the State Legislature enacted the Washington State GMA to establish a framework for comprehensive planning efforts by local governments to accommodate anticipated growth and development. Under the GMA, each county is required to adopt a comprehensive plan and to do so in consultation with its cities.

The intent of the comprehensive plan is to build on the Community Framework Plan and the 20-Year Plan revised in 1997, 2004, 2007, and 2016 to present a clear vision for Clark County's future through 2035. The Clark County Comprehensive Plan Update is anticipated to be completed by December 2025.The plan includes comprehensive planning elements addressing issues of land use, housing, rural and natural

resources, environmental goals, transportation, capital facilities and utilities, parks and open space, historic preservation, economic development, school policies and goals, community design, annexation, SMP goals and policies, and procedures for planning for a twenty-year planning horizon. For each element included there is an introduction, a discussion of that element's relationship to other elements, a description of existing conditions, estimates and projections of future needs, and goals and policies. Additionally, the plan contains strategies for implementation of these goals and policies.

The Vacant Buildable Lands Model (VBLM) is a planning tool developed to analyze residential, commercial, and industrial lands within UGA. The model serves as a tool for evaluating urban area alternatives during Comprehensive Plan updates and for monitoring growth patterns during interim periods. The most recent data available online is from 2023. However, current efforts to update the Clark County Comprehensive Plan in coordination with the cities includes more recent analyses using the VBLM. The demographic analysis and water demand projections, documented in Chapter 5, were developed based on the best available VBLM information at the time (2025).

2.6.3 Clark County Public Utilities Water System Plan

Clark Public Utilities (CPU) 2024 Water System Plan (Consor) evaluates the long-term water supply needs and resources available for CPU. The following studies and investigations are included in the CPU Plan: an inventory of existing wells, water supply systems, and interties in the County; an analysis of the population, history, and water needs to the year 2042; and supplies to serve future water needs. Future supplies are expected to come from CPU's Well 36, Carol J. Curtis and Paradise Point Wellfields.

2.6.4 Metropolitan Transportation Plan for Clark County

The Southwest Washington Regional Transportation Council is the region's principal transportation planning organization. As a means to link transportation and land use, the Council periodically produces a regional transportation plan for the metropolitan area of Clark County. The plan is developed through a coordinated process between local jurisdictions in order to develop regional solutions to transportation needs for the next 20 years and to direct the metropolitan transportation planning process.

In order to establish transportation needs over the 20-year planning period, the Council used a regional travel forecasting model. The model is based on historic and future demographic data allocated by Clark County to 2,162 individual transportation analysis zones (TAZ) within Clark County. Each TAZ was populated with 2020 and future (2040) population, household, and employment demographic data. Historic demographic data was obtained from Census 2020 and future data was based on the results of forecasts performed by the Washington State Office of Financial Management.

2.6.5 City of Vancouver Comprehensive Water System Plan

Vancouver's Comprehensive Water System Plan is updated every 10 years; most recently in 2015. The next updated plan is expected to be adopted in 2026. The purpose of the plan is to develop a planning strategy for the city's retail water service area by evaluating the existing system and its ability to meet the anticipated requirements for water source, quality, transmission, storage, and distribution over a 20-year planning period. Water system improvements were identified to meet changes in regulatory impacts, and population growth, as well as infrastructure repair and replacement. The plan also identified planning level

costs of the improvement projects and provided a financial plan for funding the projects. The plan was prepared in accordance with DOH WAC 246-290 requirements.

2.6.6 City of Washougal Water System Plan Update

The City of Washougal's WSPU was completed in 2021. The Plan states its purpose "is to document key water system information and provides analysis and recommendations that inform infrastructure development and operational decisions by City staff". This plan includes an inventory of existing facilities, establishing criteria for water system analysis and analyzing the hydraulic capacity of the system, developing a CIP based on the hydraulic analysis and developing a financial plan to fund the proposed CIP and assess existing revenue and expenses. This plan also includes an assessment of the City of Washougal's groundwater resources, water rights, and water use efficiency program." The plan was prepared in accordance with DOH WAC 246-290 requirements.

2.6.7 Salmon-Washougal and Lewis Watershed Management Plan (Lower Columbia Fish Recovery Board, July 21, 2006)

The Watershed Management Act (RCW Chapter 90.82) provides a framework to address and resolve water resource issues in each of the state's 62 WRIAs. Planning units created for each WRIA are responsible for developing a watershed plan. The planning units consist of citizens, tribes, interest groups, and government agencies where appropriate. Camas's water system boundaries and the boundaries of surrounding water providers are within the Salmon-Washougal and Lewis watersheds (WRIAs 27 and 28). The Salmon-Washougal and Lewis Watershed Management Plan (WRIA Plan) was adopted in 2006. The WRIA Plan addresses a range of issues related to water resources, including water supply, stream flow management, water quality, and fish habitat. It reviews alternative approaches for managing water resources in the area and recommends select strategies for implementation.

The Salmon-Washougal and Lewis Water Resources Management Program rules were adopted in 2008 (WAC 173-527 and WAC 173-528). These rules were based on the WRIA Plan and had five key elements:

- Setting Instream Flows.
- Closing sub-basins to future withdrawals.
- Designating "regional supply areas" for future water supply.
- Establishing reservations for water for future use, and
- Specifying conditions of use for access to the water reserves.

2.6.8 City of Camas 2019 Water System Plan Update (Carollo Engineers)

Camas' Water System Comprehensive Plan was developed to meet the City's water system needs for a 20-year planning period. The plan was prepared in accordance with DOH WAC 246-290 requirements and includes:

- A water system description.
- Historical and future water use.
- Service area population and water demand projections.
- Water quality and SDWA impacts.

- A water system analysis, including a computer simulation model.
- CIP.

The base 6-year CIP includes pipeline, pumping, control, storage, and source improvements. These improvements include the development of multiple well sites and future sources, developing or replacing storage reservoirs throughout the system, transmission and distribution improvements, and booster station improvements. New water sources will be required by the end of the planning period to provide redundant supply to its customers. The elements and the direction of Camas' plan were consistent with activities and plans of this WSPU.

2.6.9 Jones and Boulder Creek Watershed Forest Management Plan

The City Boulder Creek and Jones Creek watershed consists of roughly 1,700 acres of forest where the City collects its water. There has been minimal work done in the area to keep it managed. The largest work was in 2011 when AKS Engineering and Forestry performed a timber inventory. This document summarizes the work that was done so that the City could periodically receive timber income while still protecting and maintaining water quality. The contents consist of an assessment of existing resources, a timber harvesting plan, an access and road plan, and implementation methods, guidelines and management recommendations.

2.7 Policies, Criteria, and Standards

The City manages its water utility in accordance with established water system policies. The policies provide a consistent framework for the design, operation, maintenance, and service of the water system for appropriately implementing programs, designing new infrastructure, and serving additional customers. The policies and planning considerations set forth herein pertain solely to the water system; the City has additional land use, development, and finance policies that may specify additional requirements for development or extension of a water service.

The following documents were reviewed for this update of the City's water policies:

- The City of Camas Municipal Code (CMC).
- The City of Camas 2010 Water System Plan (2010 WSP).
- The City of Camas 2019 Water System Plan (2019 WSP).
- The City of Camas Design Standards.
- The City Draft Comprehensive Plan 2045.
- Clark County CWSP.
- Clark County Coordinated Water System Minimum Standards and Specifications. (Appendix V-A to the CWSP).
- Clark County Code.
- RCW.
- Uniform Plumbing Code.
- International Fire Code.

2.7.1 Service Policies and Standards

The service policies and standards outlined in Table 2.3 consist of policies relating to the growth, management, and service of the water system. The extension of water service to any future service area would only occur in accordance with the policies and standards detailed in this section.

Table 2.3 Service Policies and Criteria

Subject Name	Policy and Criteria	Reference	Action Items
Duty to Serve	The City will exercise reasonable diligence and care to furnish and deliver a continuous and sufficient supply of pure water to the customer, and to avoid any shortage or interruption of delivery of same The City will meet all regulatory requirements for management of its water system and provision of water to its customers, including water quality, system pressure, and adequate supply. Conserve and protect groundwater resources to provide safe, clean, high quality drinking water to residents. The City will respond to parcels requesting service within 120 days beginning on the date the applicant and water system complete a formal agreement.	CMC 13.16.010, 2025 WSP, Comprehensive Plan 2045 Policy PFS-4.8	
Government Consistency	The City's Water System Comprehensive Plan will be consistent with local, county, and state land use authorities and plans and will comply with the Washington State GMA.	2019 WSP	
Retail Water Service Area	The City will provide water service to all customers within its RWSA meeting the City's requirements.		City to update text to be consistent with Comp Plan.
Future Water Service Area	The City's future water service area shall be determined through the CWSP and adopted through the "Interlocal Agreement for Adjusting or Confirming Future Water Service Area Boundaries Between The Cities of Battle Ground, Camas, Ridgefield, Vancouver, and Washougal, and Clark Public Utilities".	2019 WSP	
Condition of Service	It is unlawful for any person, except duly authorized city employees, to make connections with any water main or water pipe belonging to the municipal water supply system, without first obtaining written permission to do so from the public works director or his designated representative.	CMC 13.32.030	
Annexation	Do not extend utilities without annexation or commitment for annexation. Exceptions may be made in cases where human health is threatened. In areas where utilities presently extend beyond City limits, but are within UGAs, plan development jointly with the County. A joint development must be consistent with City standards.	Comprehensive Plan 2045 Policy PFS-4.4	
Service to customers outside of UGA boundary	The City will continue to provide water service to [existing] customers outside of the City's UGA Boundary but within the established Water Service Area. The City is not required to provide fire flow to such customers. The City reserves the right to deny service to new customers outside the UGA that do not meet City requirements.	2010 WSP	City to review highlighted text.
Water Main Extensions	All extensions shall extend to and across the full width of the property served with water. No property shall be served with City water unless the water main is extended to the extreme boundary limit of the property line extending the full length of the front footage of the property. ▪ Extensions to water mains will be made only upon proper petitions to the City. The City shall have the right to reject such petitions or enter into contract with the petitioners under such conditions as the City may elect. ▪ All water main extensions installed, whether within or without the corporate limits of the City, shall be ~~six~~ [eight] inches in diameter or larger. ▪ All extensions of mains required to serve new customers shall be constructed at the expense of such customers. Ensure water infrastructure is designed to City standards and is in place prior to land development.	CMC 13.48.010, 2016 WSP recommended change, Comprehensive Plan 2045 Policy PFS-4.9	City to review and update "to and through" language
Oversizing	The City Council may enter into a development agreement pursuant to RCW 36.70(b).170 whereby it agrees to set aside and reserve capacity in the municipal water system for a prospective development. Such development agreement shall be permitted only if the city council makes a specific finding that the public good and general welfare will benefit by such agreement.	CMC 13.12.085 (A)	
	If in the judgment of the water department of the city, it is in the best interest of the City and of the general area where a new main is contemplated to install a larger main than that required by the immediate development, the city may install such larger main and shall pay the increased difference in cost between installation of the smaller and of the larger main. ▪ The City may participate to the extent permitted by law, through SDC credits, Local Improvement District, or other payback agreements to assist in the financing of such improvements. ▪ Water system extensions needed to serve new development shall be built prior to or simultaneous with such development, according to the size and configuration identified by the Comprehensive Water Plan as necessary to serve future planned development. ▪ The location and design of these facilities shall give full consideration to the ease of operation and maintenance of these facilities by the City. ▪ Wherever any form of City finance is involved in a water line extension, lines that promote a compact development pattern will be favored over lines traversing large undeveloped areas where future development plans are uncertain.	CMC 13.48.010 (D), 2016 WSP	City to review and update to be consistent with current practices.
Latecomer Agreements	The City may choose to allow reimbursement contracts in exchange for permission to develop and allow for reimbursement to the initial developer by future users in the area who will benefit from the system expansion. The developer must be willing to front the initial expense of system expansion.		

Subject Name	Policy and Criteria	Reference	Action Items
Satellite Management Area	The City may assume the operation of a water district or private water system within the City limit, at the water system's request, if the following conditions are met and subject to approval of the City Council: ▪ The district or private system is adjacent to or within the City's current or future RWSA as identified in the City's comprehensive plan. ▪ The assumption of the district or private system is permitted by State law. ▪ The district's or private system's facilities meet the City's performance criteria and engineering standards, or a plan is in place to assure that they will be brought up to City standards without adversely impacting City's existing customers financially or with regard to level of service. ▪ Any extension of the City's system to connect the newly accepted system will be paid for by the district or private system. ▪ The City shall require the district or private system to transfer the ownership of its water supply sources and associated water rights to the City. Water rights must be successfully transferred to the City and approved for municipal water use by Ecology prior to commitment from the City for water service.	2019 WSP	City to review and update to be consistent with current practices
Developer Extensions outside of City UGA Boundary	The City will provide water service to developer extensions outside the City's existing UGA but within the established RWSA whenever reasonably possible. Developer extensions shall adhere to the established SDC.	2010 WSP	
New Customers with Existing Wells	Developer extensions shall adhere to the established SDC and shall abandon all private wells and relinquish associated water rights to the City as a provision of the SDC. Water rights procured in this manner will be used to accommodate growth in the Retail Water Service Area.	2010 WSP	
Metering	All services to the water system shall be metered.	CMC 13.40.010 (A)	
Source Metering	All supply sources will be metered either at individual wells or at a common flow meter.	2019 WSP	

Notes:
RWSA - Retail Water Service Area.

2.7.2 Coordination with Other Agencies

Table 2.4 summarizes policies regarding the City's coordination with other agencies, which includes but is not limited to Vancouver, City of Washougal, Clark County, federal and state agencies, other public and private utilities.

Table 2.4 Coordination with Other Agencies

Subject	Policy	Reference
Coordination with Other Agencies	Coordinate with Clark County and other purveyors to eliminate private systems in accordance with the Clark County CWSP.	Comprehensive Plan 2045 Policy PFS-4.10
	Coordinate with the County and the cities of Vancouver and Washougal to protect groundwater from contamination.	Comprehensive Plan 2045 Policy PFS-4.11
Intergovernmental Cooperation	To adequately plan for growth and implement policies for the GMA, Clark County has implemented the Coordination Act which provides a legal mechanism for municipalities, special purpose districts and private water utilities to establish future water service areas within unincorporated areas.	Clark County CWSP Update 2011

2.7.3 Environmental Policies and Criteria

Table 2.5 summarizes the City's environmental policies, criteria, and goals that relate to the City's water system.

Table 2.5 Environmental Policies

Subject	Policy/Goal	Reference
SMP	Shorelines are a specifically designated environmental feature and are protected and managed by the City's SMP. Adopted in 2013, the SMP implements the Washington State Shoreline Management Act and its policies. These policies include protecting the ecological function of the state's shorelines and their associated natural resources by identifying areas for preferred uses and economic development, restoring previously impacted shorelines, and providing opportunities for the general public to have access to and enjoy shorelines.	Camas SMP 2021
Goal NE-1 Environmental Stewardship	Preserve Camas' natural environment citywide by developing a sustainable urban environment and protecting natural areas and open space, including critical areas.	Comprehensive Plan 2045
Policy NE-1.1	Support a cleanup of the Camas Mill and other contaminated sites to protect natural resources and the city's water supply.	Comprehensive Plan 2045
Policy NE-1.2	Support programs and regulations that monitor, maintain, conserve and protect water quality in Camas, including watersheds, Lacamas Lake Basin, Columbia River Basin, and Washougal River Basin.	Comprehensive Plan 2045
Policy NE-1.4	Support and implement actions identified in adopted plans, including adaptive management of natural resources that is consistent with best available science and climate guidance to improve climate resiliency.	Comprehensive Plan 2045
Policy NE-1.5	Protect and restore natural resources, valuable historic and cultural areas, climate refugia, habitat areas and corridors to provide biological and hydrological connectivity that fosters resilience to climate impacts.	Comprehensive Plan 2045

Subject	Policy/Goal	Reference
Policy NE-1.6	Create and support natural resource management plans that consider climate change impacts and guide adaptive management.	Comprehensive Plan 2045
Policy NE-1.7	Include immediate and long-term environmental impacts in the policy and regulatory decision-making process. Identify and quantify the ecosystem services benefits of natural systems and include these natural capital assets in cost-benefit assessments for community and development planning.	Comprehensive Plan 2045
Policy NE-1.9	Regulate land use and development to protect natural topographic, geologic, vegetative, and hydrologic features of undeveloped properties.	Comprehensive Plan 2045
Policy NE-1.10	Promote soil stability and minimize and control soil erosion using best management practices, best available science, ecologically sustainable site design, natural drainage systems and protection of existing native vegetation.	Comprehensive Plan 2045
Policy NE-2.1	Use best management practices and best available science to preserve, protect, and restore the biological health and diversity of Camas' critical areas.	Comprehensive Plan 2045
Policy NE-2.2	Preserve and restore aquatic and riparian habitats consistent with applicable regulations.	Comprehensive Plan 2045
Policy NE-2.4	Ensure that development throughout the City meets or exceeds standards and practices for long-term wetland protection and mitigation.	
Policy NE-3.1	Adopt the goals and policies as outlined in the current Camas Shoreline Master Program.	Comprehensive Plan 2045
Goal NE-3 Shorelines	Use the full potential of shoreline in accordance with the opportunities presented by their relationship to the surrounding area, their natural resource values, and their unique aesthetic qualities offered by water, topography, and views. Develop a physical environment that is both ordered and diversified, and which integrates water and shoreline uses while achieving a net gain of ecological function.	Comprehensive Plan 2045

2.7.4 System Reliability and Maintenance Policies and Standards

Table 2.6 outlines the City's maintenance standards and policies, as well as system reliability policies.

Table 2.6 System Reliability and Maintenance Policies and Standards

Subject	Policy/Standard	Reference
Water Shortage Response Plan	The City created a City ordinance CMC Chapter 13.14. This allows the City to promote the public interest by conserving the city's water supply in order to protect the health, welfare and safety of water users. To accomplish this declared purpose, the city reserves the right to exercise its police powers through emergency measures as set forth in this chapter.	2019 Camas WSP
Water System ERP	The City has a Disaster Manual, which identifies the emergency response functions within the City using an "all hazards" approach. Within the City's emergency response framework, the City has developed a Water System ERP which describes alternative operations for the interruption of each major water supply facility (i.e., loss of a well, reservoir, or booster pump station).	2019 Camas WSP
System Maintenance	The City proactively operates and maintains its water system as an effective means of system management. The City has an O&M manual which gets updated regularly and adds material as necessary. The manual provides detailed information on operator certification and training, water quality monitoring, operation and control, cross-connection control, and emergency planning/response.	2019 Camas WSP

Subject	Policy/Standard	Reference
Cross Connection	The control or elimination of cross-connections shall be in accordance with the rules and regulations of the Washington State Board of Health regarding public water supplies, WAC 248-54-285 as it now exists or as it may hereinafter be amended, and with any requirements set forth by the "U.S. EPA" as authorized by the "SDWA" PL 93-523, as it presently exists or as it may hereinafter be amended, and with any manual of standard practice pertaining to cross-connection control approved by the public works director or his designated representative.	CMC Section 13.32.04 Cross Connection Control or elimination
Pump Station Redundancy	With the largest pump in each booster pump station out of service, the remaining pumps should provide MDD whole concurrently replenishing fire suppression storage within 72 hours.	2019 Camas WSP
Pump Station Reliability	Wells and booster pumps with back-up power should be capable of supplying max day demand for the water system while concurrently replenishing fire suppression storage within 72 hours.	2019 Camas WPS
Supply Reliability	Wells should be capable of supplying MDD for the water system while concurrently replenishing fire suppression storage within 72 hours	2019 Camas WPS
Supply Redundancy	Largest source out of service	2019 Camas WSP

Notes:
MDD - max day demand.

2.7.5 Financial Policies

The City's financial policies related to the Water Utility are summarized in Table 2.7

Table 2.7 Financial Policies

Subject	Policy	Reference
Combined residential and commercial uses	Where a single service is provided to a combination of residential and commercial uses, the commercial rates shall be charged for all water and sewer service.	CMC Section 13.36.030
Monthly service charge and rate for automatic sprinkler systems	The monthly flat-rate charge for automatic sprinkler systems with fire hydrants and for standpipes in conjunction with fire protection shall be as provided in CMC Section 13.36.010.	CMC Section 13.36.040
Connection charges	1. Charges for connection to the city water system including setting the meter, installing a service line and tapping the water main shall be computed as follows: a. Except as hereinafter provided, the connection charge shall be the cost of materials, the labor costs for city personnel billed at then existing rates for such personnel, and any fees or charges that were necessary to be paid to third parties in order to make such connection. b. For installing a water meter for services one inch or smaller, the connection charge shall be as per the fee schedule established by the city council per resolution. c. For installing a water meter, service line, and tapping the water main for a service one inch or smaller, the connection charge shall be as per the fee schedule established by the city council per resolution or the actual cost to the city calculated in accordance with subsection (A)(1) of this section, whichever is greater. 2. There shall be no charge for connecting a sprinkler system to a water main for fire protection other than the installation cost of the same, providing that such system shall include a detector to record water usage.	CMC Section 13.36.050
Temporary water service	For temporary irrigation or commercial hydrant use, all connections shall pay a deposit as per the fee schedule established by the city council per resolution, with the nonrefundable amount established as per the fee schedule established by the city council per resolution. Water usage shall be deducted from the deposit of the then current applicable commercial rate per Section 13.36.010 of this chapter. The city reserves the right to remove the meter for nonuse or misuse at its discretion. Any remaining deposit will be returned to the applicant, or the remaining balance will be billed to the applicant. The applicant shall notify the city when use is complete. The applicant will be responsible for any damage to the equipment, and shall be invoiced for repairs or replacement of the equipment.	CMC Section 13.36.060
Utility charge – Governmental Users	The following designated governmental users shall pay for water and sewer utilities as follows: 1. Rental by the Camas fire department of all fire hydrants within the city shall be as per the fee schedule established by the city council per resolution. 2. Rental of fire hydrants, per hydrant, outside the limits of the city by any other municipality or fire district shall be as per the fee schedule established by the city council per resolution. 3. All other utility services for governmental users shall be charged at the regular meter rate.	CMC Section 13.36.070
Meters – Installation – Reading – Accuracy	1. All services to the water system shall be metered. 2. All meters up to and including one inch in size will be owned, installed and maintained by the city water department. Meters larger than one inch shall be paid for by the customer. All services shall have the meter installed before the service is connected. The type and make of all meters purchased and paid for by any customer or applicant must be approved by the water superintendent before being installed. 3. The city will not furnish or read auxiliary or submeters used for the customer's convenience. 4. The city will keep an accurate account on its books of the reading of meters, and such account, so kept, shall be offered at all times, places and courts as prima facie evidence of the use of water service by the customer, and shall be the basis on which all bills are calculated. 5. Should any meter fail to register correctly the use of that part of the water service which the meter should properly register, the service shall be estimated by the city from a corresponding period. 6. The city will, upon written request, test any customer's meter, and where circumstances require, adjust for wrong charges for a period not to exceed three months' previous. 7. When a customer requests a meter test, a deposit as per the fee schedule established by the city council per resolution to cover the cost of the test may be required of the customer. 8. The amount so deposited will be returned to the customer if the meter is found upon test to overregister more than two percent under conditions of normal operation. 9. A customer shall have the right to require the city to conduct the test in his presence, or if he so desires, in the presence of an expert or other representative appointed by him. 10. All meters will be tested before installation, and no meter will be placed in service or allowed to remain in service which is known to have an error in registration in excess of two percent under conditions of normal operation. 11. For the purpose of making charges, all meters serving the customer's premises will be considered separately, and the readings will not be combined, except that where the city, for operating necessity, elects to install two or more meters instead of one at a central location to service the customer's premises, the readings of two or more meters will be combined for the purpose of making charges. 12. The location of the meter or meters used in measuring the customer's use of water must be in a place satisfactory to the city before service will be supplied. Ordinarily, this site shall be the property line and curb. Where meters are at present or may be installed within a building, the city will not be held responsible for damage from water seepage through the wall, nor for damage from leaking meter, pipe or fittings. 13. No rent or other charge whatever shall be made by the customer against the city for placing or maintaining meters upon the customer's premises. 14. If a meter underregisters the amount of water due to tampering with the meter, and/or piping, or in any other way causing underregistration, the service may be discontinued and will not be reconnected until the customer immediately makes the necessary corrections in his own water lines to prevent further damage to the city's meters. 15. Meter readings are to be averaged during any period when it will be impossible or impracticable to read any meter on the regular reading date. 16. It is unlawful to place any material on or to otherwise obstruct any water meter. a. Separate water meters shall be installed for each dwelling unit in a townhouse, condominium or other multifamily dwelling configuration where individual dwelling units are separately owned. Single meters may be installed to serve multifamily residential structures when said structures and the units therein remain under a single ownership. b. Water connection shall be charged beginning on the date of installation. All connections will be billed continuously for the base charge even during periods of non-use, including vacancy and disconnection for nonpayment.	CMC Section 13.40.010
Meter – Reading	1. Meters shall be read as nearly as possible at regular thirty-day intervals or sixty-day intervals, and the bill rendered will be based on consumption to the nearest hundred cubic feet. 2. Other than regularly scheduled reading of water meters, water meters may be read by the city on the day a notice of change of tenancy or ownership is delivered to the city or as close as possible to such day as required in CMC 13.44.040.	CMC Section 13.40.020
Meter – Multiple - Determination	When one customer is served by more than one meter on separate service lines, the minimum for each service or the meter minimums for each meter and the surcharges for water supplied may be calculated and billed separately.	CMC Section 13.40.030

Subject	Policy	Reference
Meter – Shared - Liability	When more than one family, business or other customer receives water through one service line in one building and it is found impractical to separate the water piping for each customer, the owner of the premises shall be responsible for payment of all water served to the premises. In the event of a delinquent bill where several consumers receive water from a common service, the water superintendent shall not cause the service to be shut off until ten days after mailing written notice of such fact to all the joint consumers and owner of the premises.	CMC Section 13.40.040
Meter – Shared – Notice to separate service - Shutoff	When two or more houses, buildings or other premises occupied by separate consumers are supplied from a single-service connection, the owner or owners shall immediately, upon notice from the water superintendent, separate each customer's line and connect up to individual services and if separate services are not established within a reasonable time thereafter, the service shall be shut off and further service refused. The joint service may, however, be continued at the option of the water superintendent, providing one owner is responsible and agrees to pay the total water bill for both premises. Computation of the total bill for the services shall be by adding the total of the separate use classifications of the premises.	CMC Section 13.40.050
Charges – Meter service – Billing intervals	1. All residential and most commercial water services shall be billed at regular intervals and shall be due and payable on the twenty-first day of each month following billing. Such billings shall be delinquent on the twenty-sixth day of the month following billing. 2. All industrial and some commercial services shall be charged monthly and shall be due and payable on the tenth day of each month following billing. Such billing shall be delinquent on the eighteenth day of each month following billing. 3. A customer shall be charged the sum as per the fee schedule established by the city council per resolution for each nonsufficient fund check, or a check written on a closed account and returned by the bank to the city. 4. There shall be a penalty on all delinquent accounts assessed at the rate of five percent of the outstanding balance.	CMC Section 13.44.010
Billing liability – rental properties	1. The record owner of any real property provided utility services by the city shall be and act as the sole customer of the city. All utility services provided to the real property shall be the responsibility of the record owner of the subject property. The city shall not be responsible for unpaid billings resulting from tenants moving in or out without paying charges due, nor the collection thereof, and said charges shall be a lien on the real property until paid. 2. Except as hereinafter provided, all billings for utility services provided by the city shall be mailed to the record owner of the subject property at the record owner's address. In the event that billings are sent to a tenant or agent of the owner, the billing will become the responsibility of the tenant or agent as well as the property owner, and each can be held jointly and severally liable for such billing. 3. In the event a record owner requests billings of non-owner occupied real property be mailed to an address other than that of the record owner, including, but not limited to, any management company or to the premise address, the record owner must complete, sign, and have notarized a form provided by the finance department agreeing to the regulations and provisions associated with the request for an exception. Such form shall provide in part that the record owner agrees to be responsible for any prorating of utility billings between any tenants or lessees, any utility billings which remain unpaid, and any disconnect charges otherwise imposed pursuant to the Camas Municipal Code that may be due in the event of any delinquency associated with any tenancy.	CMC Section 13.44.015
Nonpayment—Shutoff—Hearing—Disconnection fees.	1. Whenever any charge for furnishing water and/or sewer services to any premises is not paid in full by the twenty-sixth day of the month following billing, the finance department shall give notice to the person or persons billed for such services at the address shown in the city's billing records of the city's intent to discontinue service if payment is not made. Such notice shall contain the following information: a. The amount of the charges owing. b. A statement that the person billed may request a hearing to contest the amount or validity of the charges. c. A statement that if the charges are not paid in full or a hearing requested within ten days of the notice, the city will disconnect the service of water to such premises. 2. The notice of intent to disconnect shall also contain a request for hearing form to be utilized by any person desiring to contest the amount or validity of such charges. Any person desiring such a hearing shall file the request for hearing with the finance department within ten days of the date of the notice, and shall accompany such request with a tender of the amount of charges billed. Failure to file a request for hearing and tender the amount of charges owing within such time limit shall be deemed a waiver of the right to a hearing. 3. In the event the charges are not paid, or a hearing requested accompanied with a tender of the amount owing within 10 days of the date of the date of the notice, or if the customer's check is tendered and then is returned unpaid by the bank, then the city shall proceed to disconnect the water service to the premises. 4. In the event a hearing is requested, the amount tendered by the customer shall be deposited into the customer account. If all or a portion of the charges are found not to be owing, such amount shall be refunded to the customer or credited to the customer's account. 5. Whenever a disconnection is made at the owner's request, the sum as per the fee schedule established by the city council per resolution shall be charged for the cost of disconnecting. Whenever a disconnection is made for nonpayment, the sum as per the fee schedule established by the city council per resolution shall be charged for disconnecting. 6. If service personnel is required to go to the premises for the purpose of disconnecting the service for nonpayment, the disconnection fee shall be charged even if the service has not been physically disconnected. 7. There shall be an additional charge as per the fee schedule established by the city council per resolution for each time a service is found wrongfully or illegally reconnected after being disconnected for nonpayment. 8. If a meter or spacer must be removed, padlocked, or other means used to prevent illegal reconnection of a service, then there shall be an additional charge as per the fee schedule established by the city council per resolution for removal of such meter or spacer 9. All disconnection charges and outstanding obligations for water and/or sewer furnished to such premises must be paid in full prior to reconnection. 10. If a customer's meter has been turned off for nonpayment and the customer requests reconnection after the hours of five p.m. or on a weekend or holiday, the customer shall be charged an additional turn-on fee as per the fee schedule established by the city council per resolution.	CMC Section 13.44.020

Subject	Policy	Reference
Adjustments for broken pipes	When a property owner, in any given billing period because of a broker water pipe on the owner's premises, has used, according to the meter, a quantity of water which is more than double the most recent average without leak as set forth in Section 13.64.060(A), a written application may be made to the finance director for a reduction in said billing. If the application states that the main underground service line between the meter and house or inside a crawlspace was broken on the owner's premises which caused the large consumption of water, and it is established that such broken pipe has been repaired and documentation in the form of a bill from a certified plumber or receipt for parts is attached, the finance director shall authorize a credit to such billing as follows: 1. Average water consumption will be determined by the customer's most recent winter average without leak as set forth in Section 13.64.060(A). Customers with no winter average will have the most recent two meter reads without leak used to define an average. Customers with no prior billing, or whose prior reads are zero, will use the city's default as set forth in Section 13.64.060(B). 2. The average consumption will then be deducted from the consumption which occurred at the time of the broken water pipe. 3. A credit shall be permitted only once per customer account in a five-year period. The credit shall apply to a single billing cycle and only up through the day of repair. No additional credit shall be given for a delay in repair of pipes beyond one billing period. 4. The reduction provided for by this section shall not be allowed if such excess water consumption is due to the owner's neglect or failure to repair the water system of the premises. A reduction shall not be permitted if such excess consumption is due to leaking faucets, other plumbing fixtures or irrigation systems.	CMC Section 13.44.030
Service termination	1. Each customer about to vacate any premises supplied with water service by the city shall give notice of their intended removal at least two days prior thereto; specifying the date change-in-ownership or tenancy actually occurred, otherwise, they will be responsible for all water supplied to the premises until the city water department has notice of such removal. 2. At the time specified by the customers of the termination of the service, a reading of the water meter will be made and a bill shall be rendered based on the proportionate days of usage.	CMC Section 13.44.040
Water System Development Charges	13.52.010 - Purpose. Pursuant to the authority conferred upon cities and towns by RCW 35.92.025, the city council of the city finds that property owners who seek to connect their property to the water works system of the city should be assessed a charge in order that such property shall bear its equitable share of the cost of the water works system. The city council further finds that the charge should be based upon the property owners' anticipated use of the water works system as related to the historical cost of the water works system's capacity available to meet their demands. It is the intent of the city council that the charge imposed by this chapter shall be derived from the historical cost of the system as measured by the undepreciated value of the water works system and plant in service at the time the charge is imposed and the projected cost of additions to the system to meet new demands. The charge imposed by this chapter shall be denominated a "water system development charge" and shall be in addition to any water connection, installation, or permit fees imposed by other ordinances of the city. 13.52.020 - Definitions. Unless otherwise specifically defined, the terms used in this chapter shall have the following meanings: 1. "Accessory dwelling unit" means one or more rooms with a private bath and kitchen facilities comprising an independent, self-contained dwelling unit within or attached to a single-family dwelling or in a detached building on the same lot as the primary dwelling unit. An accessory dwelling unit is distinguishable in that it is clearly subordinate to the primary dwelling unit, both in use and appearance. 2. "Industrial or unusual requirement customer" means that use classification of a nonresidential property owner who uses a meter equal to or greater than three inches in size and has a non-standard peak flow, uses a significantly large daily volume of water that is in excess of the City's typical commercial customer, or who otherwise have an unusual water usage pattern. 3. "Water system" means all facilities for collecting, transporting, pumping, treating and providing water. 13.52.030 - Imposition. 1. Except as provided herein, there is imposed on all properties in the city and all properties outside the boundaries of the city that connect to the water system of the city a water system development charge, which charge shall be assessed in accordance with the rates set forth in Section 13.52.070. 2. There shall be no water system development charge imposed for the installation of an additional meter installed to an existing residential customer service line which meter is installed for irrigation purposes. 3. Property owners that install a residential fire sprinkler system, which requires that the water meter size be increased to make the fire sprinkler system operational, shall not be charged the increased system development charge for the larger meter. 13.52.040 - Credits. 1. Development credit: a. A developer (as defined in CMC 3.88.030.K) shall be entitled to a credit against the applicable system development charge for the dedication of land or for the design or engineering or construction of an "eligible improvement". For purposes of this section, an eligible improvement shall mean an improvement or real property that is: required as a condition of development approval; identified in the water system plan or capital improvement plan; and included in the current system development charge calculation as being funded by system development charges. b. The amount of the credit shall be the dollar amount assigned to the improvement or to the land in the system development charge calculation. Where only a portion of the improvement is constructed, or a portion of the land is dedicated, the amount of the credit shall be pro-rated. c. Credits earned for one category of system development charge, e.g. water, may not be applied against a different system development charge, e.g. sewer. d. Approval from the city council shall be required prior to the start of construction or dedication of any eligible improvement. "Approval" in the context of this subsection shall be satisfied if the city requires the construction or dedication of the eligible improvement as a condition of approval for a land use application. If a developer wishes to construct an eligible improvement that is not otherwise a condition to an approved land use application, prior approval must be obtained from the city council. No system development charge credit shall be granted until either the eligible improvements have been designed, engineered, or constructed by the developer, and such work has been accepted by the city; or until the land has been dedicated by the developer and such dedication has been accepted by the city. e. If system development charges become due and payable prior to the developer becoming eligible for the issuance of credits as provided in section (4), the developer may apply to the public works director to defer collection of the charges until construction or dedication is completed. The public works director may condition deferral upon: i. The developer posting a bond or other financial security satisfactory to the city in an amount equal to one hundred twenty-five percent (125%) of the deferred system development charges, which bond or other financial security shall be conditioned upon the developer either paying the deferred system development charges or completing construction or dedication within a specified time, ii. The withholding of an occupancy permit. iii. Such other conditions acceptable to the city. f. If the developer is dissatisfied with the decision of the public works director, the developer may seek to have that decision reviewed by the city council	CMC Chapter 13.52

Subject	Policy	Reference
	2. Upon acceptance of the eligible improvement, the developer may submit an application for the system development charge credit to the public works department. After submission of the application and verification of entitlement thereto, the public works director shall submit to the City Council for concurrence. Upon ratification, the finance department shall issue a credit voucher to the developer specifying the amount of the system development charge credit and the type of credit. 3. The credit may, at the option of the developer, be applied all or in part to the system development charges owing for the developer's project. 4. To the extent the credit exceeds the amount of the system development charges owed by the developer, or the developer chooses not to apply the credit to the developer's project, the unused credit may be applied to a different project of the developer or to the project of a different developer. 5. Before the system development charge can be transferred to a different project or a different developer, the holder of the system development charge credit shall file with the finance department an application to transfer the credit on a form to be created by the finance department. The application shall identify the transferee, and the amount of the system development charge credit being transferred. The transfer application shall be accompanied by an administrative fee in an amount as may be set by resolution of the city council. 6. When credits are to be redeemed, the holder of the system development charge credit shall file an application for redemption on a form to be created by the finance department. Redemption shall be permitted only in increments equal to a whole system development charge, or when redemption will exhaust the entire system development charge credit. The application for redemption shall be accompanied by an administrative fee in such amount as may be set by resolution of the city council. When system development charge credits are being redeemed, such redemption shall not allow for system development charge credits to be pro-rated among more than one residential lot in amounts that are less than the existing system development charge per lot. For example, where system development charges are five thousand dollars per residential lot and a developer wishes to redeem eleven thousand dollars' worth of credits, the developer shall not be allowed to apply one thousand dollars per residential lot over eleven lots. The developer may apply five thousand dollars to two residential lots and the remaining one thousand dollars to one residential lot. 7. The finance department shall be responsible for maintaining appropriate records documenting the issuance, transfer, and redemption of system development charge credits. 8. Expiration of credits. Any credits issued after the effective date of this ordinance shall expire and become null and void ten years from the date of approval of the original credit by the city council. Transfer of credits or partial use of credits shall in no event extend the expiration date of those credits. 13.52.050 - Accessory dwelling units. 1. There shall be no water system development charge for connection of accessory dwelling units to the city water system. 13.52.060 - Application for connection—Use classification of property. 1. Any property owner seeking to connect his property to the water system of the city shall file with the city an application to be on a form provided by the city. The application shall contain the name and address of the property owner, the location of the property to be connected to the water system, the nature of the structure to be constructed on the subject property, the proposed use of the subject property, and any relevant information deemed necessary by the city to process the application. 2. Upon receipt of the completed application, the applicant shall then be informed by the city of the amount of the water system development charge, which shall be based upon the use classification of the property and shall be in accordance with the rates set forth in section 13.52.070. 13.52.070 - Rates. 1. The rates for water system development charges shall be determined based on the meter size installed as set forth in Table 13.52.070. 2. The water system development charge shall be indexed yearly on January 1st to address inflation based on the Engineering News Record Construction Cost Index for the City of Seattle. Effective January 1, 2020, and annually thereafter, the water system development charge shall be adjusted pursuant to the adopted cost index as set forth herein. 3. The water system development charge for properties classified as industrial or unusual requirement customer shall be based on a separate engineering study completed by the applicant and approved by the city. The factors used in the study to determine the system development charge shall include the size of meter, the average and peak volumes of water used by the customer, seasonal variations, the calculated meter customer equivalents as compared to the city's current system development charge calculation and other pertinent factors deemed necessary by the city. 13.52.080 - Payment of water system development charge. 1. The water system development charge owing under the provisions of this chapter shall be paid by the applicant at the time of issuance of the plumbing permit or building permit, whichever shall first occur, or as scheduled by a separate agreement with the city. The amount of the charge shall be based on the system development charge in effect at the time of permit application. 2. No water service shall be furnished to the property of any person seeking to connect to the water system of the city until the water system development charge imposed by this chapter has been paid to the city or until such time as the city and the applicant have entered into a separate agreement providing for the payment of such water system development charge. 13.52.090 - Revenue disposition. 1. All revenues collected pursuant to this chapter shall be paid into the water and sewer capital reserve fund and shall be used for the purpose of financing system improvements. Such revenues shall not be used to offset current operation or maintenance costs. 13.52.100 - Appeals. 1. Any applicant aggrieved by the amount of the water system development charge found by the city to be required under the provisions of this chapter, may appeal to the board of adjustment from such finding by filing a written notice of appeal with the city clerk within twenty days from the time such property owner is given notice of such amount. The chairman of the board of adjustment shall cause a notice of the time and place of hearing to be mailed to the applicant. At such hearing, the applicant shall be entitled to be heard and to introduce evidence on his own behalf. The board of adjustment shall thereupon ascertain the correct amount of the water system development charge, and the city clerk shall immediately notify the appellant thereof, by mail, which amount, together with the costs of appeal, if appellant is unsuccessful therein, must be paid within ten days after such notice is given. 2. The chairman of the board of adjustment may, by subpoena, require him to produce any pertinent books and records. Any person served with such subpoena shall appear at the time and place therein stated, and shall produce the books and records required, if any, and shall testify truthfully under oath administered by the chairman in charge of the hearing on appeal, as to any matter required of him pertinent to the appeal, and it is unlawful for him to fail or refuse to do so.	

2.7.6 Design Standards

Table 2.8 describes the City's general design standards associated with the management of the water utility and design of the water system.

Table 2.8 General Design Standards

Subject Name	Standard	Reference
Pipeline Material	Water mains shall be ductile iron.	City of Camas Water Details Water Construction Notes
Minimum Pipeline Size	Water mains shall be 8-inch diameter minimum line size. Larger line sizes may be required.	City of Camas Water Details Water Construction Notes
Valve Spacing	Valves are to be installed at all branches, for long main runs, inline valve spacing not to exceed 500 feet.	City of Camas Water Detail No. W13
Fire Hydrant Spacing	Fire hydrant spacing number and spacing shall be minimum 500 feet spacing and based on International Fire Code Appendix C, Table C.102.1.	City of Camas Code of Ordinances Chapter 17.19.040, Section C.4.a.
Fire Hydrant Specification	Hydrants shall be designed per standard detail No. W11.	City of Camas Water Detail No. W11
Looping	Water mains shall be looped wherever possible. Keep dead ends to a minimum.	City of Camas Water Details Water Construction Notes and Detail No. W13

2.7.7 Distribution System Criteria and Standards

The City's distribution system criteria and standards are summarized below in Table 2.9.

Table 2.9 Distribution System Criteria and Standards

Subject Name	Standard	Reference
Supply Components and Government Criteria	Following the Washington State DOH storage volume requirements (WAC 246-290-235(3)) and the WSDM, Chapter 9, the five components of storage listed below and illustrated in Figure 9.6 must be considered for any water system: 1. Operational storage. 2. Equalizing storage. 3. Standby storage. 4. Fire Suppression storage. 5. Dead storage.	2019 WSPU
Standby Storage	Following the Washington State DOH storage volume requirements (WAC 246-290-235(3)) and the WSDM, Chapter 9, the five components of storage listed below and illustrated in Figure 9.6 must be considered for any water system: 1. Operational storage. 2. Equalizing storage. 3. Standby storage. 4. Fire Suppression storage. 5. Dead storage.	2019 WSPU

Subject Name	Standard	Reference
Service Pressure and Fire Flow	The distribution system was evaluated for the following criteria, which match the requirements of the DOH WSDM and WAC 246-290. 1. PHD Pressure. a. Minimum allowed pressure is 30 psi during PHD. 2. Available Fire Flow. a. While delivering the required fire flow during MDD conditions, system pressures must remain above 20 psi.	2019 WSPU
Maximum Pipeline Velocities	Water main non-fire condition maximum velocity is limited to 8 feet per second according to the DOH WSDM	DOH WSDM
Minimum System Pressure	In accordance to the DOH WSDM, the City must design a water system to provide PHD while maintaining a minimum pressure of 30 psi throughout the distribution system (WAC 246-290-230(5)).	DOH WSDM
Excess Pressure	Excessive water system pressure can increase the risk of pipe failure and result in increased distribution system leakage. Working pressure in the distribution system should be limited to 80 psi unless the design engineer can justify the need for higher pressure (to reduce capital and/or pumping costs, increase fire flow reliability, or for other reasons), and verify that the pipe material is appropriate for the design working pressure.	DOH WSDM

Notes:
PHD - peak hourly demand; psi – pounds per square inch; WSDM - Water System Design Manual.

CHAPTER 3 EXISTING SYSTEM

3.1 Introduction

The City owns and operates a multi-source municipal water system (DOH) System Number 108002), which includes supply, treatment, storage, and distribution of potable water to residential and non-residential customers. Service is provided to customers across 26 pressure zones (PZ). The locations of PZ and key elements of the water system are shown in Figure 3.1. A detailed hydraulic profile of the City's water system, including each PZ are shown in Figure 3.2A and Figure 3.2B. A simplified hydraulic profile showing only key facilities and PZ is shown in Figure 3.3. This chapter reviews all of the system components incorporated in the water supply system and provides a brief summary of each facility as shown below:

- PZ.
- Sources of Supply.
- Water Treatment.
- Storage Facilities.
- Transmission and Distribution Facilities.
- BPS.
- Interties.
- SCADA.

3.2 Pressure Zones

The City's water system has 26 distinct PZ. The hydraulic profile shown in Figure 3.2A and Figure 3.2B displays how PZ are connected and illustrates water moves throughout the system between each pressure zone. Although the system has 26 distinct PZs, not all of them have separate storage facilities. A PZ that does not have a storage reservoir located in it is classified as a "closed" PZ, while a PZ that does have a storage reservoir is classified as an "open" PZ. Zones that are served by a pressure reducing valve (PRV) from a PZ with gravity storage are also classified as an "open" PZ. Table 3.1 describes each PZ, noting minimum and maximum elevations served within each zone and boundaries for each PZ are delineated in Figure 3.4.

GME - Green Mountain Estates; HGL - hydraulic grade line; LPH - Lower Prune Hill; N/A - not applicable; UPH - Upper Prune Hill.

3.3 Sources of Supply

The City currently obtains its water from ten groundwater wells and two surface water sources. Nine of the ten groundwater sources are located in the downtown area, in the Downtown 285 Zone, and Well 9 is

located in the Lacamas 544 Zone. The City's seasonal surface water sources are from Jones and Boulder Creeks to the north of the City as shown in Figure 3.1.

3.3.1 Surface Water Sources

Jones Creek has been providing the City of Camas with water since 1913. The Boulder Creek source was added in 1931. The intakes at Boulder and Jones Creeks consist of small settling basins and screens. Surface water sources may be operated between November 1st and May 15th. Seasonal raw water from the Boulder and Jones Creek intakes is conveyed to the recently constructed slow sand filtration treatment plant (SSF Plant) where the water is filtered prior to chemical treatment and discharge to the distribution system.

The SSF Plant has the capacity to treat the entire permitted flow of 1,570 gpm from the City's surface water sources. The surface water sources have lower operating expenses because they can provide flow toward two PZ without pumping, and have low silica content, which makes these sources more desirable to light industrial customers and their water quality sensitive industrial processes. However, these surface water sources are not available during peak water demand months. The City calls its groundwater sources only after demands cannot be met by production from the SSF Plant.

3.3.2 Groundwater Sources

The City currently operates ten groundwater wells. All of these wells are physically located in the Downtown 285 Zone except for Well 9. Wells 7, 8, 10, 11, and 12 are located on SE 6th Avenue, in the eastern downtown area, and are referred to as the Washougal Wellfield. Wells 6 and 14 are located further east along SE 6th Avenue near the Camas/Washougal border. The wellfield supply is conveyed across the Washougal River via a 14-inch diameter steel line under the river and a 24-inch diameter ductile iron (DI) pipe on a bridge over the river. The two pipes join, and an 18-inch diameter 343 Zone transmission line carries water from the Washougal Wellfield up toward the Angelo BPS. Well 5 is located south of Well 6 on SE 8th Street and pumps directly into the Downtown 285 zone. Well 13 is located in the Downtown 285 Zone on SE Cramer Lane and pumps into the same 18-inch diameter transmission line as the Washougal Wellfield. Well 9 is located in the 544 Zone on NW 38th Avenue near Parker Street. Table 3.2 lists the City's groundwater sources and the typical pumping rates observed in SCADA data. The City is currently investigating additional groundwater sources within its service area in anticipation of future demands.

Several of the City's groundwater sources must be operated with a booster pumping station in service to prevent over pressurization:

- When Well 5 is called into service, the Forest Home BPS must also be called on to prevent over-pressurization of the downtown zone.
- Washougal Wellfield operations are matched by pumping at the Angelo BPS. For each well that is called on at the wellfield, for up to four total wells, a corresponding pump must be called on at the Angelo BPS. The City will be adding a 5th temporary pump as a backup to the four pumps at Angelo while an additional booster station is designed and construction along Lake Road.
- There are currently piping restrictions that prevent the City from operating Well 6 and Well 14 at the same time. A planned waterline project to connect these wells to allow them to operate at the same time will be completed by the summer of 2026.

Table 3.2 Groundwater Sources

	Depth(1) (feet)	Rated Capacity (gpm)	Motor (hp)	Casing (inch)	Control Valve	Auxiliary Power
Well 5	71	675	75	8	3-inch waste valve	No
Well 6	85	1,200	150	16	4-inch waste valve	No
Well 7	84	950	100	14	3-inch waste valve	No
Well 8	87	1,250	150	14	4-inch waste valve	Yes
Well 9	253	575	100	16	4-inch waste valve	No
Well 10	92	900	150	16	8-inch	No
Well 11	106	1,000	150	16	8-inch	Yes
Well 12	106	1,000	150	16	8-inch	Yes
Well 13	103	1,350	200	20	8-inch	Yes
Well 14	75	850	200	20	8-inch	Yes
Total Groundwater Source Capacity				9,750 gpm		

Notes:
(1) Drilled depth of completed well below ground surface.
hp - horsepower.

3.4 Water Treatment

The City currently has approximately 15.5 million gallons per day (mgd) of total source water treatment capacity. A discussion of the treatment facilities is provided in the following sections. A summary of treatment facilities is provided in Table 3.3 and facility locations are shown in Figure 3.1.

3.4.1 Surface Water

The City's surface water is chlorinated and filtered. Chlorination of the surface water occurs at the City's slow sand facility with 0.840 percent sodium hypochlorite. The distance between the slow sand plant and the first customer provides 2.5 hours of CT.

In 2013, the City began construction of the SSF Plant. This plant has a design capacity of 1,570 gpm and filter beds are comprised entirely of sand. The City also treats with sodium fluoride for dental benefits.

3.4.2 Groundwater

Treatment of the City's groundwater sources includes on-site chlorination, fluoridation, and caustic soda addition. A single chemical feed facility provides treatment for Wells 7, 8, 10, 11, and 12 due to their proximity to one another. Water from Wells 6 and 14 are treated at the Well 14 site. The remaining wells each have individual treatment facilities at the well locations. Fluoridation always occurs downstream of the well pump and sodium fluoride is used at all facilities. Sodium hydroxide, also known as caustic soda, is added for corrosion control at each of the treatment facilities except for Well 9 due to natural pH. The existing treatment facilities for the City's sources are shown in Table 3.3. The residual chlorine target for all facilities is 0.8 milligrams per liter (mg/L) with alarms if the concentration is above 2 mg/L or below 0.2 mg/L. The fluoridation target for all facilities is 0.7 mg/L for all facilities with alarms if the concentration is above 2.5 mg/L or below 0.25 mg/L.

Table 3.3 Treatment Facilities

Treatment Facility	Sources Treated	Filtration	Chemical Addition
SSF Plant	Boulder Creek, Jones Creek	Yes	▪ Sodium Hypochlorite ▪ Sodium Hydroxide ▪ Sodium Fluoride
Washougal Wellfield - Site 519	Well 7, Well 8, Well 10, Well 11, and Well 12	No	▪ Sodium Hypochlorite ▪ Sodium Hydroxide ▪ Sodium Fluoride
Well 14 - Site 518	Well 6 and Well 14	No	▪ Sodium Hypochlorite ▪ Sodium Hydroxide ▪ Sodium Fluoride
Well 13 Site	Well 13	No	▪ Sodium Hypochlorite ▪ Sodium Hydroxide ▪ Sodium Fluoride
Well 9 Site	Well 9(1)	No	▪ Sodium Hypochlorite ▪ Sodium Fluoride
Well 5 Site	Well 5	No	▪ Sodium Hypochlorite ▪ Sodium Hydroxide ▪ Sodium Fluoride

Notes:
(1) Well 9 pH is above the treatment limit.

3.4.3 Groundwater Under the Direct Influence of Surface Water

The federal definition of ground water under the direct influence of surface water (GWI) is a groundwater source located near a surface water such that it has significant occurrence of contamination from pathogens such as Giardia lamblia which is not normally found in groundwater. A GWI receives direct surface water recharge and is subject to rapid changes in water characteristics that correlate to surface water conditions. Sources determined as GWI are required to achieve 99.9 percent removal of Giardia lamblia and viruses by filtration and disinfection.

A hydraulic connection to nearby surface water is a potential GWI source. In order to determine if a hydraulic connection exists, a water system may conduct a hydrogeologic investigation or use the water quality monitoring (WQM) method. The WQM method requires monitoring the groundwater and surface water source for 1 year for temperature and conductivity. If a significant correlation is determined from statistical analysis of the data, then the source is determined to be hydraulically connected to surface water. Less demanding requirements are required for hydraulically connected sources. These include eliminating the surface water influence, developing an alternate source, meeting criteria to remain unfiltered, or installing filtration.

A microscopic particulate analysis (MPA) is conducted in order to determine if a groundwater source is a GWI source. The City has completed MPA testing on Wells 6, 7, 8, 10, 11, 12, and 14 which indicate that these sources are hydraulically connected to surface water. Therefore, these sources are required by DOH to achieve a CT of 6. An evaluation by Pacific Groundwater Group in 2006 states that Well 13 is not under the direct influence of surface water but is hydraulically connected to surface water. Wells 5 and 9 are not hydraulically connected to surface water, so no CT is required.

3.5 Storage Facilities

The City currently maintains and operates seven storage facilities with a combined total of 9.95 MG. A discussion of each storage facility is provided in the following sections. A summary of the storage facilities is provided in Table 3.4. A map showing the location of the key elements of the City's water system is provided as Figure 3.1.

Table 3.4 Existing Storage Facilities

Reservoir	Capacity (MG)	Diameter (feet)	Base Elevation (feet)	Overflow Elevation (feet)	Year Constructed and Type
Butler	1.2	100x100	328	343	1913, Concrete
LPH No. 2	1.5	105	432	455	1971, Concrete
UPH No. 1	0.75	36	752	852	1971, Steel
UPH No. 2	2.4	78	748	816	2002, Steel
Gregg	0.1	16	472	542	1978, Steel
Lacamas	2.0	84	496	544	1993, Steel
18th Avenue	2.0	94	504	547	2020, Steel

3.5.1 Butler Reservoir

The Butler Reservoir consists of two adjacent, partially buried concrete reservoirs. The two reservoirs share a common wall, with the north half being constructed in 1913, and the south half being completed in 1923. The reservoirs are covered and have a total storage capacity of 1.2 MG. The base elevation of the reservoir is approximately 328 feet, and the overflow elevation is 343 feet. The entire capacity of the Butler Reservoir is usable storage. Under normal operating conditions, the Butler Reservoir is supplied through 6,420 lineal feet of 12-inch diameter cast iron (CI) transmission main. This transmission main connects with the 18-inch diameter main from Wells 6, 7, 8, 10, 11, 12, 13, and 14 at NE 22nd Avenue and NE Everett Street. The Butler Reservoir is shown in Figure 3.5 and capacity details are summarized in Table 3.4.

Figure 3.5 Butler Reservoir

3.5.2 Gregg Reservoir

The Gregg Reservoir, a 100,000-gallon capacity steel standpipe, was constructed in 1978. It has a base elevation of approximately 472 feet, an overflow elevation of 542 feet, and is the only storage facility for the 542 Zone. The reservoir provides equalization and operational storage for the 542 Zone but does not provide fire suppression storage. Fire flow demand is instead supplied by the two 1,500 gpm fire pumps at the New Gregg BPS. The Gregg Reservoir is typically supplied by a small jockey pump at the New Gregg BPS and the Crown Road BPS. The Gregg Reservoir can also be supplied by the City's SSF Plant, when it is operated during the winter months. The Gregg Reservoir is shown in Figure 3.6 and capacity details are summarized in Table 3.4.

Figure 3.6 Gregg Reservoir

3.5.3 Lacamas Reservoir

The Lacamas Reservoir, constructed in 1993, has a total capacity of 2.0 MG. It has a base elevation of approximately 496 feet, and an overflow elevation of 544 feet. The Lacamas Reservoir is a ground level reservoir. The Lacamas Reservoir is primarily supplied from the LPH Zone via the Lacamas BPS or from Well 9. PRV stations from the UPH zone can also provide fire flow to the Lacamas Zone. The Lacamas Reservoir is shown in Figure 3.7 and capacity details are summarized in Table 3.4.

Figure 3.7 Lacamas Reservoir

3.5.4 18th Avenue Reservoir

The 18th Avenue Reservoir, constructed in 2020, is a ground level steel reservoir that has a total capacity of 2.0 MG. It has a base elevation of approximately 504 feet and an overflow elevation of 547 feet. The 18th Avenue Reservoir is primarily supplied by the Lacamas Reservoir through a fill valve that opens once the Lacamas Reservoir is full. The 18th Avenue Reservoir is shown in Figure 3.8 and capacity details are summarized in Table 3.4.

Figure 3.8 18th Avenue (Anderson) Reservoir

3.5.5 Lower Prune Hill Reservoirs

Storage in the LPH Zone is currently provided by a single concrete ground level reservoir (LPH Reservoir 2) with a base elevation of 423 feet and overflow elevation of 455 feet. LPH reservoir 2 was constructed in 1971 and has a total capacity of 1.5 MG. LPH Reservoir 1, a 0.5 MG concrete ground level reservoir

originally constructed in 1935 was recently taken offline to be replaced. Once construction is completed, the new welded steel reservoir will provide an additional 0.57 MG of storage and will be plumbed together with LPH Reservoir 2 to act as one reservoir, increasing total storage capacity for the LPH Zone to 2.07 MG. Storage in the LPH Reservoir is accessible via gravity to the 455 Zone, or is pumped to the UPH Zone through the LPH BPS. Under normal system operation, water from the SSF Plant supplies the 455 Zone and the reservoirs. The 455 Zone can also be supplied through pumping from the 343 Zone via the Forest Home, Butler, and Angelo BPS. The LPH Reservoirs can also supply the 544 Zone through the Lacamas BPS. When SSF is running the surface water can supply the 544 Zone through Lacamas BPS. The LPH Reservoir 2 is shown in Figure 3.9 and capacity details are summarized in Table 3.4.

Figure 3.9 LPH Reservoirs

3.5.6 Upper Prune Hill Standpipe and Reservoir

The UPH Reservoir 1 and Reservoir 2 were constructed in 1971 and 2001, respectively. Reservoir 1 has an overflow elevation of 852 feet, stands 100-feet tall, and has a total capacity of 0.75 MG. This reservoir sets the HGL for the 852 Zone. The UPH Reservoir 2 is below the HGL of the 852 Zone and serves the zone by pumping through the UPH BPS to the UPH Reservoir 1. It has an overflow elevation of 816 feet, stands 68-feet tall, and has a total capacity of 2.4 MG. The BPS has a total pumping capacity of 2,900 gpm. Including the standpipe and reservoir, the 852 Zone is supplied by the LPH BPS, 12-inch diameter transmission line, and 16-inch diameter Ostenson Canyon transmission line. The UPH Reservoirs are shown in Figure 3.10 and capacity details are summarized in Table 3.4.

Figure 3.10 UPH Reservoirs

3.6 Pipe Network

The City owns over 159 miles of pipe in its distribution system. An inventory of existing pipelines in the system, as reported from the City's hydraulic model, is summarized in Table 3.5. The system is predominately looped and located within public rights-of-way, giving the City access for repair and maintenance. The City replaces aging and undersized pipes to serve the City's growing demands on an ongoing basis. Pipe materials within the City currently include the following:

- CI Pipe.
- Polyvinyl chloride (PVC) Pipe.
- DI Pipe.
- Steel (ST) Pipe.

Table 3.5 Pipe Diameter and Material

Diameter	DI (feet)	CI (feet)	ST (feet)	PVC (feet)	Unknown	Total (feet)	Percent
6-inch	77,204	69,979	20,210	903	9,108	180,065	21%

3.7 Pressure Reducing Stations

The City maintains numerous pressure reducing stations as shown in Table 3.6 and Figure 3.1 to help maintain pressure in low elevations and minimize potential risks from high pressures. In most cases, there are two PRVs at each station. The smaller valve operates to provide the average daily demand to the zone that it serves. The larger valve, which is generally set 5 psi lower than the small valve, is primarily used for fire protection or large demand situations. The City's PRVs have pressure sustaining features, which are set to ensure that upstream pressures are maintained. The City has a contract with GC Systems to service the 71 PRVs located within the water system. This contract allows GC Systems to perform general maintenance and ensure that the valves are operating correctly, both on an individual and system-wide level.

Table 3.6 PRV

PRV Station	PRV Model ID	Size (inches)	Downstream Zone	Downstream Setting (psi)	Upstream Pressure (psi)

3.8 Booster Pumping Stations

The City currently maintains and operates ten booster pumping stations to move water between PZ. A description of each BPS is included in the following sections. Table 3.7 provides a summary of each pump station and details the rated capacity of each pump. Locations for each of the City's BPS are shown in Figure 3.1.

Table 3.7 BPS Summary

Name	From Zone	To Zone	Year Constructed	Auxiliary Power	Pump Information		
					Pump No.	Power (hp)	Design Capacity (gpm)
Angelo BPS	343 Transmission	455 - LPH	2001	Yes	1	75	1,000
					2	75	1,000
					3	75	1,000
					4	75	1,000
Butler BPS	343 – Transmission	455 - LPH	1948(2)	No	1	50	800
					2	60	600
Crown Road BPS	343 – Transmission	542 - Gregg	2011	Yes	1	75	800
					2	75	800
					3	75	800
Forest Home BPS	343 - Lower (Downtown)	455 - LPH	1949(3)	No	1	50	1,000
GME BPS	544 - Lacamas	695 - GME	2023	Yes		15	180
					2	15	180
					3	15	180
					4	60	650
					5	60	650
New Gregg BPS	455 - LPH	542 - Gregg	2003	Yes	1	100	1,500
					2	100	1,500
					3	15	500
Lacamas BPS	455 - LPH	544 - Lacamas	1993	Yes	1	25	500
					2	25	500
					3	100	1,500
LPH BPS	455 - LPH	852 - UPH	1971(4)	Yes	1	150	1,000
					2	150	1,000
					3	100	750
UPH BPS	852 - UPH	852 - UPH	2002	Yes	1	20	750
					2	20	750
					3	40	1,400
					4	40	1,400
Francis Road BPS	455 - LPH	550	1942	No	1	7.5	80

Notes:
(1) Source: The City.
(2) Pumps were replaced in 1998.
(3) Pump was replaced in 1999.
(4) Pumps were replaced in 2002 and 2004.

3.8.1 Butler Booster Pump Station

The Butler BPS is located at the Butler Reservoir site and pumps from the 343 Zone to the 455 Zone. The Butler BPS has one end suction centrifugal 50-hp pump and one end suction centrifugal 40-hp pump that are capable of supplying 800 and 600 gpm, respectively. When one of the larger two pumps in the New Gregg BPS is called on, one of the Butler pumps is also turned on to feed the 14-inch diameter suction line of the New Gregg BPS. This station does not have the capacity for an additional pump. Figure 3.11 shows the interior of the Butler BPS and capacity details are summarized in Table 3.7.

Figure 3.11 Butler BPS

3.8.2 New Gregg Booster Pump Station

The New Gregg BPS is also located at the Butler Reservoir site and pumps water from the 455 Zone to the 542 Zone. The New Gregg BPS is equipped with two 100-hp double end suction split case pumps, each with a capacity of 1,500 gpm. In 2013 a third 500 gpm pump was added for domestic service and to maintain the level in the Gregg Reservoir. The two larger pumps are typically only called on when fire flow demands occur. The New Gregg BPS has suction side flow limitations due to insufficient head provided by the Butler Reservoir. When one of the larger two pumps in the New Gregg BPS is called on, a pump in the Butler BPS must also be called on to supply adequate pressure for the Station's 14-inch diameter suction line. Figure 3.12 shows the interior of the New Gregg BPS and capacity details are summarized in Table 3.7.

Figure 3.12 New Gregg BPS

3.8.3 Forest Home Booster Pump Station

The Forest Home BPS, located at 418 NW 10th Avenue, pumps from the Downtown 343 Zone to the 455 Zone. This station contains one pump with a rated capacity of 1,000 gpm. When Well 5 is called into service, this BPS is also called on to prevent over-pressurization of the Downtown 285 Zone. Figure 3.13 shows the Forest Home BPS and capacity details are summarized in Table 3.7.

Figure 3.13 Forest Home BPS

3.8.4 Lower Prune Hill Booster Pump Station

The LPH BPS is located at the LPH Reservoir site and pumps water from the 455 Zone to the 852 Zone. This station has three pumps with two 150-hp split case double end suction pumps capable of providing 1,000 gpm each and a 100-hp vertical turbine pump capable of providing 750 gpm for a total rated station capacity of 2,500 gpm. This station has does not have capacity for an additional pumping unit. With the improvements to LPH Reservoir 1, the City is also replacing the LPH BPS. Construction is expected to be completed in 2026. Once operational, the new LPH BPS will utilize three 250-hp vertical turbine pumps capable of providing 1,600 gpm each to supply the 852 Zone. The upgrades at LPH BPS will increase the total station capacity to 4,800 gpm. The LPH BPS is shown in Figure 3.14 and current capacity details are summarized in Table 3.7.

Figure 3.14 LPH BPS

3.8.5 Lacamas Booster Pump Station

The Lacamas BPS, located at 4620 NW Sierra Street, pumps water from the 455 Zone to the 544 Zone. This station has two 25-hp turbine pumps that are capable of supplying 500 gpm each and one 100-hp turbine pump equipped with a VFD capable of supplying up to 1,500 gpm. The VFD is required for the largest pump due to suction side limitations. The Lacamas BPS is shown in Figure 3.15 and capacity details are summarized in Table 3.7.

Figure 3.15 Lacamas BPS

3.8.6 Angelo Booster Pump Station

The Angelo BPS is located at Fallen Leaf Park and is the primary BPS supplying the 455 Zone. It pumps from the 18-inch diameter transmission main in the 343 Zone to serve the 455 Zone and feeds the suction side of the Lacamas BPS. This station has four 75-hp split case double end suction pumps capable of pumping 1,000 gpm each. A selected well is called on with the first pump of the Angelo BPS to provide adequate suction side supply. If additional wells are called on to meet demand, a corresponding pump is also called on at the station to prevent over pressurization of the 343 Zone. The Angelo BPS is shown in Figure 3.16 and capacity details are summarized in Table 3.7.

Figure 3.16 Angelo BPS

3.8.7 Upper Prune Hill Booster Pump Station

The UPH BPS is located at 2822 NW 18th Avenue and is used to maintain level in the UPH Standpipe, which sets the HGL for the 852 Zone. This station has four pumps with two 20-hp split case double end suction pumps capable of providing 750 gpm each and two 40-hp split case double end suction pumps capable of providing 1,400 gpm each. The UPH BPS suction line is fed from the 2.4 MG reservoir. The 2.4-MG reservoir is fed from the LPH BPS. The UPH BPS is shown in Figure 3.17 and capacity details are summarized in Table 3.7.

Figure 3.17 UPH BPS

3.8.8 Crown Road Booster Pump Station

The Crown Road BPS is located at 3700 SE Crown Road and pumps from the 343 Zone to the 542 Zone. This station has three pumps capable of providing 800 gpm each for a total station capacity of 2,400 gpm. There is one pedestal open for an additional pumping unit within the station. When the station is called into service, a selected well is called on simultaneously to provide sufficient suction side supply. The Crown Road BPS is shown in Figure 3.18 and capacity details are summarized in Table 3.7.

Figure 3.18 Crown Road BPS

3.8.9 Green Mountain Estates Booster Pump Station

The GME BPS is the City's newest BPS and is located at 9046 N Hargrave Street. This station pumps from the 542/544 Zones to the GME Zone through three pumps capable of providing 180 gpm each and two fire pumps each capable of providing 650 gpm for a total station capacity of 1,840 gpm. This station is the sole source of supply for the GME Zone (closed zone), which has no storage instead utilizes a hydropneumatic tank to prevent constant cycling of pumps and maintain a constant discharge pressure downstream of the pumps. The GME BPS is shown in Figure 3.19 and capacity details are summarized in Table 3.7.

Figure 3.19 GME BPS

3.8.10 Francis Road Booster Pump Station

The Francis Road BPS is located at the intersection of 1514 NW 10th Avenue and NW Francis Road. This station was constructed in 1942 and has one 7.5-hp pump capable of supplying 80 gpm to a few customers in the 455 LPH Zone at higher elevations. The Francis Road BPS is shown in Figure 3.20 and capacity details are summarized in Table 3.7.

Figure 3.20 Francis Road BPS

3.9 Interties

The City currently has emergency intertie agreements with the City of Washougal and the City of Vancouver, which are detailed in Table 3.8. The City has two one-way emergency PRV interties with Washougal, located on SE Shepherd Road and at the intersection of SE 3rd Street and Whitney Street. These interties provide water from the City of Camas to the City of Washougal under low pressure conditions. The City's intertie with Vancouver is located at the intersection of SE Columbia Palisades Drive and SE Brady Road. Additionally, the City has an agreement for emergency use of two fire hydrants located at SE 1st and Friberg for firefighting purposes. Intertie locations are shown on Figure 3.21 and interlocal agreements are provided in Appendix C.

Table 3.8 Interties

Location	Other System	Flow Direction	Valve/Meter Size (inches)	Max Flow Rate (gpm)	Type of Service
SE Shepherd Road	City of Washougal	To Washougal	8 1.5	1500 gpm at 100 psi	Emergency
SE 3rd Street and Whitney Street	City of Washougal	To Washougal	8 1.5	1500 gpm at 100 psi	Emergency
SE Columbia Palisades Drive and SE Brady Road	City of Vancouver	To Vancouver			Emergency
SE 1st and Friberg	City of Vancouver	N/A	N/A	N/A	Emergency

Notes:
(1) Not a physical intertie. Agreement is for the emergency use of two fire hydrants owned/maintained by the City of Vancouver.

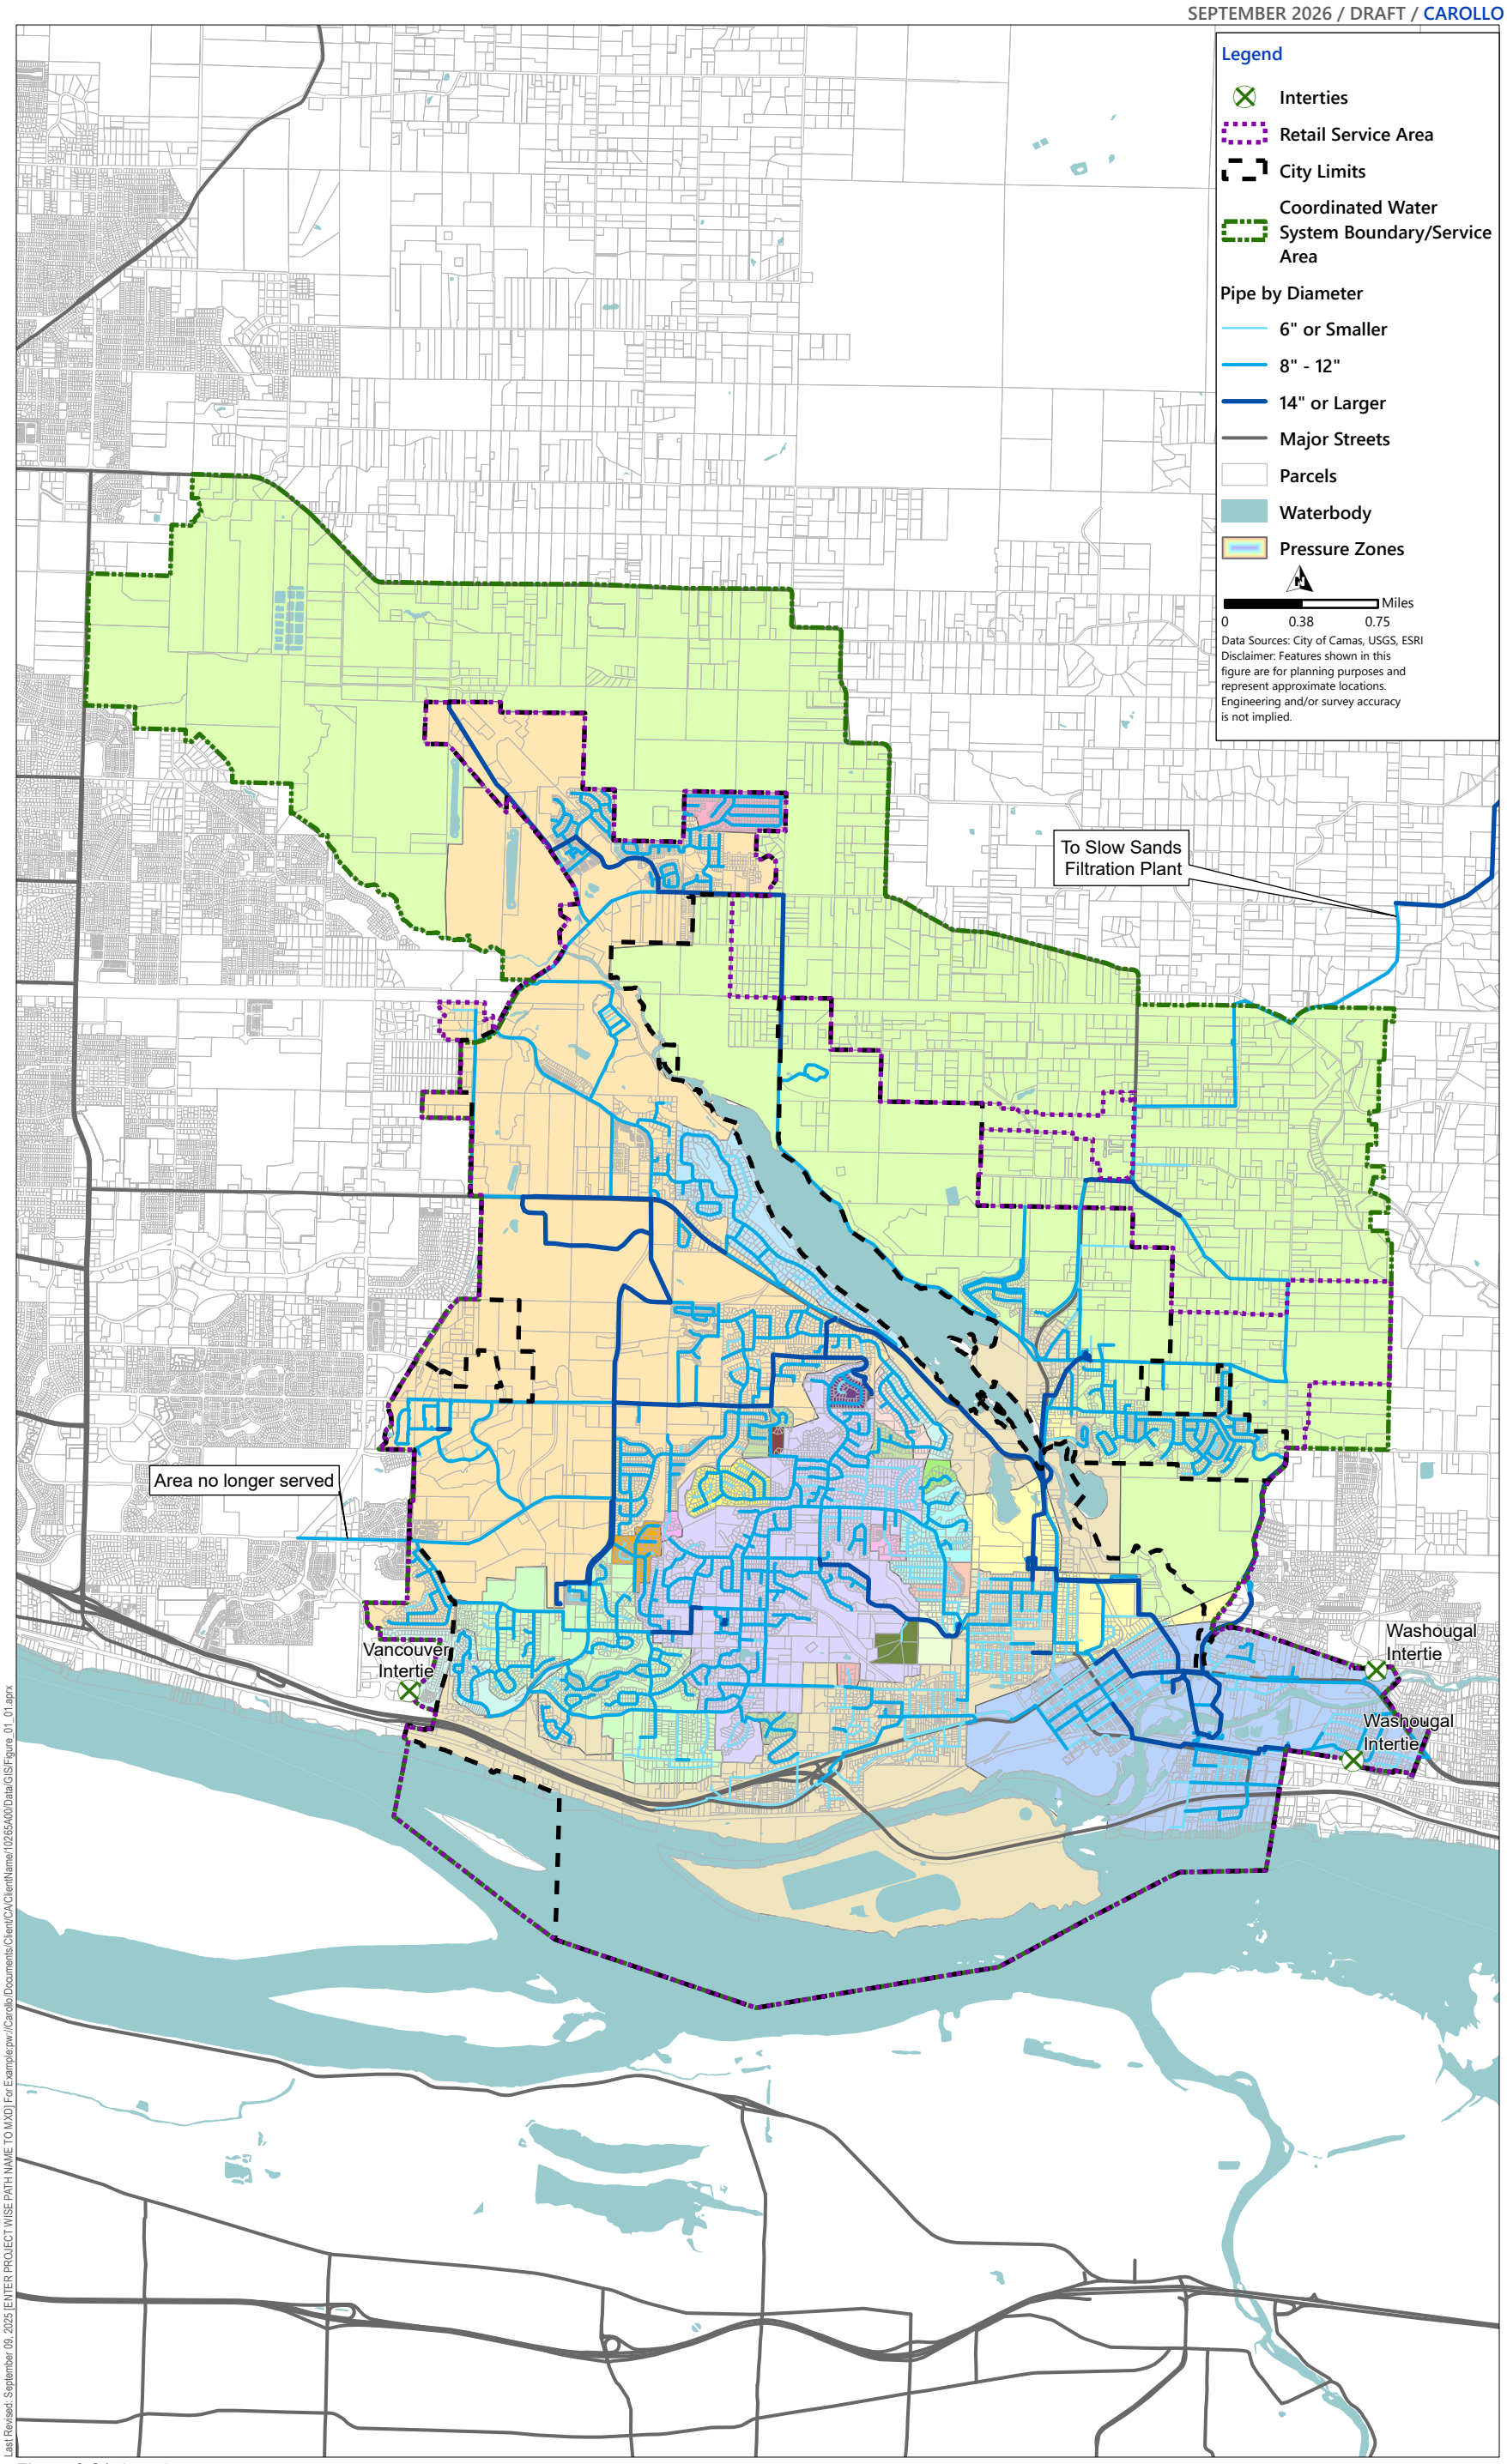

Figure 3.21 Interties

3.10 Supervisory Control and Data Acquisition

The City has a SCADA system with master control located at the City Operations Center. The system uses programmable control software, which can be controlled by a personal computer at the operations center, or from remote by a modem connected to a remote computer. The system monitors reservoir levels, well status, well flow rate, booster pump flow rates, pump status, run time, power usage, and alarm conditions. The system is able to record and display trending data for everything the City monitors. The City continually rotates well and booster pump calls to exercise the pumps and to evenly distribute wear on the pumps.

CHAPTER 4 OPERATION AND MAINTENANCE

4.1 Water System Management and Personnel

The water system is operated and maintained by the City staff, with contractor-provided services that City staff are not trained or equipped to perform. The organization of the City's water utility is shown in Figure 4.1. This section includes a brief discussion of the responsibilities of positions in the Public Works Department.

The City is governed by a mayor and seven council members, all of which are elected officials. The Public Works Director reports to the mayor and council and directs the City's utilities, including water. The City's organization combines water and sewer operation to furnish domestic water and sanitary sewage disposal service to industrial, commercial, and residential areas within the City and surrounding areas. The following subsections discuss the roles and responsibilities of the water system personnel.

4.1.1 Public Works Director

The City's water system is operated by the Public Works Department. The Public Works Director is responsible for overseeing Camas' water, sewer, and solid waste services. The Engineering Manager, Operations Manager, and Utilities Manager all report to the Public Works Director.

4.1.2 Capital Engineering

The City's Capital Engineering Department is lead by the Engineering Manager and is responsible for engineering services, including capital planning, project implementation, development review, construction management, and operational support. Field engineering support is supplied by both City staff and contracted private parties such as engineering consultant firms.

4.1.3 Utility Manager

The water system is one of several utilities within the Public Works Department that is managed by the Utilities Manager, who reports directly to the Public Works Director. The Utilities Manager is responsible for the management of the operation and maintenance of the City's water supply, water treatment, water distribution, wastewater collection, and wastewater treatment systems. For the City's water supply system, the Utility Manager has budgetary responsibility and directs the Lead Water System Operator in carrying out daily operations and maintenance, water quality monitoring, and asset management and facility inspection. The Utilities Manager works with the Engineering Manager to develop the City's Water System Plan (WSP) and supports engineering design review. The Utilities Manager is also responsible for all aspects of the water system during an emergency, including damage assessments, assessing customer impacts, coordinating with jurisdictional public health agencies and adjacent water utilities, keeping the public and media informed through the Director of Communications and Public Affairs, and working with the Public Works Engineering Manager for design and construction services required for repair and recovery operations.

4.1.4 Water System Operators

The Water System Operators perform all field maintenance and operation functions for the City's water utility. The Water System Operator responsibilities include the operation, maintenance, and repair of the following assets:

- Pump stations.
- PRVs.
- Reservoirs.
- Wells.
- Treatment systems.
- SCADA systems.

Further responsibilities include, but are not limited to, the following water system activities:

- Main flushing.
- Tank and reservoir cleaning.
- Valve and hydrant maintenance, repair, and replacement.
- Leak detection and emergency water main repairs.
- Meter reading and repair.

4.1.4.1 Cross-Connection Control Specialist

The CCS performs inspections of construction projects and existing facilities to ensure compliance with specification and standards for cross connection control. They perform recordkeeping to ensure that state regulations are met, and results are compiled to meet the appropriate department's standards. As a secondary focus, the CCS performs construction, maintenance, and repair of the City's water distribution system.

4.1.4.2 Water Quality Specialist

Within the water division a water system operator is assigned responsibility for source and distribution water quality monitoring. The responsibilities for water quality monitoring for routine compliance sampling and testing are outlined in the O&M manual. Other responsibilities include water quality data verification, reporting to the DOH, and conducting sanitary surveys. Positive coliform events of the water system require the water quality monitoring operator to follow procedures as outlined in the Emergency Response Plan in Appendix **[D]**.

4.1.5 Emergency Public Communication

The City's Director of Communications and Public Affairs is the designated media contact. Additional responsibilities include issuing a health advisory as part of a Tier 1 public notice during an emergency.

4.2 Operator Certification

The City's operators are experienced and well trained, exceeding the minimum state requirements (WAC 246-292-050). As a Class 3 system (population between 15,000 and 50,000 people) the City is required to have at a minimum, a Water Treatment Plant Operator (WTPO) Level 3, a Water Distribution Manager (WDM) Level 3, and a CCS. The City certified operators are shown in Table 4.1. As staff changes, the Water Works Certification Board is notified of any changes to the mandatory or supporting certificated personnel.

4.2.1 Professional Growth and Training

Public Works Leads and administrative staff ensure operators receive the necessary training and continuing education to effectively operate the water system. The City provides opportunities for staff professional growth and training; planning for approximately 25 hours per year of professional growth and training for each employee. Through these activities, City staff are able to obtain the required continuing education unit (CEU) requirements for their operators' certifications. City staff are regular attendees of training programs sponsored by both Washington Environmental Training Resources Center and the Pacific Northwest Section of the American Water Works Association (AWWA). The professional growth requirement may also be met by advancement by examination or certification by examination to a different classification.

Table 4.1 Certified Operators

Name	Title	Certification			
		WDM	WTPO	Certificate Number	CCS
Brandon Prather	Lead	3	2	11124	Yes
Derek Engler	Senior	2		11703	No
Allen Nelson	Water Operator	4	3	8187	Yes
Will Weglege	Senior	2	2	12451	No
Henry Erickson	MW2	2		11540	Yes
Nick Mettler	CCS	2		16006	Yes

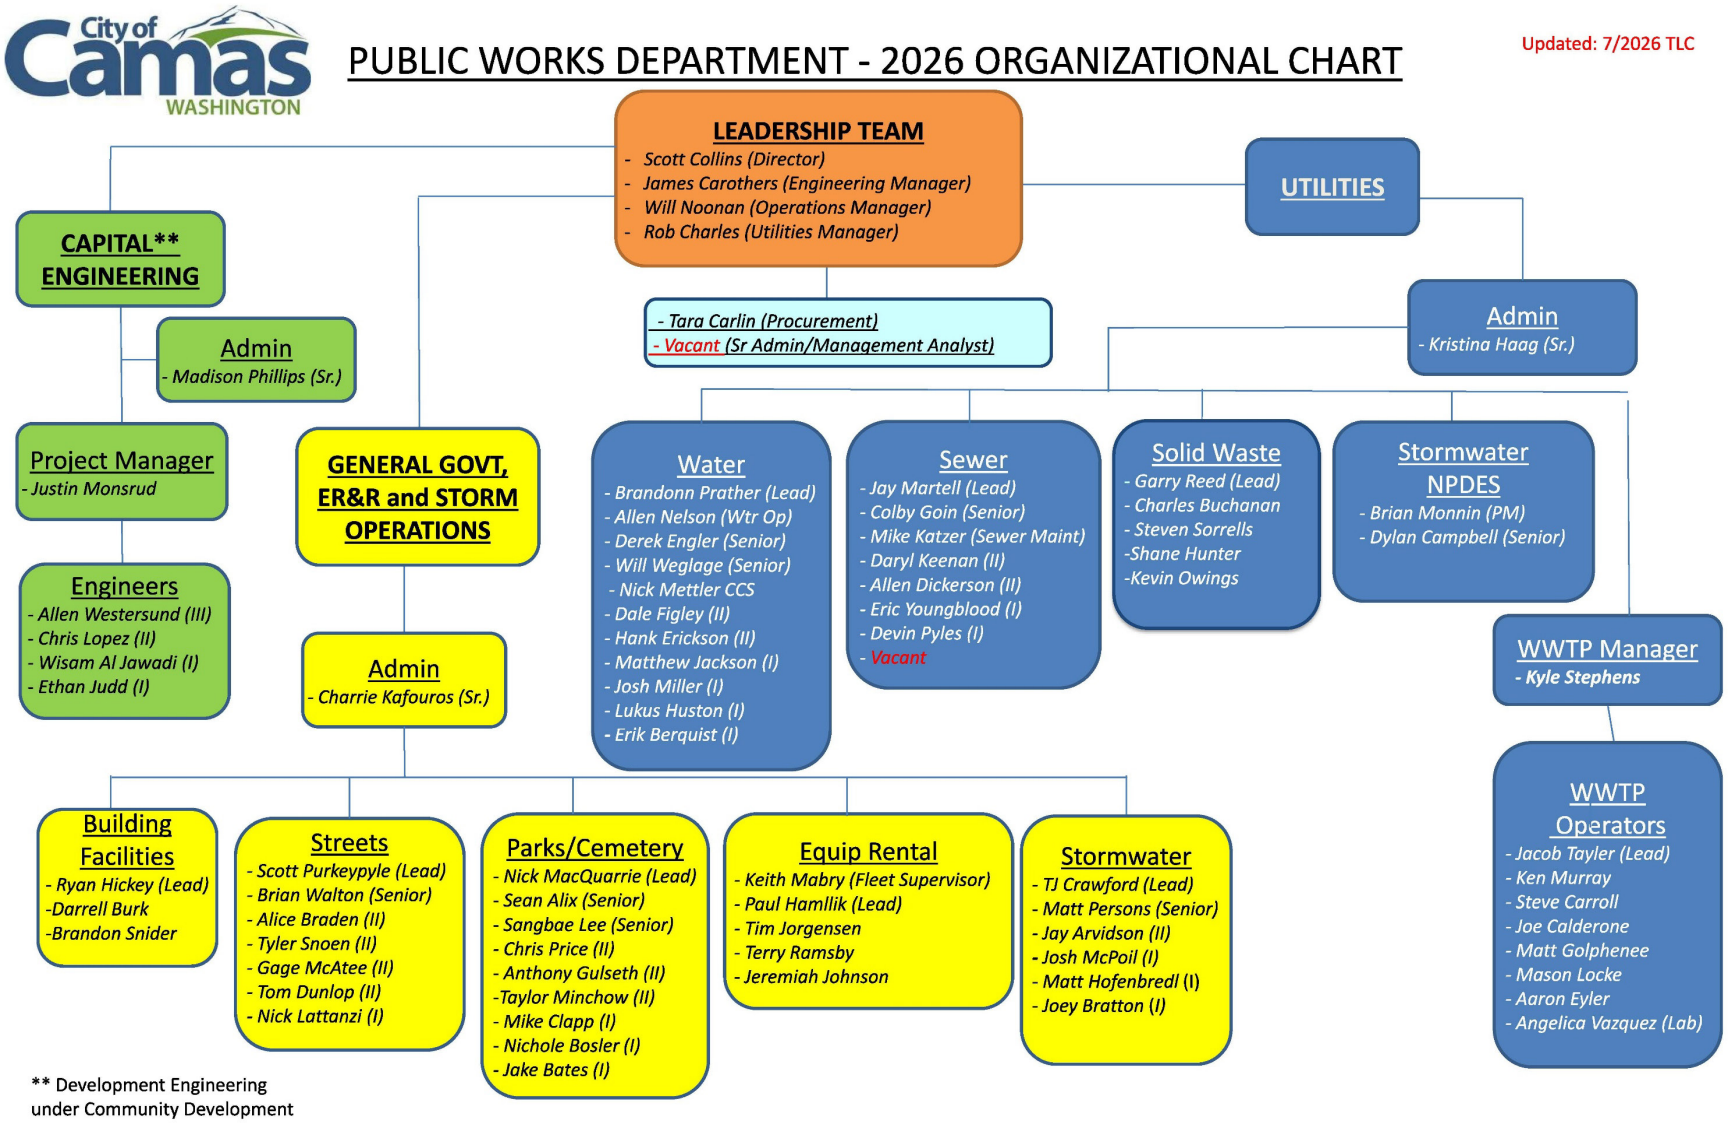

Figure 4.1 2026 Organizational Chart

4.3 Customer Complaint Response Reporting

Customers interact with the City through a variety of methods. Customer service representatives are available by phone and through an online Utility Service Request system on the City's website. Customer service agents are trained to answer typical questions and route service requests (complaints) to the appropriate department (Operations, Finance, Engineering, etc.). Calls are tracked by customer service agents, and the resulting activities are documented in the maintenance management system if a work order is issued. The finance department also tracks billing-related requests.

City operators also routinely interact with customers during maintenance activities. Often, these interactions are directly related to ongoing system maintenance such as hydrant flushing, and customer inquiries or concerns are resolved on the spot. Operators direct additional requests to customer service representatives, as needed. The Utilities Manager is responsible for responding to more complex and time-sensitive customer complaints.

4.4 Record Keeping and Reporting

The City maintains detailed records of the water system. Substantial record keeping activities are required to record and report customer water usage, water production, water quality information, and maintenance activities. All recordkeeping and reporting follows DOH regulations as specified in WAC 426-290-480.

The City's Finance Department is responsible for billing customers for water use. The billing records include customer account data for classes of customers, water use, billing, service, and comments. Water production for the City's surface water sources and wells are tracked in real time via SCADA, which maintains approximately a year of historical data. Operators record production daily and report the production monthly to DOH. Based on these records and water consumption records, the City develops and submits an annual WUE Report to DOH.

The City conducts substantial water quality testing, as summarized in Chapter 7. Hard copies of the water quality laboratory reports from the testing are kept at the City. In addition, analytical laboratories also submit reports directly to DOH. This data is summarized annually in the City's consumer confidence report that is available on its website.

The City maintains a maintenance management system to manage work order requests and document maintenance activities. Historically, the City has recorded work efforts on hard copy maintenance cards that are available for reference to City staff.

The City submits all required construction completion reports to DOH. Construction completion reports for distribution main projects are maintained on file at the City and are available upon request by DOH.

4.5 Routine System Operating Procedures and Preventative Maintenance

Basic system operation and major system components are described in Chapter 3 - Existing System and Chapter 9 - System Analysis. Detailed documentation of the system operation procedures and preventive maintenance can be found in the City's O&M Manual. The manual provides detailed information on operator certification and training, water quality monitoring, operation and control, cross-connection

control, and emergency planning/response. Routine operating procedures and preventative maintenance aspects of the O&M Manual are summarized below.

4.5.1 Routine Operating Procedures

The City is updating its O&M Manual in 2026 to reflect recent changes in the system and capture the institutional knowledge of retiring operators. The O&M Manual provides the following types of operation and control information for wells, reservoirs, pump stations, and pipelines:

- Facility/process components, such as booster pumps, SCADA telemetry, valves, chemical metering pumps, storage tanks, etc.
- Description of facilities/processes, including area served and relationship to other facilities/processes.
- Operation and control, including set points and chemical usage guidelines.
- Guidance on performing maintenance activities such as cleaning, pump isolation, and meter/pump calibration.
- Alarm responses.
- Emergency operation, including use of safety equipment (i.e., emergency showers and eyewash, etc.) and facility operations on auxiliary power.

To aid in accessing the detailed information, the O&M Manual provides annotated pictures identifying all facility equipment.

A hard copy of the O&M Manual is kept at the City's operations center and is available electronically on the City's network. The slow sand filtration plant operations and control are documented in a separate O&M Manual that is kept onsite at the plant and available electronically on the City's network.

4.5.2 Preventative Maintenance

The City staff are responsible for daily operation of the City's surface water sources, wells, treatment facilities, booster stations, PRVs, storage facilities, and distribution system. In addition to daily operation, they also perform preventative maintenance on the system based on City goals. These preventative maintenance goals help the City maintain its assets at an acceptable level of risk, while meeting the City's desired level of service goals. An activity's complexity and level of effort is generally greater the less frequently it is performed. Daily and weekly activities can likely be completed in an hour or less. In general, activities are intended to be grouped (i.e., weekly, semi-weekly, monthly, and quarterly during a single visit) to reduce inefficiencies in travel and site setup (i.e., traffic control at PRVs, etc.). Some activities may take several days and require specialized contractors.

Daily preventative maintenance focuses on inspections of the general condition and function of the facilities and maintaining and recording chemical levels. Frequency of inspections is based on industry practices and professional judgement. Weekly and monthly maintenance activities include more detailed inspections and cleaning of assets, as well as maintenance of the surface water sources. Annual preventative activities include basic maintenance of equipment (i.e., oil and filter changes, exercising infrequently used valves and pumps, cleaning cooling systems on generators, etc.). All activities are completed to the extent possible based on available staff and resources. A more detailed description of the preventative maintenance activities is provided in Appendix **[E]**.

4.6 Facility Maintenance

A high-level condition assessment was prepared for the City's water system facilities in 2016. The assessment included review of information for the existing facilities and inspection of the facilities on January 5 and 6, 2016. The assessment included each supply well and BPS. The City's storage reservoirs, PRV stations, and piping were not included in the assessment.

4.6.1 Booster Pump Stations and Supply Wells

Overall, the City's BPSs and supply wells were found to be in generally good condition. The facilities have been well-maintained with regularly scheduled maintenance and CIP work being performed. Electrical equipment conditions were the most common deficiency observed, primarily due to equipment age.

Table 4.2 lists the projects identified in the 2016 condition assessment that have been completed in the years following.

Table 4.2 Completed CIP Projects from 2016 Condition Assessment

Asset	Project Description	Year Completed
Well No. 6	Replace starter cabinet and RTU	2018
	Well casing, motor, and pump rebuild	2026
Well No. 7	Replace well pedestal grout and install two additional anchor bolts	2024
	Well casing, motor, and pump rebuild	2026
Well No. 8	Replace starter cabinet	2024
	Well casing, motor, and pump rebuild	2024
Well No. 10	Well casing, motor, and pump rebuild	2025
Well No. 11	Well casing, motor, and pump rebuild	2025
Well No. 12	Well casing, motor, and pump rebuild	2025
Well No. 13	Well casing, motor, and pump rebuild	2022
Lower Prune Hill BPS	Replacement	2026
Washougal Wellfield	Chlorine generator replacement	2017
Lacamas BPS	Motor and IR testing	2026

Notes:
RTU - remote terminal unit.

In addition to the improvements noted above, the City constructed the Green Mountain Estates BPS in 2022.

4.6.2 Reservoirs

The City has previously assessed the condition of its reservoirs for the 2010 WSP. The City's reservoirs are generally in good condition. The Butler Reservoir, the City's oldest reservoir, has reached the end of its usable life. The City intends to abandon the Butler Reservoir as soon as a replacement is constructed in the 343 Zone. The City's second oldest reservoir, the 0.5 MG reservoir at the Lower Prune Hill reservoir site was replaced in 2025 per the 2010 WSP's recommendation and is currently in service. Additional upgrades to the City's water storage systems include the new 2.0 MG 18th Avenue Reservoir constructed in 2020 and the implementation of cathodic protection to all steel reservoirs in 2023. Steel reservoirs require regular recoating and is considered routine maintenance.

4.6.3 Recommended CIP Summary

Not all projects identified in the 2016 condition assessment have been planned or completed as of August 2026. A list of the outstanding recommended projects is provided in Table 4.3. Improvement projects have been separated into BPS improvements, which are denoted "RP-" and supply projects, which are denoted "RS-". It should be noted that projects were identified for the Lacamas BPS but seeing as how the City intends to abandon the Lacamas BPS in the next 5-10 years, there does not appear to be much benefit in going through with these upgrades and has therefore be omitted from the CIP summary in Table 4.3. As seen in the table, the remaining condition assessment projects are anticipated to cost approximately $2.1 million. It is anticipated that future project designs will further revise the cost estimates and prioritization of projects. Costs for these projects have been incorporated into the miscellaneous facility projects annual program for reporting in the CIP, which is shown in Chapter 10.

The cost estimates presented in this section are opinions developed from bid tabulations, cost curves, information obtained from previous studies, City estimates, and Carollo's experience on other projects. The cost estimates have been prepared for general planning purposes and for guidance in project evaluation and implementation. Final costs of a project will depend on actual labor and material costs, competitive market conditions, final project scope, implementation schedule, and other variable factors.

All costs are escalated from 2016 to 2026 dollars with a 5D Handy Whitman Index factor of 1.89. Cost estimates were developed using a Class 4 budget estimate, as established by the American Association of Cost Estimators. This level of estimate is used for budgeting and feasibility studies and assumes a 1 percent to 15 percent level of project definition. The expected accuracy range is -30 percent to +50 percent, meaning the actual cost should fall in the range of 30 percent below the estimate to 50 percent above the estimate.

Table 4.3 Outstanding Booster Pump Station and Well CIP Summary

Asset	Project ID	Project Type	Estimated Cost	Project Description
Butler BPS	RP - 1	Strategic Replacement	$100,000	Replace or refurbish pumps 1 and 2.
	RP - 2	Condition	$6,000	The motor starter(s) at the Butler BPS were recommended for replacement during the condition assessment.
	RP - 3	Condition	$4,000	The check valve(s) at the Butler BPS were recommended for replacement during the condition assessment.
Angelo BPS	RP - 4	Strategic Replacement	$180,000	Replace or refurbish pumps 1, 2, 3, and 4.
Crown Road BPS	RP - 5	Condition	$9,000	Remove vent caps and install new vent piping for the emergency generator's diesel tank as part of routine maintenance.
	RP - 6	Strategic Replacement	$260,000	Replace or refurbish pumps 1 and 2.
Upper Prune Hill BPS	RP - 7	Condition	$9,000	Add lateral support to the pump discharge header.
	RP - 8	Strategic Replacement	$380,000	Replace or refurbish pumps 1, 2, 3, and 4.
	RP - 9	Condition	$80,000	MCC and RTU require general maintenance.
Gregg BPS	RP - 10	Strategic Replacement	$275,000	Replace or refurbish pumps 1 and 2.
	RP - 11	Strategic Replacement	$105,000	Replace or refurbish pump 3.
Booster Pump Station Projects (RP) Total			**$1,408,000**	
Well 7	RS - 1	Condition	$40,000	Replace panelboard and starter cabinet.
Well No. 9(1)	RS - 2	Strategic Replacement	$100,000	Well casing, motor, and pump rebuild.
	RS - 3	Condition	$45,000	pH, Chlorine, Fluoride.
	RS - 4	Condition	$155,000	Replace Starter cabinet and RTU.
Well 11 and 12(1)	RS - 5	Condition	$12,000	Tie rods across flexible coupling at pump discharge to prevent flexing. Air release is locating on discharge header for wells 11/12 rather than for each well.
	RS - 6	Condition	$12,000	MCC requires general maintenance.
Well No. 14(2)	RS - 7	Strategic Replacement	$100,000	Well casing, motor, and pump rebuild.
Washougal Wellfield Salt Storage Building(1)	RS - 8	Condition	$260,000	Replace existing storage building and provide anchorage for the two NaOH storage tanks.
Supply Projects (RS) Total			**$724,000**	
Total All Projects			$2,132,000	

Notes:
(1) Planned for 2027 or later.
MCC - motor control center.

4.7 Sanitary Survey

A sanitary survey of the City's water system was completed by DOH in January 2025. No significant deficiencies were identified. All recommendations and required submittals by DOH have been completed.

4.8 Emergency Response Program

The City has a Disaster Manual, which identifies the emergency response functions within the City using an "all hazards" approach. Within the City's emergency response framework, the City has developed a Water System ERP following a RRA according to AWIA requirements. The ERP defines risks, water system roles and responsibilities during an emergency, communication procedures, personal safety, alternative water sources, equipment replacement procedures, property protection procedures, and water sampling and monitoring procedures. The ERP also describes alternative system operations for the interruption of each major water supply facility (i.e., loss of a well, reservoir, or booster pump station). Further, it documents an incident specific response plan for major risks, such as drought, earthquake, flood, cyber-attack, etc. The ERP is provided in Appendix **[D]**). The sensitive nature of information included in the RRA necessitated its exclusion from the WSP; however, the RRA is on file with the City and DOH.

4.9 Cross-Connection Control Program

As required by WAC 246-290-490, cross-connection control, utilities have the responsibility to protect customers from water contamination due to cross-connections. A cross-connection is any actual or potential physical connection between a public water system or the consumer's water system and any source of non-potable liquid, solid, or gas that could contaminate the potable water supply by backflow. City Ordinance 10504 addresses cross-connections and their prevention, which can be found as part of the Camas Municipal Code under Water Use Regulations 13.32.

This ordinance and corresponding Municipal Code provide the City's water department the ability to protect the water supply from contamination by prohibiting cross-connections, requiring backflow prevention devices, establishing fees for the inspection of cross-connection assemblies, and adopting State standards for cross-connection regulations. The ordinance and corresponding Municipal Code provides procedures for the abatement of cross-connections and the installation of backflow prevention devices.

The City has four employees certified as cross-connection control specialists. The City's CCC program and records are continually updated and information on each cross-connection device are on file with the City. The Public Works Department and the Building Department coordinate notification to customers who have devices that need to be tested. The City's backflow program management software was upgraded XC2 to SAMS in 2019, which will allow for higher efficiency when entering test report data and sending notifications to water customers regarding their backflow devices.

Per WAC 246-290-490(8), all water systems must complete Annual Summary Report (ASR) forms documenting the status of the water system's CCC program and submit to the DOH upon request. The previous five years of water system ASRs are provided in Appendix **[F]**.

The City maintains the following information on file for its cross-connection control program:

- Date of last inspection.
- Results of inspection.
- Recommended protection.
- List of approved assemblies.
- Test and maintenance reports.
- List of certified testers.
- Customer account number, billing address, service address, phone numbers, device history and maintenance records.

The City's Cross-Connection Control Program requires the inspection of backflow prevention devices at the time of installation. These devices are also scheduled to be inspected annually after installation, after the device is repaired, after the device is relocated or reinstated, and as necessary if tests indicate repeated failure.

Owners of backflow prevention devices are notified by mail that their devices are due for inspection. Three notices are provided, with an example of the first backflow prevention postcard that is sent out to owners being shown in Figure 4.2. However, it is the responsibility of the customer to see that their device is tested. Failure to provide the City with a backflow prevention device inspection report from a certified cross-connection control specialist within 30 days of the third notification will result in the customer's water service being terminated. This termination is then reported to DOH. The City's list of certified backflow testers as of 2025 is provided in Figure 4.3.

The CCS and assistant host an informational backflow booth at the City's annual Camas Days event to educate consumers. They answer questions regarding backflow and provide general knowledge to the public on the issues. Updated informational brochures with current contact information are distributed at the event, online, and at various City facilities. An example brochure is provided in Appendix **[G]**.

ANNUAL BACKFLOW TEST REMINDER

Public Works Department

First Notice: «LTR_Letter_Sent_Date »

Response due by: «LTR_Letter_Response_Date »

«Mailing_Address »

For service address: **«[Facility]Service Address (Full)»**

Camas Water Customer,

Our records indicate that you have a backflow prevention device(s) at the service address above for either lawn sprinkler irrigation or fire suppression. That backflow device listed below is **due or past due** for its annual testing. Please provide the City of Camas with the results of your test no later than **30 days** from the date of this letter.

«LTR_Assembly_List »

Per Washington State Law (WAC 246-290) and Camas Municipal Code (CMC) section 13.32, backflow prevention assemblies are **required to be annually tested** by a Certified Backflow Assembly Tester (BAT). A list of Certified BAT can be found on our website: cityofcamas.us
Please Note: Noncompliance can result in the City taking appropriate actions to protect the drinking water, up to and including terminating your water service to this address, according to Washington State Law, WAC 246-290-490.

4.10 Pipeline Repair and Replacement

The City currently has a modest water main repair and replacement (R&R) program to address O&M and capacity concerns as opportunities arise, such as during redevelopment or in conjunction with other utility projects. While much of the City's distribution system was constructed after 1990, the distribution piping near downtown was constructed in the 1950s and early 1960s and is expected to begin reaching the end of its useful life during the next 20 years.

Useful life is the length of time that a pipe is anticipated to remain in service. Useful life depends largely on the pipe material, but can also depend on soil conditions, water constituents, and installation. When a pipe is in service beyond its useful life, the increasing costs of maintenance associated with a failing pipe typically exceed the cost of replacement. Useful life analyses do not predict exactly when and where failures will occur, rather it is a method to identify the pipes for inclusion in an ongoing R&R program.

Remaining useful life (RUL) is simply the period of time remaining before the end of useful life is reached. A pipeline replacement schedule can be developed by looking at the remaining useful life of all the pipes

in the distribution system. This replacement schedule is often reported in terms of average annual feet of pipe replacement over a ten-year replacement period due to limitations in historical installation records and difficulties in assessing the impact of environmental conditions and other factors limiting useful life. Within a given replacement period, pipes near or exceeding their useful life should be prioritized based on the criticality of the pipe to the system. For example, a large diameter transmission main or pipes that can be included in redevelopment or transportation projects may be a higher priority. By incorporating criticality, the City will be able to address existing priorities and adapt to changing priorities while maintaining an annual replacement program.

4.10.1 Pipe Material and Age

Pipe material was available from the City's records. The information was reviewed by City staff and recent replacement projects were incorporated into the data. The City does not have a reliable pipe age inventory. As a rule of thumb, pipes installed before or during the 1970s were classified as CI pipes installed after the 1970s were classified as DI pipe.

4.10.2 Useful Life

Useful life in combination with pipe age provides the basis for the RUL calculations. The estimated useful life of each pipe material based on industry standards and City staff knowledge, as presented in Table 4.4. The City chose a 75-year useful life for CI pipes, polyvinyl chloride (PVC) and steel pipes. Cast iron and steel useful life were conservatively selected at the lower end of the typical range. The PVC useful life is within industry ranges; however, it has little overall impact given less than 1 percent of the system is PVC. DI pipes were considered to have an 85-year useful life, which was the median of the industry range. It is important to note that the actual useful life of an individual pipe can vary widely due to soil, groundwater, and installation conditions. It is recommended that the condition of pipes being replaced be noted for consideration in future analyses, which will increase the accuracy of the useful life estimates.

Table 4.4 Useful Life of Pipes

Pipe Material	Useful Life (years)
CI	75
DI	85
PVC	75
Steel	75

4.10.3 Remaining Useful Life Analysis

RUL is defined as the length of time left before a pipe's maintenance costs will likely exceed its cost of replacement. The period of time between the end of the useful life and today is the RUL. For example, a DI pipe installed in 2000 has a useful life of 85 years, where it will reach the end of its useful life by 2085. From the current year, 2026, this DI pipe's RUL would be 59 years. Due to the limited pipe age information available, a thorough RUL analysis could not be completed. However, it is understood that much of the City's CI and Steel piping was installed prior to 1960 and therefore, based on the chosen useful life for these materials, are expected to reach the end of their useful life by end of the planning period (2046). It is recommended that all CI and steel piping, approximately 20 percent of the distribution system pipeline,

be replaced over the 20-year planning period. The majority of the City's DI and PVC pipe are not anticipated to reach the end of their useful life until after the planning period.

The pipe recommended for replacement represents the majority of the City's downtown and surrounding areas. Pipes reaching their RUL serve all types of customers, including commercial, industrial, and residential customers. Pipes that exceed their useful life will continue to provide service but are at a greater risk for pipe breaks and may have increased leakage. Therefore, replacement should be prioritized based on criticality to the system to best manage the aging distribution infrastructure within the City's available budget.

4.10.4 Pipeline Repair and Replacement Program

Over the 20-year planning period, the City should replace all the CI and steel piping. This amounts to approximately 20 percent of the entire distribution system, or 1 percent system replacement per year over the 20 years. Further discussion of the pipe replacement CIP is provided in Chapter 10. Additionally, small diameter mains (2-inch to 6-inch) should be upsized to 8-inch to meet current City standards. To gain economies of scale, the City should consider geographically concentrated projects that incorporate other utilities, such as sewer main R&R and roadway resurfacing.

4.11 Operations and Maintenance Improvements

The City has a well operated and maintained system. Condition assessments identified repair and replacement projects for above ground assets (i.e., pump stations, wells, and reservoirs, etc.). The majority of projects were necessary due to aging electrical equipment and normal replacement of pumps and motors. Having recently replaced the Lower Prune Hill reservoir, the Butler reservoir is the only other reservoir built prior to 1940 which has reached the end of its usable life and is due to be replaced. A PRV study conducted in 2024 identified various solutions to fire-flow deficiencies and PRV operational inefficiencies.

It is anticipated that the piping in Downtown and surrounding areas will begin to reach the end of their life in the short-term planning horizon (2026 to 2035). The City's long-term goal is to create a risk prioritized water infrastructure rehabilitation program that addresses above and below ground assets. However, at this time, the City's financial resources are focused on meeting the rapid growth occurring in Camas.

To gain economies of scale during the replacement, the City should consider geographically concentrated projects that incorporate other utilities, such as sewer main R&R and roadway resurfacing.

CHAPTER 5 WATER REQUIREMENTS

Projecting realistic future water requirements, i.e., demand, is necessary for planning infrastructure projects and securing adequate water supply to meet future growth. Future water demands are a key component of the water system analyses presented in this Plan and in the City's CIP. Accurate demand projections require a thorough review of historical water use, predicting where and how much growth will occur, and estimating the future water use for existing and new customers.

Historical data provides the City's unique water use over a long period of time, which captures the range of water use due to weather, economic conditions, conservation practices, and other factors. This Chapter presents an analysis of historical water use from 2017 to 2024 based on customer billing and production records. This data provide information on the City's different types of customers, as well as water use parameters on an average annual basis, seasonally, and for the maximum day. Historical water use patterns and parameters were established from these data to predict future water use for existing and new customers.

The City's draft 2045 Comprehensive Plan was used to predict where and how much demand will occur in the water system. The number and type of future customer accounts were determined based on developable vacant parcels and future land use. The resulting future accounts were converted to projected demands using the historical water use patterns and parameters.

Demand projections were generated for the planning period of 2026 to 2046 for the City's established RWSA. The projections were divided into three planning scenarios:

- Short-term, 5-year (2027-2031).
- Medium-term, 10-year (2032-2036).
- Long-term, 20-year (2037-2046).

Dividing the planning period into three scenarios aids in the development and phasing of improvement projects and the CIP, as well as being consistent with DOH requirements.

Demand projections were expressed as ERU, average day demand (ADD), and MDD. One ERU is defined as the average quantity of water beneficially used by one average, full-time, single-family residence (SFR) per day. The quantity of water used by other customer classes, and by the whole system, can be expressed in terms of ERUs. The ADD is typically used in operational evaluations. It is calculated by dividing the total water produced by the number of days per year (2020 and 2024 were leap years and include 366 days per year). The MDD represents the single largest day water demand during the year and is a key parameter for infrastructure sizing.

Changes in water use, conservation activities, system growth, and other factors may result in higher or lower than projected water use. Planning for the potential changes allows the City to better manage potential risks from these changes. For example, lower than projected water use may be a concern for the City's financial planning, while higher than projected water use may be a concern for water supply planning. Therefore, three demand scenarios were developed: low, medium, and high demand scenarios. The low demand scenario represents future demand with conservation; the high demand scenario generally reflects the highest demands in the last eight years; the medium demand scenario is a

conservative projection between the low and high projections. Details on the historical water use, demographic projections, and demand calculations used to develop these projections are presented in this Chapter.

5.1 Historical Water Use

Historical water use data, i.e., consumption data, was obtained from City records to characterize the demands of the City's customers. Annual water use data for the years 2017 to 2024 were used to develop historical demand patterns and parameters, which represent current and expected future water use. Two key demand parameters were generated from the data: typical water use per customer class, and typical water use per ERU. These parameters were used as the basis of future demand projections.

5.1.1 Historical Accounts

The City customers were divided into seven customer classes. These customer classes are:

- Accessory Dwelling Unit (ADU) Shared.
- City Accounts.
- Commercial.
- Industrial.
- Irrigation.
- Multifamily Residential (MFR).
- SFR.

The number of accounts for each customer class is summarized in Table 5.1. As seen in the table, SFR makes up approximately 91 percent of accounts. The total number of accounts has increased by approximately 21 percent from 2017 to 2024 due to growth and development in the City.

Table 5.1 Historical Number of Accounts by Customer Class

Year	SFR	MFR	Commercial	Industrial	City	Irrigation	ADU Shared	Total
2017	7,539	334	239	30	45	96	8	8,291
2018	7,730	332	249	30	46	109	13	8,509
2019	8,147	337	248	27	46	106	14	8,925
2020	8,489	352	253	24	46	106	15	9,285
2021	8,877	354	264	24	50	121	16	9,706
2022	8,974	356	268	23	48	106	18	9,793
2023	9,031	357	273	22	49	121	22	9,875
2024	9,191	356	272	22	50	122	21	10,034
Average Annual Growth Rate	2.9%	0.9%	1.9%	-4.3%	1.5%	3.5%	14.8%	2.8%
Average Percent per Class	91.3%	3.7%	2.8%	0.3%	0.5%	1.2%	0.2%	100%

5.1.2 Large Users

The City's top 10 water users in 2024, herein termed "large users," were also evaluated in this study. The large users class includes the following customers:

- Taiwan Semiconductor Manufacturing Company (TSMC) Washington (formerly known as "Wafertech Industries").
- Analog Devices (formerly known as "Linear Technologies").
- Georgia Pacific Mill.
- Camas School District No. 117.
- City of Camas.
- Bodycote Industrial Metal Technology (IMT).
- Fisher Creek Investments.
- Hills at Round Lake Homeowner's Associate (HOA).
- Prestige Care and Rehabilitation.
- Clara Street Block Building.

These large users represent 34 percent of the total consumption; therefore, it is typical to separate them (number of accounts and consumption) from the rest of the system as to not skew any system-wide ERU values for these customer classes. Individual demand projections were developed for each large user to provide additional accuracy in the demand projections, as well as the system analyses. The development of the large user demand projections is detailed in Section 5.6.2.

5.1.3 Historical Consumption

The City's historical annual water consumption was provided for each customer class based on City billing data, as presented in Table 5.2 in units of mgd. The table also includes the average, 75th percentile, 3-year average, and maximum statistics on historical consumption. The SFR customer class has the highest water demand and the industrial class has the second highest water demand for all years.

Table 5.2 Historical Water Demand by Customer Class (mgd)

Year	SFR	MFR	Commercial	Industrial	City	Irrigation	ADU Shared	Total[(1)]
2017	1.85	0.11	0.13	1.21	0.10	0.23	0.003	3.67
2018	1.88	0.10	0.15	1.18	0.07	0.28	0.003	3.69
2019	1.80	0.10	0.15	1.07	0.07	0.24	0.004	3.45
2020	2.00	0.12	0.13	1.06	0.07	0.18	0.005	3.58
2021	2.31	0.14	0.17	1.15	0.10	0.28	0.005	4.17

3-Year Average (2022-2024)	**2.20**	**0.15**	**0.19**	**1.16**	**0.12**	**0.30**	**0.006**	**4.16**
Maximum	**2.31**	**0.16**	**0.21**	**1.22**	**0.19**	**0.43**	**0.007**	**4.33**

Notes:
(1) Totals may not equal due to rounding.

The average percentage of accounts and annual water consumption by customer class from 2017 to 2024 are presented in Figure 5.1 and Figure 5.2. Comparing accounts and water consumption illustrates the differences in water use between the customer classes. As seen in these figures, SFR customers represent 91 percent of the accounts yet only comprise 53 percent of the total consumption. By contrast, industrial customers represent less than one percent of the accounts, but account for 30 percent of the total demand. This difference in proportional water use was quantified by comparing the historical water use per account for each customer class (in Table 5.3), as described in Section 5.1.3.

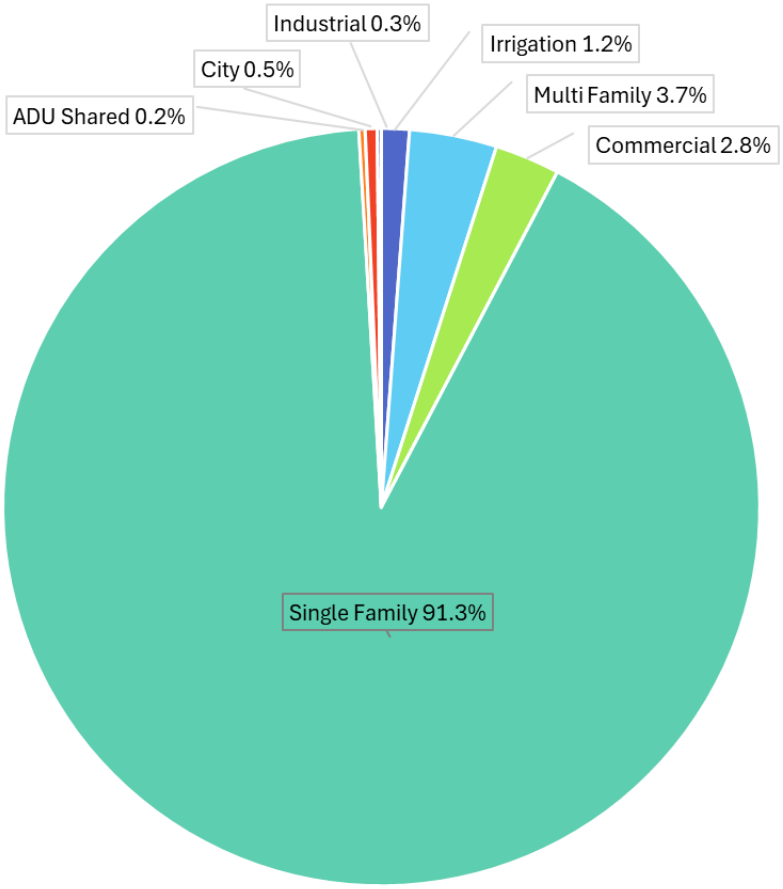

Figure 5.1 Average Number of Accounts by Customer Class

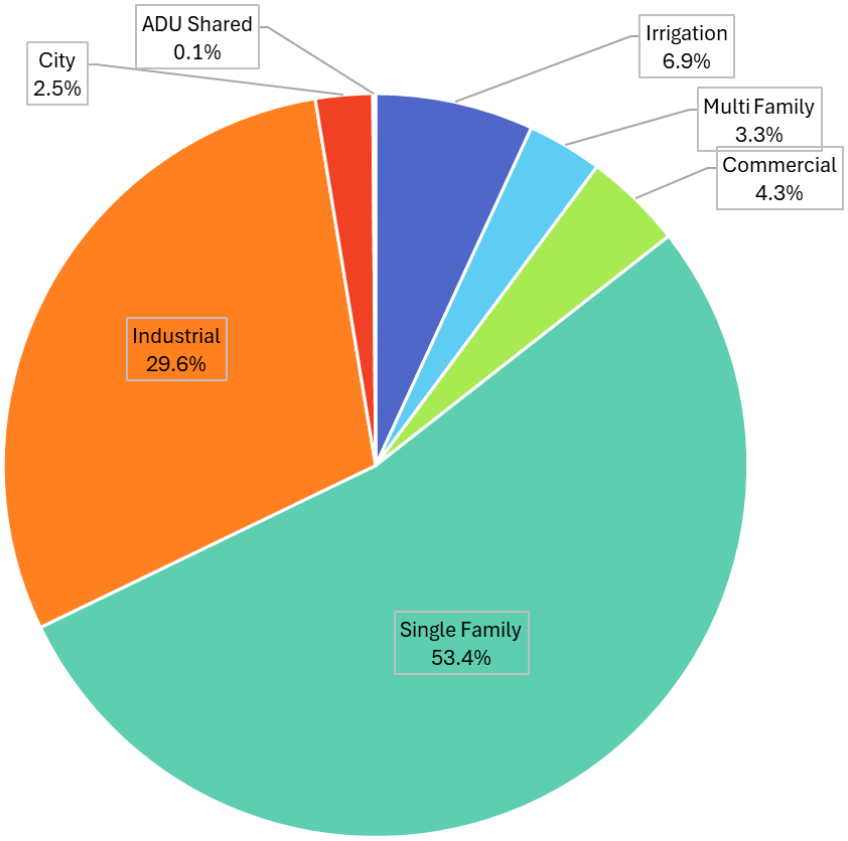

Figure 5.2 Average Amount Consumed by Customer Class

5.1.4 Water Use per Account and Equivalent Residential Units

The demand of each customer class can be expressed in terms of ERUs for forecasting and planning purposes. As discussed previously, one ERU is the amount of water consumed by a typical SFR. According to the Washington Administrative Code 246-290-010, non-residential customer water consumption is expressed as a multiple of SFR ERU. In this case, consumption data from 2017-2024 was used to establish the "single-family residence" ERU. Importantly, the ERU calculation is based on historical consumption (i.e., billing records) and therefore does not include distribution system leakage.

To calculate ADD water use per ERU, the total annual volume of water consumed by SFRs is divided by the total number of active SFR accounts. The resulting value, also called the ERU planning value, is the average SFR's annual water use per account. To determine the number of ERUs in other customer class, the volume of water used by those customer categories is divided by the ERU value.

Table 5.3 shows the historical annual average water consumption by customer class. The table also includes the average, 75th percentile, three-year average, and maximum consumption statistics. The 3-year average (2022 to 2024) quantity of water used by one typical, full-time SFR ERU is equal to 242 gallons per day (gpd). From 2017 through 2024, the 75th percentile of water consumption per ERU was 248 gpd.

Table 5.3 Historical Annual Water Use per Account (gpd/account)

Year	SFR	MFR	Commercial	Industrial	City	Irrigation	ADU Shared
2017	246	315	564	40,338	2,143	2,402	315
2018	244	309	611	39,230	1,459	2,541	198
2019	221	303	624	39,651	1,511	2,247	259
2020	236	338	520	44,258	1,487	1,677	303
2021	260	400	639	48,029	1,988	2,295	332
2022	232	387	628	53,183	1,657	2,082	286
2023	253	437	716	52,933	1,974	2,186	304
2024	242	399	778	50,262	3,711	3,507	297
Average	**242**	**361**	**635**	**45,986**	**1,991**	**2,367**	**287**
75th Percentile	**248**	**400**	**658**	**50,930**	**2,027**	**2,437**	**307**
3-Year Average (2022-2024)	**242**	**408**	**707**	**52,126**	**2,447**	**2,591**	**295**
Maximum	**260**	**437**	**778**	**53,183**	**3,711**	**3,507**	**332**
ERUs per Account(1)	**1.0**	**1.5**	**2.6**	**190.2**	**8.2**	**9.8**	**1.2**

Notes:
(1) ERUs per Account based on average of annual water consumption.

Compared to other Washington utilities evaluated by Carollo, the City's water use per SFR account appears slightly high, possibly indicating larger properties requiring irrigation or lower than usual replacement rates of high-flow appliances and fixtures. Additionally, the City's MFR water use per account appears low, possibly due to a higher percentage of low-density MFR accounts (such as tri-plexes or quad-plexes), or due to monitoring MFR irrigation demands in separate irrigation meters (under the "Irrigation" customer class).

Calculating the City's water use in terms of ERUs provides a means to express water use by non-residential customers as an equivalent number of SFR accounts. The ERUs per account for MFR and all non-residential accounts are obtained by dividing the average water use per account for each customer class by the ERU water use. For example, the average Commercial account uses approximately 2.6 times the water use of an average SFR account; therefore, each Commercial account is equivalent to 2.6 ERUs. Table 5.3 presents the average number of ERUs per account for each customer class based on average historical water use. The number of ERUs per account ranges from 1.2 for ADU accounts to 190.2 for Industrial accounts.

5.2 Seasonal Demands

The pattern of water consumption differs between the customer classes. Figure 5.3 presents average total monthly consumption by customer class from 2017 through 2024. Note that, with exceptions, the City has historically conducted bi-monthly meter reading; therefore, the water consumption was averaged between months to better reflect the actual water consumed in the month. As of June 2025, the City has started monthly reads. SFR and irrigation accounts show a significant peak in total consumption during the summer months. Water use increases significantly during the summer when daylight hours are longer, and lawn and landscape watering is prominent. Other outdoor uses, including car washing and recreation, are also at their highest during summer months. By contrast, industrial users do not demonstrate significant seasonal variation in demand. These monthly variations in demand for each customer class can be used to target water use efficiency efforts and/or to project future water-use patterns for planning purposes.

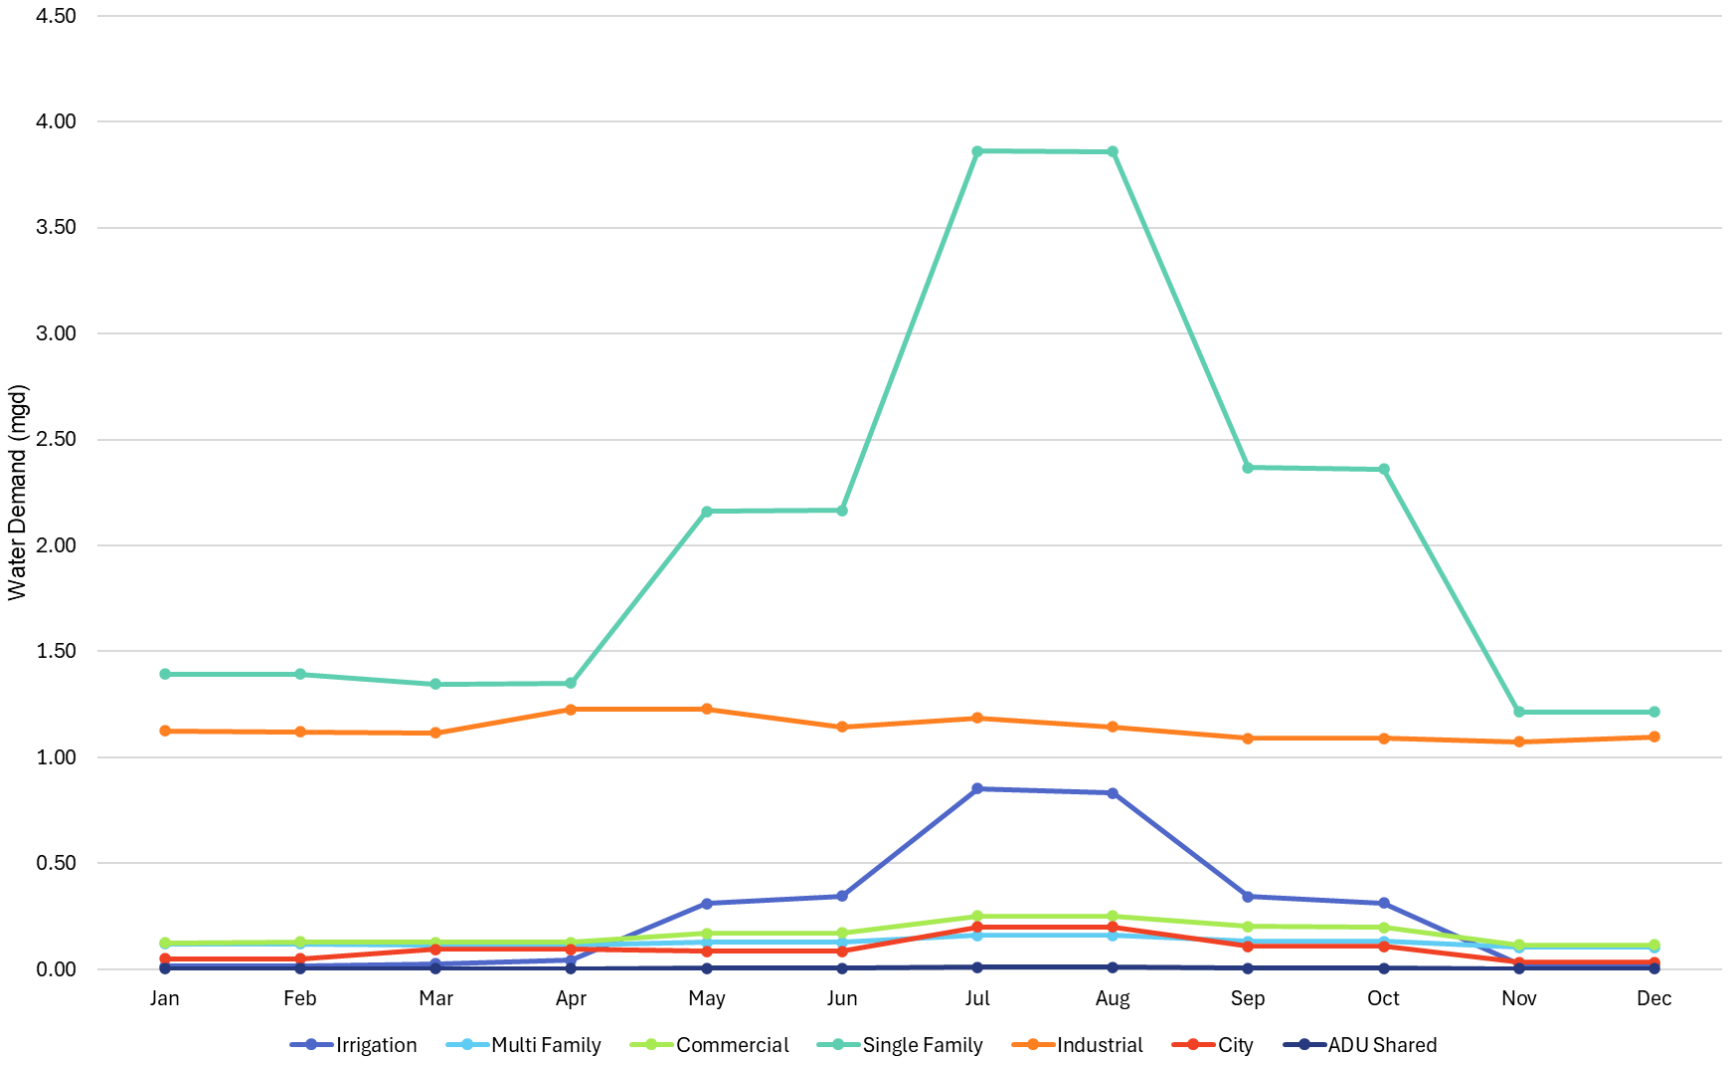

Figure 5.3 Average Seasonal Demand by Customer Class

5.3 Historical Production

The historical average and maximum water demands are important parameters when performing system and supply analyses. The term "water demand" refers to all the water requirements of a system including metered customers, unmetered water use, and unaccounted-for water such as leakage. For this reason, the City's production data, which accounts for all water demand, was used to calculate the ADD and MDD for each year. Additionally, historical production allows the City to track system-wide demands on a daily basis, rather than monthly or bi-monthly as is the case with billing records. Note that as of June 2025, the City has started monthly reads. Table 5.4 lists the historical annual production from 2017 through 2024. As shown, the annual production ranged from 1,448 million gallons (MG) to 1,729 MG.

5.3.1 Distribution System Leakage and Non-Revenue Water

DSL is equal to the total water produced minus the total authorized consumption. Aging water infrastructure leads to real losses such as water main breaks, reservoir leaks or overflows, and general distribution system leakage. It is important to note though that DSL includes apparent losses other than leakage as well, such as data handling errors, water theft, meter inaccuracy or failure, and untracked authorized water use. Authorized Non-Revenue Water that is not metered by the City contributes to the DSL as well.

The City's total water production and consumption in millions of gallons, or MG, as well as estimates of DSL for 2017 through 2024 are shown in Table 5.4 and presented graphically in Figure 5.4. The City's average annual DSL over the three-year period from 2022 to 2024 was 10.3 percent. There is a slight discrepancy in the DSL calculated from the historical billing records and the value reported on the Water Use Efficiency reports submitted annually to DOH. In early 2025, the City transitioned to a new data management and billing software, Tyler Technology's Utilities Pro, to improve data quality, management, and reporting. While the two sources are generally consistent, minor differences are present, which are likely due to errors introduced during the transition of historical data to the new software or to the timing of report preparation and subsequent revisions made to ensure accuracy.

Table 5.4 Historical Distribution System Leakage

Year	Historical Billing Data[1]				Annual Water Used Efficiency Reports[2]			
	Total Production (MG)	Total Consumption (MG)	DSL (MG)[3]	DSL (%)	Total Production (MG)	Total Consumption (MG)	DSL (MG)	DSL (%)
2017	NA	1,338.8	NA	NA	1,493.4	1,339.0	154.4	10.3%
2018	1,541.2	1,346.5	194.7	12.6%	1,545.9	1,348.9	197.1	12.7%
2019	1,447.6	1,259.6	188.1	13.0%	1,447.6	1,253.3	194.3	13.4%
2020	1,537.3	1,309.0	228.3	14.9%	1,537.3	1,314.8	222.5	14.5%
2021	1,729.0	1,522.0	207.0	12.0%	1,733.0	1,478.4	254.6	14.7%
2022	1,639.4	1,439.5	199.9	12.2%	1,639.4	1,406.0	233.4	14.2%
2023	1,699.2	1,530.3	168.9	9.9%	1,699.2	1,524.2	175.0	10.3%
2024	1,697.5	1,547.2	150.3	8.9%	1,697.5	1,540.9	154.6	9.2%
Average				**11.9%**[4]				**12.4%**
3-Year Average (2022-2024)				**10.3%**				**11.2%**

Notes:
(1) Historical production and consumption data were calculated based on the data provided by the City in July 2025.
(2) Historical production and consumption shown are based on the Water Use Efficiency report submitted to Washington's Department of Health (DOH).
(3) Distribution System Loss (DSL) was determined by subtracting total consumption from total production.
(4) 2017 Water Total Production was not provided for this analysis, therefore the DSL's average percentage excluded the year of 2017.

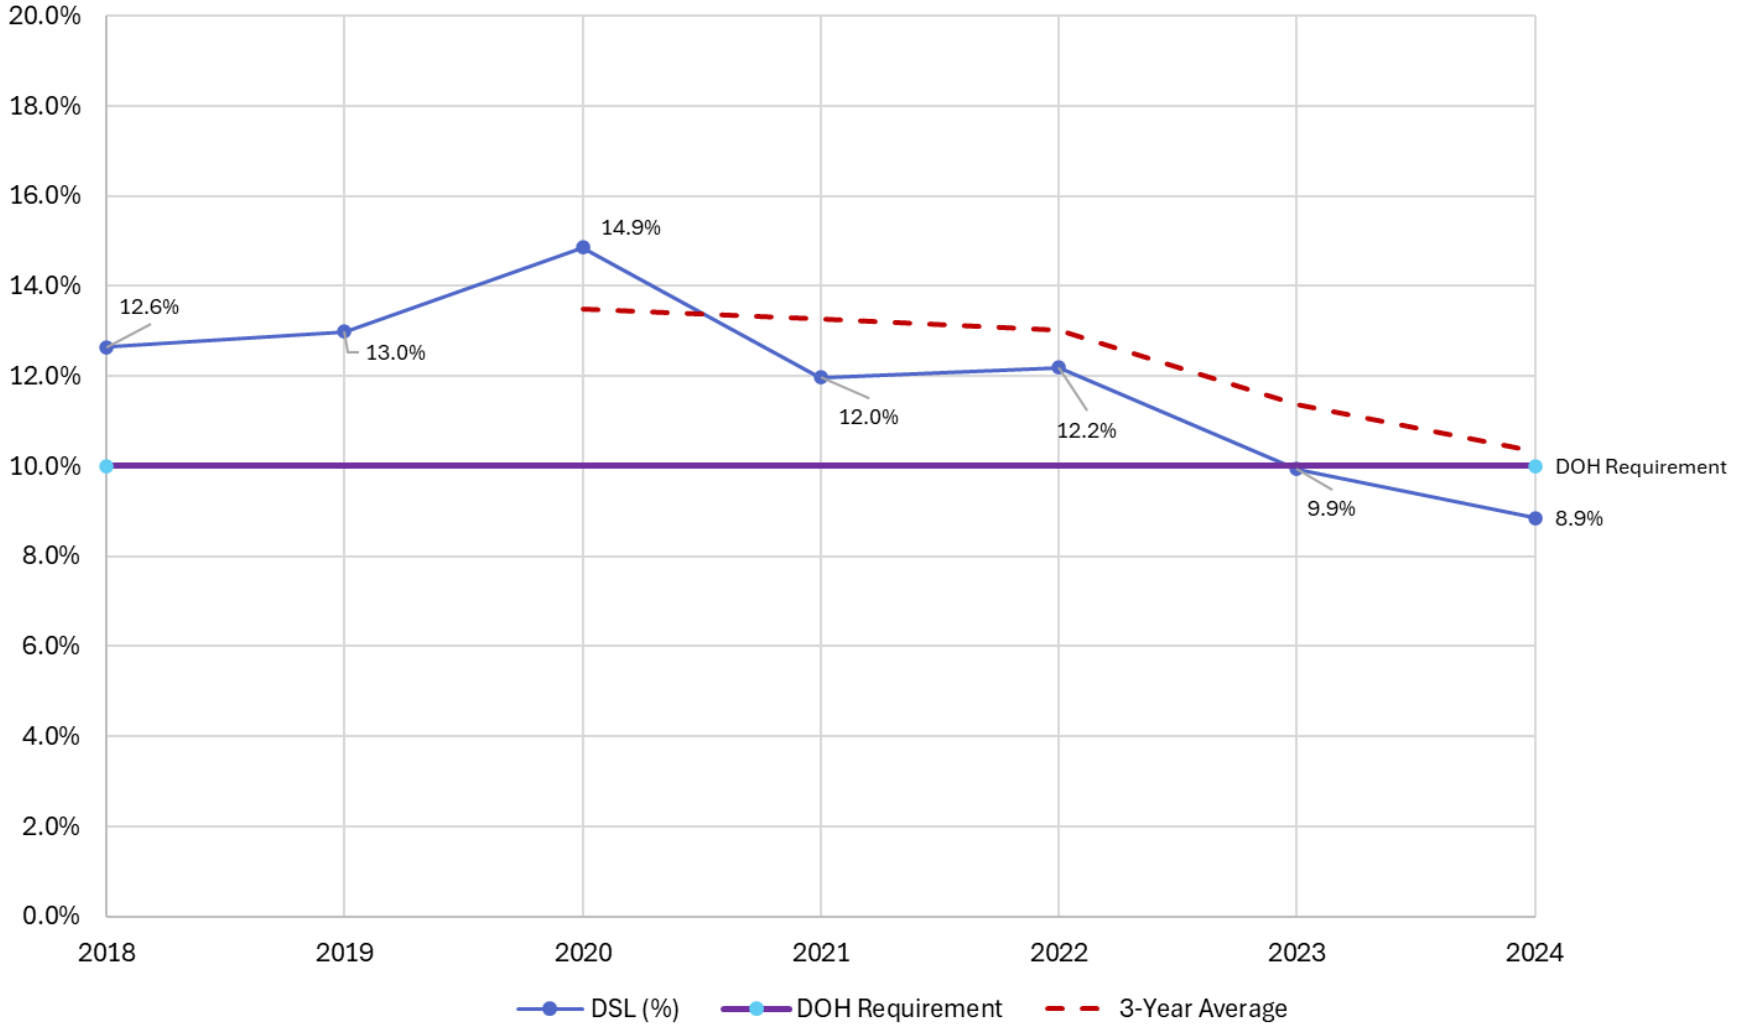

Figure 5.4 Historical Distribution System Leakage Trend

5.3.2 Historical Average and Maximum Demands

The City produces water for its customers through ten wells and two surface water sources. Table 5.5 presents the ADD and MDD (based on production) for the period of 2018 through 2024. The average annual water produced from 2018 through 2024 was 1,613 MG per year. The average ADD over the period was 4.42 mgd. The annual ADD trends increases slightly over this period, reflecting the growing number of City water customers.

Table 5.5 Historical Average Production, Maximum Day Demand, and Peaking Factor

Year	Date of MDD	MDD (mgd)	MDD without Top 2 Large User	ADD (mgd)	ADD without Top 2 Large Users	MDD:ADD Peaking Factor with Top 2 Large Users	MDD:ADD Peaking Factor(1)
2018	July 28	8.3	7.2	4.2	3.3	2.0	2.2
2019	July 15	7.7	6.6	4.0	3.0	1.9	2.2
2020	August 16	8.7	7.5	4.2	3.3	2.1	2.3
2021	July 29	9.3	8.1	4.8	3.8	2.0	2.2
2022	July 29	8.8	7.5	4.5	3.5	2.0	2.2
2023	August 21	8.8	7.6	4.7	3.7	1.9	2.1
2024	July 8	10.2	8.9	4.7	3.6	2.2	2.5
Average		**8.8**	**7.6**	**4.4**	**3.4**	**2.0**	**2.2**
3-Year Average (2022-2024)		**9.3**	**8.0**	**4.6**	**3.6**	**2.0**	**2.2**
75th Percentile		**9.3**	**8.1**	**4.7**	**3.7**	**2.1**	**2.3**
Maximum		**10.2**	**8.9**	**4.7**	**3.8**	**2.2**	**2.5**

Notes:
(1) Peaking factor excludes large user demand. Large user demands were removed from both MDD and ADD values to calculate the peaking factor.
(2) Totals may not equal due to rounding.

The MDD is a key benchmark for supply capability, pump station discharge rates, reservoir capacity, and pump sizes. The MDD is the highest daily production in a given year and typically occurs during the summer when irrigation is prevalent. Table 5.5 presents the historical MDD from 2018 to 2024. MDD is less dependent on indoor water use (which drives the ADD), and more dependent on irrigation. The highest MDD value (10.2 mgd) occurred in 2024, which had record-setting high temperatures and low rainfall. The next highest MDD occurred in 2021, three years earlier during COVID-19, when many individuals were still working from home.

The second to last column of Table 5.5 presents the historical MDD to ADD peaking factor including the top two large users, which reflects systemwide demand patterns. The last column presents the MDD to ADD peaking factor with the top two large users removed, providing a comparison of typical residential and commercial demand trends across different years. Large user demands are excluded from the peaking factor by removing large user demands from both ADD and MDD. This is because large user demands do not typically exhibit the same daily variation and peaks as other customers. Because of their significant demands, including large user demands in peaking factors can skew peaking factors intended to represent the majority of customers. The peaking factor is also a key parameter in developing the future MDD projections, as discussed later in this chapter. The maximum peaking factor of 2.46 occurred in 2024

and the minimum peaking factor of 2.17 occurred in 2021 and 2022. The MDD to ADD peaking factor over the period is shown graphically in Figure 5.5. Figure 5.5 illustrates the variability in the peaking factor over the period. Section 5.6.4 discusses the peaking factor to be used for future projections.

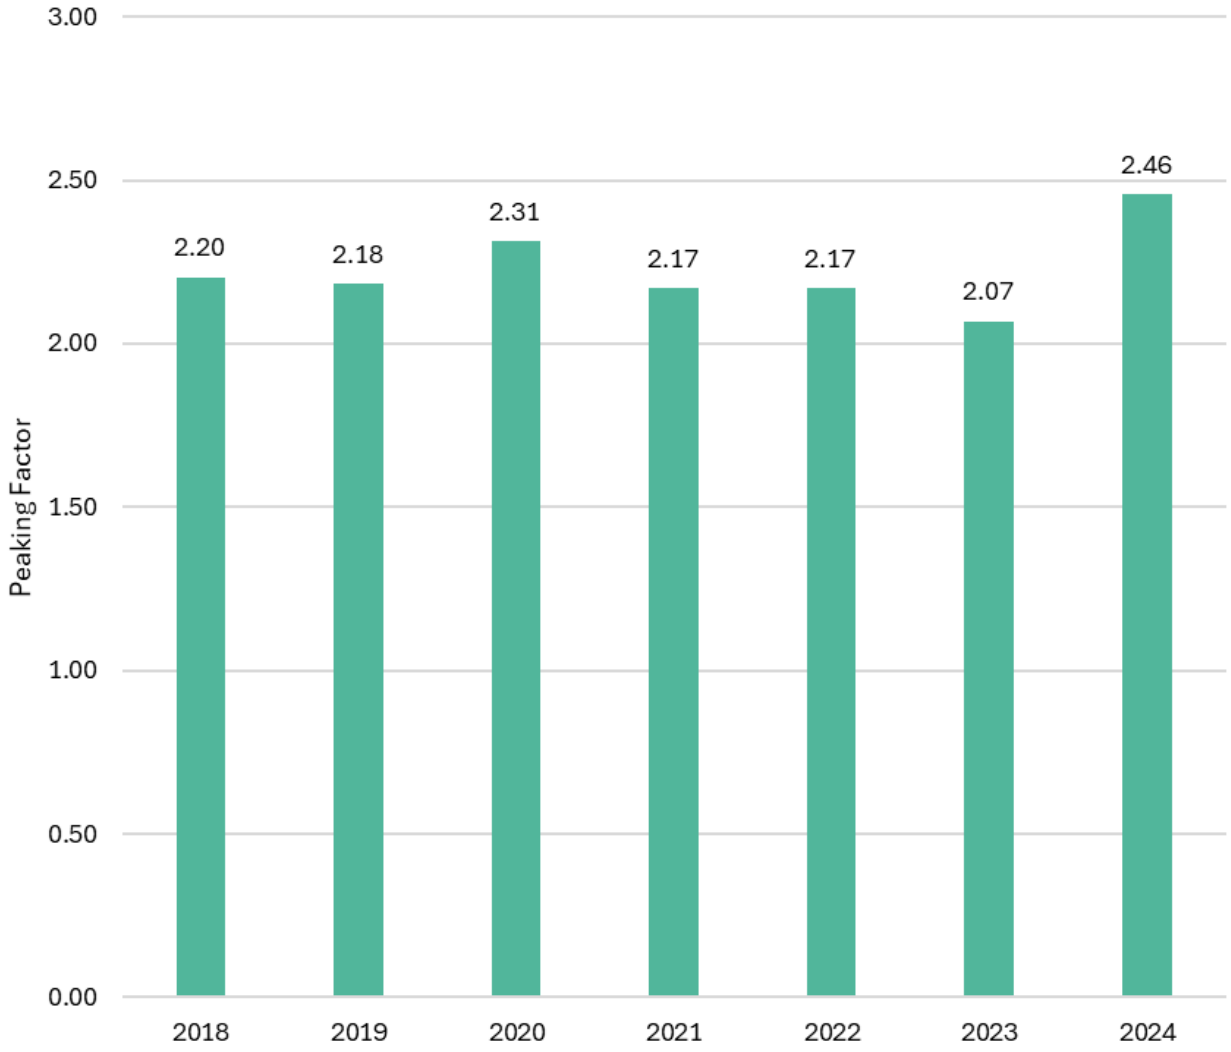

Figure 5.5 MDD/ADD Peaking Factor

5.4 Demographic Forecast

Demand projections depend on the future number of customers to be served by the City's water system. Thus, demographic forecasts of future population and employment must be made to establish an estimate of the future number of customers. A demographic analysis consistent with regional growth planning was performed to estimate the number and type of future customer accounts served by the City's water system. Converting the number of accounts into demand projections is discussed in Section 5.6.

5.4.1 Land Use

Land use designations and regulations provide important information in determining future water requirements. Land use determines the area available for various types of development including both SFR and MFR development, as well as commercial and other types of land use that provide the economic base necessary to support residential development.

5.4.1.1 Existing Land Use

Figure 5.6 depicts the best available data on existing land use based on Clark County Geographic Information System (GIS) data developed for the 1994 GMA and the 2023 VBLM data. While these sources provide the best available information, some parcel records were not up to date. In those cases, a simple check was done to confirm whether the parcels are vacant or developed. Because these GIS data are not up-to-date, existing water customers were derived using the City's billing data and matching it to parcel property IDs thereby providing the geographic location. Each metered account was assigned one of the eight customer classes. Open space, water, agriculture and vacant land uses were also part of the existing land use classes but are not associated with metered accounts.

Figures 5.6 shows the City’s existing land use.

5.4.1.2 Future Land Use

Future land use designations were obtained from the City's 2045 Comprehensive Plan and the Preferred Land Use Alternative Map. (Camas 2025). These future land use designations are depicted in Figure 5.7. The future land use designations are used to evaluate the 20-year development conditions as described below.

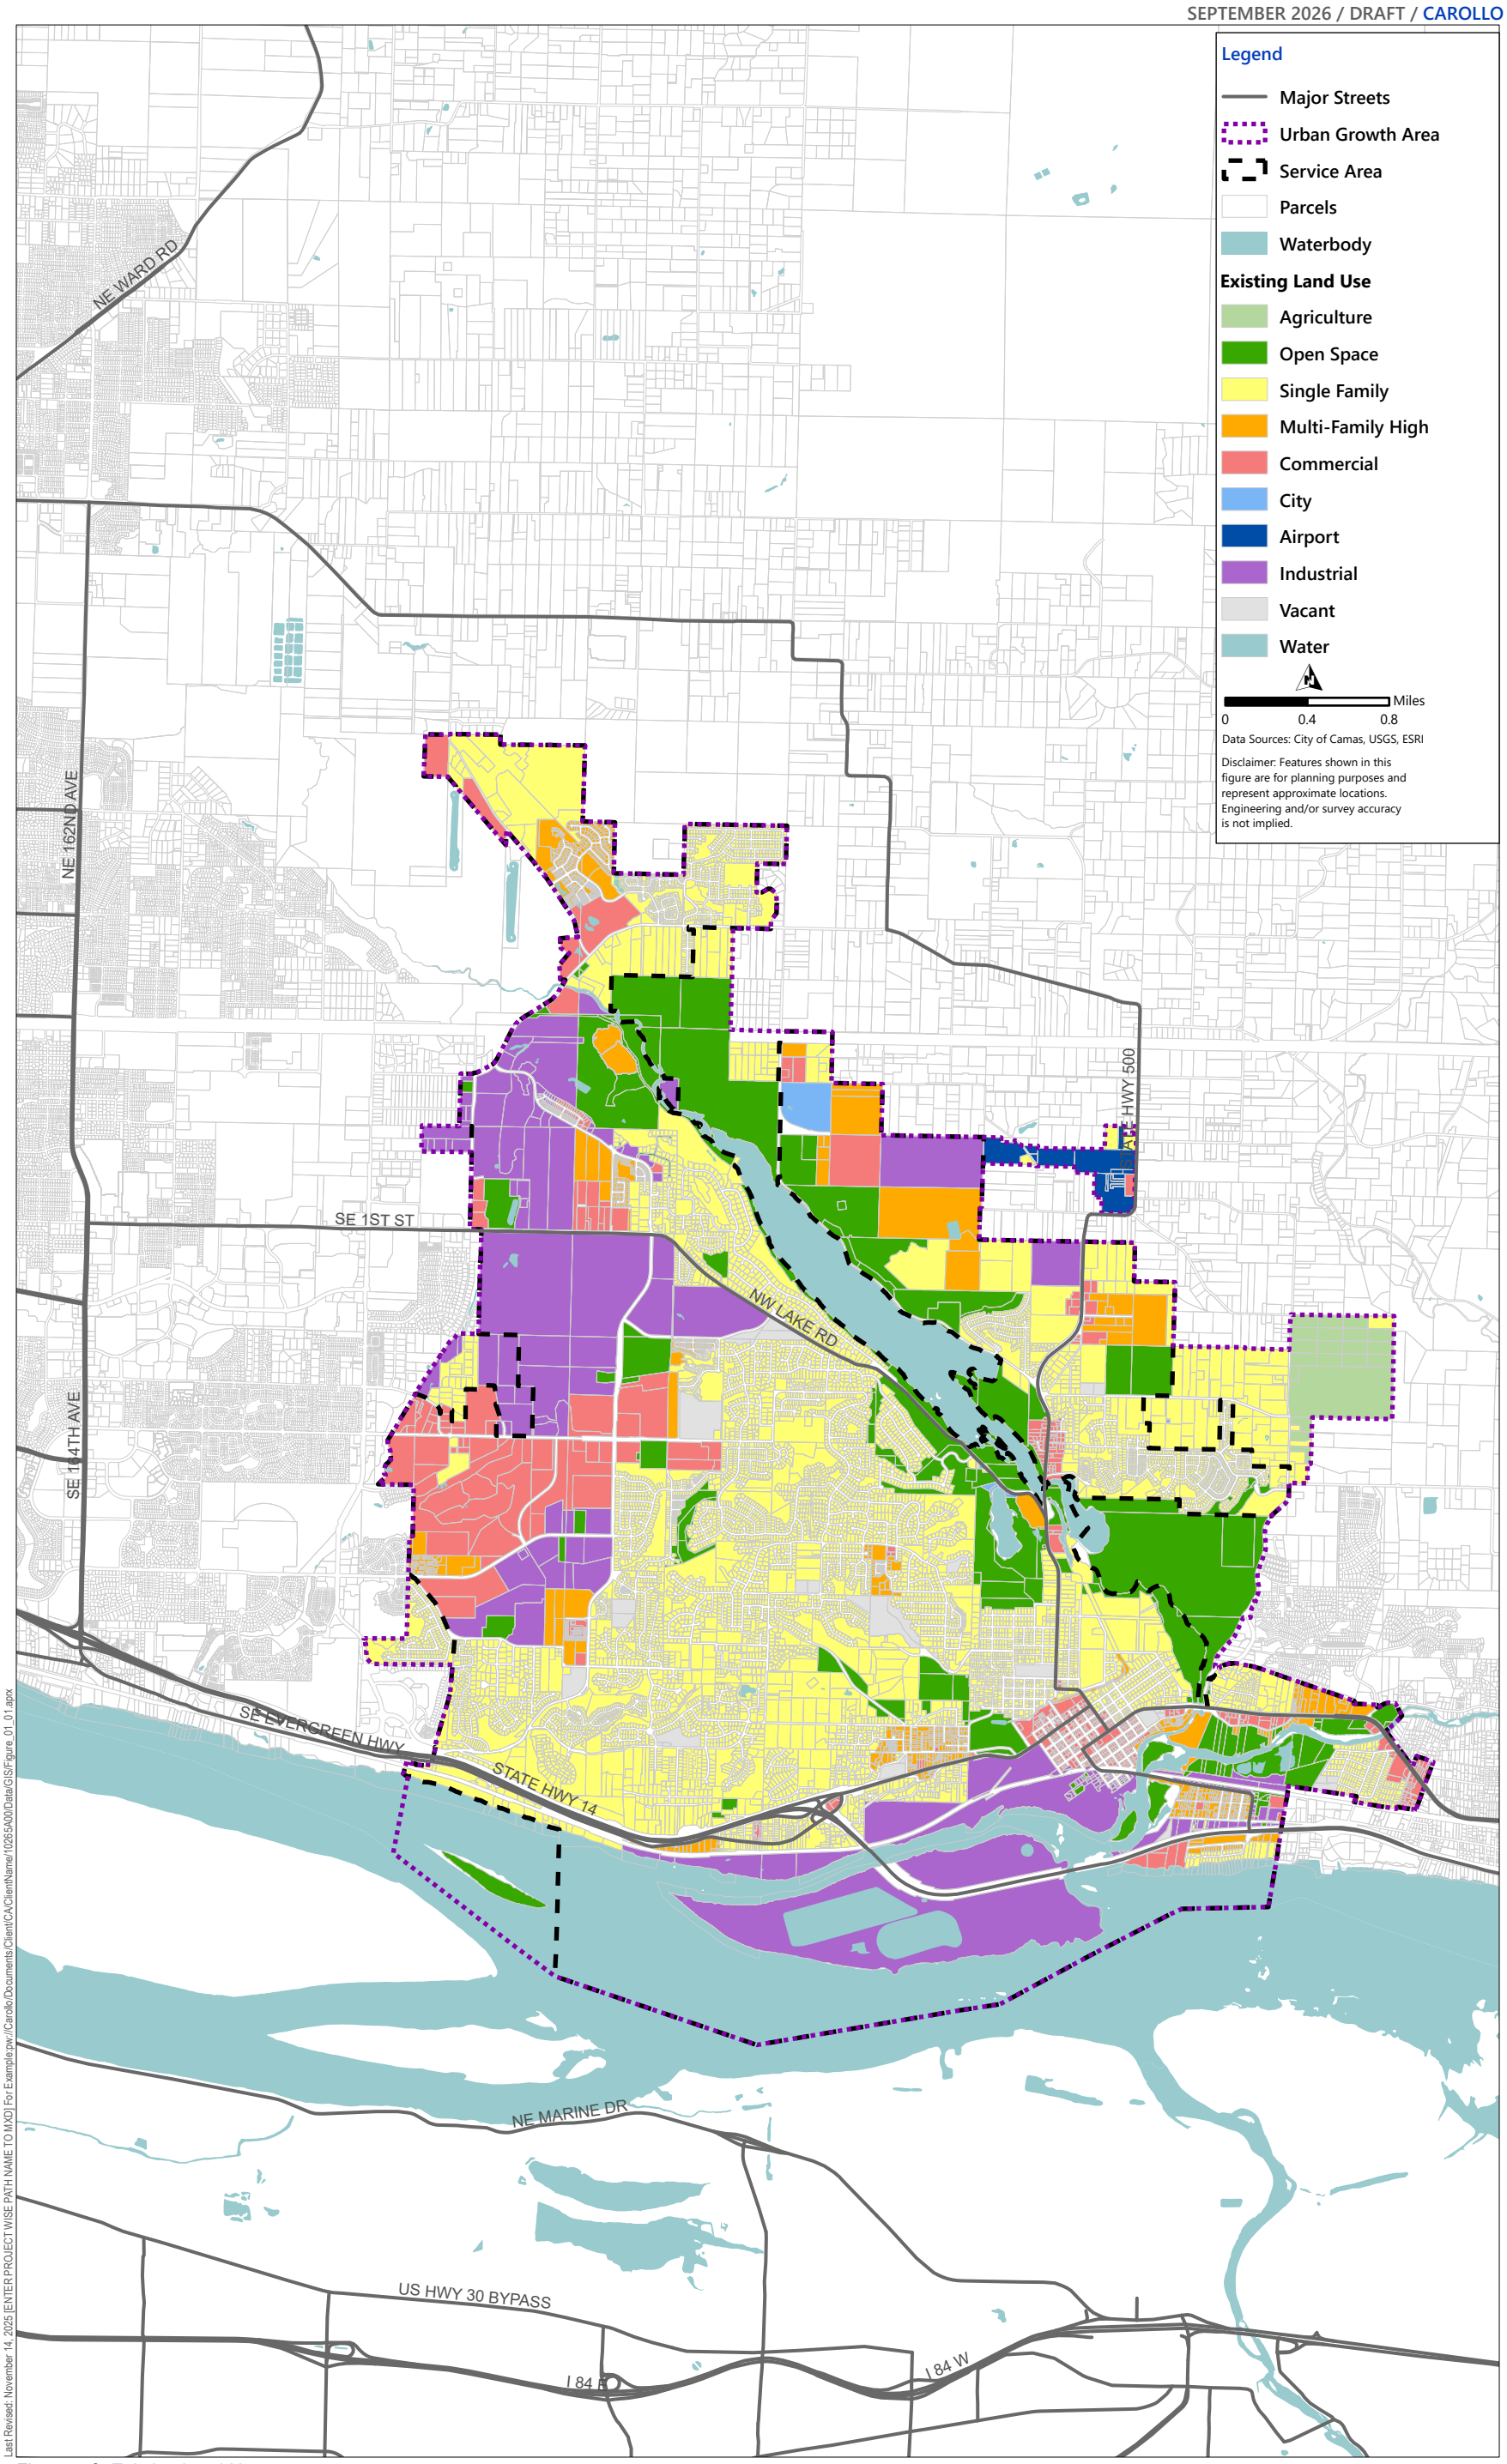

Figure 5.6 Existing Land Use
CITY OF CAMAS
WATER SYSTEM PLAN UPDATE

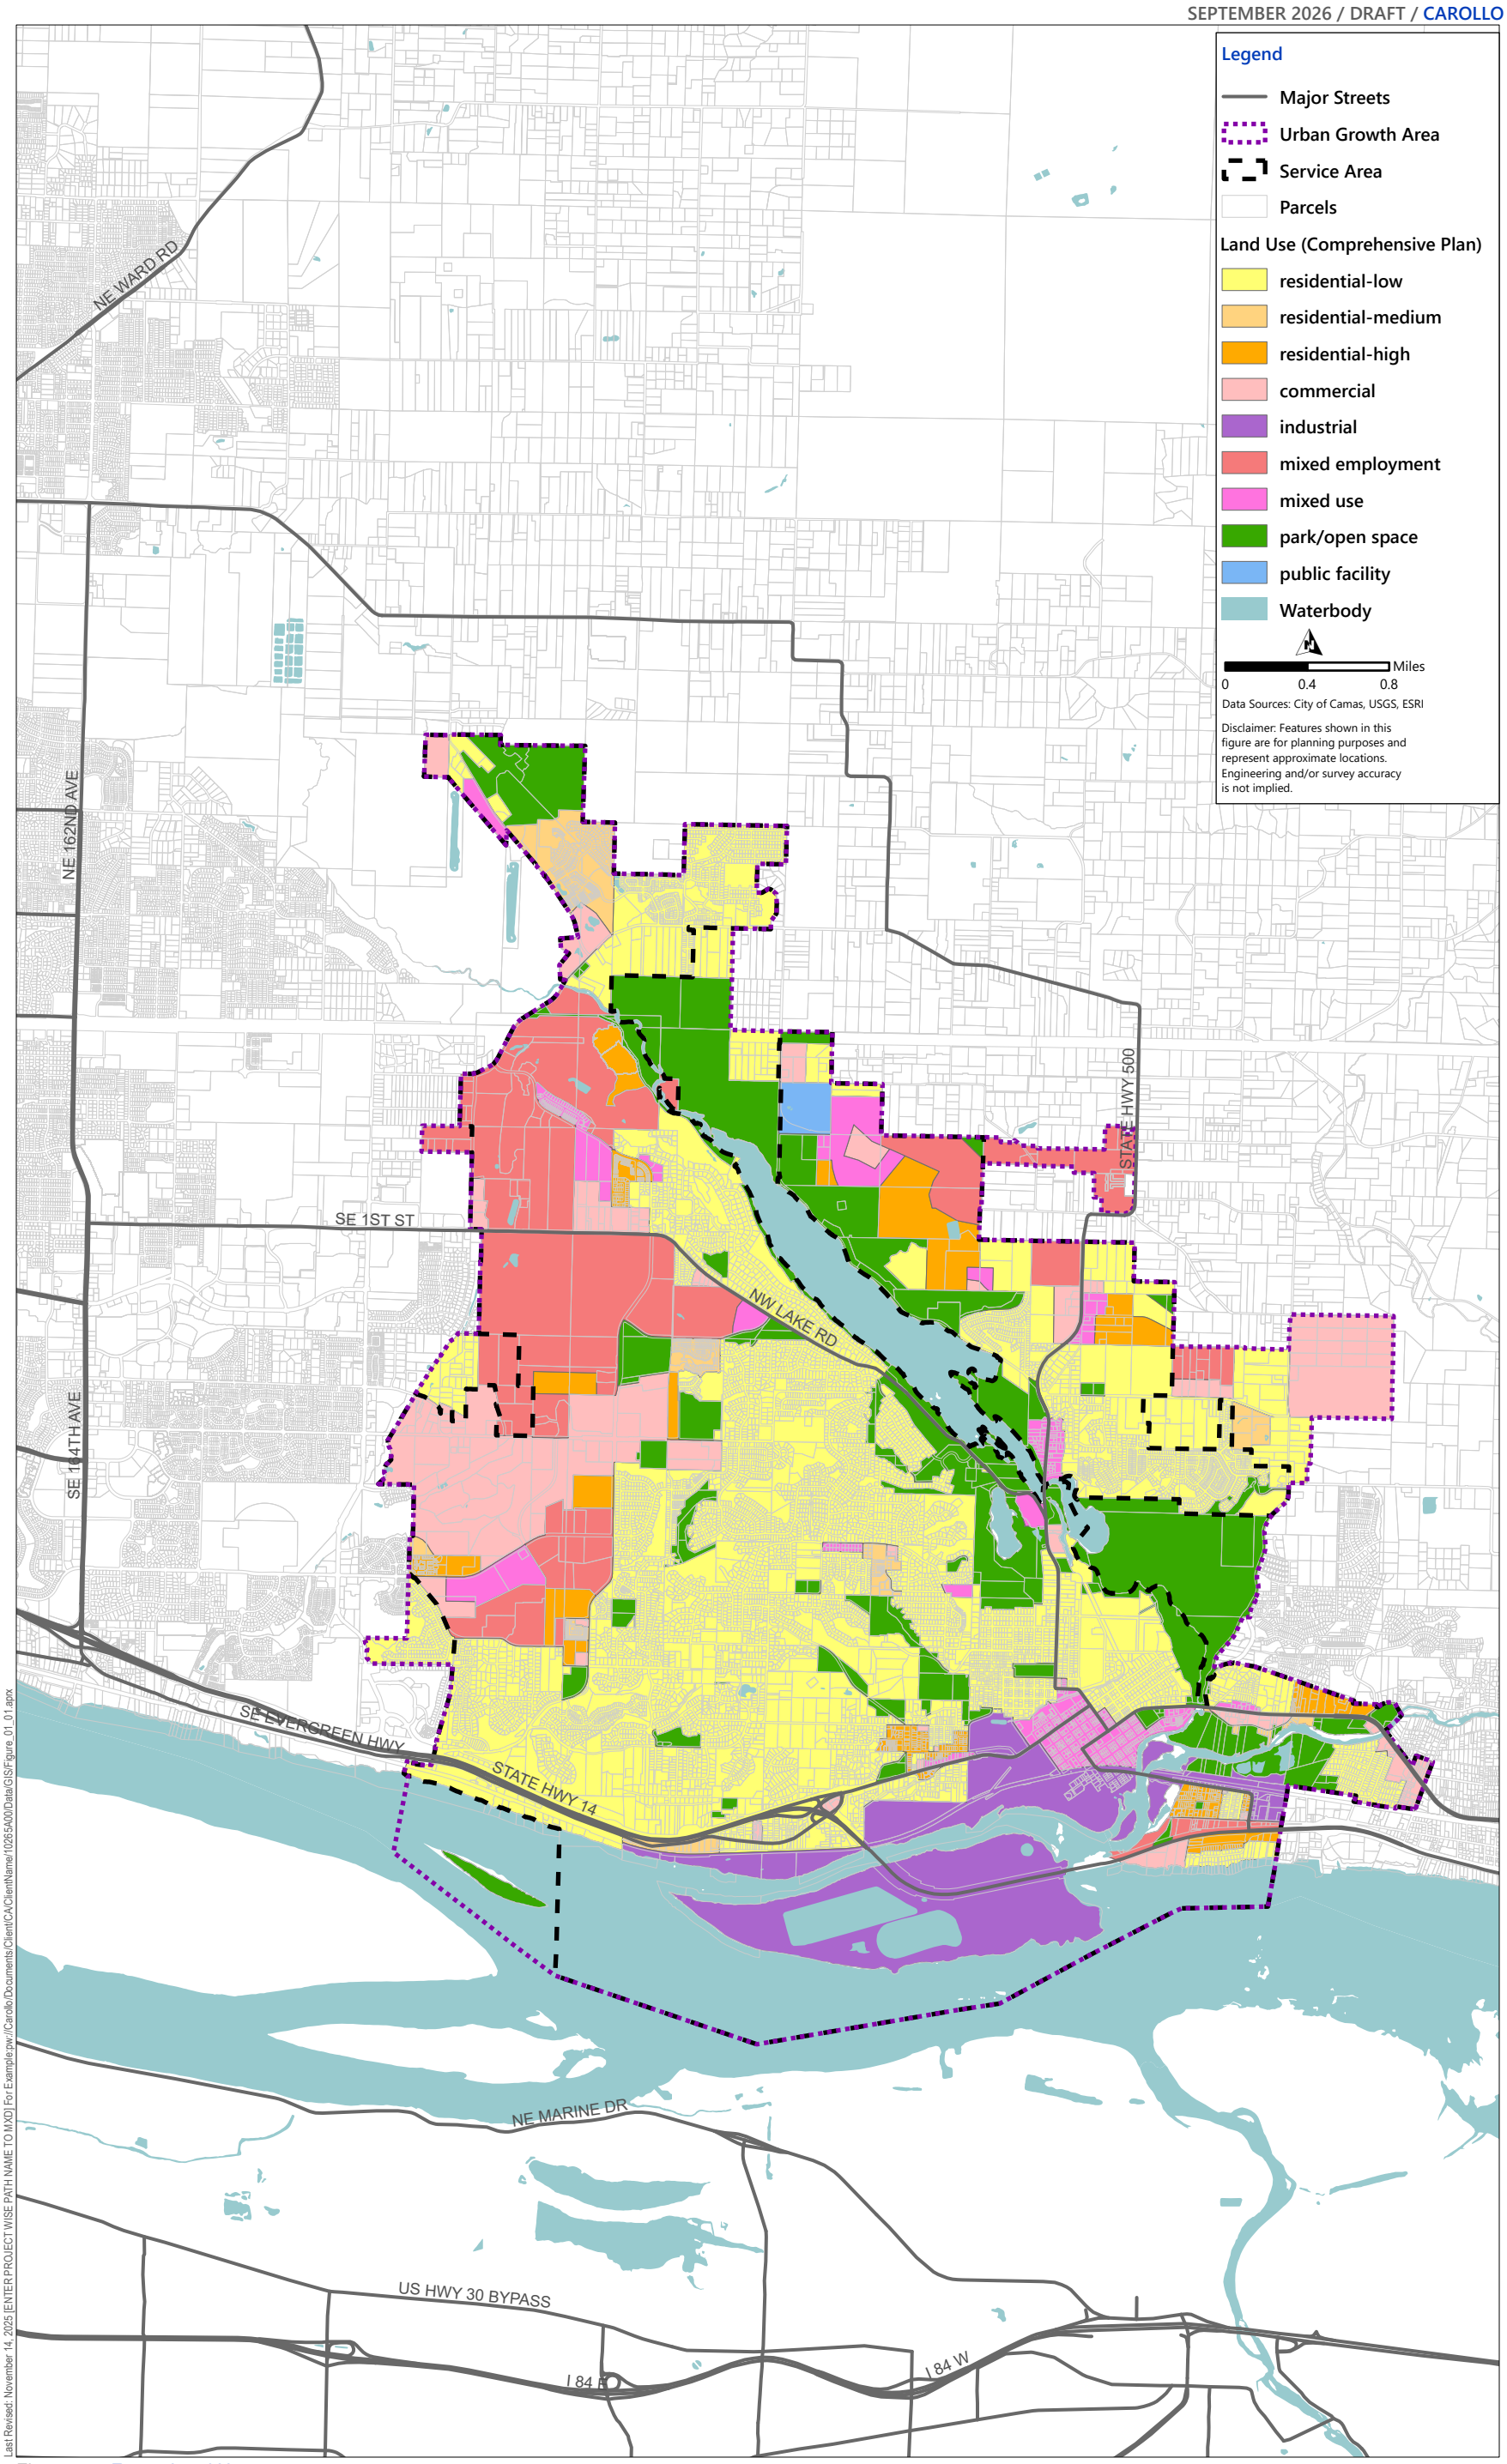

Figure 5.7 Future Land Use
CITY OF CAMAS
WATER SYSTEM PLAN UPDATE

5.4.2 Demographic Projections

To determine future demand for the City's RWSA, current and projected demographic trends provided by the City were used. The number of households in 2025 is based on the number of residential accounts in 2024 provided by the City and an annual growth rate of 2.9 percent. Number of employees in 2025 is from the US Census Bureau data. 2045 projected households and employees were provided by the City's planning department. Years 2036 and 2046 projections are linearly interpolated and extrapolated from the 2031 and 2045 values. Table 5.6 shows the City's household and employment projections.

Table 5.6 System-wide Household and Employment Projections

System-wide Projections	2025	2031(3)	2036(5)	2045(4)	2046(5)
Households	9,824(1)	11,415	12,790	15,443	15,738
Employees	12,600(2)	13,604	18,929	24,098	24,904

Notes:
(1) Existing number of households for 2025 are based on the number of residential accounts in 2024 provided by the City and 2.9% average annual growth rate.
(2) Number of employees in 2025 are estimated based on the U.S. Census Bureau's Data for the 2019-2023 period.
(3) The 2031 Household Projections were based on the City's Current Development Project Dashboard, which identifies parcels currently under review, in construction, on hold, or in the permitting process. Employee projections were estimated based on the anticipated redevelopment of parcels designated for commercial and industrial land uses.
(4) Projections for household and employees for 2045 were provided by the City.
(5) 2036 and 2046 projected values are based on interpolation and extrapolation of the 2031 and 2045 values.

The City's VBLM data does not identify the specific locations where residential and employment growth will occur or when, so projected household and employees were distributed across the service area based on known developments expected to occur within the short term (2031) and using the VBLM parcel constrained/unconstrained classification (2036 and 2046).

- For 2031: Residential units and employments were allocated based on parcels currently under review, in permitting, or under construction per the City's Current Development Project Dashboard, and growth was assigned to these areas.
- For 2036: For residential land uses, approximately 20 percent of each land uses' buildout density was assumed to be added by 2036. 20 percent development of residential demand aligns with the household projections presented in Table 5.6 based on the buildout densities for single family and multifamily parcels obtained from the 2022 Clark County Buildable Lands Report. Buildout densities are 20 dwelling units per acre for MFR and six dwelling units per acre for SFR. For non-residential land uses (commercial, City, and industrial), approximately 50 percent of the 2046 buildout density was assumed to be added by 2035, with commercial and City at 20 employees per acre and industrial at 9 employees per acre. Employment increments for 2036 were calculated as the additional number of employees needed to reach the 2036 total projection, including any employees already accounted for in 2031.
- For 2046: For residential land uses, 95 percent of buildout density was assumed to be added by 2046. Similarly, non-residential land uses were assumed to reach 95 percent of buildout density.

By 2045, the City is expected to have a population of 37,080 people, a 7,729-person increase from the estimated 2023 population of 29,352 (Camas 2045, 2025). This represents an annual average growth rate of 1.2 percent. The 2023 Clark County VBLM information is in Appendix **[X]**. Moreover, projections were prepared specifically for the North Shore area which is expected to add about 1,230 housing units by 2046, which is included in the projected households in 2046. Figure 5.8 shows the City's residential projections for North Shore area.

The City currently serves several accounts located outside the RWSA. These accounts were not grown as expansion of water service in this area is not expected, per the definition of the RWSA. Instead, their 2025 demands were held constant over the entire 20-year planning period.

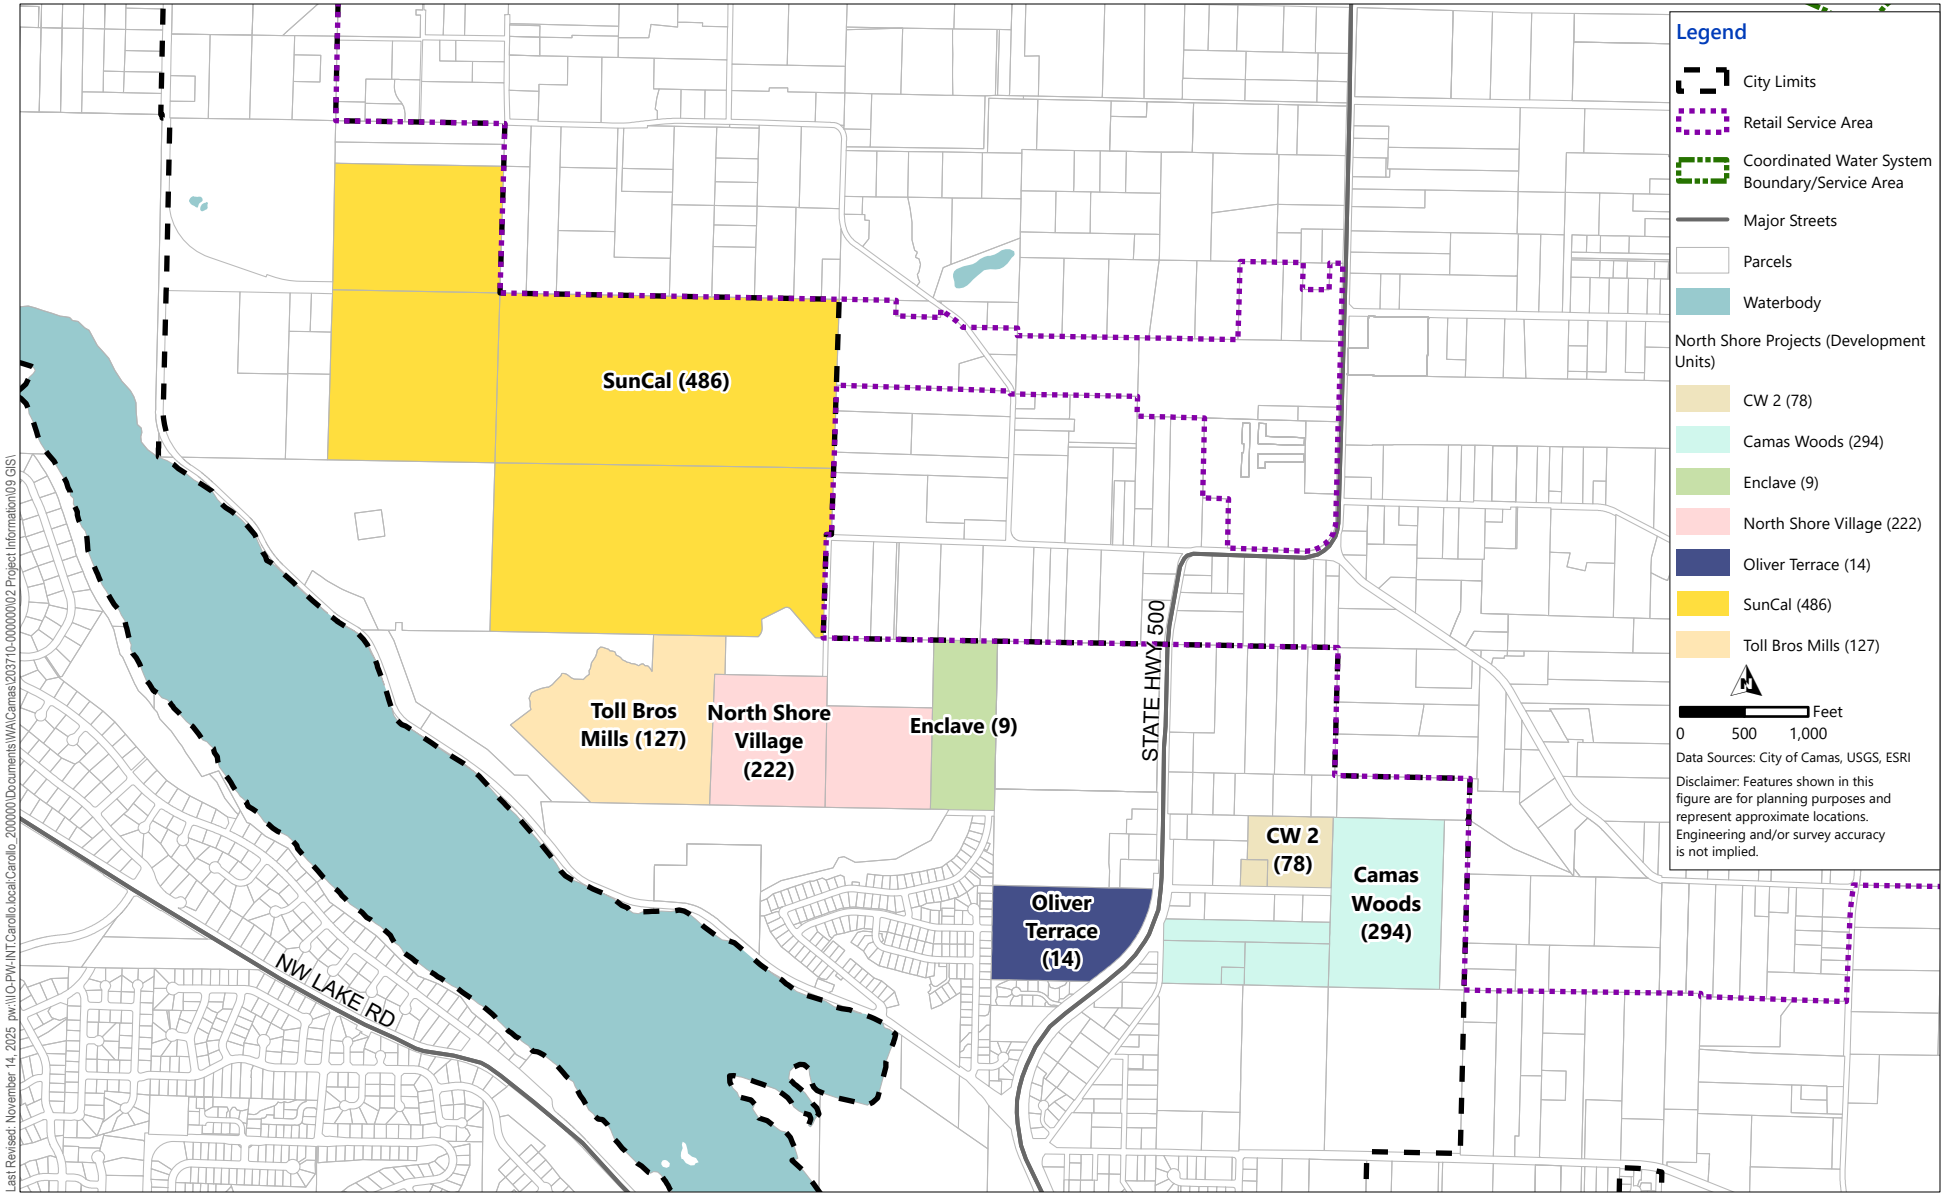

Figure 5.8 Projected Growth in North Shore Area in Number of Units

5.5 Projected Number of Accounts

Water accounts were projected using the GIS data and percent of land developed that meets the household and employee projections presented in Section 5.4. Growth was added to existing accounts to align with the household and employee projections presented in Table 5.6.

Table 5.7 summarizes the projected number of water accounts for each planning year. The projections show increased growth over historical growth in multi-family residential and industrial accounts. These projections form the basis for estimating the City's future water demand. The ERU factors for low, medium, and high demand scenarios were then applied to the account projections to develop the City's future demand estimates.

Table 5.7 Projected Number of Water Accounts

System-wide Projections	2025	2031	2036	2046	Average Annual Growth Rate
Airport	1	1	1	1	0%
SFR(1)	9,350	10,284	11,018	12,808	1.5%
MFR	490	1,303	2,007	3,379	9.6%
Commercial(2)	260	286	347	482	2.9%
Commercial Large Users	12	12	12	12	0%
City	50	50	50	50	0%
Industrial	13	25	68	123	11.5%
Industrial Large Users	10	10	12(3)	12(3)	0.9%
Total of Accounts	10,187	11,971	13,541	16,867	2.4%

Notes:
(1) SFR includes ADU Shared category from historical accounts. ADU Shared are not projected separately from SFR.
(2) Commercial accounts include demand irrigation water demand. The Irrigation category of account from historical accounts are not projected separately.
(3) Two additional large users were assumed to be added, one located in North Shore and one in the STEP Basin.

5.6 Projected Water Demand

Projecting future water demand is one of the key elements of the water system planning process. Identification of system improvements such as supply, pumping, storage, and piping requirements are all related to demand projections. This section summarizes the ERU, ADD, and MDD projections, as well as the potential range in future demands associated with various factors, such as water use per ERU, DSL, and climate change.

5.6.1 Potential Range in Future Water Demand

Numerous factors and assumptions affect the accuracy of projected future water demands. Recognizing that certain assumptions built into the demand projections will vary in the future, the projections were developed for low, medium, and high demand scenarios to provide a range in demands that may be experienced in the future.

The variables considered in developing the range of demand projections are summarized in Table 5.8 and are discussed below.

- **Future Water Accounts:** The future water accounts are shown in Table 5.7 and were projected using VBLM data and planning data from the City. Because the 20-year planning period (2046) of this Water System Plan Update (WSPU) extends beyond the 20-year planning period of the Comprehensive Plan 2045, linear interpolation was used to determine the future water accounts in the planning periods for the WSPU.
- **Water Use per ERU:** Water use per ERU for the low, medium, and high demand projections are based on the City's historical data from 2017 to 2024. The low projection reflects the historical average of 242 gpd/ERU, while the medium projection reflects the 75th percentile value of 248 gpd/ERU. The high demand projection was based on maximum of the historical data presented in Table 5.3, which equals 260 gpd/ERU.
- **ERUs per Account:** The historical ERUs per account by customer class presented in Table 5.3 were used to project the future demands. These ERU per Account values based on the average of the historical data and a water use per ERU value of 242 gpd/ERU.
- **Distribution System Leakage:** The City's three-year running average DSL varied between 10.3 and 13.0 percent of the City's total production between 2022 through 2024, as shown in Table 5.4. For the low demand scenario, a DSL of 9.1 percent was selected to represent the City's conservation goals, based on the most recent 2024 data. For the medium and high demand scenario, 10 percent was used to represent the City's goal of meeting Washington Department of Health threshold.
- **Climate Change Impacts:** Climate models project that the Pacific Northwest will generally experience warmer, wetter winters and hotter, drier summers. To estimate the potential impact on the City's future demands, Carollo evaluated historical and projected maximum temperature data from an ensemble of global climate models under multiple future scenarios.

  A regression analysis was developed between the City's historical consumption and modeled historical climate data. This relationship was then applied to future climate projections. The City elected to assume no change for the low scenario, to use the Shared Socioeconomic Pathway (SSP) 1-2.6 scenario as the basis for the medium demand scenario, and to use the SSP 3-3.7 scenario as the basis for the high demand scenario for its planning assumptions. SSP 1-2.6 represents a sustainably focused future and decreasing rate of change. SSP 3-3.7 represents a world with limited climate policy and higher emissions producing greater warming than SSP 1-2.6 but less than SSP5-8.5. It brackets a plausible upper range of climate stress on demand and supplies for planning.

  Results indicate that by midcentury, climate change may increase overall water demand by approximately 2.93 percent under the SSP 1-2.6 scenario and by approximately 4.49 percent under the SSP 3-3.7 scenario. Seasonal impacts are more pronounced, with the largest increases expected during the spring (February–April) and fall (September–October) shoulder seasons.
- **Maximum Day/Average Day Peaking Factor:** Due to the high projected demands for the City's largest two water users (described in the following section), and the lack of summer peaking in demand, the MDD/ADD peaking factor was not applied to the top two largest users to avoid overly conservative demand projections. Instead, peaking factors for the two largest users were calculated separately and are described in the section below. The MDD/ADD peaking factors developed for all customers excluding the top two large users is based on the historical production data. The MDD/ADD

peaking factors for all customers excluding large users varied from 2.07 to 2.46 between 2018 and 2024 as shown in table 5.5. For the low demand projection, the average peaking factor from 2018 and 2024 of 2.22 was used. For the medium demand projection, the three-year average observed between 2022 and 2024 of 2.23 was used. For the high demand projection, the 75th percentile observed from 2018 and 2024 of 2.31 was used.

- **Large Industrial Users Maximum Day/Average Day Peaking Factor:** The MDD/ADD peaking factor was not applied to large industrial users to avoid overly conservative demand projections. Instead, the two largest users were assigned a peaking factor of 1.25 for the low demand scenarios, which represents a maximum day demand approximately 10 percent above the average day demand. For the medium scenario, a peaking factor of 1.30 was applied to remain consistent with the City's 2022 economic development studies. The high scenario used a conservative peaking factor of 1.50. It is important to note that the remaining eight large users were assigned to the non-large user peaking factor, as their water use pattern aligns more closely with typical business diurnal demands, unlike the top two large industrial users.
- **Future Large Industrial Users:** Additional demand for Future large users was based on individual demand projections that are presented in the following sections.

Table 5.8 Demand Projection Parameters

Demand Scenario	Demographic Growth Scenario	Water Use per ERU (gpd/ERU)	Distribution System Leakage (%)	Maximum Day Peaking Factor	Large Industrial User Peaking Factor(1)
Low	Average	242	9.1%	2.22	1.25
Medium	75th Percentile	248	10.0%	2.23(2)	1.30
High	Maximum	260	10.0%	2.31(3)	1.50

Notes:
(1) The large industrial peaking factors were only applied to the top two large industrial users, as their usage patterns are industrial in nature and do not follow typical business diurnal demand patterns like the other large users.
(2) The three-year average from 2018-2024 was used to determine the maximum day peaking factor for the medium demand scenario.
(3) The 75th percentile from 2018 to 2024 was used to determine the maximum day peaking factor for the high demand scenario.

5.6.2 Large Users Demand Forecast

The City's top 10 water users, or large users, were identified by the City as presented in Section 5.1.1. Low, medium, and high demand forecasts were created for each large user based on historical water use data from 2017 through 2024.

The low demand scenario projections were determined by identifying the lowest projected demand for each large user based on four calculated estimates: the average historical growth rate, the most recent three-year average growth rate, the large users' annual demand with the maximum historic yearly demand held constant, and the current demand. If the current demand is the lowest of these four estimates, it was used as the low demand scenario. The high demand scenario projections were determined by identifying the highest projected demand for each large user based on three calculated estimates: the average historical growth rate, the most recent three-year average growth rate, and the large users' annual demand with the maximum historic yearly demand held constant. The medium demand scenario is an average of the low and high demand projections.

For three large users, however, projections were developed using a different approach. Georgia Pacific demonstrated a decline in average demand from 2017 to 2024 period following a reduction in production and accompanying layoffs in 2018 that eliminated approximately two-thirds of its jobs, according to City staff. Similarly, the City and Camas School District No. 117 have reduced irrigation use due to recent budget cuts. For these three large users, demand projections were conservatively set equal to the maximum observed demand between 2017 and 2024 and applied consistently across all demand scenarios, as increases in demand are not anticipated. Additionally, Clara Street Block Building, LLC presented very limited data with only other data shown in 2021. For planning purposes, it is assumed that its 2024 demand will remain steady over the projection period.

The City has requested future large users demand projections to be included and increase linearly through 2046. Table 5.9 shows the additional future large user demands for 2031, 2036, and 2046.

Table 5.9 Additional Future Large User Demands

Demand Scenario	2031 (mgd)	2036 (mgd)	2046 (mgd)
Low	0.0	0.0	0.25
Medium	0.19	0.375	0.75
High	0.375	0.75	1.50

Additionally, all the existing large users demand projections are presented in Table 5.10. For each of the existing large users, Table 5.10 provides the Service Area, 2025 demand, and the projected 2031, 2036, and 2046 demands.

5.6.3 Projected ERUs

Projected ERUs for single family residential is the projected number of accounts since ERU is defined as water consumption from one single family home. Projected ERUs for all other customer classes is the projected number of accounts multiplied by the number of ERUs per account for that customer class. Table 5.11 presents the projected ERUs for each of the City's Service Areas under different growth scenarios. To spatially allocate demands across the retail water service area, the City's 2023 VBLM data was used to determine whether parcels are constrained or unconstrained, and whether parcels are expected to develop or redevelop by 2045 consistent with the future land use per the Comprehensive Plan 2045.

5.6.4 Projected Average Day and Maximum Day Demands

ADD projections were determined by multiplying the total number of projected ERUs per Service Area by the appropriate water use per ERU for each demand scenario, as listed in Table 5.8. Additionally, the ADD projections incorporate the assumptions for DSL and the unique large users demand projections. To develop MDD projections, the ADD projections for all customers were multiplied by the peaking factors. For the two largest existing users and the future users, the large user peaking factors shown in Table 5.8 were applied depending on the demand scenario.

Tables 5.12 and 5.13 show the projected ADD and MDD, respectively, under the low, medium, and high demand scenarios. These projections, as well as historical ADD and MDD, are visually depicted in Figure 5.8.

Table 5.10 Existing Large Users Demand Projections

Large User	Service Area	Demand - 2025 (mgd)	Demand - 2031 (mgd)			Demand - 2036 (mgd)			Demand - 2046 (mgd)		
			Low	Med	High	Low	Med	High	Low	Med	High

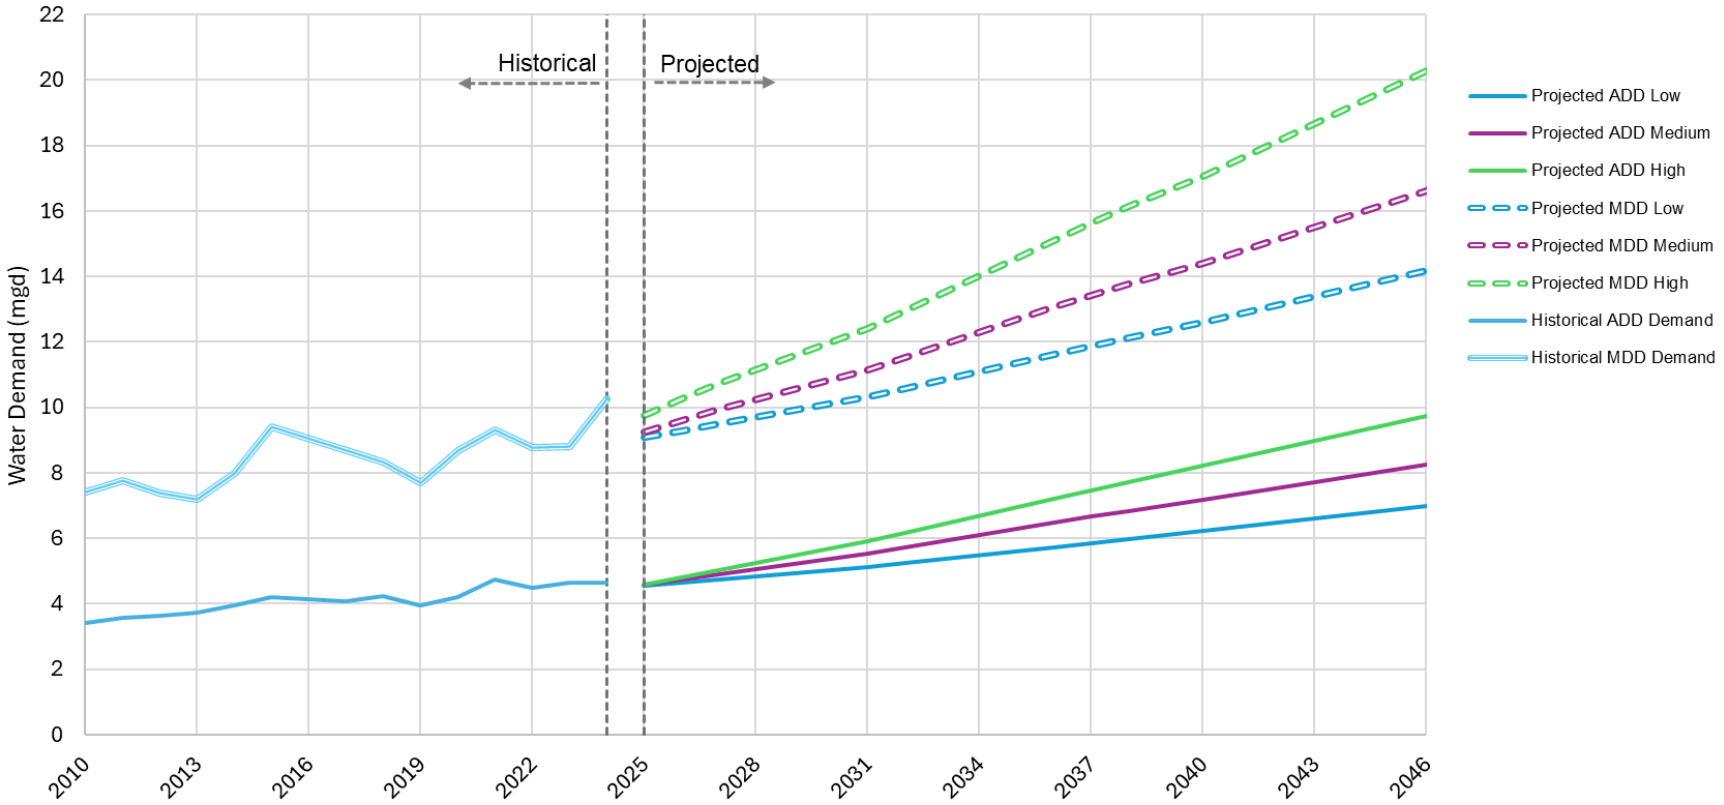

Figure 5.9 Average and Max Day Demand Projections

CHAPTER 6 WATER USE EFFICIENCY

The City promotes efficient water use to conserve and protect their existing water supplies for present and future residents. The City promotes water conservation and efficient use of water through a variety of activities that encompass their WUE Program. The program encourages water conservation and utilizes continued improvements to reduce leakages and water loss in the City's system. This chapter details both the City's existing and future WUE programs.

6.1 WUE Program Background

In 2003, the Washington State Legislature passed the Engrossed Second Substitute House Bill 1338, known as the Municipal Water Law or the WUE rule, to address the increasing demand on Washington's water resources. This law established that all municipal water suppliers (MWS) must use water more efficiently in exchange for water right certainty and flexibility to help them meet future demand.

The WUE rule, which became effective on January 22, 2007, emphasizes the importance of measuring water use and evaluating the effectiveness of the water supplier's WUE program. The intent is to minimize water withdrawals and water use by implementing water saving activities and adopting policies, resolutions, ordinances, or bylaws. This chapter follows the guidelines set forth in the Water Use Efficiency Guidebook, Fourth Edition, (May 2025) as well as the Water System Planning Handbook (June 2025).

6.1.1 Current WUE Program

The City's current WUE Program was established as part of the 2019 WSP. Per the WAC 246-290-830(4)(a), all water purveyors with 1,000 or more connections were required to set efficiency goals through a public process. The established goals promote water use efficiency for internal operations and for water customers. The past WUE Program goals were established in the 2010 WSP and subsequently re-established in 2013 and 2019:

- **Demand-Side Goal:** Reduce customer consumption per ERU by 1 percent or approximately 2 gpd per year over the next six years.
- **Supply-Side Goal:** Continue to reduce distribution loss to or below 10 percent for the next five years.

The following summarizes the current program.

6.1.1.1 Supply-Side Measures

The City implements the following supply-side measures as part of their WUE Program. A number of these measures are mandated by the DOH per the WUE Guidebook. The following summarizes the City's supply-side measures:

1. Record and monitor supply source production (Mandatory).
2. Record and monitor customer demands through customer water meters (Mandatory).
3. Test and calibrate industrial and commercial meters annually (Mandatory).

4. Replace customer water meters with enhanced advanced metering infrastructure (AMI) meters. Once complete, the City will regularly test and repair residential meters per manufacturer recommendations.
5. Perform annual leak detection surveys through a private contractor. Hydrants and valves are checked as part of leak detection surveys (Mandatory).
6. Repair or replace old distribution system piping with defects as budget allows.
7. Reclaimed Water: Treated wastewater is used for washdown and process use and for landscape irrigation at the wastewater treatment plant (WWTP) (Mandatory to evaluate reclaimed water).

6.1.1.2 Demand-Side Measures

The City implements a number of demand-side measures that previously met the DOH requirement for six WUE measures. These measures are similar to many of the example water use efficiency measures presented in Appendix B of the Water Use Efficiency Guidebook. The City provides an overview of their water use efficiency activities on their Water Services website (http://www.ci.camas.wa.us/index.php/pwwater). The City's various public outreach activities meet the DOH requirement for educating customers about water use efficiency. The following provides a summary of the City's demand-side measures:

1. Include water consumption history on customer's utility bills.
2. City staff alert and visit customers where customer leaks are identified.
3. Promote installation of smart controllers and irrigation timers for the school district and industrial users.
4. Educate the public on conservation and water-saving devices at community events and on the City website (http://www.ci.camas.wa.us/images/DOCS/WATER_SEWER/REPORTS/waterconservation.pdf).
5. Distribute water-saving devices such as shower timers at community events.
6. Require xeriscaping and Low Impact Development (LID) to reduce irrigation requirements for new developments.
7. Work with developers to evaluate their irrigation systems to incorporate drip systems or micro sprayers.
8. Promote odd/even day and late night or early morning irrigation for all customers.

The above supply- and demand-side WUE measures are effective in encouraging WUE for the water system. Additional measures have been evaluated since the requirement increased to nine measures due to the City falling in the range of 10,000 to 49,999 service connections. These are discussed further in Section 6.2.3.

6.1.2 Distribution System Leakage

DSL is a significant element of supply-side WUE requirements. DSL above 10 percent on a three year rolling average is considered excessive and necessitates the creation of a WLCAP. DSL is the difference between total water production and metered water use. The estimate of DSL is dependent on the accuracy of meter readings for supply and customer meters. Table 6.1 presents the City's reported three-year rolling average DSL from 2021 through 2025. From 2021 through 2024, the City's three-year rolling DSL average was above their WUE program goal and DOH standard of 10 percent, but the City is making progress in lowering the DSL as seen from 2022 through 2025.

Table 6.1 Distribution System Leakage (Three-year Rolling Average)

Year	3-Year Rolling Average DSL (%)
2021	14.2
2022	14.5
2023	13.1
2024	11.2
2025	6.7

The DSL in Table 6.1 differs from that calculated in Chapter 5 - Water Requirements, where Chapter 5 evaluates historical billing data for consumption. The City cannot account for the differences; however, it is believed to be related to year end meter reading.

Although the 2025 three-year rolling average is below the 10 percent threshold, the City transitioned billing software in 2025, which required consumption data to be compiled from two sources. This may have contributed to higher reported water use. As a result, the City will complete a WLCAP to address its DSL. This can be found in Appendix **[X].**

6.1.3 Historical Effectiveness of Current Water Use Efficiency Program

The City's current WUE Program includes measures for residential, irrigation, commercial, and industrial customers. The effectiveness of the City's program in meeting their WUE goals can be evaluated considering system-wide water use trends.

The 2019 WSP used a planning ERU of 260 gpd based on average residential use from 2013 to 2015. The current planning ERU value of 242 gpd was based on the average of water use from 2022 to 2024. This equates to a decrease of 0.8 percent annually over the nine-year period, close to the City's goal of 1 percent.

Annual water use per account from 2017 to 2024 was detailed previously in Section 5.1.4. Water use across the City's SFR, MFR, commercial, industrial, city, irrigation, and ADU shared accounts have fluctuated since 2017. Overall, SFR and ADU shared water use have decreased from 2017 to 2014 by 2 and 6 percent, respectively. The City believes these decreases were in part from the WUE Program. Some decreases may have been from requirements in the Washington State Plumbing Code, which limits maximum flow rates for faucets, showers, toilets, and urinals. It is acknowledged that other factors may have played a prominent role, such as weather and economic conditions.

The City does not officially track staff time or project costs associated with WUE. The supply-side WUE measures, such as metering and leak detection, are core activities of the Utility and are funded through Utility Capital Improvement and O&M funds. The City estimates that it dedicates approximately 0.5 full-time-equivalents (FTE) of staff time to conduct demand-side measures across its Water Utility, finances department, and development services staff. It is not possible to estimate the cost of each demand-side measure; therefore, a cost-benefit comparison cannot be calculated.

Water consumption in City billing is based on the following most common meter size for SFR and cost per 100 cubic feet:

- Inside City limits:
  - Base rate for 3/4-inch meter: $15.54.
  - Cost per one hundred cubic feet: $2.76 or 0.37 cents per gallon.
- Outside City limits:
  - Base rate for 3/4-inch meter: $23.31.
  - Cost per one hundred cubic feet: $4.15 or 0.55 cents per gallon.

Because the City's water rates are generally comparable to those of neighboring utilities, its WUE Program appears to be implemented in a cost-effective manner.

6.2 Future WUE Program

The City plans to continue its efforts to encourage efficient water use and has updated its WUE Program, which is included in Appendix **[X]**. Going forward, the program will continue to focus on measures targeted at residential customers. The WUE Program goals established in 2026 are:

- **Demand-Side Goal:** Reduce customer consumption per ERU by 1 percent over the next 6 years.
- **Supply-Side Goal:** Continue to reduce distribution loss to 10 percent or less over the next 5 years.

Public comment on the future WUE program was taken at the **[XXXXXX]** City Council Meeting. An agenda and minutes for the meeting are provided in Appendix **[D]**.

6.2.1 Mandatory Measures

The WUE Program requires certain measures to be implemented, some of which can be incorporated as supply-side measures by the utility as described in Supply-Side Measures as well as in Future WUE Program Supply-Side Measures. The City's WUE Program will continue to meet the following mandatory measures in the future:

- Install production (source) meters.
- Install consumption (service) meters.
- Perform meter calibration.
- Implement a water loss control action plan to control leakage if the three year rolling average exceeds 10 percent.
- Educate customers about water use efficiency practices.
- Evaluate rates that encourage water demand efficiency, as discussed in a subsequent section.
- Evaluate reclamation opportunities, as discussed in a subsequent section.

6.2.1.1 Rate Structure

The City's current rate structure bills customers on a uniform volumetric charge. In 2010, the City added a consumption-based element to sewer rates based on average winter water consumption, which was thought to encourage water efficiency. In 2023, a rate study was performed that evaluated a tiered rate structure. Ultimately, it was determined that the current rate structure would remain in place. Future rate studies will continue to reevaluate rate structures to encourage conservation.

6.2.1.2 Reclaimed Water

Per WAC 246-290-100 and WUE requirements, water systems with over 1,000 connections must evaluate reclaimed water opportunities. As mentioned previously, the City currently uses treated wastewater at the WWTP. In addition, the City previously evaluated reclaimed water opportunities in 2006 with costs escalated to 2025 dollars in the concurrent effort of updating the General Sewer Plan, considering a multitude of locations to use the water for irrigation; Figure 6.1 displays locations with irrigation connections. Overall, it was concluded that using reclaimed water as irrigation water was not economically feasible, and therefore, the reclaimed water system will not be expanded at this time.

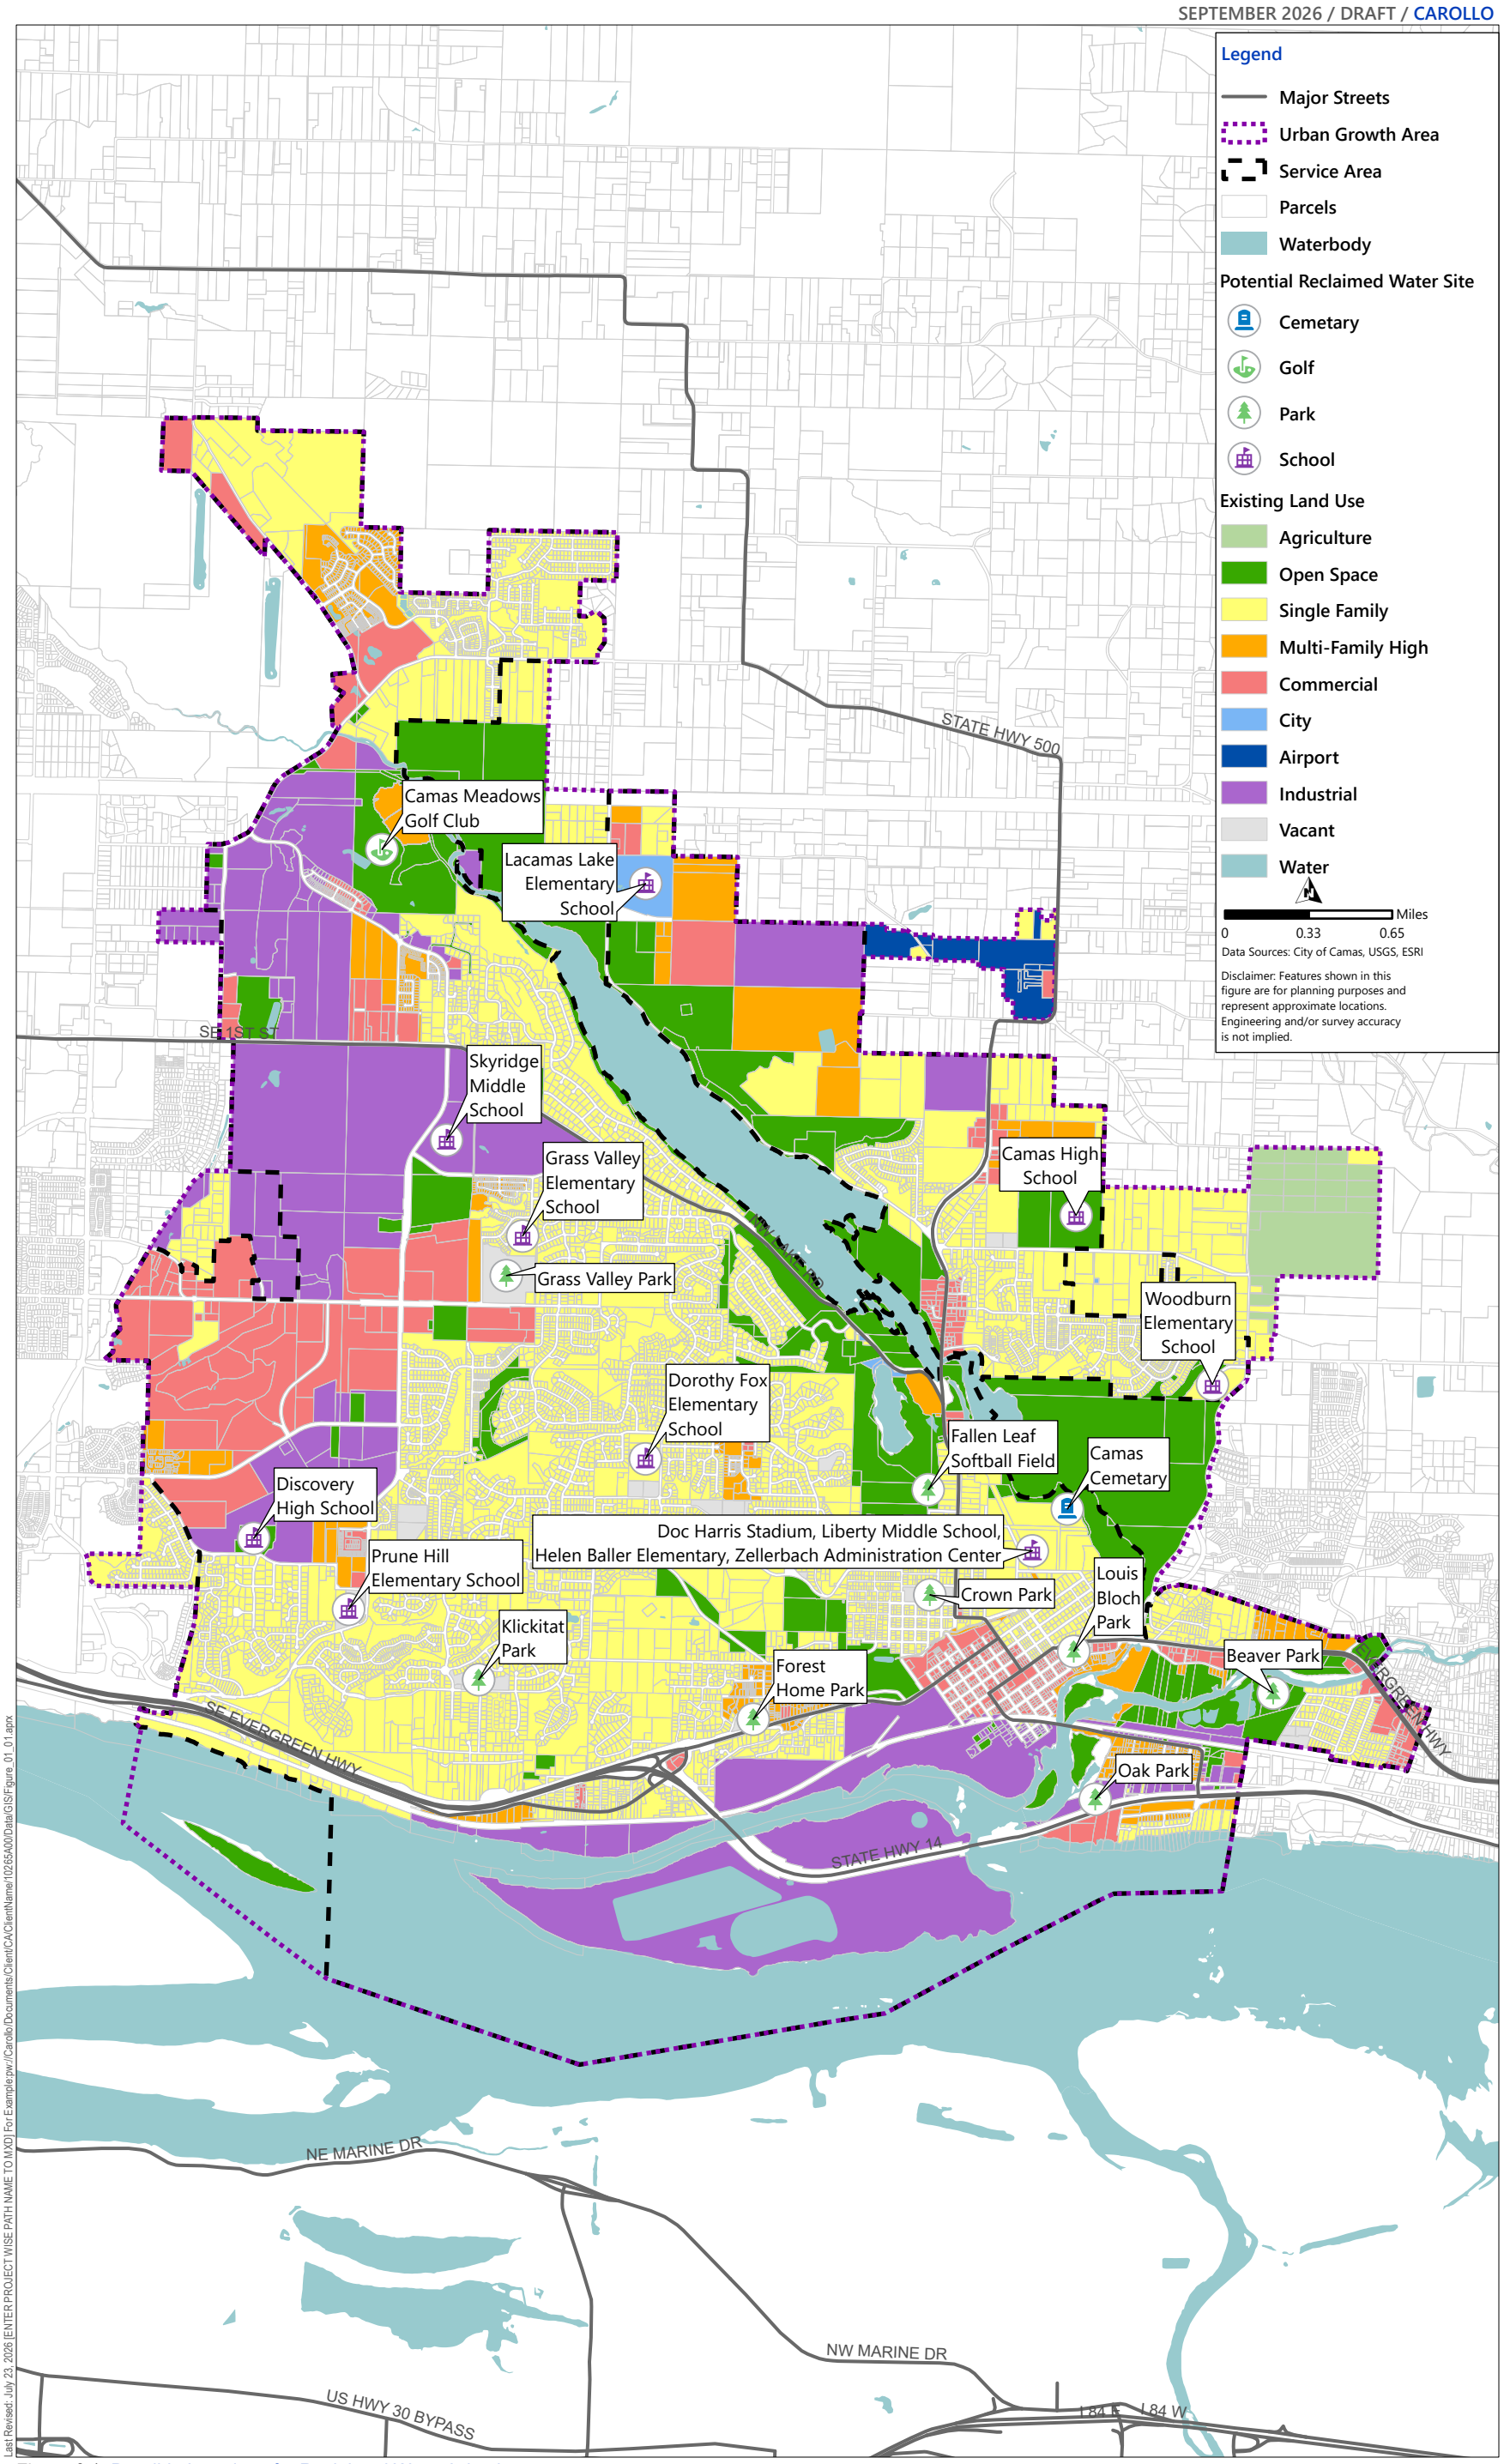

Figure 6.1 Possible Locations for Reclaimed Water Irrigation

6.2.2 Future WUE Program Supply-Side Measures

The City completed replacing 100 percent of customer water meters with AMI meters in 2025. The AMI meters provide operational benefits, reduces data error and helps identify customer-side leaks. Installation of AMI meters is expected to enhance meter accuracy, leak detection and customer education through the detailed water use data and statistics provided by the AMI system. The City will continue the existing supply-side measures as described in Section 6.1.1.1 and updated fourth supply-side measure to be as follows:

- The City will repair and/or replace residential meters per manufacturer recommendations.

6.2.3 Future WUE Program Demand-Side Measures

Due to an increase in connections, the City must have at least nine demand-side measures. Some of the current measures will continue, some are modified, and three new ones were added. The following list provides the new measures:

1. City staff alert and visit customers where customer leaks are identified.
2. Promote installation of smart controllers for City-wide users.
3. Educate the public on conservation and water-saving devices at community events and on the City website (http://www.ci.camas.wa.us/images/DOCS/WATER_SEWER/REPORTS/waterconservation.pdf).
4. Promote xeriscaping and LID to reduce irrigation requirements for new developments.
5. Promote irrigation systems to incorporate drip systems or micro sprayers.
6. Promote odd/even day and late night or early morning irrigation for all customers.
7. Provide monthly billing to all customers.
8. Send water savings tips to customers in the annual water quality report.
9. Onsite irrigation at the WWTP with treated effluent.

6.2.4 Projected Demands with Water Use Efficiency Goals

The projected water demands considering the water savings from the City's WUE Program were represented with the low demand scenario presented in Chapter 5. Projected demands with WUE savings were compared to the medium demand projection. The low demand projection assumes a 2025 demand based on 242 gpd/ERU while the medium demand projections assumes a 2025 demand based on 248 gpd/ERU. The low demand projection also assumes the WUE Program will help to reduce the MDD to ADD peaking factor by approximately 0.45 percent. The low and medium demand projections assume the City's DSL is 9.1 and 10 percent, respectively. Table 6.2 presents the projected ADD and MDD with and without the WUE Program for the 20-year planning period. The projected demands with the WUE Program are also shown in Figure 6.2. For ADD, WUE measures are projected to provide a reduction of 1.0 mgd, or 11.9 percent, by 2046. For MDD, WUE measures are projected to provide a reduction of 2.4 mgd, or 14.6 percent, by 2046.

Table 6.2 WUE Demand Projections

Demand Scenario	2046 Projection with WUE (mgd)	2046 Projection without WUE (mgd)	Water Savings (mgd)	Percent Savings
ADD	7.4	8.4	1.0	11.9
MDD	14.2	16.6	2.4	14.6

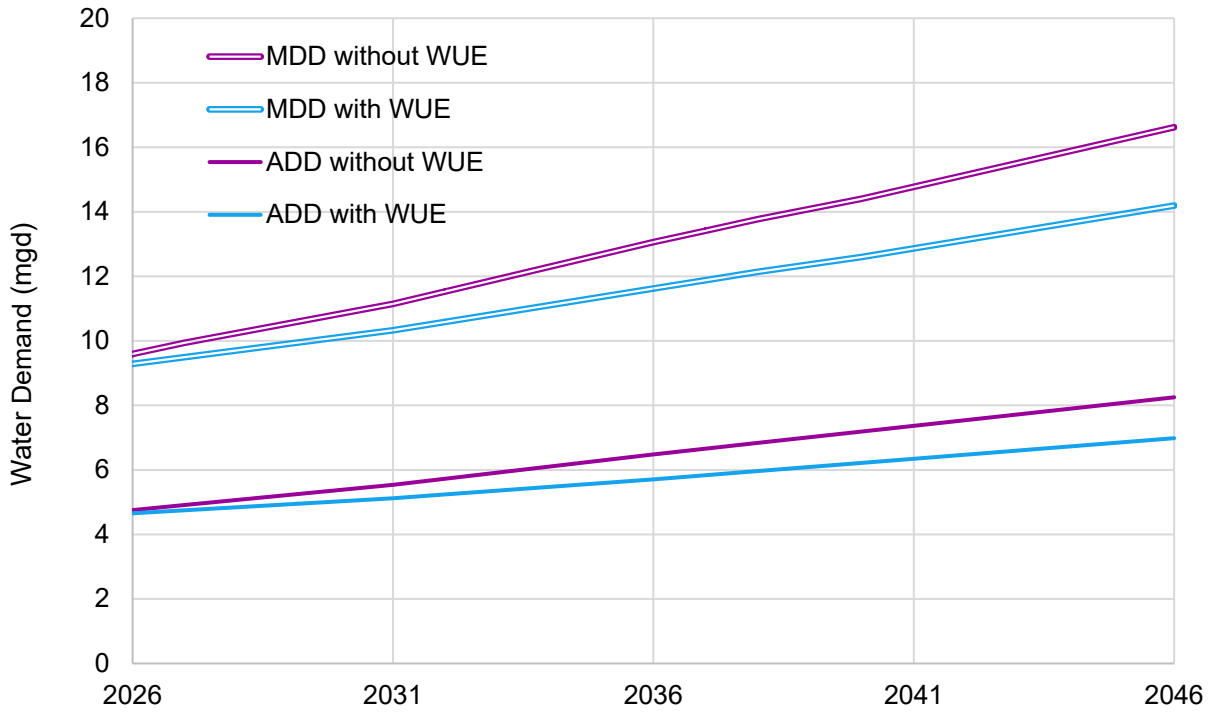

Figure 6.2 Projected Demands With and Without Water Use Efficiency

6.2.5 Future WUE Program Effectiveness

The effectiveness of the existing WUE program was evaluated using system-wide water use data. Measuring the effectiveness of the City's future WUE Program against the established goals could be similarly evaluated using system-wide water use data. Estimating the water savings directly resulting from the City's WUE Program in a single year is difficult. Therefore, long-term trends should be use to more clearly show the impact of the City's WUE Program.

The first step would be to establish a baseline from historical information. The second step is to evaluate the resulting water use after promoting WUE through targeted activities and events to customers. It is recommended that water use be tracked for at least a year to identify trends. Some considerations will need to be given to variations in weather and economic conditions. Another method would be to perform the same before/after water use analysis for WUE Program participants who volunteer and provide their address. The resulting information would be valuable for the City to correlate its WUE Program efforts with direct water savings for its customers.

AMI was implemented in 2025. The City will leverage AMI water usage data in its targeted public education programs to customers in a particular area or user profile, such as heavy irrigators. Using AMI, the City can estimate overall usage, irrigation usage, and peak water use rates.

6.2.6 Budget

The City recognizes the importance of continuing their WUE measures and considers it a core function of the Utility. The WUE program provides cost savings through demand reduction and reduction in DSL. Continuing the WUE Program can assist the City in meeting peak demands and avoiding curtailment periods. The City will continue the following level of effort for demand-side measures: approximately 0.5 FTE of staff time across its Water Utility, finances department, and development services department. Due to AMI capabilities, it is anticipated that the City will further personalize water use communications with customers without increasing staff effort. Future supply-side WUE measures will be funded, as appropriate, through the Capital Improvement and O&M funds. If AMI detects a large number of existing and new leaks, the City will evaluate the need for additional personnel in its meter maintenance group to address leaks.

6.3 Water Shortage Plan

Camas Municipal Code (CMC) Chapter 13.14 has been created to allow the City to impose restrictions during a water shortage. It defines five stages of water emergencies:

- Stage I - Anticipated Water Shortage.
- Stage II - Serious Water Shortage.
- Stage III - Critical Water Shortage.
- Stage IV - Emergency Water Shortage - Mandatory Outdoor Restrictions and Indoor Conservation.
- Stage V - Regional Disaster - Water Rationing.

The Public Works Director is responsible for declaring and implementing the water shortage plans. Stages I or II implement voluntary reductions in water use for customers and some City watering reductions. Stages III and IV further regulate or prohibit nonessential uses of water. Details on the Water Shortage can be found in CMC Chapter 13.14.

CHAPTER 7 WATER QUALITY

7.1 Introduction

The City is defined as a Group A - Community Water System and must comply with the drinking water standards of the federal Safe Drinking Water Act (SDWA) and its amendments, as regulated by the USEPA. The DOH adopted the updated federal standards under WAC 246-290, of which the most recent version became effective June 17, 2025.

The quality of the City's drinking water sources is of primary concern to the City. The City's water is supplied by groundwater aquifers and surface water sources (Jones and Boulder Creeks), which are tested regularly for the presence of contaminants at frequencies prescribed by DOH regulations. The City is in compliance with all DOH reporting requirements, including publication and distribution of an annual Water Quality Report that keeps consumers informed as to the quality of the City's water supply and water delivery systems.

This chapter includes the following components:

- Description of current drinking water quality regulations.
- Summary of anticipated future regulations.
- Summary of current monitoring programs.
- Summary of the City's compliance with USEPA and DOH regulations.
- Recommendations.

This chapter utilizes information from the DOH's website for Drinking Water Regulation and Compliance , the USEPA's website for regulations under the SDWA, the City's annual Water Quality Reports (included in Appendix E), and the City's previous 10 years water quality data.

7.2 Overview of Regulatory Requirements

The SDWA of 1974, amended in 1986 and 1996, established specific roles for the federal government, state government, and water system purveyors, with respect to water quality monitoring. The USEPA is authorized to develop national drinking water regulations and oversee the implementation of the SDWA. State governments are expected to adopt the federal regulations and accept primary responsibility or "primacy" for administration and enforcement of the Act. States can also regulate contaminants and set advisory levels. Public water system purveyors are assigned the day-to-day responsibility of meeting regulations by incorporating monitoring, record-keeping, and sampling procedures into their operation and maintenance programs.

Applicable SDWA regulations are summarized in Table 7.1 and are divided into those that address source water quality, surface water treatment, distribution system water quality, and system-wide requirements, respectively. Monitoring requirements under each rule are noted herein.

Table 7.1 Drinking Water Regulations

Rule	CFR	WAC 246-290	Affected Contaminants	Publication Date of Final Rule
Source Water Quality				
National Primary and Secondary Drinking Water Standards	See below	Part 4, 300, 310, 315 and 320	Bacteriological, IOC, VOC, SOC, Asbestos, Radionuclides, THM, Lead/Copper, Phase II/V	Phases I through V promulgated 1987 through 1992
Radionuclide Rule	40 CFR 141.15 141.25 141.26	Part 4, 300(9) 310(6), and 320	Radionuclides	Promulgated April 4, 1997
Arsenic Rule	40 CFR 141.23 141.24 141.16	Part 4, 300(3) and 310(3)	Arsenic	Promulgated February 2002 Compliance by January 23, 2006

Operator Certification Rule		WAC 246-292	N/A	Effective January 4, 2014

Notes:
CFR - Code of Federal Regulations; DBP - disinfection byproducts; ESWTR - Enhanced Surface Water Treatment Rule; HAA5 - haloacetic acids; IOC - inorganic contaminants; LT1ESWTR - Long Term 1 Enhanced Surface Water Treatment Rule; LT2ESWTR - Long Term 2 Enhanced Surface Water Treatment Rule; MCL - maximum contaminant levels; NPDWR - National Primary Drinking Water Regulation; PFAS - per- and polyfluoroalkyl substances; UCMR - Unregulated Contaminants Monitoring Rule; VOC - volatile organic compounds, SAL - State Action Levels; SOC - synthetic organic chemicals; THM - trihalomethanes.

7.3 Source Water Quality

Historically, the City has relied on groundwater supplies from wells and surface water diversions. All of the City's sources are treated with chlorine, fluoride, and sodium hydroxide for pH adjustment (with the exception of Well 9). Surface water is treated via a slow sand filtration plant. Regulations that address source water quality for groundwater and surface water systems are described herein.

7.3.1 National Primary and Secondary Drinking Water Standards

The NPDWRs, established by the USEPA, are legally enforceable primary standards to protect the public from consuming water containing contaminants that present a risk to human health. The current list comprises 87 contaminants, including six microorganisms (two of which are nonpathogenic indictors of potential contamination, total coliform, and Escherichia coli), turbidity, four DBP/byproduct groups, three disinfectants, 16 inorganic contaminants, 53 organic contaminants, and four radionuclides. MCL and maximum contaminant level goals (MCLG) have been set for 73 of these contaminants. Disinfectant MCLs and MCLGs are comprised of Maximum Residual Disinfectant Levels (MRDL) and Maximum Residual Disinfectant Level Goals (MRDLG) have been set for three disinfectants. Ten other contaminants are regulated through treatment technique requirements.

The USEPA has also published secondary regulations which are not legally enforceable and function as guidelines to help utilities provide aesthetically pleasing drinking water (taste, odor, color, etc.). The secondary standards set secondary maximum contaminant levels (SMCL) for 15 compounds. These compounds do not present a health risk at the SMCL. States are not required by the USEPA to enforce any of the secondary standards; however, each state may choose to regulate any or all of the secondary standards. For new community water systems, the DOH requires treatment for secondary MCL exceedances under WAC 246-290-320 (3)(d). For other public water systems, the WAC stipulates that the required follow-up action be determined by the DOH based on the degree of consumer acceptance of the water quality and their willingness to bear the cost of meeting the secondary standard.

Current primary and secondary MCLs for inorganic and organic constituents, respectively, are documented in the following subsections.

7.3.2 Inorganic Chemicals

Regulated IOCs include elemental metals such as mercury, arsenic, and iron. Some non-metallic constituents such as chloride, fluoride, and sulfate are also included in this category. Physical properties of IOCs that affect water quality in this category include turbidity, specific conductivity, total dissolved solids, and color. WAC 246-290-310 specifies primary and secondary MCLs for IOCs, which are summarized in Table 7.2 and Table 7.3, respectively.

Table 7.2 Primary MCLs for Inorganic Chemicals

Chemical	Primary MCL (mg/L)(1)
Antimony (Sb)	0.006
Arsenic (As)	0.01
Asbestos	7 million fibers/liter (length > 10 microns)
Barium (Ba)	2.0

Chemical	Primary MCL (mg/L)(1)
Beryllium (Be)	0.004
Cadmium (Cd)	0.005
Chromium (Cr)	0.1
Copper (Cu)	1.3(2)
Cyanide (HCN)	0.2
Fluoride (F)	4.0
Lead (Pb)	0.015(2)
Mercury (Hg)	0.002
Nickel (Ni)	0.1
Nitrate (as N)	10.0
Nitrite (as N)	1.0
Selenium (Se)	0.05
Sodium (Na)	20(3)
Thallium (Tl)	0.002

Notes:
(1) Source: State DOH Drinking Water Regulations (246-290-310), effective June 2025.
(2) Lead and copper have established Action Levels (AL), rather than MCLs. These are discussed further in the LCR, under the Distribution System Water Quality section.
(3) USEPA has established a recommended level of 20 mg/L for individuals that have restrictions on daily sodium intake. This is not an enforceable standard.

Table 7.3 Secondary MCLs for Inorganic Chemicals

Chemical	Primary MCL (mg/L)(1)
Aluminum	0.05 to 0.2 mg/L
Chloride	250 mg/L
Color	15 (color units)
Copper	1.0 mg/L
Corrosivity	Non-corrosive
Fluoride	2.0 mg/L
Foaming Agents	0.5 mg/L
Iron	0.3 mg/L
Manganese	0.05 mg/L
Odor	3 threshold odor number
pH	6.5-8.5
Silver	0.10 mg/L
Sulfate	250 mg/L
Specific Conductivity	700 (umhos/cm)
Total Dissolved Solids	500 mg/L
Zinc	5 mg/L

Notes:
(1) Source: State DOH Drinking Water Regulations (246-290-310), effective June 2025.

7.3.2.1 Monitoring Requirements

The City has a waiver for IOC testing that reduces the frequency to once every nine years for all its wells. The next IOC samples are required in 2028.

7.3.2.2 Compliance

The City complies with the requirements for monitoring IOCs and has not exceeded any water quality requirements. Water quality data for inorganic chemicals from 2021-2024 is presented in Table 7.4.

Table 7.4 Inorganic Chemicals Monitoring Results

Contaminant	MCL Goal	MCL	2021	2022	2023	2024
Fluoride (mg/L)	1	4	0.34-1.03	0.16-1.1	0.13-1.11	0.12-1.24
Nitrates (mg/L)	10	10	ND-2.9	ND-2.1	ND-1.7	ND-2.0

7.3.3 Volatile Organic and Synthetic Organic Compounds

VOCs are manufactured, carbon-based chemicals that vaporize quickly at normal temperatures and pressures. VOCs include many hydrocarbons associated with fuels, paint thinners, and solvents. This group does not include organic pesticides, which are regulated separately as SOCs. VOCs are divided into the following two groups:

- Regulated VOCs that have been determined to pose a significant risk to human health.
- Unregulated VOCs for which the level of risk to human health has not been established.

There are currently 21 regulated VOCs and 33 regulated SOCs (excluding PFAS). A list of these compounds and their MCLs is included in Table 7.5.

Table 7.5 Regulated Volatile and Synthetic Organic Chemicals

Organic Chemical	Federal Regulation	Primary MCL (mg/L)(1)	Organic Chemical	Federal Regulation	Primary MCL (mg/L)(1)
Volatile Organic Chemicals					
Vinyl chloride	Phase I	0.002	Monochlorobenzene	Phase II	0.1
Benzene	Phase I	0.005	Ortho-Dichlorobenzene	Phase II	0.6
Carbon Tetrachloride	Phase I	0.005	Styrene	Phase II	0.1
1,2-Dichloroethane	Phase I	0.005	Tetrachloroethylene	Phase II	0.005
Trichloroethylene	Phase I	0.005	Toluene	Phase II	1
Para-Dichlorobenzene	Phase I	0.075	Trans-1,2-Dichloroethylene	Phase II	0.1
1,1-Dichloroethylene	Phase I	0.007	Xylenes (total)	Phase II	10
1,1,1-Trichloroethane	Phase I	0.2	Dichloromethane	Phase V	0.005
Cis-1,2-Dichloroethylene	Phase II	0.07	1,2,4-Trichloro-benzene	Phase V	0.07
1,2-Dichloropropane	Phase II	0.005	1,1,2-Trichloroethane	Phase V	0.005
Ethylbenzene	Phase II	0.7			

Organic Chemical	Federal Regulation	Primary MCL (mg/L)(1)	Organic Chemical	Federal Regulation	Primary MCL (mg/L)(1)
Synthetic Organic Chemicals					
Arochlor	Phase II	0.002	Benzo(a)pyrene	Phase V	0.0002
Atrazine	Phase II	0.003	Dalapon	Phase V	0.2
Carbofuran	Phase II	0.04	Di(2-ethylhexyl) adipate	Phase V	0.4
Chlordane	Phase II	0.002	Di(2-ethylhexyl) phthalate	Phase V	0.006
Dibromochloro-propane	Phase II	0.0002	Dinoseb	Phase V	0.007
2,4-D	Phase II	0.07	Diquat	Phase V	0.02
Ethylene dibromide	Phase II	0.00005	Endothall	Phase V	0.1
Heptachlor	Phase II	0.0004	Endrin	Phase V	0.002
Heptachlor epoxide	Phase II	0.0002	Glyphosate	Phase V	0.7
Lindane	Phase II	0.0002	Hexachlorobenzene	Phase V	0.001
Methoxychlor	Phase II	0.04	Hexachloro Cyclopentadiene	Phase V	0.05
PCBs	Phase II	0.0005	Oxamyl (vydate)	Phase V	0.2
Pentachlorophenol	Phase II	0.001	Picloram	Phase V	0.5
Toxaphene	Phase II	0.003	Simazine	Phase V	0.004
2,4,5-TP	Phase II	0.05	2,3,7,8-TCDD (dioxin)	Phase V	$3x10^{-8}$

Notes:
(1) 40 CFR 141.61(a) and (c); adopted by State DOH, effective April 1999.
PCB - Polychlorinated biphenyls.

7.3.3.1 Monitoring Requirements

Per DOH requirements, VOCs and SOCs must be sampled once every three years, unless a waiver is in place. State waivers requiring no monitoring have been issued for dioxin, endothal, diquat, glyphosate, and insecticides. Additionally, the state grants a waiver if a chemical is not in use or previous monitoring indicates contamination would not occur. The City must apply for waivers through DOH. There are two types of waivers, risk-based or area-wide. The risk-based waiver requires a susceptibility analysis and DOH charges a fee for these waivers (purchased waivers). Area-wide waivers are issued if a chemical is not used within a region, thus DOH does not charge for these waivers. While the state issues both types of waivers, an area-wide waiver is referred to as a "State waiver." A waiver is in place for two years, during which time there are no requirements for monitoring. However, once a waiver expires, monitoring frequency for VOCs and SOCs is one sample every three years.

The City is required to sample for VOCs to once every three years at the eastern wellfield (Well 6 and 14) and has waivers at the remaining wells reducing frequency to every six years. The City also has issued waivers reducing sampling frequency for herbicides and pesticides to nine and three years, respectively.

7.3.3.2 Compliance

A review of the City's previous 10 years of water quality data shows that all the City's source wells test below VOC and SOC MCLs or are not detected at all.

7.3.4 Radionuclides

In December 2000, the USEPA announced updated standards for radionuclides. This rule became effective in December 2003. All community water systems are required to meet the MCLs listed in Table 7.6 and requirements for monitoring and reporting. All systems were required to complete initial monitoring and phase in the monitoring requirements between December 8, 2003, and December 30, 2007. Initially, utilities were required to undergo four consecutive quarters of monitoring for gross alpha, combined radium-226/-228, and uranium. Only systems that were considered "vulnerable" were required to monitor for gross beta (quarterly samples), tritium, and strontium-90 (annual samples). The initial monitoring was used to determine if the system would have to perform reduced or increased monitoring.

Table 7.6 Regulated Radionuclides

Radionuclide	MCL(1)
Radium – 226	3 pCi/L
Combined Radium – 226 and 228	5 pCi/L
Uranium	30 µg/L
Gross Alpha (excluding Uranium)	15 pCi/L
Beta Particle and Photon Radioactivity	4 millirem/year(2)
Tritium	20,000 pCi/L(2)
Strontium-90	8 pCi/L(2)

Notes:
(1) Environmental Protection Agency, 40 CFR 141.66.
(2) According to USEPA 40 CFR 141.66, "average annual concentration of beta particle and photon radioactivity from man-made radionuclides in drinking water must not produce an annual dose equivalent to the total body or any internal organ greater than 4 millirem/year." The MCLs for tritium and strontium-90 are assumed to produce body organ doses equivalent to 4 millirem/year.
pCi /L - picocurie per liter.

7.3.4.1 Monitoring Requirements

The WAC states "The purveyor may omit analysis for radium-226 and radium-228 if the gross alpha particle is less than 5 pCi/L." The City is required to sample for radium-228 and monitor gross alpha at all wells every six years. The USEPA has adopted a new schedule of sampling once every three years that has not yet been adopted by DOH. In Washington State, natural occurrence levels of the regulated radionuclides have generally been quite low.

7.3.4.2 Compliance

The City is in full compliance with the monitoring requirements and has no exceedances to date.

7.3.5 Arsenic Rule

In January 2001, USEPA promulgated a new standard that requires public water systems to reduce arsenic levels in drinking water. The final rule became effective in 2002 and required compliance by 2006. The rule applies to all community water systems and non-transient, non-community water systems, regardless of size. The rule not only establishes an MCL for arsenic (0.010 mg/L), based on a running annual average (RAA) of quarterly results and an MCLG for arsenic (zero), but also lists feasible and affordable

technologies for small systems that can be used to comply with the MCL. However, systems are not required to use the listed technologies in order to meet the MCL.

Initial monitoring of arsenic required groundwater systems to take one sample between 2005 and 2007. Monitoring requirements decreased to one sample every three years (for groundwater systems) if the initial result is less than the MCL. Monitoring requirements increased to quarterly samples if the initial results were greater than the MCL. Each entry point to the distribution system should have been tested, unless otherwise specified by the State.

The arsenic rule has been adopted by the Washington DOH as a revision to the arsenic MCL under WAC 249-290-310.

7.3.5.1 Monitoring Requirements

Monitoring requirements are once every three years, per requirements for IOCs. Arsenic must be monitored at each entry point to the distribution system as part of the IOC monitoring framework. If any sampling point is in violation of an MCL, the system is in violation.

7.3.5.2 Compliance

The City is in full compliance with the monitoring requirements and has no exceedances to date.

7.3.6 PFAS NPDWR

The USEPA initially announced a finalized National Primary Drinking Water Regulation (NPDWR) for six PFAS in drinking water on April 10, 2024. The final regulations set MCLs for five PFAS as individual components: Perfluorooctanoic acid (PFOA), perfluorooctyl sulfonate (PFOS), perfluorohexanesulfonic acid (PFHxS), perfluorononanoic acid (PFNA), and hexafluoropropylene oxide dimer acid (HFPO-DA commonly known as GenX). Additionally, an MCL was set for PFAS mixtures containing at least two or more of the following: PFHxS, PFNA, GenX, and perfluorobutane sulfonic acid (PFBS). The Hazard Index (HI) is used for the PFAS mixture MCL to account for combined and co-occurring levels of these PFAS compounds in drinking water. MCLGs were also established for these six PFAS compounds.

On May 14, 2025, USEPA announced its intent to modify the already promulgated NPDWR. This change would keep MCLs for PFOA and PFOS but rescind MCLs for the other PFAS under the existing NPDWR. Additionally, the intended changes included an extended timeline for compliance from 2029 to 2031. However, it is unclear at this time if these proposed changes will take effect, as these changes must undergo full rulemaking process under the Administrative Procedure Act, legal review, and potential judicial review. While the USEPA expects to finalize their proposed revision in the spring of 2026, it is unclear if it will ever take effect. The City should plan to operate on the assumption to comply with MCLs by 2029. For the purposes of this document, it is assumed that the currently promulgated NPDWR will remain in effect as it is the more conservative approach to managing the regulations and maintaining compliance.

Prior to issuance of UCMR 5, USEPA concluded there was enough data on the health effects of PFAS to begin the process of regulating certain PFAS compounds. The following describes the sequence of key actions taken by USEPA related to PFAS:

- In February 2021, USEPA issued notice for its intent to enforce limits on PFAS in drinking water to safeguard communities from PFAS contamination, specifically PFOA and PFOS.
- In June 2022, USEPA announced new health advisory levels (HAL) for four PFAS: PFOA, PFOS, GenX, and PFBS. This was the first time HALs had been issued for PFBS and GenX. For PFOA and PFOS, these new HALs are several orders of magnitude below the HAL announced in 2016 (i.e., 70 nanograms per liter [ng/L] for PFOA and PFOS combined). The new HALs for PFOA and PFOS were labelled "interim" because the USEPA's draft analysis of health studies for PFOA and PFOS were still undergoing review by the Science Advisory Board at the time of the announcement.
- On March 14, 2023, USEPA announced a proposed NPDWR to establish legally enforceable levels for not only PFOA and PFOS but also PFNA, GenX, PFHxS, and PFBS.
- On April 10, 2024, USEPA announced the final NPDWR for six PFAS. Under the NPDWR, the USEPA established MCLs for six PFAS in drinking water: PFOA, PFOS, PFHxS, PFNA, and GenX as contaminants with individual MCLs, and PFAS mixtures containing at least two or more of PFHxS, PFNA, GenX, and PFBS using a Hazard Index MCL to account for the combined and co-occurring levels of these PFAS in drinking water. USEPA also finalized health-based, non-enforceable MCLG for these PFAS. A summary of these levels is provided in Table 7.7. An explanation of the HI approach follows the table.

Table 7.7 MCLs and MCLGs for Specific PFAS Compounds in Drinking Water

Compound	Final MCLG	Final MCL (Enforceable Levels)
PFOA	Zero	4.0 ppt(1)
PFOS	Zero	4.0 ppt(1)
PFNA	10 ppt	10 ppt
PFHxS	10 ppt	10 ppt
HFPO-DA (GenX)	10 ppt	10 ppt
Mixtures containing two or more of PFHxS, PFNA, HFPO-DA (GenX), and PFBS	HI of 1.0 (unitless).	HI of 1.0 (unitless).

Notes:
(1) In aqueous matrixes, ppt can also be expressed as ng/L.
ppt - parts per trillion.

While PFOA, PFOS, PFNA, PFHxS, and GenX have their own individual MCLs and MCLGs under the NPDWR, a HI of less than 1.0 must also be met to comply with the rule. The HI is used to reduce the risk of health impacts from a chemical mixture. The HI is calculated via a sum of fractions. Each fraction compares the level of each PFAS measured in the water to the health-based water concentration. The equation below summarizes the HI calculation. It includes indexes for PFHxS, PFNA, and GenX (all of which have their own individual limits as MCLs) and PFBS (which does not have its own individual limit as an MCL).

With the HI approach, the concentration of each of these four PFAS would be divided by a corresponding health-based value (10ppt for PFHxS, PFNA, and GenX; 2000 ppt for PFBS). The sum of these fractions needs to be below 1.0 to comply with the NPDWR. Note, however, that an exceedance must be triggered

by two or more chemicals. For example, a GenX concentration of 11 ppt alone would not cause a HI exceedance, but it would cause an MCL exceedance. A PFBS concentration of over 2,000 ppt alone would not cause a HI exceedance unless another chemical within the calculation exceeded 10 ppt.

$$HI = \frac{[PFHxS]}{10ppt} + \frac{[GenX]}{10ppt} + \frac{[PFNA]}{10ppt} + \frac{[PFBS]}{2000\ ppt}$$ Hazard Index Calculation

7.3.6.1 Monitoring Requirements

Under the NPDWR, public water systems (PWS) will be required to take initial monitoring samples at all entry points to the distribution system based on the frequency outlined in Table 7.8. This initial monitoring must be completed by 2027. The City has already completed this initial monitoring requirement through sampling efforts under the SAL requirements for PFAS, which are discussed more in the following section.

Systems with appropriate, previously acquired monitoring data from UCMR 5, state-led, or other applicable monitoring programs using USEPA Methods 533 or 537.1, will not be required to conduct separate initial monitoring for regulated PFAS.

Table 7.8 PWS Sampling Requirements under USEPA's Proposed PFAS Rule

PWS Type	Monitoring Frequency
Groundwater Systems serving >10,000 persons	Monitor regulated PFAS quarterly within a 12-month period.
Groundwater Systems serving ≤ 10,000 persons	Monitor regulated PFAS twice within a 12-month period, with sampling events conducted at least 90 days apart.
Surface Water Systems	Quarterly within a 12- month period. Samples are required to be collected 2 to 4 months apart.

After initial monitoring, PWS must monitor for rule compliance on a quarterly basis at each entry point to the distribution system. However, based on the initial monitoring results, agencies may reduce compliance monitoring frequency if the monitoring results are below the rule trigger level (RTL). The RTL is half of the MCLs or HI (i.e., 2 ng/L for specific PFAS with an MCL, or an HI of 0.5). Primacy agencies (states) have the flexibility to reduce monitoring to annually or triennially for systems that are consistently below RTLs. Any results above the RTL automatically require a reversion back to quarterly sampling.

For systems required to monitor quarterly, compliance will be determined by running annual averages at the sampling point. When calculating the running annual averages, if a sample result is less than the practical quantitation level for the monitored PFAS, the PWS may use zero as the result on that sample to calculate the average for compliance purposes.

7.3.6.2 Compliance

The PFAS NPDWR has a 5-year compliance window from its year of inception (2024) with specific requirements throughout this timeframe:

- Within three years of rule promulgation (2024-2027):
  - Initial monitoring must be complete.

- Starting three years following rule promulgation (2027-2029):
  - Results of initial monitoring must be included in Consumer Confidence Reports (i.e., Annual Water Quality Report).
  - Regular monitoring for compliance must begin, and results of compliance monitoring must be included in Consumer Confidence Reports.
  - Public notification for monitoring and testing violations.
- Starting five years following rule promulgation (starting 2029):
  - Public notification for MCL violations.
  - Comply with all MCLs (including performing mitigation measures or installing PFAS treatment as required to comply with the MCLs).

All requirements described in this section will supersede current DOH SALs related to PFAS as per the WAC 246-290-315 Subsection (8) unless the State of Washington enacts more stringent or additional requirements beyond those listed in the PFAS NPDWR.

Due to the timeframe in which the PFAS NPDWR requirements are rolled out, the WAC 246-290-315 is temporarily more stringent than the PFAS NPDWR until 2027. Currently in Washington, PWS must report exceedances of certain PFAS above SALs (summarized previously in Table 7.6.1 and Section 7.3.9.1.). The City of Camas has conducted its required initial monitoring as required by the PFAS NPDWR, but will also continue to comply with monitoring and reporting requirements under WAC 246-290-315 and 246-290-320 until 2027, when the reporting requirements under the PFAS NPDWR become more stringent (unless the State of Washington enacts more stringent requirements).

The City is in full compliance with PFAS monitoring requirements, however sampling data collected have indicated certain wells within the City's water supply exceed MCLs. To comply with the PFAS NPDWR by 2029 some form of PFAS mitigation will be needed at these wells. Additionally, the City has taken action to mitigate PFAS by constructing a treatment facility at Well 13 and evaluate mitigation alternatives at other wells of concern.

7.3.7 Washington State Action Levels for PFAS

The State of Washington's DOH has primacy to establish SALs and state MCLs that set more stringent or more encompassing requirements for public water systems than federal requirements. The basis on which SALs or State MCLs may be established is described in WAC 246-290-315.

DOH set SALs for certain PFAS in December of 2021. DOH considers establishment of SALs when human exposure to the contaminant in question can occur through drinking water, and when the contaminant is known or likely to occur in public water systems at levels of public health concern.

DOH may develop a SAL based on the following:

- Evaluation of available peer-reviewed scientific literature and government publications on fate, transport, exposure, toxicity, and health impacts of the contaminant and relevant metabolites;

- An assessment based on the most sensitive adverse effect deemed relevant to humans and considering susceptibility and unique exposures of the most sensitive subgroup such as pregnant women, fetuses, young children, or overburdened and underserved communities; and
- Technical limitations to achieving the SAL such as insufficient analytical detection limit achievable at certified drinking water laboratories.

SAL exceedance requires follow-up action as described in WAC 246-290-320.

- A State MCL may be established by DOH in specific cases where:
- Regulating the contaminant in question presents a meaningful opportunity to reduce exposures of public health concern for persons served by public water systems.
- Where there is a need for an enforceable limit to achieve uniform public health protection in Group A public water systems.
- The need for an enforceable limit to support source water investigation and clean-up of a contaminant in drinking water supplies by responsible parties.

State MCLs would require treatment for the contaminant in question, whereas SALs require specific follow-up actions as described in WAC 246-290-320. DOH has not yet established any State MCLs but has established a series of SALs that were enacted in late 2021 and became effective in 2022. These specific SALs are described further in the Compliance section below. Note that DOH modified the SALs in December of 2025 to more closely align with the federal USEPA MCLs.

7.3.7.1 Monitoring Requirements

The City is in compliance with all monitoring rules associated with constituents subject to SALs. WAC 246 290-300 describes the monitoring requirements for contaminants subject to DOH SALs. These requirements are summarized in Table 7.9.

Table 7.9 Sampling Requirements for WA SALs

Contaminant or Group of Contaminants	Initial Sampling	Routine Sampling Frequency	Sampling Location
PFAS with prescribed SALs (see compliance section below)	One sample on or before December 31, 2025	Once every three years	Per the locations described in WAC 246-290-300.7b.

While one sample is required before the end of 2025, sampling requirements for UCMR 5 will generally fulfill this requirement for large public water systems, as is the case for Camas. UCMR 5 sampling requirements (described in Sections 7.3.8 and 7.3.8.1) include the five PFAS that are subject of the Washington SALs. However, sampling for contaminants with SALs may bring specific follow-up actions. These follow up actions generally include notification of the result to DOH, and public notification. There are also follow-up requirements for samples that do not exceed the SALs but result in a certain percentage of the SAL.

7.3.7.2 Compliance

The City is currently in compliance with existing state regulations regarding PFAS sampling and public notification requirements under WAC 246-290-320. Some sampling efforts at Well 13 showed PFAS levels above the SALs. As a result, the City has taken follow-up actions, including follow up monitoring and

public notification, in accordance with WAC 246-290-320. Although a SAL exceedance does not trigger the need for treatment, the City is also currently constructing a PFAS treatment system for Well 13.

Washington's SALs for PFAS have been in effect since 2022 and currently govern monitoring and follow-up actions for five PFAS. Utilities must complete initial SAL sampling by December 31, 2025, and continue routine monitoring every three years thereafter. In contrast, the USEPA's PFAS NPDWR was finalized in April 2024, with initial monitoring required by 2027 and enforceable MCLs beginning in 2029. This creates an overlap period where SAL requirements remain in force until federal MCLs become effective. Washington's emergency rulemaking in 2024–2025 clarified that SAL protections will continue through this transition to avoid any regulatory gap.

Washington has indicated through emergency rules and recent updates that SALs will effectively transition to match the federal MCLs when they become enforceable in 2029. However, in December 2025, DOH updated the SALs to align with the MCL values. They are effective January 15, 2026.

The following table shows the SAL values that existed from 2022 through 2025, as well as what the updated SAL values are.

Table 7.10 Washington State Action Levels

Compound	Old SAL – Previously Effective 2022 through 2025 (ppt)	Updated SAL - Effective Jan 15, 2026 (ppt)
PFOA	10	4
PFOS	15	4
PFNA	9	10
PFHxS	65	10
PFBS	345	N/A (part of HI)
HFPO-DA (GenX)	N/A	10
Mixtures containing two or more of PFHxS, PFNA, HFPO-DA (GenX), and PFBS	N/A	HI of 1.0 (unitless).

Notes:
(1) Old SAL exceedances were based on a single sample exceedance (with second sample averaging allowed). Updated SAL exceedances are based on annual running averages to be in alignment with federal MCL rules.
(2) The hazard index calculation is the same as the MCL hazard index calculation.

The City does not anticipate any compliance issues with the updated SALs. The Tier 2 notification requirements remain in place, they are just now required for exceedances of the updated SAL values. The City is actively implementing PFAS treatment at Well 13 and is developing a plan for treatment at other well sites in order to maintain compliance with drinking water regulations when the federal MCL enforcement begins in 2029.

7.3.8 Manganese

The USEPA included manganese, a naturally occurring ion, in UCMR4 to help assess if a primary MCL, in addition to the existing secondary MCL, should be established. Manganese is currently regulated by DOH as a secondary standard; any exceedances trigger follow-up actions as directed by DOH. Elsewhere, in 2019, Canada established two new values regulating manganese in drinking water: A health-based

maximum allowable concentration (analogous to the US's primary contaminant MCL) of 0.12 mg/L and an aesthetic objective (analogous to the US's secondary contaminant MCL) of 0.02 mg/L. The aesthetic objective for manganese is below the USEPA's current secondary MCL of 0.05 mg/L.

Manganese was included in sampling for UCMR4 to help assess if it should be moved from a secondary MCL to a primary MCL. As of March 10, 2020, the USEPA determined there was not enough information to proceed to the regulatory determination assessment phase. Manganese was included in Contaminant Candidate List 5, finalized in 2022.

However, USEPA has established HALs for manganese. HALs establish a specific duration and threshold concentration of exposure below which no health effects are anticipated to occur. For all persons, USEPA has a one-day and 10-day HAL of 1 mg/L and a lifetime HAL of 0.3 mg/L. For bottle-fed infants younger than six months, the USEPA also has a 10-day HAL of 0.3 mg/L.

In December 2023, DOH published updated recommendations pertaining to manganese, which included the following:

- Manganese treatment should be installed if levels exceed the 0.05 mg/L secondary MCL.
- Treatment should reduce manganese levels to below 0.02 mg/L.
- Public notification should be provided if manganese levels exceed 0.3 mg/L, consistent with USEPA HALs discussed above.

7.3.8.1 Monitoring Requirements

The City monitors for manganese as part of its complete inorganic chemical test panel which is required once every nine years.

7.3.8.2 Compliance

The City is in full compliance with the monitoring requirements and has no exceedances to date.

7.3.9 Surface Water Treatment Rules

7.3.9.1 Surface Water Treatment Rule

On December 31, 1990, USEPA promulgated the Surface Water Treatment Rule (SWTR) to establish filtration and disinfection as a drinking water treatment technique in lieu of MCLs for Giardia lamblia, viruses, HPC bacteria, Legionella, and turbidity. The SWTR is based on the premise that all surface water and GWI are at risk of microbiological contamination, and the previous requirements were inadequate to prevent waterborne disease outbreaks. The SWTR requires 99.9 percent (3 log) removal and/or inactivation of *Giardia* cysts, and 99.99 percent (4 log) removal and/or inactivation of viruses. To meet these requirements, surface water systems must disinfect according to strict requirements, must filter water unless certain source water-quality and site-specific conditions are met, and must be operated by qualified personnel. To avoid the filtration requirement, the following criteria must be met:

1. 90 percent of the samples taken from the source water must have fewer than 100 total coliform bacteria per 100 milliliters (mL) and fewer than 20 fecal coliform bacteria per 100 mL.
2. The turbidity level prior to disinfection must not exceed 5.0 nephelometric turbidity unit (NTU).

3. *Giardia* and virus inactivation requirements must be met, providing redundant disinfection components and maintaining required disinfection residuals.
4. An approved watershed control program must be implemented with annual onsite inspections.
5. Total Coliform Rule (TCR) requirements in the distribution system and THM requirements must be met.
6. The water system must be free of waterborne disease outbreaks.
7. The purveyor must have alternative operating plans to address high turbidity levels and other water quality issues.

Utilities that use unfiltered water must maintain a disinfectant residual throughout the water distribution system. At entry points to the distribution system, residual disinfectant concentrations cannot be <0.2 mg/L for more than four hours. At distribution system sample locations, residual disinfectant concentrations cannot be undetectable in greater than 5 percent of samples in a month, for any two consecutive months. Heterotrophic plate count (HPC) ≤ 500/mL is deemed to have detectable residual disinfectant.

GWI is regulated by the SWTR. The intent is to provide the same level of treatment for groundwater sources that are at risk for contamination by pathogens as surface water supplies. Examples of water sources that may be classified as GWI are shallow wells, springs, infiltration galleries, and Ranney wells.

7.3.9.2 Long Term 2 Enhanced Surface Water Treatment Rule

The LT2ESWTR is intended to address a number of deficiencies in the original 1990 SWTR, including the following:

1. Cryptosporidium is not addressed in the SWTR.
2. Pathogen reduction may not be adequate in poorer quality waters.
3. Virus disinfection requirements may be greater than indicated in the SWTR.
4. Disinfectants and Disinfection Byproducts Rule (DBPR) may undermine the SWTR by causing utilities to reduce disinfectant residuals.

USEPA developed the ESWTR in two stages. The proposed Interim ESWTR was published in the Federal Register on 29 July 1994. USEPA finalized the Interim ESWTR and Stage 1 DBPR in November 1998, as required by the 1996 Amendments to the SDWA, Section 1412(b)(2)(C). The final rules resulted from formal regulatory negotiations with a wide range of stakeholders that took place in 1992-93 and 1997. On January 16, 2001, USEPA published final revisions to the Interim ESWTR and Stage 1 DBPR. The LT1ESWTR was promulgated in February 2002 and builds on the requirements of the SWTR. The LT1ESWTR specifies treatment requirements to address *Cryptosporidium* and other microbial contaminants in public water systems serving less than 10,000 persons.

The LT2ESWTR proposed rule was promulgated in August 2003 and published in the Federal Register on January 5, 2006. The LT2ESWTR requires PWSs that use surface water or groundwater under the direct influence of surface water to monitor their source water (influent water prior to treatment) for *cryptosporidium*, *E. coli*, and turbidity for a period of two years starting six months after the rule is finalized. Based on the results of this monitoring, water systems will be classified in one of four risk bins. Systems classified in higher risk bins must provide 90 to 99.7 percent (1.0 to 2.5 log) additional reduction

of *Cryptosporidium* levels. The regulation specifies a range of treatment and management strategies, collectively termed the "microbial toolbox," that systems may select to meet their additional treatment requirements. All unfiltered systems must provide at least 99 or 99.9 percent (2 or 3-log) inactivation of *Cryptosporidium*, depending on the results of their monitoring.

7.3.9.3 Monitoring requirements

Monitoring requirements are dictated by source water quality and the selected treatment processes. The City has recently completed construction of a new SSF Plant for its surface water sources. The City's surface water sources have been listed as Bin 1 sources for *Cryptosporidium* removal and do not require additional treatment beyond slow sand filtration. Specific treatment objectives and monitoring for the slow sand facility include:

- Turbidity reduction as required for slow sand filtration processes, providing finished water turbidity less than 1 NTU in 95 percent of samples each month and no turbidity samples greater than 5 NTU.
- Provide 3-log giardia removal and inactivation through a combination of 2-log removal by filtration and 1-log inactivation by chlorine disinfection.
- Provide a total 4-log virus inactivation and removal through filtration and disinfection.
- Provide a continuous free chlorine residual of not less than 1.0 mg/L entering the distribution system at the water quality station and pressure reducing valve vault at NE 277th Avenue and NE 14th Street.
- Provide treated water pH of 7.5 plus or minus 0.2 units (if the optional caustic feed system is installed and used for pH adjustment).
- Provide a fluoride residual of 0.7 mg/L.

7.3.9.4 Compliance

The City has constructed a new slow sand filtration treatment plant that is in full compliance with all surface water treatment rules.

7.3.9.5 Filter Backwash Recycling Rule

The Filter Backwash Recycling Rule (FBRR) regulates the recycling of filter backwash water within the treatment process of public water systems. The purpose of the rule is to require systems to review their recycle practices and, where appropriate, work with the DOH to make any necessary changes to recycle practices that may compromise microbial control. The City's slow sand filter backwash water is wasted to a detention pond rather than recycled to the head of the plant and thus the FBRR does not apply.

7.3.10 Groundwater Rule

The USEPA enacted the final Groundwater Rule (GWR) January 8, 2007, for the purpose of providing increased protection against microbial pathogens in public water systems that use untreated groundwater. The GWR will apply to public water systems that serve groundwater as well as to any system that mixes surface and groundwater, if the groundwater is added directly to the distribution system and is provided to customers without providing disinfection contact time.

To implement the GWR, USEPA is taking a risk-based approach to protect drinking water from groundwater sources that have been identified as being at the greatest risk of fecal contamination. This strategy includes four primary components:

1. **Sanitary Surveys**. Sanitary surveys must be conducted every three years and meet the provisions of the 1998 Interim ESWTR as it relates to populations served. In addition, the sanitary survey shall implement the eight elements of the USEPA/State Joint Guidance on Sanitary Surveys. These elements relate to source protection; identification of the physical components and their condition; and description and implementation of programs for treatment, distribution, storage, pumping, monitoring, operation and maintenance; and operator certification.
2. **Source Water Monitoring**. Source water monitoring is triggered when a system does not sufficiently disinfect drinking water to achieve 4-log (99.99 percent) virus removal and identifies a positive routine sample during its TCR monitoring and hydrogeologic sensitivity assessment monitoring (at the State's discretion) targeted at high-risk systems. Once a total coliform-positive sample is found within a distribution system, the system is required to collect one source water sample per source and monitor for a fecal indicator. Washington State may choose to issue a waiver if the groundwater source has a hydrogeologic barrier.
3. **Corrective Action**. Corrective action is required for any system with a significant deficiency or evidence of source water fecal contamination. Corrective actions must be taken by "groundwater systems that have a significant deficiency or have detected a fecal indicator in their source water." USEPA guidelines recommend that corrective actions take place within 90 days, or longer if approved by the State. The problem should be solved by eliminating the contamination source, correcting the significant deficiencies, or providing an alternate source of water supply.
4. **Compliance Monitoring**. Compliance monitoring ensures that treatment technology installed to treat drinking water reliably achieves 4-log virus inactivation. Compliance monitoring applies to all groundwater systems that disinfect as a corrective action. Systems serving greater than 3,300 individuals must continuously monitor their disinfection treatment process. If disinfection concentrations are below the required level, the system must restore disinfection concentration within fours hours.

The compliance date for triggered source water monitoring and the associated corrective actions, as well as compliance monitoring, was December 1, 2009. Initial sanitary surveys should have been completed by December 31, 2012. However, for community water systems that have been identified by the State as outstanding performers (generally those that have treatment that provides 4-log virus inactivation or removal at all sources), the initial sanitary survey must be completed by December 31, 2014.

Many of the requirements of the GWR are determined by the individual state agencies. The requirements of the GWR were adopted by the Washington DOH into WAC 246-290 in November 2010. In addition, DOH has provided a Fact Sheet for Group A utilities with recommended actions to prepare for the GWR. These actions include the following:

- Correct deficiencies from the last sanitary survey.
- Install a sample tap at each wellhead.
- Know specifically where each well's water goes. Triggered source water monitoring will require monitoring of all sources, unless it can be shown that the area of concern in the distribution system is only served by a limited number of sources.

- Update the emergency response plan, to be ready to provide alternate water, if needed.
- If currently treating groundwater from a well, contact the regional office engineer to confirm whether you currently achieve 4-log virus inactivation. Systems that treat to this level will not be required to conduct triggered source water monitoring but instead will be required to meet treatment technique monitoring requirements.

7.3.10.1 Monitoring Requirements

The DOH is not requiring all systems to perform assessment monitoring. In addition, DOH has indicated that the sanitary surveys completed under the GWR will not differ significantly from those currently required.

Triggered source water monitoring is required at all sources if a distribution system sample tests positive for total coliform (as collected under the total coliform regulations). The federal GWR includes a provision that positive coliform samples attributed to a distribution system source will not trigger source water monitoring. The DOH has not yet decided on the criteria for determining whether a sample can be attributed to the distribution system but may not require triggered source monitoring if they document in writing that the coliform positive sample was attributed to a distribution system deficiency. Source water monitoring will be required at fewer sources if systems can demonstrate the sources impacting each TCR sample site. However, such a plan would need to be pre-approved by the DOH.

The federal GWR also allowed for reduced source water monitoring after 12 non-detect samples. The DOH has not yet established a reduced monitoring standard.

7.3.10.2 Compliance

The City completed its sanitary survey in 2024. No reduction in monitoring resulted from the survey. The City is in full compliance at this time.

7.3.11 Unregulated Contaminant Monitoring Rule

The primary source of occurrence data used to identify emerging contaminants is collected via UCMR. This data is used to support regulatory decision-making regarding contaminants. The SWDA Amendments of 1996 established the following protocols for the UCMR:

- Monitor no more than 30 contaminants every five years.
- Monitor only a representative sample of public water systems serving fewer than 10,000 people (all public water systems serving more than 10,000 people are required to monitor for the selected contaminants).
- Store analytical results in a National Contaminant Occurrence Database.

The Unregulated Contaminant program requires that every five years, the USEPA issues a list of unregulated contaminants for monitoring. Monitoring under this program is conducted using a tiered approach based on the level of development of the selected analytical method. Large water systems (serving more than 100,000 people) are required to monitor for both List 1 and List 2 chemicals:

- Assessment Monitoring (List 1): is conducted for contaminants that have analytical method technologies that are well established.

- Screening Survey (List 2): is conducted for contaminants with more recently developed analytical methods, which employ technologies that are not as widely used, or for which laboratory capacity required to conduct larger-scale Assessment Monitoring may be insufficient.
- Pre-Screen Testing (List 3): is conducted for contaminants that have very new or specialized analytical methods.

The USEPA identified and published unregulated contaminants for the first direct implementation of the UCMR (UCMR1) in 1999, which required some public water systems to monitor for unregulated contaminants from 2001 to 2005. To date, there have been five UCMRs published by the USEPA. The most recent implementation of this rule (UCMR5) was published on December 27, 2021. The implementation period for UCMR5 is 2022 to 2026 with sampling taking place from 2023 through 2025. The final list of 30 contaminants includes 29 PFAS and lithium.

The 1986 amendments to the SDWA require public water systems to monitor for unregulated contaminants every five years and submit these data to the states. The intent of this program is to gather scientific information on unregulated contaminants to determine if regulations are required to protect human health. Both the 1993 and 1996 amendments to the act added new lists of contaminants, which led the USEPA to develop a revised program for monitoring. The new program became known as the Unregulated Contaminant Monitoring Regulations (UCMR 1999). The new UCMR program began in 2001 and produces a new list of unregulated contaminants for monitoring every five years.

Under the UCMR program, USEPA asks large systems to take two sets of samples for unregulated contaminants at six-month intervals. There are two tiers of contaminants in UCMR 1: List 1 - Assessment Monitoring, and List 2 - Survey Screening. List 1 contaminants are sampled by all water systems serving over 10,000 people. There are 10 List 1 contaminants, consisting of flame-retardants and other priority contaminants (USEPA Method 527), and some explosives (USEPA Method 529). List 2 contaminants are analyzed using less common analytical techniques, and only a portion of the purveyors required to test for List 1 contaminants are required to test for List 2. List 2 contaminants include Acetanilide pesticides and degraded products (USEPA Methods 525.2 and 535), and Nitrosamines/N-nitrosodimethylamine (NDMA) (USEPA Method 521).

The UCMR is used as a tool for the USEPA to collect data, and ultimately establish regulations for contaminants that are suspected to be present in drinking water but do not have health-based standards set under the SDWA.

The second cycle (UCMR 2) of monitoring was published in the Federal Register on January 4, 2007. UCMR 2 required monitoring for 25 contaminants using five analytical methods during 2008- 2010. The third cycle (UCMR 3) of monitoring was published on May 2, 2012. UCMR 3 required monitoring for 30 contaminants: 28 chemicals, and 2 viruses. Monitoring occurred during 2012 to 2015. The fourth cycle (UCMR 4) of monitoring was published on December 20, 2016. UCMR 4 required monitoring for 30 chemicals, which included nine cyanotoxins and one cyanotoxin group; two metals; nine pesticides; three brominated HAA5 DBP groups, three alcohols, and three semi-volatile organic chemicals. Monitoring occurred during 2018 to 2020. The fifth cycle (UCMR 5) was published on December 27, 2021, and is currently ongoing, requiring monitoring for applicable systems between 2023 and 2025. UCMR 5 requires monitoring for 29 different PFAS and lithium.

From 2013 to 2015, USEPA's third installment of UCMR sampling efforts measured for six PFAS. These included PFOS and PFOA, two of the most notable and prevalent PFAS compounds. At the time, there

were limited detections nationwide, but laboratory analysis methods could not measure levels low enough to reflect the presence at very low concentrations of these compounds across the US. For the 2023 to 2025 period, the 29 different PFAS compounds can now be measured at relatively low levels through advancements in laboratory analysis methods.

Results from UCMR 5 are currently being reported and compiled as of the date of this report. As of August 2023, around 20 percent of systems have reported results so far and around 8 percent of those systems have seen detections of PFOA and PFOS. However, these results are from Quarter 1 of four quarterly reporting requirements, so some public water systems with no detections may show detections in later reports.

7.3.11.1 Monitoring Requirements

The City has conducted monitoring as required for the previous UCMRs. For systems required to sample under UCMR 5 with a groundwater source (including the City), sampling must occur two times during a consecutive 12-month monitoring period, where sampling events occur 5-7 months apart. For systems with a surface water source, a groundwater source under the direct influence of surface water, or a mixed-source system, sampling must occur four times during a consecutive 12-month monitoring period. Sampling events must occur 3 months apart (quarterly sampling). The City's efforts for UCMR 5 sampling efforts are currently ongoing.

7.3.11.2 Compliance

The City is in compliance with the UCMR 1 through 4 testing requirements and expects to comply with all monitoring requirements of UCMR 5.

7.4 Distribution System Water Quality

Regulations that address distribution system water quality are described herein.

7.4.1 Total Coliform Rule

Coliform bacteria describe a broad category of organisms routinely monitored in potable water supplies. Though not all coliform bacteria are pathogenic in nature, they are relatively easy to identify in laboratory analysis. If coliform bacteria are detected, then pathogenic organisms may also be present. Bacterial contamination in a water supply can cause a number of waterborne diseases; therefore, these tests are strictly monitored and regulated by DOH.

The TCR specifies two types of MCL violations, "monthly" and "acute." A purveyor is required to notify both DOH and system consumers if either a monthly or acute MCL violation occurs. The TCR also requires secondary disinfection in accordance with the following:

- A minimum disinfectant residual of 0.2 mg/L free chlorine or 0.5 mg/L chloramines measured as total chlorine must be continually present at the entrance of the distribution system, with a detectable chlorine residual maintained throughout the distribution system.
- A sample with HPCs less than 500 colony forming units per 100 mL is assumed to carry the required minimum residual.

The original 1989 TCR rule was revised on February 13, 2013. Water systems must comply with the requirements of the Revised Total Coliform Rule (RTCR) by April 1, 2016. The revision requires public water systems that are vulnerable to microbial contamination to identify and fix problems; and establishes criteria for systems to qualify for and stay on reduced monitoring, which could reduce water system burden and provide incentives for better system operation. The rule changes associated with the RTCR are summarized below:

- Monitoring Changes: The RTCR links monitoring frequency to water quality and system performance.
- Public Notification Changes: The RTCR requires public notification when an *E. coli* MCL violation occurs, or when a utility fails to conduct the required assessment and corrective action.
- MCL Changes and Treatment Technique Violation: The RTCR replaces the MCL and MCLG for total coliforms with a MCL and MCLG for *E. coli*, as well as a treatment technique for coliforms.
- New Assessment Requirements: As part of the new treatment technique requirements, all utilities must conduct an assessment to find and fix any vulnerabilities when a treatment technique trigger occurs. Systems must conduct a Level 1 assessment or a more complex Level 2 assessment depending on the level of concern raised by the results of total coliform sampling.
- Corrective Action Requirements: Utilities are responsible for correcting any sanitary defects found through Level 1 or Level 2 assessments within 30 days or on a schedule approved by the DOH if this timeframe is not possible.

7.4.1.1 Monitoring Requirements

Monitoring requirements are described in the City's coliform monitoring plan (CMP). The City currently collects 30 samples per month from 26 locations based on a residential population of 31,794 as provided by the DOH Water Quality Monitoring Schedule as of October 2025.

7.4.1.2 Compliance

Within the last 10 years the City has had three total coliform exceedances; one total coliform exceedance in 2018, 2020, and 2023. All follow-up tests were negative, and no public notification was required. The City is currently in full compliance with the TCR and its RTCR compliant CMP can be found in Appendix E.

7.4.2 Stage 1 Disinfectants and Disinfection Byproducts Rule

The Stage 1 DBPR was promulgated in December 1998 and regulates the concentration of disinfectants such as chlorine, chlorine dioxide, and chloramines, which are oxidants used to control waterborne disease. The DBPR also regulates DBPs such as TTHMs and HAAs, bromate, and chlorite. DBPs are formed when disinfectants used to control microorganisms react with natural organic matter in water.

The MCLs for THMs and HAAs are 0.080 and 0.060 mg/L, respectively. The four regulated trihalomethanes are chloroform, bromodichloromethane, dibromochloromethane, and bromoform. The five regulated HAAs are monochloroacetic acid, dichloroacetic acid, trichloroacetic acid, monobromoacetic acid, and dibromoacetic acid. Compliance with the TTHM and HAA MCLs is based on a system-wide RAA of quarterly samples taken in the distribution system. The Stage 1 DBPR also introduced MRDL of 4 mg/L for free chlorine and chloramines, and 0.8 mg/L for chlorine dioxide based on an RAA of samples collected concurrent with TCR monitoring.

7.4.2.1 Monitoring Requirements

Monitoring locations under the Stage 1 DBPR were initially identified in an Initial Distribution System Evaluation (IDSE) prepared by the City in 2004. The City's IDSE explains that chlorine and chloramines are monitored as part of the CMP, which currently tests at 40 sites system wide. The City monitors quarterly for disinfectant residuals at each of these locations. Additionally, the IDSE identifies nine locations representing the longest detention time corresponding to each water treatment plant. The IDSE notes that because the City does not use ozone or chlorine dioxide, monitoring for bromate or chlorite is not necessary. Monitoring for DBPs included a TTHM and HAA sample from each site quarterly.

7.4.2.2 Compliance

The City meets the requirements of the Stage 1 DBPR.

7.4.3 Stage 2 Disinfectants and Disinfection Byproducts Rule

The Stage 2 DBPR was promulgated by the USEPA on January 4, 2006. The key provisions of the Stage 2 DBPR consist of:

- An IDSE to identify distribution system locations with high DBP concentrations. Further information is provided below.
- Site-specific locational running annual average (LRAA) instead of system-wide RAAs to calculate compliance data. LRAAs will strengthen public health protection by eliminating the potential for groups of customers to receive elevated levels of DBPs on a consistent basis.

The MCLs for TTHMs and HAA5 remain unchanged from the Stage 1 DBPR at 0.080 and 0.060 mg/L, respectively, although they will now be calculated as LRAAs.

The IDSE is the first step in Stage 2 DBPR compliance. Its intent is to identify sampling locations for Stage 2 DBPR compliance monitoring that represents distribution system sites with high TTHM and HAA levels. For systems serving more than 500 people, three options were available for the IDSE:

- 40/30 Waiver, which allows systems with no samples exceeding TTHM and HAA concentrations of 40 and 30 micrograms per liter (µg/L), respectively, during eight consecutive quarters to apply to waive the IDSE requirements.
- Standard Monitoring Program, which involves a one-year distribution system monitoring effort to determine locations that routinely show high TTHMs and HAA5 concentrations.
- System-Specific Study, based on historical data and a system model.

The Washington DOH adopted the Stage 2 DBPR on January 4, 2010.

7.4.3.1 Monitoring Requirements

The City was approved for a 40/30 waiver in 2006 and is currently required to collect two samples per year for THM and HAA5.

7.4.3.2 Compliance

The City is in compliance with monitoring requirements for the Stage 2 DBPR. Since April 2021, there have been no samples exceeding the MCL for THM or HAA5 as shown in Table 7.9. The results represent the range of samples from all sources sampled in a particular year.

Table 7.11 Disinfection Byproducts Rule Monitoring Results

Contaminant	MCL Goal	MCL	2021	2022	2023	2024
Haloacetic Acids (µg/L)	48	60	ND-1.4	ND	0.87-1.0	ND
Total Trihalomethanes (µg/L)	60	80	2.5-6.5	5.7-7.6	0.5-4.1	–2.9-3.5

7.4.4 Lead and Copper

The USEPA first promulgated the LCR to control lead and copper levels in drinking water in 1991. The LCR was revised in 2000 and 2007. The LCR sets an AL of 0.015 mg/L for lead and 1.3 mg/L for copper. The AL is exceeded if the concentration in more than 10 percent of tap water samples collected during any monitoring period is greater than the action level. If the 90th percentile value for tap water samples is above the action level, it does not signal a violation but may trigger other requirements that include water quality parameter monitoring, corrosion control treatment, source water monitoring/treatment, public education, and/or lead service line replacement. In 2018, the Centers for Disease Control and Prevention (CDC) revised the blood lead reference value for children to 3.5 micrograms per deciliter.

A revised definition of “lead free” was issued and became effective on January 4, 2014. This defines “lead-free” as <0.25 percent lead, and any new meters, pipe fittings, etc., that are installed will have to meet this new definition as well as any parts that are used in repairs.

In January 2021, the LCR was revised again with the effective date postponed to December 16, 2021, and a compliance deadline of October 16, 2024. In 2021, the revised LCR defined a trigger level of 0.01 mg/L for the system's 90th percentile level, additional actions upon system-wide action level exceedance (ALE), and additional actions upon individual tap sample ALE. Now, when the 90th percentile exceeds the trigger level, systems are required to implement additional planning, monitoring, and reevaluation of current treatment. When the 90th percentile exceeds the AL, systems are now required to notify all customers within 24 hours, begin semi-annual sampling, and either install corrosion control treatment (CCT) or reoptimize their system. Lastly, individual tap sample ALE will require 72-hour notice and "find-and-fix" efforts including identifying the lead source and taking action to reduce lead levels. Under the revised LCR, a Lead Service Line Inventory is required of all service lines on both the system and homeowner side of the meter. At a minimum, service lines must be classified as one of the following:

- Lead, where the line is made of lead.
- Non-lead evidence is required to support this determination.
- Galvanized requiring replacement:
  - Replacement is required where a galvanized service line is determined to be downstream of a current or former lead service line.
- Status unknown, where there is no documentation or evidence of the service line material type.

A Lead Service Line (LSL) Replacement Plan is required for systems with lead service lines, galvanized lines requiring replacement, or service lines where the material is unknown. Additionally, partial lead service

line replacement is no longer allowed. Public-side line replacement is now required when a private-side line is replaced. Table 7.10 summarizes the LCRR.

Table 7.12 Comparison of the Major Provisions of the TCR and the RTCR Rule Requirements

Focus Area	Rule Requirement
Identifying Areas Most Impacted	▪ Complete an LSL inventory. ▪ Systems without LSLs must demonstrate their absence.
Strengthening Treatment Requirements	▪ 10 µg/L TL in addition to the current 15 µg/L AL. ▪ If the TL is exceeded based on 90th percentile lead concentrations, systems must re-optimize CCT or conduct a study if CCT is not currently in place. ▪ Calcium hardness adjustment is no longer a lead CCT option and phosphate inhibitors must be orthophosphate. ▪ Calcium, conductivity, and temperature analyses are no longer required as part of the WQP sampling. ▪ If an individual tap sample exceeds 15 µg/L, systems must collect a follow-up sample, conduct WQP monitoring at or near the site (0.5-mile radius, similar pressure zone), and perform a corrective action. This is termed a "find-and-fix" approach.
Systematically Replacing LSL	▪ Systems with lead above the TL must develop a goal for LSL replacement; 3 percent LSL replaced per year with systems above the AL. ▪ No partial LSLs can be conducted. ▪ Utilities must replace their portion of an LSL within 45 days if the customer replaces their portion.
Increasing Sample Reliability	▪ Prioritize sample collection from sites served by LSLs. ▪ For sites with LSLs, the fifth liter should be collected. ▪ Collect samples in wide-mouth bottles with no cleaning, flushing, etc. prior to sample collection.
Improving Risk Communication	▪ Utilities must notify individual tap sample consumers within 3 days of a 15 µg/L sample detection. ▪ Utilities must inform customers served by an LSL or lead status unknown service line. ▪ Consumer Confidence Report must provide updated health effects language and information regarding LSL replacement programs. ▪ Utilities must notify system-wide customers of lead AL exceedance within 24 hours. ▪ Systems must improve public access to lead information, including LSL locations, and respond to requests for LSL information, deliver educational materials to customers during water-related work that could disturb LSLs, and provide increased information to health care providers.
Protecting Children in Schools and Childcare Facilities	▪ Develop a list of schools and childcare facilities by the 2024 compliance deadline. ▪ Test 20 percent of licensed childcare facilities and elementary schools each year. ▪ Provide testing to secondary schools on request. ▪ Provide information and communicate results to users of the facility, parents, Primacy Agency, and the local or state health department.

Notes:
TL - trigger level; WQP - water quality parameter.

On October 8, 2024, the USEPA issued the final Lead and Copper Rule Improvements (LCRI) that requires the identification and replacement of lead service lines within 10 years. In limited situations, systems with high proportion of lead service lines will be allowed additional time to complete service line replacements.

Additionally, under the LCRI water systems are required to regularly update the LSL Inventory that was required under the revised LCR. This rule also changes tap sampling requirements and lowers the lead action level from 15 µg/L to 10 µg/L.

7.4.4.1 Monitoring Requirements

The City must collect 30 samples every three years, based on the standard monitoring schedule. The most recent set of customer tap samples were collected in 2024.

7.4.4.2 Compliance

The City's monitoring results indicate that the City is in compliance with the requirements of the LCR. The City's LCR monitoring results for 2021 and 2024are presented in Table 7.11. Results represent the 90th percentile of all samples taken within a given period.

Table 7.13 Lead and Copper Rule Monitoring Results

Contaminant	MCL Goal (mg/L)	Action Level (mg/L)	2021 Result (mg/L)	2024 Result (mg/L)
Lead	0	0.015	ND	0.014
Copper	0	1.3	0.93	0.73

7.5 Water Quality Monitoring Program

Federal regulations related to system-wide requirements are discussed herein.

7.5.1 Consumer Confidence Report

The Consumer Confidence Report (CCR) Rule was finalized on September 19, 1998. Each July, community water systems must provide an annual report to customers providing information as to the quality of their drinking water supply. These reports are referred to as "Consumer Confidence Reports" or CCRs. These reports let customers know whether their water meets state and federal drinking water standards. The CCR includes information on the water source, the regulated and unregulated contaminants that have been detected during the year, and their concentrations. The report also provides information on DBPs or microbial contaminants and the potential health effects of the contaminants at concentrations greater than the MCL. The likely source of the contaminants is identified, and a summary of any violations in monitoring, reporting, or record-keeping is included. The reports can assist customers with special health needs to make informed decisions regarding their drinking water. CCRs provide references and telephone numbers as to health effects data and available information about the water system in general.

7.5.1.1 Compliance

The City issues an annual Water Quality Report, which includes a basic description of drinking water contaminants, source description, and annual water quality results. The annual Water Quality Reports for 2021 through 2024 are included in Appendix E.

7.5.2 Public Notification Rule

The Public Notification Rule (PNR) requires that public water systems notify their customers when they violate USEPA or State regulations (including monitoring requirements) or otherwise provide drinking

water that may pose a risk to consumers' health. The original public notification requirements were established in the SDWA; the revised PNR was promulgated in 2000 as required by the 1996 SDWA amendments.

The PNR establishes three notification levels:

- Immediate Notice (Tier 1): In a situation where there is the potential for human health to be immediately impacted, notification is required within 24 hours.
- Notice as Soon as Possible (Tier 2). In a situation where an MCL is exceeded or water has not been treated properly, but there is no threat to human health, notification is required as soon as possible and within 30 days.
- Annual Notice (Tier 3). In a situation where a standard is violated that does not directly impact human health, notice must be provided within one year, likely within the system's CCR.

Notification requirements are described in the City's Emergency Response Plan (ERP), available through City Staff. The ERP includes protocol for notifying the DOH and the public when a positive detection of VOCs/SOCs, IOCs, physical characteristics, or bacteriological presence is determined. The ERP maintains current phone numbers and contact information to all relevant utilities, contractors, government agencies, and local cable and radio stations.

7.5.2.1 Compliance

Since the last WSP update, PFAS has been the City's only violation of the PNR. Proper action was taken to notify the public, and the City is currently undergoing efforts to mitigate PFAS in its sources and distribution system.

7.5.3 Operator Certification

The 1996 SDWA amendments require that states develop and implement an operator certification program. Final guidelines were published in February 1999. The regulations set out minimum guidelines for such a certification program including operator classification and qualifications. These sections of the regulation require that:

- Each treatment facility and/or distribution system is placed under the direct supervision of a certified operator.
- Operator certification must be equal to or greater than the system classification being operated.
- At least one certified operator is available on every shift.
- Operators must sit for, and pass, a validated exam demonstrating skills, knowledge, ability, and judgment necessary for the system classification.
- Each operator must have a high school diploma, GED, or state-approved experience and training.

While the responsibility for developing the program lies with DOH, individual systems must bring all operators up to the level of certification as required. The "grandparenting" clause of the regulation will address existing operators; however, new operators will be required to meet the guidelines of the legislation. Washington State issued revised operator certification guidelines in December 2000 (WAC 246-292). A grandparenting clause is also present in this regulation. However, because this clause expired in 2002, full compliance was required by that date.

On December 4, 2013, the DOH adopted the proposed rule changes for the Waterworks Operator Certification rule. The changes of the rule include strengthening the state's authority to enforce regulations, clarify authority to certify Backflow Assembly Testers (BAT) and Cross Connection Control Specialists (CCSs), and other updates to reflect current program practices, move requirements from guidelines into rules, and improve language and readability. Adopted changes pertinent to PWSs include the following:

- Requires purveyors to designate an operator in responsible charge for each operating shift and each major segment of the system, if applicable.
- Requires purveyors to designate and report all mandatory positions to the department within 30 days of starting operations or when a position is vacated.
- Purveyors shall not require operators to perform work that is beyond their skills, abilities, or level of certification.
- Additional requirements for operators, CCSs, and BATs are included.

7.5.3.1 Compliance

Operation, maintenance, cross-connection control, and water quality monitoring functions for the City are accomplished under the direction of the Water/Sewer Superintendent. As a Group A water system, the City presently meets minimum staff certification requirements. To ensure compliance in the future, all certified staff are provided the necessary expenses and leave time to attend classes and seminars in order to meet requirements for certification renewal. Further details on operator certifications are described in Chapter 4.

7.6 Future Regulatory Requirements

The SDWA and its amendments require that the USEPA reevaluate existing drinking water regulations on a periodic basis and develop and promulgate new standards and regulations as necessary to protect public health. At any given time, there may be many contaminants at various stages of the rulemaking and revision process, such as information gathering, regulation development, public comment, or periodic review. Anticipated future regulatory requirements are summarized in Table 7.12. This table includes ongoing programs to introduce new regulatory requirements, under the UCMR and the Contaminant Candidate List (CCL), as well as specific rules and regulations currently under consideration.

The City does not anticipate issues with meeting the other future regulatory requirements listed in the table based on the limited available information. The City will revisit each proposed rule when specific requirements are published. A brief description of anticipated requirements under each rule is provided herein.

Table 7.14 Future Regulatory Requirements

Proposed Rule	Affected Contaminants	Proposed Publication Date[1]
Unregulated Contaminant Monitoring Rule	▪ Unregulated Contaminants	▪ UCMR 6 – 2026
Fifth Regulatory Determination	▪ Fifth Regulatory Determination	▪ Reg-Det 5 - unknown
Contaminant Candidate List	▪ Unregulated Contaminants	▪ CCL4 - unknown
Hexavalent Chromium	▪ Hexavalent Chromium	▪ August 2027
Nitrosamines	▪ Nitrosamines	▪ Unknown

Proposed Rule	Affected Contaminants	Proposed Publication Date(1)
TOrC	▪ Toxic Organic Chemicals	▪ Unknown
1,4-dioxane	▪ 1,4-dioxane	▪ Unknown
DBPs	▪ DBPs	▪ Unknown
MDBP	▪ MDBP	▪ Summer 2027

Notes:
(1) Effective and compliance dates were obtained from the Federal Register and USEPA's Drinking Water Hotline and represent the best information available as of the date of this report.
MDBP - Microbial and Disinfection-by-Products; TOrC - toxic organic chemicals.

7.6.1 Unregulated Contaminant Monitoring Rule (UCMR 6)

The SDWA requires USEPA to issue a list of no more than 30 priority unregulated contaminants in drinking water once every five years. This requires public water systems to monitor for the selected contaminants. The results of current and previous UCMR As of April 2024, the USEPA has identified 68 potential contaminants that may be included in UCMR 6 sampling, which include chlorinated acids, pesticides and degradates, volatile/semivolatile organics, flame retardants, phenols, organic compounds, and pharmaceuticals. The final rule is expected in 2026 with sampling between 2028 and 2030 to follow.

7.6.2 Fifth Regulatory Determination

Under the SDWA, the USEPA must make regulatory determinations (whether to promulgate a new regulation or remove it from consideration) on at least five contaminants every five years. In the first three Regulatory Determinations (Reg-Det 1, Reg-Det 2, and Reg-Det 3 respectively), the USEPA decided not to regulate contaminants under consideration. In the Fourth Regulatory Determination, the USEPA made final determinations to regulate PFOS and PFOS and to not regulate six other contaminants. The USEPA can make "off-cycle" determinations, such as the positive determination to consider a new perchlorate MCL in 2011. The preliminary fifth regulatory determination was announced in January of 2025 and proposes not regulate nine contaminants on CCL 5. The final determination will be released by the USEPA upon review of the input received during the public comment period.

7.6.3 Sixth Contaminant Candidate List

The SDWA requires the USEPA to review its drinking water regulations every six years in light of advances in the fields of health effects, analytical methodologies, treatment, and occurrence data to determine whether any revisions are needed. Any contaminants provided on the CCL are not subject to any proposed or promulgated regulations but are known to occur in public water systems. The USEPA requested nominations of chemicals, microbes, or other substances for consideration on the draft CCL 6 and is currently evaluating nominations and other contaminant data for inclusion on the draft list.

7.6.4 Contaminants of Emerging Concern

Contaminants of emerging concern are a group of priority pollutants that are not typically regulated by the USEPA. This group includes VOCs, 1,4-dioxane, nitrosamines such as NDMA, hexavalent chromium, and perchlorate. Also, among these contaminants are endocrine disrupting compounds (EDC) and pharmaceutical and personal care products (PPCP).

7.6.4.1 Hexavalent Chromium

Total chromium was regulated in 1991 at 100 µg/L. The USEPA has been working over the past several years to develop a draft risk assessment for hexavalent chromium (Cr(VI)). This assessment was extended from its initial 2012 completion date to incorporate the latest health effects research. Total and Cr(VI) monitoring were also included in UCMR3. The USEPA recently finished conducting an Integrated Risk Information System (IRIS) toxicological assessment of Cr-VI and released the final Cr(VI) IRIS on August 1 2024. As the final risk assessment is now published, USEPA will move forward with determining whether or not to promulgate a Cr(VI) MCL. USEPA is required to make this regulatory determination within three years of the release of the final risk assessment, by August 2027.

7.6.4.2 Nitrosamines

Nitrosamines meet the first two of the three SDWA criteria for regulating a new contaminant:

1. NDMA and other nitrosamines are carcinogens.
2. UCMR2 data showed that NDMA and other nitrosamines occur frequently enough to warrant considering regulatory action.

There is still significant debate as to whether this suite of chemicals meets the third criterion, whether their regulation would provide a meaningful opportunity for risk reduction. The contribution of drinking water to the typical person's nitrosamine exposure is small (<0.1 percent) compared to exposure from foods and from what is produced inside the body (endogenous exposure).

Whether or not nitrosamines are regulated will depend largely upon how the USEPA evaluates if regulation would provide a "meaningful opportunity for risk reduction." The agency has adopted a new "life-stages" approach to risk assessment, which focuses more on at risk populations, like infants and toddlers, who drink more water per body weight.

A total of six nitrosamines, including NDMA, were monitored as part of UCMR2. As of March 2011, UCMR2 data indicate that NDMA is the predominant nitrosamine occurring in drinking water. Further, NDMA was detected three times more frequently in surface waters than ground waters and 10 times more frequently in surface water plants using chloramines versus chlorine alone. NDMA was also detected at higher concentrations at maximum residence time locations in the distribution system as compared to entry points. Six nitrosamines, including NDMA, were listed within CCL4.

Current regulatory discussions have focused around regulating nitrosamines as a group; NDMA would almost certainly be included. More than half of the systems that would be impacted by a nitrosamine rule are chloraminated systems. There are many potential treatment options, but many conflict with other regulations. Also, new treatment research at pilot- or full-scale is needed before the risk assessment can be completed. More information on this topic is anticipated to become available over the next few years, but no regulations are anticipated in the near future.

7.6.4.3 Toxic Organic Chemicals

Whether TOrC like PPCPs and EDCs in the environment pose a significant exposure risk to humans or wildlife is still not well understood and the subject of much investigation and debate. Research on these compounds began in the 1990s and the magnitude of the issue is still not fully defined. The use and subsequent release of antibiotics and natural/synthetic steroids to the environment has generated

controversy to date regarding pharmaceuticals as pollutants. However, a plethora of other drug classes, bioactive metabolites, and transformation products, as well as PPCPs have yet to be examined. Certain physiologically active compounds (for example, caffeine, aspirin, and sex steroids) have been known for over 20 years to enter the environment by a variety of routes, primarily via treated and untreated sewage effluents. Available UCMR3 data indicates endocrine disrupting compounds are largely absent in drinking water sources at even very low levels.

Currently, PPCPs are not regulated by USEPA. The USEPA is studying the effect of PPCPs and has not publicly discussed proposing any regulations. A significant portion of on-going research concerns where and how TOrCs should be treated. Options include drug take back programs, treatment at wastewater treatment plants, and treatment at drinking water plants, with the first option being the most practical and cost-effective.

7.6.4.4 1,4-dioxane

1,4-dioxane is a synthetic organic compound commonly used in a variety of commercial and industrial processes such as stabilization of chlorinated solvents and pharmaceutical manufacturing as well as found as a by-product in goods such as paint strippers, dyes, and greases. The USEPA has classified 1,4-dioxane as likely to be carcinogenic to humans, and the compound has been listed in CCL3, CCL4, and CCL5 as well as monitored under UCMR3. USEPA has no established MCL for 1,4-dioxane however, the latest Drinking Water Specific Risk Level Concentration from USEPA is 0.35 µg/L for the 10^{-6} cancer level (one in a million lifetime cancer risk). The USEPA's health advisory level for noncancer toxicity effects is 0.2 mg/L, so the 0.35 µg/L level for cancer effects is the more conservative level. The notable removal difficulty of 1,4-dioxane is one of the key concerns. While no conventional drinking water treatment technologies can reliably remove it at drinking water levels, ultraviolet light-hydrogen peroxide advanced oxidation process (UV AOP) is effective at treating 1,4-dioxane to below the method reporting limit of 0.1 µg/L.

7.6.4.5 Emerging Disinfection Byproducts

The USEPA continually considers whether additional regulation of DBPs is warranted, as illustrated by the inclusion of several unregulated DBPs on the fourth CCL, the decision to consider revisions to the Stage 1 and 2 D/DBPRs based on the Third Six-Year Review cycle, and inclusion of several classes of unregulated DBPs through the UCMR. A number of potentially significant disinfection by-products continue to be the subject of on-going research. For example, both iodo-substituted HAAs and THMs have been shown to form under certain conditions when drinking water is chloraminated. Nitrosamine is under consideration for inclusion in any new DBP regulations. Bromate has been the subject of scrutiny as well. Since more brominated DBPs can be more toxic, the USEPA required monitoring for HAA9 under UCRM4. No regulations have been proposed as of yet, but as more information emerges, the USEPA may regulate some of these emerging DBPs.

7.6.5 Microbial and Disinfection-by-Products

The National Drinking Water Advisory Council presented recommendations to USEPA in December 2023 on additional MDBP regulations, which may lead to potential rules being promulgated. These rules are expected from USEPA in summer 2025. Items that may be covered in these new rules include:

- Adoption of a positive numeric minimum disinfectant residual requirement, with minimum specific values for free chlorine and chloramines.

- Data and analysis requirements associated with DBPs of emerging concern.
- Source water evaluation screening requirement, plus additional mandatory treatment to reduce DBP formation and disinfectant demand.
- Finished water storage tank inspection and cleaning requirements.
- Improvement of chloramination practices to promote microbial control and DBP formation potential with guidance, monitoring, and nitrification control plan requirements.
- Improvement of water quality and regulatory compliance for consecutive systems (wholesale connections), requiring disinfectant sampling at wholesale and consecutive system connections and processes for addressing DBP control in these systems.

7.7 Summary and Recommendations

The City seeks to maintain high-quality water for its customers from source to tap. While the City currently complies with all DOH monitoring and reporting requirements, the PFAS MCLs described in Section 7.3.6 compel the City to develop and implement a compliance framework by 2029. This section summarizes actions taken to date and outlines a roadmap for future efforts.

Preliminary risk assessments and mitigation screenings indicate uncertainty about PFAS impacts on the City's water supply. As a result, the City will likely need some form of treatment to meet future MCLs. To support planning and budgeting, source development and PFAS mitigation will be incorporated into the Capital Improvement Plan, detailed in Chapters 8 and 10. These projects typically require significant capital investment and will guide the City in securing necessary funding sources.

7.7.1 Recommendations for Compliance with PFAS MCLs

The actions presented in this section summarize framework to assist the City in planning PFAS mitigation measures and compliance with the PFAS NPDWR. The City has taken early action on multiple items described below, though it is recommended that the City continue to implement this framework for system wide PFAS compliance and mitigation.

Based on PFAS sampling data as of the date of this report, Wells 5, 6, 11, 13, and 14 have reported PFAS levels that exceed the PFAS NPDWR MCLs. Well 5 and 13 are individual wells. Wells 6 and 14 combine before their EPTDS, comprising Wellfield East. Wells 7, 8, 10, 11, and 12 combine before their EPTDS, comprising Oak Park Wellfield. For the purposes of developing planning-level estimates for PFAS mitigation, it was assumed that Well 13, Oak Park Wellfield, and Wellfield East would require treatment to achieve PFAS levels below the proposed MCLs. Because only certain wells within Oak Park Wellfield have shown PFAS levels above the MCLs, treatment may not be required for the full flow of Oak Park Wellfield. However, due to the uncertainty around PFAS fate and transport within the aquifer below the wells, the remaining wells at Oak Park may become impacted. For the purposes of cost planning, mitigation costs for Oak Park are presented as a range to cover the mitigation costs that may be required given what the City currently knows about the PFAS levels, and to cover the mitigation costs that may be required if all wells in Oak Park become impacted.

The City is currently under contract to design and construct PFAS treatment at Well 13, given it has shown the highest levels of PFAS throughout the wellfield.

It is recommended that an adaptive PFAS response plan be adopted by the City to strategically plan for PFAS mitigation. The goal of a PFAS response plan will be to develop a roadmap to compliance with the MCLs by USEPA's proposed deadline of 2029. The table below summarizes the major elements of the response plan. The following sections describe these elements in more detail.

Table 7.15 PFAS Response Plan Components

Actions		2024 - 2026	2026 - 2029	
1.	Risk Assessment	Confirm and fast track priority risks, build treatment at Well 13.	Continue to develop and modify risk assessment as PFAS mitigation progresses.	
2.	PFAS Mitigation Screening	Evaluation of alternatives to mitigate PFAS system wide by 2026.	Act on mitigation efforts and adapt plan accordingly based on results from PFAS Monitoring efforts.	
3.	Treatment design and construction	Ongoing efforts for treatment, including design, construction, and operations optimization as needed based on results from Risk Assessment and PFAS Mitigation Screening efforts.		
4.	PFAS Monitoring	Develop PFAS Monitoring Plan, continue sampling.	Continued monitoring.	
5.	Source Management	Source Identification Plan.	Identify Sources.	Source Control (if needed).
6.	Capital Needs Planning	Track funding and financing opportunities.		
7.	Communications	Develop and build upon a communications strategy that conveys efforts and progress to obtain and maintain stakeholder support, including from the public and City Council.		
8.	Advocacy	Partner with other agencies when available to advocate for science-based decisions, funding, and innovative treatment solutions. Help support regional efforts to reduce PFAS treatment costs.		

7.7.1.1 Risk Assessment

It is recommended that the City develop a risk assessment that will serve to identify immediate and near-term actions that can be taken to mitigate PFAS and maintain the City's commitment to providing high-quality water by ranking the highest risks facing the City with respect to PFAS. The risk assessment will incorporate system PFAS goals, infrastructure evaluations from all City wells, and latest hydrogeological information, and PFAS sampling results. The resulting risk register will serve to guide and prioritize efforts moving forward but will be adjustable over time to accommodate new information and the rapidly-changing landscape associated with PFAS.

This effort will work concurrently with design of treatment at Well 13, while establishing actions that could be done in tandem to increase system resiliency against PFAS. It is intended that this risk assessment be updated by the City over time to adapt to changes in PFAS concentration and build upon progress from mitigating the highest risks identified.

7.7.1.2 PFAS Mitigation Screening

This effort includes ongoing evaluations to find the best alternative for PFAS mitigation system wide in a manner that will ensure compliance by USEPA's proposed deadline of 2029. Screening options will generally be divided into the categories of treatment-based mitigation or operational-based mitigation. An evaluation of treatment-based mitigation efforts should include a technology evaluation, comparing the efficacy of typical treatment technologies for PFAS: granular activated carbon (GAC), ion exchange (IX), and reverse osmosis (RO). Treatment efficacy depends on many site-specific factors, including water

quality, system hydraulics, and site constraints. Depending on water quality, pre- or post-treatment may be needed, for example. Operational-based mitigation efforts may include source identification, alternative sources of supply, or upgrading the capacity at well stations if PFAS results are below the USEPA's reporting limit at those well stations. Any impacts to operations will need to consider the impacts to the overall system and allow the City to maintain its high level of service to its customers.

The optimal solution for the City will likely be a combination of both technological and operational-based mitigation measures. The plan to screen alternatives and implement recommendations will likely need support from design services, hydrogeological services, and other support. It is intended that this effort be adaptive and updated over time based on latest PFAS sampling results and successful implementation of fast-track measures described in the Risk Assessment section.

Evaluations that involve changes to the hydraulics of a well (introducing treatment may increase headloss and lower pump yield, for example) should consider impacts and changes to the overall system. These considerations may include upgrading well pumps to maintain capacity with higher headloss, or a change of well operational strategies to maintain the same overall yield.

7.7.1.3 Treatment Design and Construction

This effort plans for and executes tasks necessary for the construction of PFAS treatment systems. Should the Risk Assessment or Mitigation Screening efforts identify treatment to be the optimal solution at a well station, this task will be utilized. The design process may vary depending on the well site, procurement approach, and treatment goals, but will generally include some similar elements.

- Site evaluation efforts will review site hydraulic, electrical, and infrastructure capacities.
- Basis of design reports will develop a treatment plan for the site, including any pre- or post-treatment (corrosion control) requirements based on water quality data.
- Design deliverables, such as 30 percent, 60 percent, 90 percent, and final design packages, including drawings and specifications (deliverables may look different if the procurement approach allows for a fast-track delivery).
- Permitting and regulatory support.
- Engineering services during construction, including supporting startup, commissioning, and operations optimization.
- Ongoing systems integration support. This effort will monitor treatment performance and overall PFAS reduction systemwide to help guide next steps for the system.

7.7.1.4 PFAS Monitoring

The City's existing PFAS Monitoring Plan should be continued and built upon so it allows the City to continue to build insight on the fate and transport of PFAS in the aquifers, while also allowing the City to track progress from mitigation measures that have been implemented. This allows for the overall PFAS response plan to adapt to any changes in PFAS concentration. The monitoring program will also ensure compliance with monitoring requirements listed under the PFAS NPDWR.

7.7.1.5 Source Management

A PFAS source identification plan should be developed to gain insight into any potential sources of PFAS. This plan may include additional sampling efforts and can be modified as needed to the needs of the City. The City can follow guidance provided in the Water Research Foundation Report 5082, "Investigation of Alternative Management Strategies to Prevent PFAS from Entering Drinking Water Supplies and Wastewater" to support source identification or source management measures.

7.7.1.6 Capital Planning Needs

Efforts to track funding opportunities will be important to minimize impacts on ratepayers. These efforts should track all available opportunities and ensure the City is in compliance with funding requirements.

7.7.1.7 Communications

Stakeholder engagement and community outreach will be important throughout these PFAS mitigation efforts to obtain and maintain support. This may include continuing upon the City's public outreach efforts or providing updates to City Council on current PFAS status.

7.7.1.8 Advocacy

The PFAS response plan should also include an advocacy component. Actions under this effort could include developing partnerships with neighboring utilities to coordinate sampling efforts or supporting regional efforts within the industry to advocate for utility support and funding for PFAS.

CHAPTER 8 WATER RESOURCES

The City has a diverse water portfolio, which includes groundwater wells and surface water supplies. To meet future demands, the City will need to fully utilize existing water resources and develop new sources to continue to provide high levels of service. The City currently receives its water from 10 groundwater wells and two surface water diversions. This chapter presents an evaluation of these supplies to identify future deficiencies in the City's water rights or in the ability of its supplies to produce reliable water at the levels needed to meet future demands. These deficiencies are addressed by the City's water supply strategy summarized in this chapter.

The City obtains its water from two surface water sources and 10 wells. Eight of the groundwater sources (Wells 5, 6, 7, 8, 10, 11, 12, 14) are located in the City's Lower Washougal Wellfield (LWWF), in the lower Washougal floodplain near downtown Camas. Wells 7, 8, 10, 11 and 12 are often referred to as the City's "Oak Park" wellfield. Well 13 is north and west of the Oak Park wells and is effectively part of the same wellfield pumping center but is not typically referenced as being part of the LWWF. The remaining well (Well 9) is located in the uplands about two miles north of the Columbia River and 1.5 miles west of Lacamas Lake. The City's Boulder and Jones Creek surface water diversions are located in the headwaters of the Washougal River drainage.

8.1 Water Right Analysis

The City relies upon its groundwater wells and surface water sources to meet its current supply needs. Water rights for these sources are administered by Ecology. The DOH regulates source water protection. This section summarizes the City's existing water rights and analyzes the ability of the rights to meet the City's projected demand.

The City has diverted water from Jones Creek since 1913 and Boulder Creek since 1931. Historically, the surface water sources were the City's primary water supply and operated continuously for 24 hours per day with wells being used to meet higher summer peaks. In evaluating options to meet future demands, the City determined that the expansion of existing surface water diversions was not feasible. The City then began expansion of its groundwater supplies, focusing on the productive aquifers in the Lower Washougal River floodplain.

With the issuance of four new groundwater permits in 2008, came the requirement the City cease their surface water operations between May 15 and October 31 of each year. The requirement further stated "At the State's discretion, the water rights associated with these diversions will be placed into the State's Trust Water Program as permanent, seasonal donations." In 2015, the City attempted to place the rights into the Trust Program but was advised by Ecology that the action was not strictly necessary provided they agreed to operate the surface water supply consistent with the intent of the agreement.

Today, the City's focus is on developing new groundwater sources under its existing water right permits. Additional water rights are also being pursued.

8.1.1 Water Rights Summary

The City's water system (DOH ID 108002) currently has two water right claims which have been modified by Certificates of Change, eleven certificated water rights, and five water right permits. A summary of the City's water rights is provided in Table 8.1. Copies of the water right certificates for each well are included in Appendix G. The City's 2023 Water Facility Inventory is provided in Appendix F. Note, in September 2025, the City requested that Ecology extend the development schedule on each of the City's four water right permits to 2031. These extensions were granted by Ecology in May 2026. The City's current plan for developing the wells is presented in Section 8.4.

The City has limitations on its water rights that complicate the calculation of total instantaneous water right (Qi) and annual water right (Qa) as described below:

- Jones and Boulder Creek surface water sources may only be operated seasonally from October 31 through May 15, as directed by Permit G2-30144. The Qa for periods outside of the operating time window are used to maintain instream flow in the Creeks (not for City use).
- Historically, water right permits and certificates with priority dates before 1979 were limited by Ecology to a "total combined maximum Qa of 5,750 acre-feet per year (AFY)". However, modifications to the City's water right claims resulted in the recognition of an additional 550 AFY which increased the total Qa to 6,300 acre-feet/year with priority dates before 1979.
- Withdrawals from Well 9 are considered non-additive. The certificate does not increase the cumulative annual total of all rights but does increase the Qi.
- Certificate CG2-20938 (an irrigation water right allocating 330 gpm and 106 AFY for use between May 1 to October 1) was acquired by the City in 2015 and transferred into permanent trust as instream baseflow support for Lacamas Creek. The City retains the option to request to apply the consumptive use portion of the right (90.3 AFY) as potential mitigation for future water use within the Lacamas Creek drainage downstream of the water right location.

The City's resulting water rights equate to a Qi of 14,045 gpm (20.2 mgd), an additive Qa of 11,090 AFY (9.9 mgd), and a non-additive Qa of 210 AFY (0.3 mgd) as described by Permit G2-30756 (see Page 2) and Certificate G2-27384 (Well 9).

Table 8.1 Water Right Summary

Source	Water Right Number	Priority Date	Instantaneous Qi (gpm)	Annual Qa (AFY)(1)
Claims				
Well 1	Claim 121022 transferred to Well 10(2)			
Well 3	Claim 121023 transferred to Well 11(2)			
Certificates				
Boulder Creek(3)	C-712	08/22/1923	1,120 (2.5 cfs)	977 (A)
	CS2-SWC 712			843 A (Instream Flow)
Jones Creek(4)	C-711	09/05/1930	450 (1.0 cfs)	393 (A)
	CS2-SWC 711			337 A (Instream Flow)
Well 5	G 6636-A G2-*09325C	03/22/1968	600	920(5) (A)
Well 6	G 6635-A G2-*09325C	03/22/1968	1,500	2,400(5) (A)
Well 7	G2-00501	03/22/1971	1,000	530(6) (A)
Well 8	G2-24400	02/04/1977	900	530(6) (A)
Well 9	G2-27384	08/13/1986	650	210 (N)

Well 11(2) (Well 3)	C-85-A G2-*0004C	07/21/1945	900	118 (A)
Well 13(2) (Well 4)	G2-GWC4079 G2-*05130C	02/12/1959	1,325	1,208(6) (A)
Permits				
Lower Washougal Wellfield	G2-30144	08/21/1986(7)	500 (At Well 8)	2,150 (A) (All 8 wells)
Well 14 (Anderson Site)	G2-30145	08/21/1986(7)	1,000	880 (A)
Parkers Landing	G2-30146	08/21/1986(7)	1,000	880 (A)
Treatment Plant Well	G2-30147	08/21/1986(7)	1,000	880 (A)
Umbrella Wellfield(8)	G2-30756	01/08/2020	6,700	11,090 (All 8 wells)
Total			**14,045(9)**	**11,090 (A)(9)** **210 (N)**
Pending Applications				
Steigerwald Regional Supply(10)	G2-30528		17,213	13,555

Notes:
(1) (A) = Additive water right, additive to other rights. (N) = Non-additive water right, not included when summing a cumulative total of all rights.
(2) Original water rights for Wells 1 through 4 have each been re-assigned to their respective replacement Wells 10 through 13. Well 10, 11, and 12 were installed to replace Well 1, 2 and 3, which have failed due to collapsed well casings; see Pacific Groundwater Group report dated June 9, 2003. Well 13 replaced Well 4 after Well 4 was determined to be groundwater under the influence of surface water; see Pacific Groundwater Group report dated August 14, 2006. G2-CV1-2P160 which is now associated with Well 10 allowed for seasonal between May 1st and August 31st. Year-round operation of Well 10 is authorized under Permit G2-30144 for the LWWF.
(3) This source was formerly known as the Little Washougal River. The certificate refers to an instantaneous quantity (Qi) and does not specify an annual withdrawal. An Ecology Report of Examination for Well 7 (G2-00501) summarizes existing water rights, including 1,820 AFY for Boulder Creek (C-712), based on continuous withdrawal at the instantaneous right specified. The withdrawal from surface water sources is limited to May 15 through October 31.
(4) The certificate refers to an instantaneous quantity (Qi) and does not specify an annual withdrawal. An Ecology Report of Examination for Well 7 (G2-00501) summarizes existing water rights, including 730 AFY for Jones Creek (C-711), based on continuous withdrawal at the instantaneous right specified. The withdrawal from surface water sources is limited to May 15 through October 31.
(5) The Permit and Report of Examination preceding this certificate limited water rights to “the total quantity withdrawn or diverted from all sources is not to exceed 3,300 AFY.
(6) The Permit and Report of Examination preceding this certificate limited water rights to “the total quantity withdrawn or diverted from all sources is not to exceed 5,750 AFY.
(7) The original Ecology Report of Examination for these permits indicated a priority date of 08/21/2003. However, Ecology assigned a priority date of 08/13/1986 via amended permits to match with the date of the Clark County Reservation identified by watershed planning for WRIAs 27/28.
(8) Installation of one future well in the LWWF is included under this permit.
(9) Due to permit and certificate restrictions, the total Qi and Qa do not equal the sum of quantities for each column.
(10) Joint application with City of Camas and City of Washougal.

8.1.2 Water Rights Analysis

The City's water rights were compared to existing, 5-year (2031), 10-year (2036) and 20-year (2046) demand projections to establish water right surplus or deficiency. Both Qi and Qa were considered and are summarized in Table 8.2 and Table 8.3, respectively. The City's Water Rights Self-Assessment is provided in Appendix H.

The City currently has surplus water rights based on the actual well pumping in 2024, which was considered to be the existing condition. Note, the reported values reflect the pumping over the entire year, where not all wells were pumped at the same time.

Table 8.2 Instantaneous Water Rights (Qi) Summary

Year	MDD – High Scenario(1) (gpm)	Instantaneous Water Right (Qi) (gpm)	Surplus/Deficiency (gpm)
Existing	6,765(2)	12,475(3)	5,710
2031	8,620	12,475 (3)	3,855
2036	10,490	12,475 (3)	1,985
2046	14,080	12,475 (3)	-1,605

Notes:
(1) Future values based on high MDD demand projection scenario.
(2) Based on actual 2024 maximum day production data.
(3) Instantaneous water rights of 14,045 gpm shown in Table 8.1 minus 1,570 gpm of surface water rights not available during the summer months.
MDD - maximum day demand.

Table 8.3 Annual Water Rights (Qa) Summary

Year	ADD - High Scenario(1) (AFY)	Annual Water Right (Qa) (AFY)	Surplus/Deficiency (AFY)
Existing	5,230(2)	11,090	5,860
2031	6,610	11,090	4,480
2036	8,070	11,090	3,020
2046	10,910	11,090	180

Notes:
(1) Future values based on high ADD demand projection scenario.
(2) Based on actual 2024 annual production data.

For the future water rights evaluation, the forecasted source production was based on the high demand projection scenario. The high demand scenario generally reflects the water use rates from the period of highest demands in the last eight years, as presented in Chapter 5. Use of the highest projected demands is intended to support the City in planning for sufficient physical supplies to meet demands and provide sufficient time for phasing in new supplies, which is typically a multi-year process.

The City is expected to have sufficient Qa through the next 20 years; however, the City is expected to have a Qi deficiency of 1,605 gpm by 2046. As described in the water supply strategy later in this chapter, the City plans to meet this deficiency by a combination of improving pumping yields from existing well facilities, developing all of its existing water rights, and securing water rights for additional supply sources.

Additionally, the City will continue to encourage water use efficiency including the reduction of irrigation use, which is a major driver for the relatively high projected MDD.

8.2 Ability to Pump

In addition to water rights, each of the City's supply sources physical capacity or "Ability to Pump" was evaluated. The resulting Ability to Pump was compared to demands to determine supply surplus or deficiency. The supply evaluation considered both high scenario projections for ADD and MDD conditions. Further, the Ability to Pump was evaluated for three supply scenarios:

- Standard (all supplies) represents the City's ability to meet demands with all sources pumping continuously (24 hours per day).
- Reliability (only supplies with backup power) represents the City's ability to meet demands during a widespread power outage where only supplies with auxiliary power are available.
- Redundancy (largest source out-of-service) represents the City's ability to meet MDD with the single largest source out of service. For the purposes of this analysis, Well 13 is assumed to be the largest source with a capacity of approximately 1,350 gpm.

Table 8.4 shows the supply sources contributing to ability to pump totals for each supply scenario under MDD and ADD demand conditions. Supply improvements to address all identified deficiencies are summarized in Section 8.4.

Table 8.4 Ability to Pump – Supply Summary

Source	Capacity (gpm)	MDD Standard	MDD Redundancy	MDD Reliability(3)	ADD Standard	ADD Redundancy	ADD Reliability(3)
Boulder Creek(1)	1,120	0	0	0	1,120	1,120	1,120
Jones Creek(1)	450	0	0	0	450	450	450
Well 5	675	675	675	0	675	675	0
Well 6(2)	1,200	1,200	1,200	0	1,200	1,200	0
Well 7	950	950	950	0	950	950	0
Well 8	1,250	1,250	1,250	1,250	1,250	1,250	1,250
Well 9	575	575	575	0	575	575	0
Well 10	900	900	900	0	900	900	0
Well 11	1,000	1,000	1,000	1,000	1,000	1,000	1,000
Well 12	1,000	1,000	1,000	1,000	1,000	1,000	1,000
Well 13	1,350	1,350	0	1,350	1,350	0	1,350
Well 14(2)	850	0	0	850	0	0	850
Total	**11,320**	**8,900**	**7,550**	**5,450**	**10,470**	**9,120**	**7,020**

Notes:
(1) The City's surface water sources are unavailable between May 15 and October 31. MDD typically occurs during these months, therefore capacity is assumed to be zero.
(2) A hydraulic restriction prevents the simultaneous operation of Well 6 and 14. The well with the larger capacity (Well 6 at 1,200 gpm) is considered in the existing and redundancy ability to pump scenario, while the well with the smaller capacity (Well 14 at 850 gpm) is assumed to be zero.
(3) Only supplies with backup power are assumed to have reliable capacity.

8.2.1 MDD Ability to Pump

The MDD ability to pump represents the City's ability to pump under maximum day demand periods, typically during summer months. Demands above the MDD (such as peak hour demands or fire flow) are served by storage and evaluated in Chapter 9. The MDD Ability to Pump was compared with the high scenario projected MDD for the planning period to evaluate supply capacity, as shown in Figure 8.1 and Table 8.5. Note, due to water right restrictions, the City's surface water sources are unavailable during the summer; therefore, are not included in the MDD ability to pump analysis.

Table 8.5 MDD Ability to Pump Analysis

Year	MDD (gpm)(1)	Standard Available Supply (gpm)	Standard Surplus/ Deficiency (gpm)	Redundancy Available Supply (gpm)	Redundancy Surplus/ Deficiency (gpm)	Reliability Available Supply (gpm)	Reliability Surplus/ Deficiency (gpm)
Existing	6,765(2)	8,900	2,135	7,550	785	5,450	-1,315
2031	8,620	8,900	280	7,550	-1,070	5,450	-3,170
2036	10,490	8,900	-1,590	7,550	-2,940	5,450	-5,040
2046	14,080	8,900	-5,180	7,550	-6,530	5,450	-8,630

Notes:
(1) Future values based on high MDD demand projection scenario.
(2) Based on actual 2024 annual production data.

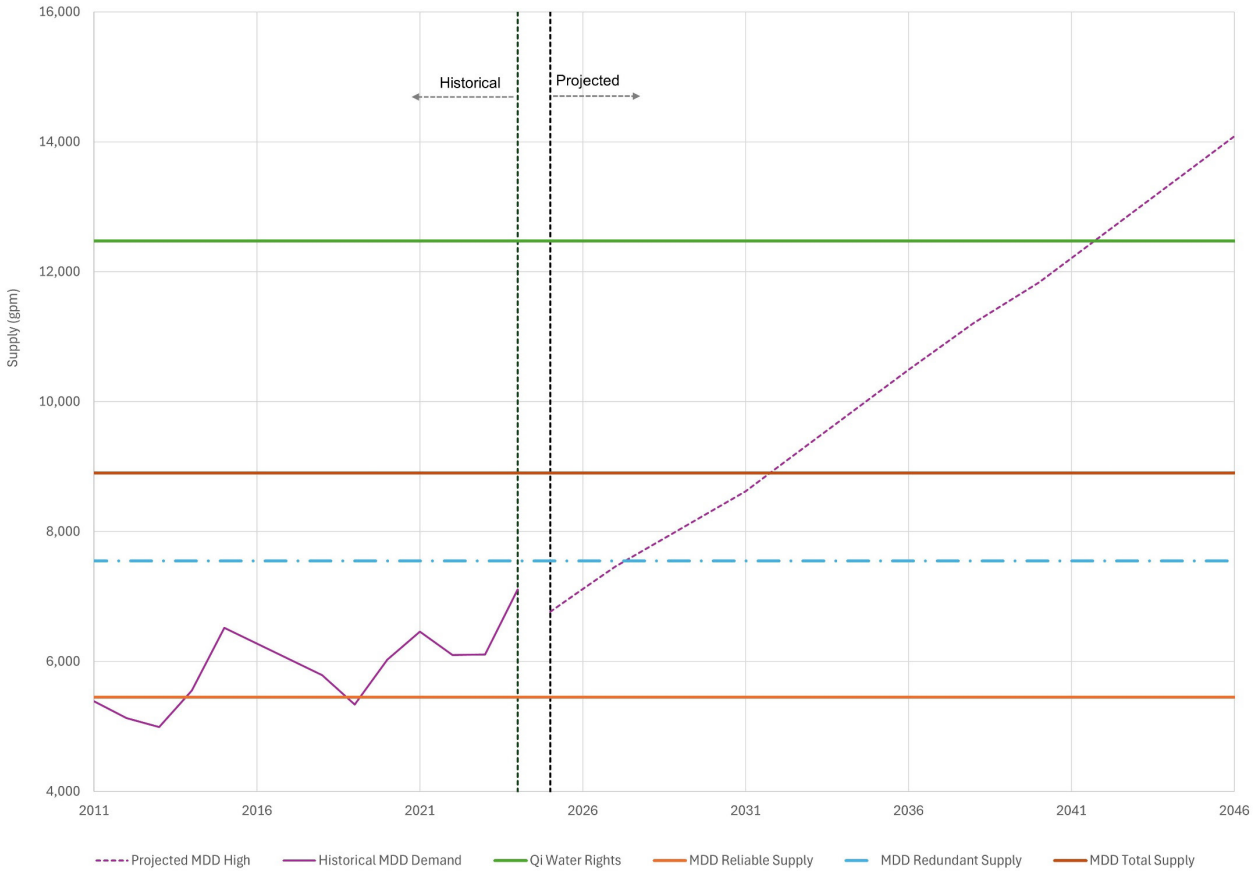

Figure 8.1 MDD Ability to Pump

The City's existing MDD ability to pump is approximately 8,900 gpm (12.8 mgd) in the standard scenario, approximately 7,550 gpm (10.9 mgd) in the redundancy scenario, and approximately 5,450 gpm (7.8 mgd) in the reliability scenario. The MDD Ability to Pump analysis shows a deficiency under the existing reliability scenario and increasing to all scenarios by 2031.

The City needs approximately 5,180 gpm of supply in the standard scenario, approximately 6,530 gpm of supply in the redundancy scenario, and approximately 8,630 gpm of supply in the reliability scenario by the end of the 2046 planning year. Improvements to existing well capacity may increase supply by 3,850 gpm to approximately 12,750 gpm by resolving physical capacity issues in Well 6 and 14 and increasing capacity of Wells 8, 11, and 12. The future construction of Well 18, 19, and 13B add an additional 4,000 gpm of MDD Ability to Pump capacity, allowing the City to meet projected MDD under all scenarios. Additionally, backup power is needed for Wells 5, 6, 7, 9, and 10 to increase reliable MDD Ability to Pump. Recommendations to address MDD supply deficiencies are further detailed in Section 8.4.

8.2.2 ADD Ability to Pump

The ADD Ability to Pump evaluation confirms the City's ability to supply average demand throughout the year. High scenario ADD projections were used to represent typical conditions expected to occur. ADD Ability to Pump was compared with the projected high ADD scenario for the planning period to evaluate supply capacity, as shown in Figure 8.2 and Table 8.7. The City's surface water sources, Jones and Boulder Creek, are included in the ADD Ability to Pump analysis.

Table 8.6 ADD Ability to Pump Analysis

Year	ADD (gpm)[1]	Standard Available Supply (gpm)	Standard Surplus/ Deficiency (gpm)	Redundancy Available Supply (gpm)	Redundancy Surplus/ Deficiency (gpm)	Reliability Available Supply (gpm)	Reliability Surplus/ Deficiency (gpm)
Existing	3,245[2]	10,470	7,225	9,120	5,875	7,020	3,775
2031	4,095	10,470	6,375	9,120	5,025	7,020	2,925
2036	5,005	10,470	5,465	9,120	4,115	7,020	2,015
2046	6,765	10,470	3,705	9,120	2,355	7,020	255

Notes:
(1) Future values based on high ADD demand projection scenario.
(2) Based on actual 2024 annual production data.

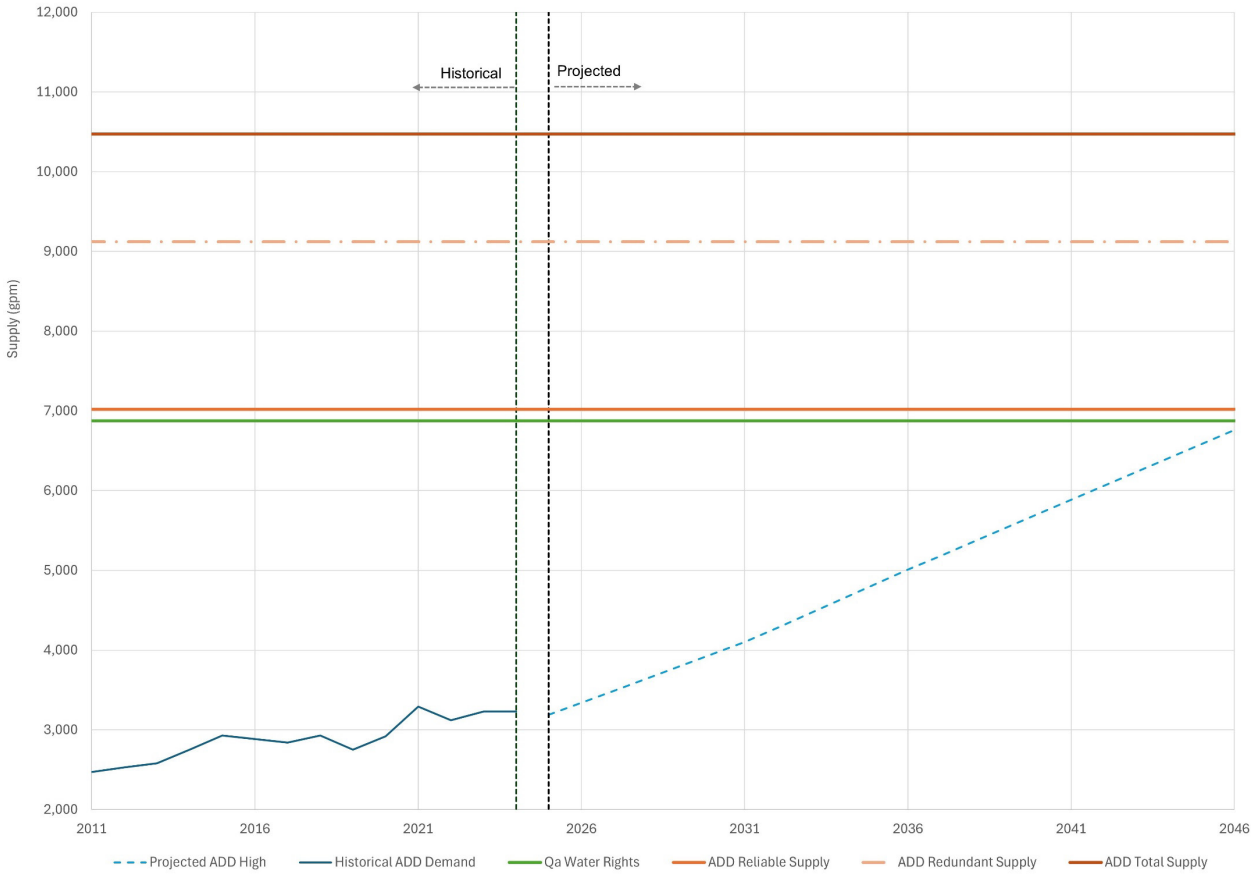

Figure 8.2 ADD Ability to Pump

The City's existing ADD Ability to Pump is approximately 10,470 gpm (15.1 mgd) in the standard scenario, approximately 9,120 gpm (13.1 mgd) in the redundancy scenario, and approximately 7,020 gpm (10.1 mgd) in the reliability scenario. All supply sources have adequate physical capacity under all scenarios and planning years to meet projected ADD.

No additional physical capacity recommendations are necessary to meet future ADD. It is anticipated that projects to address the MDD Ability to Pump deficiencies will concurrently increase ADD Ability to Pump capabilities.

8.3 Water Supply Strategy

The City requires additional supplies or improvements to existing facilities to provide the sought level of service during the planning period, where deficiencies already exist for the MDD ability to pump reliability scenario. To serve the projected 2046 MDD, the City needs a minimum additional supply of 5,180 gpm in the standard scenario, 6,530 gpm in the redundancy scenario, and backup power at all supply facilities to meet reliability level of service goals By the end of the planning period, the City will also need an additional 1,605 gpm of instantaneous water rights (Qi). The City's water supply strategy is comprised of four parts:

- Lower Washougal Wellfield Expansion.
- Construct Wells for Existing Water Rights.

- Secure Additional Water Rights.
- Continue a WUE Program.

The improvements are grouped into either the short-term (2027-2036) or long-term (2037-2046) planning horizons.

8.3.1 Lower Washougal Wellfield Expansion

Improved pumping from existing well facilities to achieve their full water right can provide additional future supply. The Ability to Pump analysis identified 3,850 gpm (5.5 mgd) of MDD supply can be obtained through addressing hydraulic limitations at Well 6 and 14 and increasing pumping capacities through upgrades at Wells 8, 11, and 12. While the pumping capacity will increase, the improved wells will not increase the ADD Ability to Pump due to water right restrictions. The LWWF expansion delays the need for developing additional supply sources.

Potential improvements to existing supply facilities include the following and should be completed by the 2031 planning year:

- The City is currently upsizing the pipeline between Well 6 and Well 14, which resolves an existing transmission deficiency that restricts the wells from operating simultaneously. This project is not included in existing analysis but is assumed to be completed soon as the project is currently in construction.
- Increase the yield of Well 8 to 2,250 gpm (an additional 1,000 gpm) by upgrading existing well screen and pump assemblies. Hydrogeologic investigations indicate additional capacity is available with well redevelopment and upgrades.
- Increase the yield of Wells 11 and 12 to 2,000 gpm each (an additional 1,000 gpm at each well) by upgrading existing pump assemblies. Hydrogeologic investigations indicate additional capacity is available with well upgrades.
- Install backup power for Wells 5, 6, 7, and 10 to increase reliability of the wellfield. It is assumed all new supplies will have backup power available.
- Install per- and polyfluoroalkyl substances (PFAS) treatment for all wells nearing or exceeding federal maximum contaminant levels, with provisions to add wells that may require treatment in the future. Recommendations for projects to address water quality concerns due to PFAS are summarized in Chapter 7.

The City's ongoing O&M program have kept supply facilities in good condition. R&R activities will be triggered by components reaching the end of their usable life. Additional information on the City's O&M and R&R programs is presented in Chapter 4.

8.3.2 Secure Additional Water Rights

The City is actively pursuing new water sources to meet future deficiencies and to improve supply redundancy. A water rights investigation is recommended to evaluate the transfer or acquisition of additional water rights detailed in this section.

8.3.2.1 Transfer or Acquisition of Additional LWWF Water Rights

On January 8, 2020, the City filed application G2-30756 for a new water right permit with Ecology. The application requested authority to withdraw 6,700 gpm and an unspecified annual quantity from the City's LWWF, non-additive to existing rights. The City also requested authorization for an additional point of withdrawal (well) in the LWWF; however, the requested new well (Well 18) will be authorized by adding a point of withdrawal to one or more existing water rights (e.g., G2-0004C and G2-CV1-2P160) through a showing of compliance with RCW 90.44.100(3).

Additionally, a preliminary hydrogeologic analysis indicated the Washougal River and LWWF aquifer may possibly not be in hydraulic connection during the summer. This could potentially allow for the City to transfer surface water rights for use in the LWWF during the summer months to increase available Qi. However, to verify these conditions additional groundwater modeling and monitoring will be required. Since this approach could be speculative, it is recommended the City complete a water rights investigation and discuss feasibility with Ecology.

8.3.2.2 Use of Lacamas Creek Water Rights

In 2015, water right CG2-20938 was placed into the water rights trust program by the City. The water right is a seasonal irrigation right used for past farming of a property located north of the City between NE Ward Road and NE 172nd Avenue. The donated portion is for 330 gpm and 106 acre-feet, of which 90.3 acre-feet is considered the consumptive quantity. The City requested that they be allowed to apply this consumptive quantity as mitigation for future water right requests in the Lacamas Creek basin. New water resource projects that might have impacts to Lacamas Creek or Lacamas Lake could potentially utilize this water right to help offset in-stream impacts to the Lacamas Creek drainage. Utilizing this water right would require site selection and development of a new groundwater well. Additional discussions with Ecology will be needed to verify the applicability to a given project.

8.3.2.3 Steigerwald Regional Supply Source

In the long-term, the City anticipates obtaining supply from the future Steigerwald Regional Supply Source (Water Right Application G2-30528), as discussed in the Detailed Implementation Plan (Lower Columbia Fish Recovery Board 2008) for the Salmon-Washougal and Lewis Watershed WRIAs. Under (WAC) 173-500-040, WRIAs were formalized and the Ecology was given responsibility for the development and management of these planning boundaries. The Salmon-Washougal and Lewis Watershed Management Plan WRIAs 27 and 28 (Lower Columbia Fish Recovery Board 2006) and subsequent Detailed Implementation Plan were created to address a range of issues related to water resources, including water supply, stream flow management, water quality, and fish habitat. The City and the Jones and Boulder Creek surface water supply watersheds reside within WRIA 28.

The completion of WRIA 27 and 28 watershed plans in 2008 eliminated the water rights reservation established by WAC 173-592 and replaced them with regional water supply areas and some stream allocations in WAC 173-527 for the Lewis River Basin (WRIA 27) and WAC 173-528 for the Salmon Creek-Washougal River Basin (WRIA 28).

The Watershed Management Plan discusses the regional water supply areas for Camas, which was designated as the Steigerwald area near Washougal. Ecology has designated water supplies near the City as "Instream Flow with Closures and Reserves." This designation limits the ability of the City to obtain new water rights outside of the regional water source.

The Steigerwald Regional Supply Source will be jointly developed with the City of Washougal. The Cities have applied for a joint water right (Water Right Application G2-30528) for 17,213 gpm of instantaneous water rights and 13,555 AFY of annual water right. The Place of Use has been designated as the water service area for both cities (as defined by each City's most recent water system plan approved by DOH). It is anticipated that the supply source will include up to 10, 20-inch diameter wells with individual well yields of 2,000 gpm or more. As an entirely new supply source, the Cities will need to permit, design, and construction the proposed wells and related facilities, such as disinfection, auxiliary power, and potentially treatment. To convey the water, the City will need several miles of transmission main.

8.3.2.4 Georgia Pacific Water Rights Acquisition

Additionally, the City may consider purchasing or leasing water rights and wells from Georgia Pacific (GP), if available, to develop an additional future water source closer to the City's water system. If production from the GP site proves problematic (due to the costs of treatment for contaminants for example), the water rights could still represent a value to the City as a mitigative offset for a new water right request. However, GP has expressed the desire to keep their water rights and wells for the entirety of the planning period.

8.3.2.5 Columbia River Surface Water Supply

Should the water sources described above not be available or sufficient to meet future needs, the City should explore development of a surface water supply on the Columbia River. Conversations with Ecology indicate water rights for this source are open to appropriation. The feasibility of this alternative should be further evaluated in the next WSP due to the extensive permitting and planning requirements. Development of a surface water supply also requires surface water treatment, leading to significant capital investments.

8.3.3 Develop Wells for Existing Water Rights

The City has existing water rights that allow for the development of additional wells. Hydrogeologic investigations indicate the Lower Washougal Wellfield is recommended site to develop new wells. To meet projected customer demand under this planning period, three wells are recommended for development. By the end of the long-term planning horizon, development of Wells 18, 13B, and 19 should be completed to increase the ability to pump under MDD conditions by approximately 4,000 gpm if the City has obtained sufficient and/or additional water rights prior to the development of these sources.

8.3.4 Continue Water Use Efficiency Program

The final element of the City's supply strategy is to continue to reduce demand through its water use efficiency program. The City has observed declining per account water use for over a decade. The observed drop in the water use and MDD peaking factor can be attributed in part to the City's water use

efficiency program, which is summarized in Chapter 6. WUE gains, including reductions in distribution system leakage, may delay the need for new supplies presented below.

8.3.5 Summary of Improvements

The City water supply strategy outlines the necessary steps to increasing capacity to meet future demands. The focal point of the strategy is to maximize production from existing supply facilities and fully utilizing available water rights before shifting to developing new facilities and pursuing additional water rights. The identified projects to increase the City's supply capacity are summarized below and incorporated in the CIP in Chapter 10. Desktop calculations indicate these projects will address identified physical supply capacity deficiencies under this planning period if sufficient water rights can be obtained; it is recommended the City reevaluate supply needs again in the next WSP. The City's water supply strategy is comprised of the recommended projects summarized below:

1. Well 6 and 14 Transmission Pipeline (in progress).
2. LWWF Expansion and PFAS Treatment (CIP Project S-01).
3. Water Rights Investigation (CIP Project G-03).
4. Well 18 Development (CIP Project S-02).
5. Well 13B Development (CIP Project S-03).
6. Well 19 Development (CIP Project S-04).

Table 8.9 describes each improvement, timing, increase in supply, and resulting MDD Ability to Pump after project completion. By the end of the planning period, the LWWF Expansion project and proposed new wells are expected to effectively make full use of the City's existing and assume proposed LWWF water rights applications are approved. The completion of the LWWF Expansion project delays the City's need for new supplies until the long-term planning horizon (post 2036). It is anticipated remaining supplies will be developed in phases to meet expected demand growth and distribute capital costs.

Table 8.7 Supply Improvements - MDD Ability to Pump

Improvement	Timing	Additional Supply (gpm)	MDD Ability to Pump (gpm)	Reliable MDD Ability to Pump (gpm)	Redundant MDD Ability to Pump (gpm)
	Existing		8,900	5,450	7,550
Well 6 and 14 Transmission Pipeline(1)	Short-term	850	9,750	5,450	8,400
LWWF Expansion	Short-term	3,000	12,750	12,750	10,500(2)
Well 18 Development	Long-term	2,000	14,750	14,750	12,500
Well 13B Development	Long-term	1,000	15,750	15,750	13,500
Well 19 Development	Long-term	1,000	16,750	16,750	14,500

Notes:
(1) The Well 6 and 14 Transmission Pipeline is in progress and is not included in the City's CIP.
(2) Well 8 capacity will be increased to 2,250 gpm during the LWWF Expansion, becoming the largest source out of service in the redundancy scenarios.

The increase in MDD Ability to Pump for these improvements is shown in Figure 8.4. To maintain redundant MDD Ability to Pump, the City will need to complete all recommended supply projects by the end of the planning period. Therefore, well development and PFAS treatment are anticipated to be a

major element of the City's CIP. Since ADD Ability to Pump is sufficient with existing supply facilities, it is assumed supply improvements to address MDD Ability to Pump will provide additional redundancy for the City's system.

If the City cannot obtain sufficient water rights in LWWF to meet the projected need, the City will need to consider additional water sources. Figure 8.3 outlines the water resources decision making framework and the recommended order of prioritization for pursuing water supply outside of the LWWF. A description for each option is provided in Section 8.3.2.2 through Section 8.3.2.5. It is recommended that the City complete an evaluation to determine the feasibility of each water supply option.

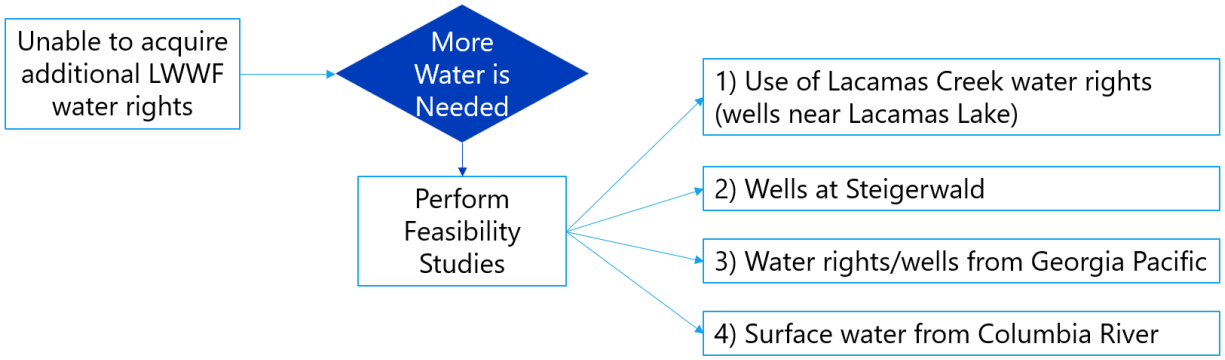

Figure 8.3 Water Resources Decision Making Framework

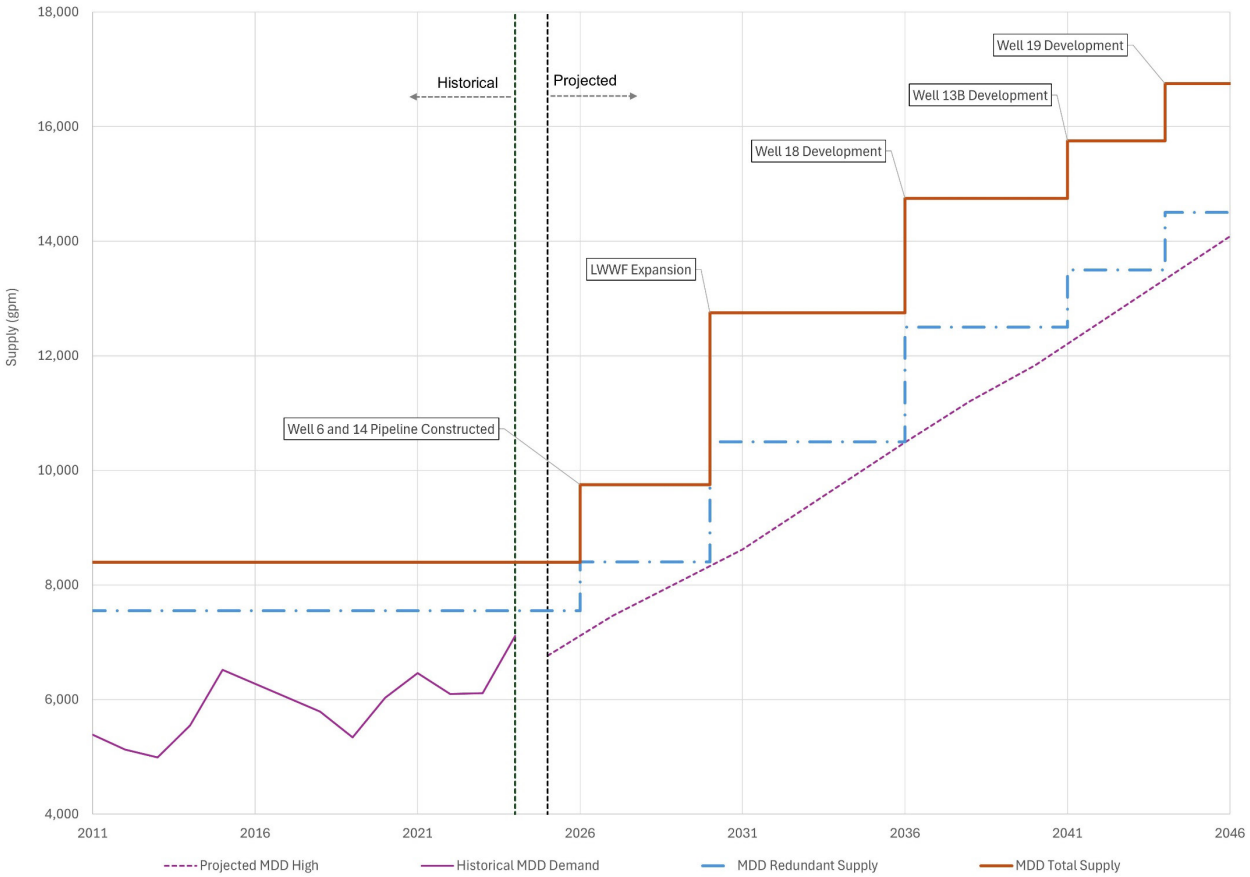

Figure 8.4 MDD Ability to Pump with Improvements

8.4 Groundwater Management

The City's wellhead protection plan was updated as part of the Plan. Section 1428 of the 1986 Amendments to the Federal Safe Drinking Water Act mandates that each state develop a wellhead protection program and that all federally defined public water systems (in Washington, Group A systems) using groundwater as its source implement a wellhead protection plan. In July 1994, the WAC addressed requirements for Group A public water systems (WAC 246-290) and was modified to include mandatory wellhead protection measures. The legislative authority to require wellhead protection (WHP) planning can be found in the RCW Chapters 43.20.050, 70.119A.060, and 70.119A.080.

8.4.1 Wellhead Protection Program

The overall goal of the state WHP program is to prevent the contamination of groundwater used by Group A public water systems. This is to be accomplished by providing management zones around public wells, identifying existing groundwater contamination sources, and managing potential sources of groundwater contamination prior to their entry into the drinking water system. Under the WAC, local public water systems have the primary responsibility for developing and implementing local wellhead protection plans (WHPP). However, due to the limited jurisdictional and regulatory authority afforded most purveyors, coordination with other local, State, and Federal agencies is essential to the successful implementation of a WHPP.

The DOH has developed regulations that require Group A water systems using groundwater sources to develop and implement the WHPP (WAC 246-290-135). The objective is to prevent releases of contaminants to groundwater in areas that contribute water to the public supply systems. The City's Wellhead Protection Report is included in Appendix I.

The basic elements of a WHPP include:

- Assessment of initial groundwater susceptibility for each water supply source.
- Delineation of the wellhead protection area (WHPA) that directly contributes groundwater to each water supply well.
- Inventory of land uses and identification of potential sources of contamination within each WHPA. These include time-of-travel zones (capture zones) representing 6-month, 1-, 5-, and 10-year periods to assess how quickly a potential contaminant might reach a source well.
- Documentation of notification to owner/operators of known or potential hazards.
- Documentation to regulatory agencies and local governments with the known or potential hazards.
- Development of spill prevention plans and water contingency plans that minimize or eliminate the possibility of contamination to the groundwater supply and also development of options for maintaining water supply in the event the aquifer contributing to a source is contaminated.
- Documentation of coordination with local emergency incident responders including notification of WHPA boundaries, susceptibility and inventory findings, and contingency plan.

The State of Washington WHPP applies to the City's wells.

8.4.2 Wellhead Protection Area

The updated WHPP used the WHPA developed in 2016 (PGG 2016). Capture zones for the Lower Washougal Wellfield were estimated using a calibrated MODFLOW groundwater flow model. This included Well 14 and the planned Parkers Landing and Treatment Plant wells. However, these later two wells were not constructed. The model simulations assumed that the City would exercise all of their existing and the two planned future wells. This assumption provides for a fairly conservative assessment of the capture zone extent. In addition, high-range pumping was assumed for the nearby Georgia Pacific Wellfield. Groundwater withdrawals from Georgia Pacific have likely decreased since the 2016 WHPA development due to reduced operations so the interaction between the GP and Camas wellfields may be overstated. In order not to rule out possible contaminant sources to the west of the LWWF, a 'Western Search Area' expansion of the WHPAs was added from the west side of the Washougal River as far west as the Crown Zellerbach Power Ditch (Appendix I). New modeling of the City's WHPAs is underway and may revise some of the assumptions above (Strata Geosciences, in press).

8.4.3 Existing and Potential Contamination Hazard Identification

The City performed a risk assessment within the existing WHPAs and immediate surrounding areas (buffer zone). The inventory of potential contamination sources within the WHPA was performed according to the DOH publication: "Inventory of Potential Contaminant Sources in Washington's Wellhead Protection Areas (1993)." Potential contaminant risks that lie within the vicinity of the LWWF were investigated and mapped using data from multiple sources. The primary source contains data from Ecology's Facility/Site database, including state cleanup sites, federal superfund sites, hazardous waste generators, solid waste facilities, and underground storage tanks. Additional information was gathered from Clark County's (2025) parcel database; septic system and infiltration facilities data on file with Clark County, the City of Camas, and the City of Washougal; Ecology's Environmental Information Management database; DOH's Sentry database; USEPA Enforcement and Compliance History Online PFAS industry sectors analytical tool; and a custom records request from Lightbox Environmental Data Resources. The information from these sources were classified and plotted on GIS coverages to assess whether existing and potential contaminant sources were located within the vicinity of Camas' production wells and WHPA delineations.

Table 7-1a in Appendix A of the WHPP summarizes known environmental sites of potential concern within the LWWF capture zones. Forty-seven contaminant sources of potential concern to the water supply were identified within the wellfield capture zones, and an additional 22 sites of potential concern were identified within the Western Search Area. A previously developed PFAS historic site list (Mott MacDonald 2025) was reviewed in tandem with Table 7-1a and USEPA's PFAS Industry Sectors Analytical tool (USEPA 2025a) to develop a PFAS industry site risk ranking (Table 7-8 in Appendix A). Thirty-six sources of potential PFAS concern to the water supply were identified within the wellfield capture zone, and an additional 18 sites of potential PFAS concern were identified within the Western Search Area.

8.4.4 Contingency Planning Tasks

As described in the WHPP, the nine shallow wells within the LWWF are most susceptible to contaminant risks given the hydrogeology and land surface activities. The capacity of the most productive wells in the Lower Washougal wellfield is about 1,300 gpm. If the supply from one of these wells was lost or compromised, the City would have to rely on a combination of the other sources to meet summertime peak demands (other wells, interties, and emergency use of surface water sources).

Additional risks to the City's supply arise from the fact that five of the City's wells (Wells 7, 8, 10, 11, and 12) are clustered in close proximity to each other. Several, if not all, of these wells could be impacted by a single contaminant release, such as a major railroad spill. Depending on the nature of impact to the wells, the City could perform immediate mitigation with changes in well pumping, treatment, blending of waters between wells, and other operational changes to meet demands; however, should multiple wells become impacted, the City may not be able to support the City's entire water demand on a sustainable basis, particularly during the high demand summer months. If multiple wells are impacted, the City may need to institute short-term rationing and pursue expedited drilling of additional wells.

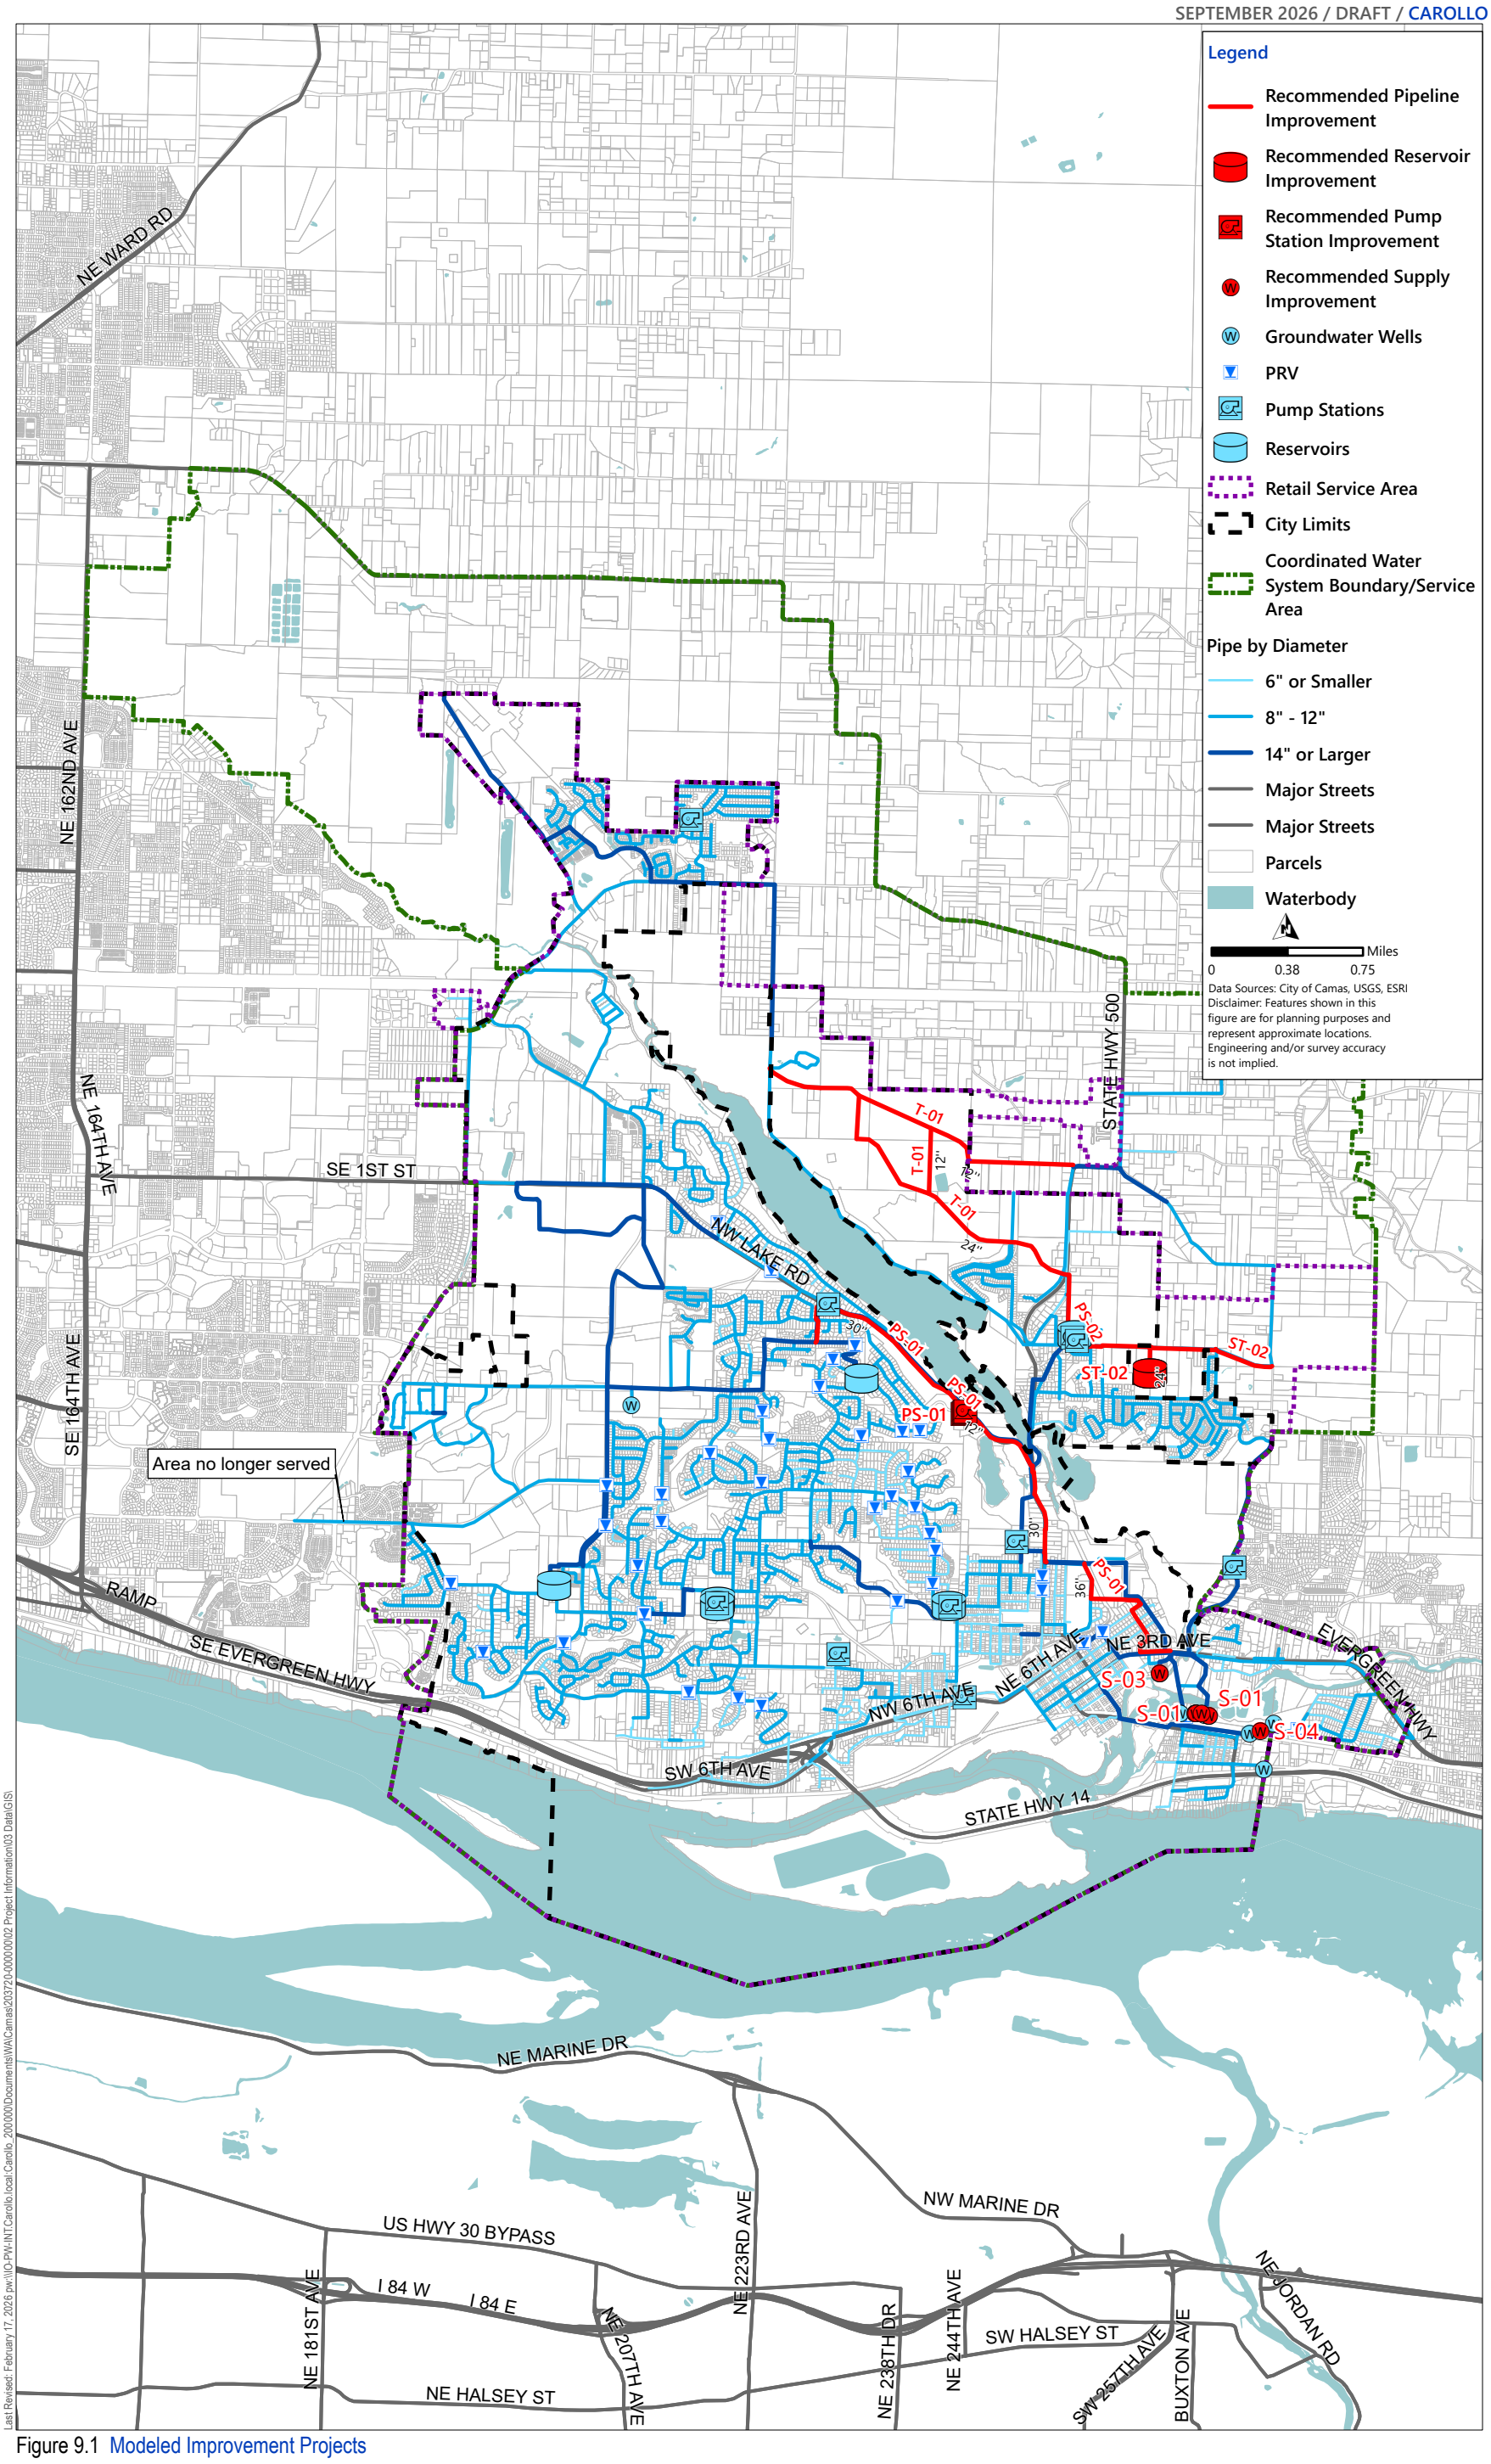
8.4.5 Management Strategies and Implementation Tasks

[To be added upon completion of the Wellhead Protection Plan.]

CHAPTER 9 DISTRIBUTION SYSTEM ANALYSIS

9.1 Introduction

This chapter summarizes potential future system deficiencies in the City's water distribution system and offers recommended system improvements. Carollo evaluated the capacity of the pipeline system using the City's updated and calibrated hydraulic model. Carollo's hydraulic model development and calibration technical memorandum in Appendix **[X]**, summarizes all model updates made during this plan. Desktop evaluations of storage reservoir and pump station capacities were conducted in Microsoft Excel. Improvements identified in this chapter are summarized in the CIP in Chapter 10.



The analysis presented in this chapter is organized by first identifying high velocity and low-pressure deficiencies through the hydraulic model analysis for PHD and fire flow conditions in Sections 9.2.3 and 9.2.4. Recommendations are then provided to address deficiencies under both conditions. Next, Section 9.3 outlines deficiencies in pumping areas via desktop analysis then discusses pump station recommendations. Then, Section 9.4 outlines the storage deficits determined through desktop analysis. A multi-phased approach to addressing storage deficits is subsequently described, assuming all pumping and low-pressure/dead storage deficiencies have been fixed. The chapter finishes with a summary of all distribution system recommendations that will be included in the CIP.

9.2 Distribution System Model Analysis

The calibrated InfoWater Pro model of the City's distribution system was used to analyze the system for future planning years. Projected system demands (from the medium demand scenario) were added for the 2031, 2036 and 2046 planning years. Projected system demands for 2026 were also added to establish the baseline for existing system deficiencies. The hydraulic model was used to evaluate typical system conditions under MDD with diurnal operations (PHD) and for fire flow availability under MDD conditions.

9.2.1 Modeled Improvement Projects

Since the City expects significant growth, existing supplies do not adequate capacity to meet future projected demands. The hydraulic model will not run under conditions where demand exceeds supply. Therefore, it was necessary to add future supply improvements to the model before the distribution system analysis could be conducted. All supply and booster pumping improvement projects identified in the water supply strategy in Chapter 8 and storage and pumping analysis, including required transmission pipeline improvements associated with these projects were also added to the model. The improvement projects added to the model and used for the distribution system analysis are shown in Figure 9.1.

Last Revised: February 17, 2026 pw:\\IO-PW-INT.Carollo.local:Carollo_200000\Documents\WA\Camas\203720-000000\02 Project Information\03 Data\GIS\

Figure 9.1 Modeled Improvement Projects

9.2.2 System Criteria

9.2.2.1 Peak Hour Flow Criteria

Chapter 2 discussed system policies and criteria in detail. Key parameters evaluated by the model included system pressure criteria during normal operations and fire flow testing of the system.

During normal operations, the minimum pressure as set by the Washington State Department of Health (DOH) during MDD at PHD is 30 psi at the service meter. DOH velocity criterion is to keep pipeline velocities below 8 feet per second (fps).

9.2.2.2 Fire Flow Criteria

Fire flows are typically the largest flows system's experience and often a major factor in pipeline sizing and network configurations. Using the InfoWater Pro fire flow test feature, the hydraulic model evaluated the fire flow capabilities at all hydrants in the system. Specifically, it systematically simulated a fire at each model node representing a fire hydrant for each of the planning years under MDD conditions. All fire hydrant nodes in the model were simulated with a minimum pressure of 20 psi during the point fire demands, meaning once the node reaches 20 psi, no additional fire flow can be provided. Fire flow demands were allocated based on the land use nearest the hydrant and the following assumptions per land use class:

- Residential with Sprinklers: 500 gpm.
- Residential without Sprinklers: 1,000 gpm.
- Non-Residential: 1,500 gpm.
- The City does not have a record of which houses have sprinklers and which do not. Therefore, for system analysis purposes all existing residential areas are assumed to require 1,000 gpm of fire flow. Recently developed neighborhoods such as Green Mountain Estates were assigned a fire flow of 500 gpm because these homes were confirmed to have sprinklers. Additionally, two neighborhoods not receiving required fire flow were confirmed by City staff to have sprinklers and therefore assigned a fire flow of 500 gpm.
- For specific facilities and customers such as schools, industrial campuses, and churches within the City's service area, the local fire marshal requires fire flow up to 5,000 gpm. These site-specific fire flows were assigned to the respective hydrants neighboring these sites in addition to the required fire flow by land use. Figure 9.2 shows the fire flow requirements within the City's service area.

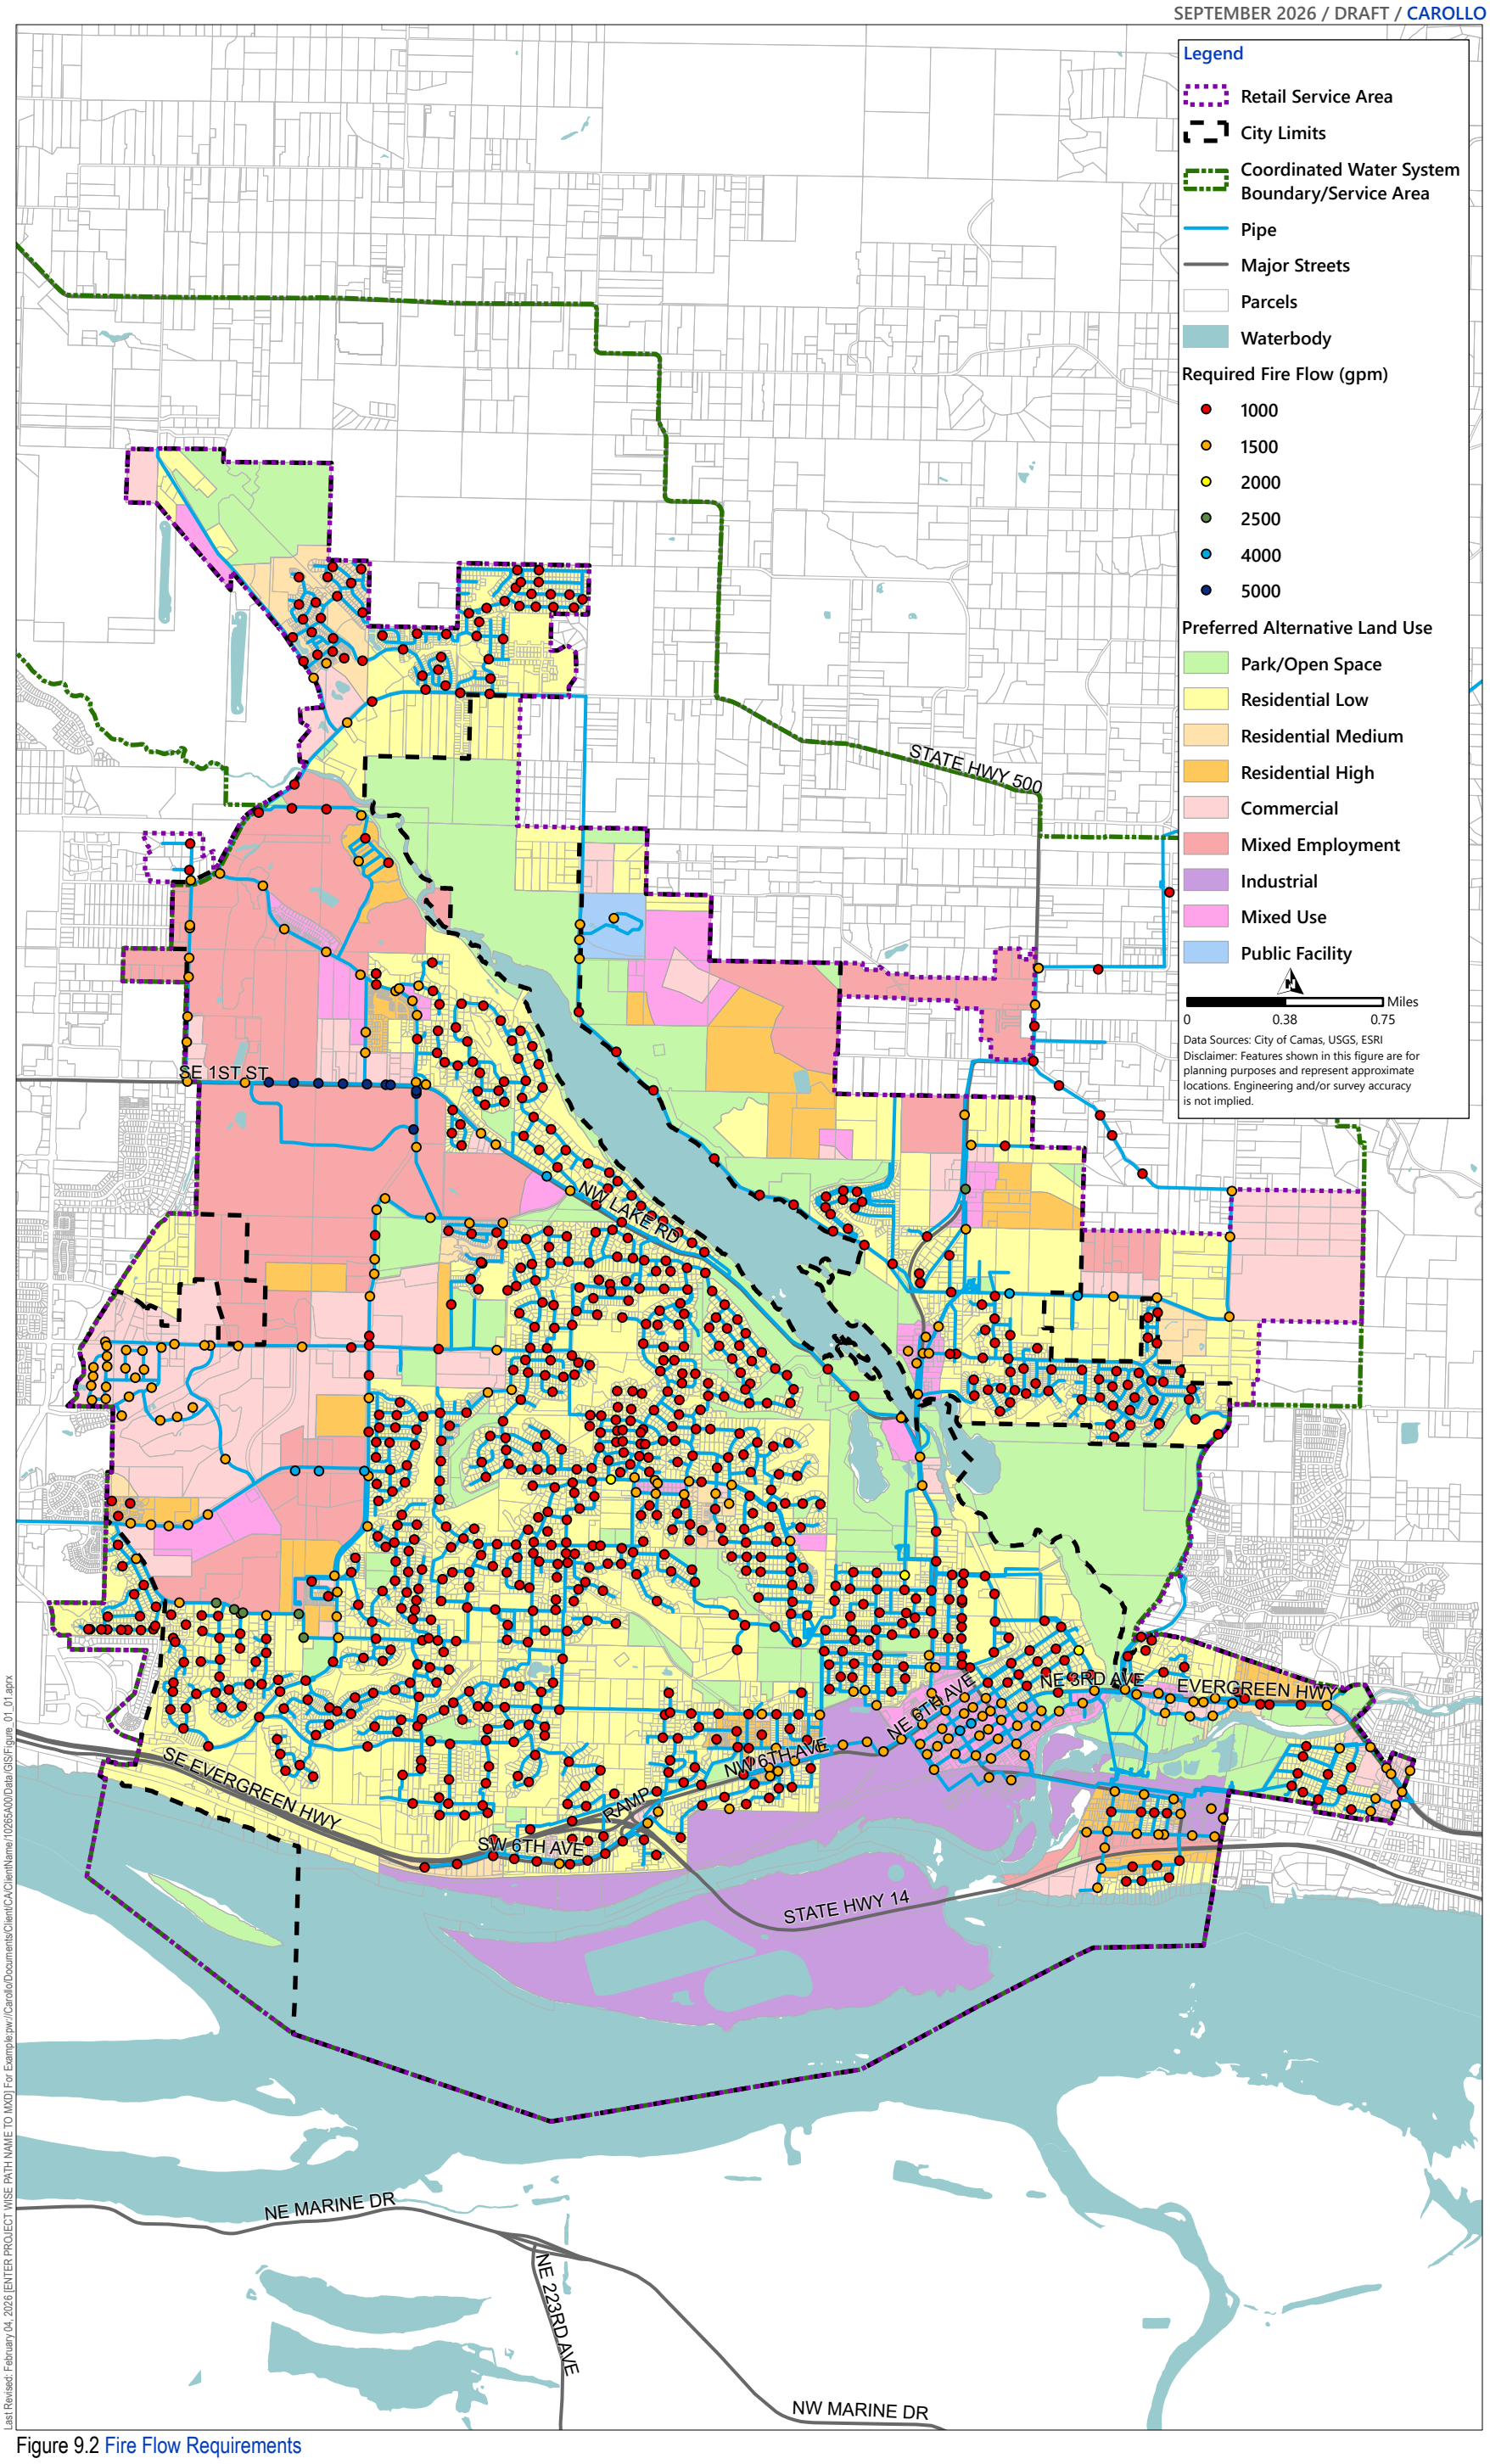


Figure 9.2 Fire Flow Requirements

9.2.3 Peak Hour Flow Evaluation

9.2.3.1 Velocity Results

The model was run in extended period simulation (EPS) for 72 hours at MDD with diurnal operations to evaluate general system velocity conditions for the 2031, 2036 and 2046 planning years. This approach allows the sources, pumps, and reservoirs to operate as their SCADA and controls were set.

Maximum modeled pipeline velocities are shown in Figure 9.3. Note, this figure only shows maximum pipeline velocities for 2046, where existing infrastructure would be most stressed to serve higher demands. Although no pipelines having maximum velocities exceeding DOH minimum criterion of 8 fps were identified, there were multiple transmission pipeline projects needed to serve areas of future development or areas where existing pipelines are undersized causing concerns with high head loss. These pipelines are not shown on Figure 9.3, as they are not deficiencies but are summarized below as recommendations and will be incorporated into the CIP in Chapter 10.

9.2.3.2 North Shore Transmission Pipeline (T-01)

The City expects large development to occur in its North Shore which is located just north of SE Leadbetter Road in the coming years. The development will be a mix of industrial and commercial larger users, as well as single family residences. To serve the projected demands of the area, approximately 6,300 linear feet (LF) of 12-inch diameter pipeline and 12,400 LF of 24-inch diameter pipeline (North Shore Transmission Pipeline) are needed to connect to the existing distribution system. Additionally, to convey water to the development area approximately 4,200 LF of existing pipeline between Gregg Reservoir and the proposed North Shore roundabout needs to be upsized to 24-inch diameter pipeline (Phase 2 Pipeline). The City expects a developer to construct the North Shore Transmission Pipeline by 2030. Since the Phase 2 portion of the pipeline requires upsizing of existing infrastructure, it is recommended for completion in 2033 to evenly distribute CIP funds and further discussed in Chapter 10.

9.2.3.3 Angelo Pump Station Discharge Pipeline (T-02)

Angelo Pump Station is a key facility supplying water to the 455-LPH and 852-UPH pressure zones. The current discharge piping in the distribution system network for this facility consists of various sized pipelines ranging from 6-inch to 14-inch in diameter. These pipelines have been identified as aging, undersized infrastructure causing high head loss and discharge pressures from Angelo Pump Station when demands increase in future planning scenarios. To mitigate these issues, it is recommended to upsize approximately 3,350 LF of various diameter pipeline to 16-inch diameter pipeline. This project is expected to allow more efficient operation at Angelo Pump Station, maximizing available pumping capacity.

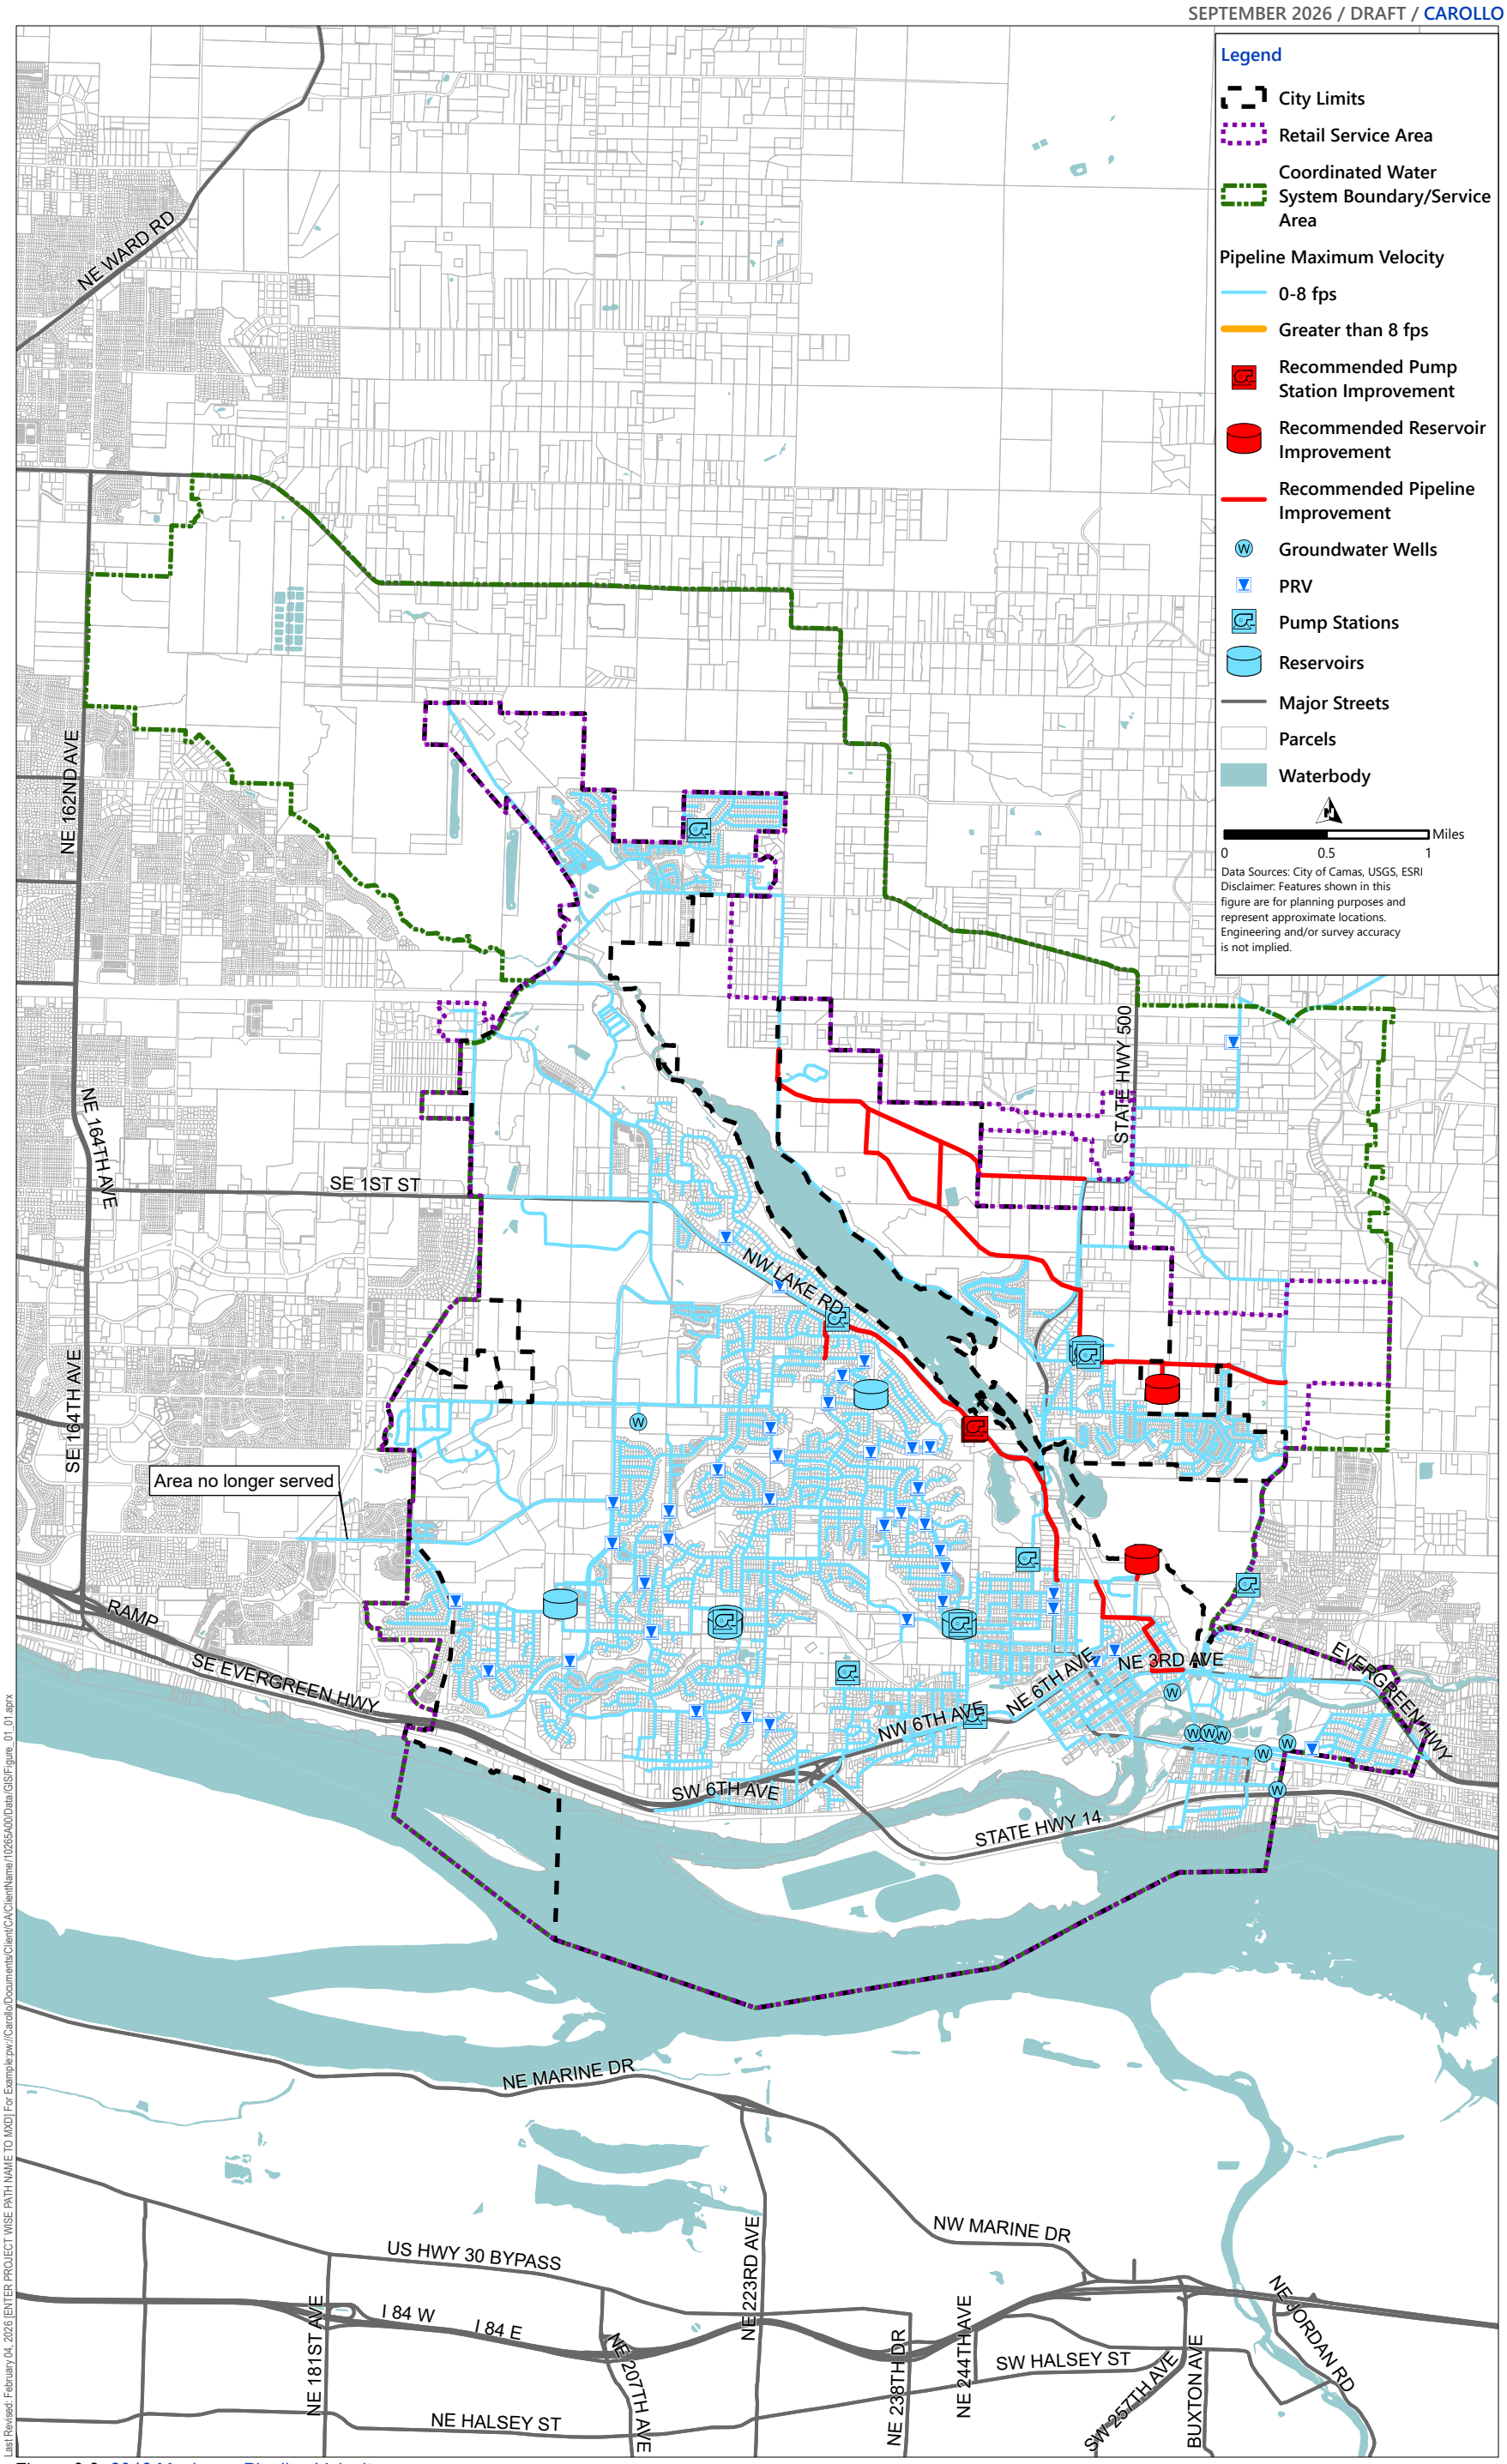

Figure 9.3 2046 Maximum Pipeline Velocity

9.2.3.4 Pressure Results

The same model run described in Section 9.2.3.1 was run to evaluate pressure results. Using the criteria presented in the preceding section, the hydraulic model provides minimum pressures under PHD conditions.

Figures 9.4, 9.5 and 9.6 show the minimum pressures for 2031, 2036 and 2046 PHD conditions respectively.

As seen in Figure 9.6, the system has a few low pressures below 30 psi. Some of the pressure zones cover large elevation ranges, leading to low pressures at high elevations. The City identified some locations where high elevation customers were served from a higher zone. No projects are recommended for such areas and the hydraulic model was updated accordingly to match these conditions. Customers experiencing lower pressures in the 455 – LPH zone are being served from reservoirs that are not at a high enough elevation, which results in low pressures and large amounts of dead storage within the reservoirs. This is further detailed in the storage analysis section below and a recommendation was made to rezone these customers.

9.2.3.5 High Elevation Customer and Low Pressure Recommendations

This section offers recommendations to address the areas where pressures drop below the minimum criteria of 30 psi identified in the previous Section, 9.2.3.4. The improvement for high elevation customers in the Francis Road area of the 455-LPH zone involves modifying pressure zone boundaries to be served by the new pump station recommended in PS-03. To address low pressures near the UPH Reservoirs, pipeline upsizing is recommended to reduce head loss in the area. Each of the recommended improvements requires further site-specific and project-level engineering analysis before implementation. Figure 9.7 outlines the projects necessary to address these deficiencies and projects are summarized in Table 9.1.

Table 9.1 Low Pressure Area Improvement Projects

Low Pressure Area	CIP Name	Original PZ	Revised PZ	Improvement Type
Area 1	D-06	852	-	Upsize pipeline to reduce head loss.
Area 2	PS-03	455	Francis Road	Increase pump station service area.

Notes:
PS - pump station.

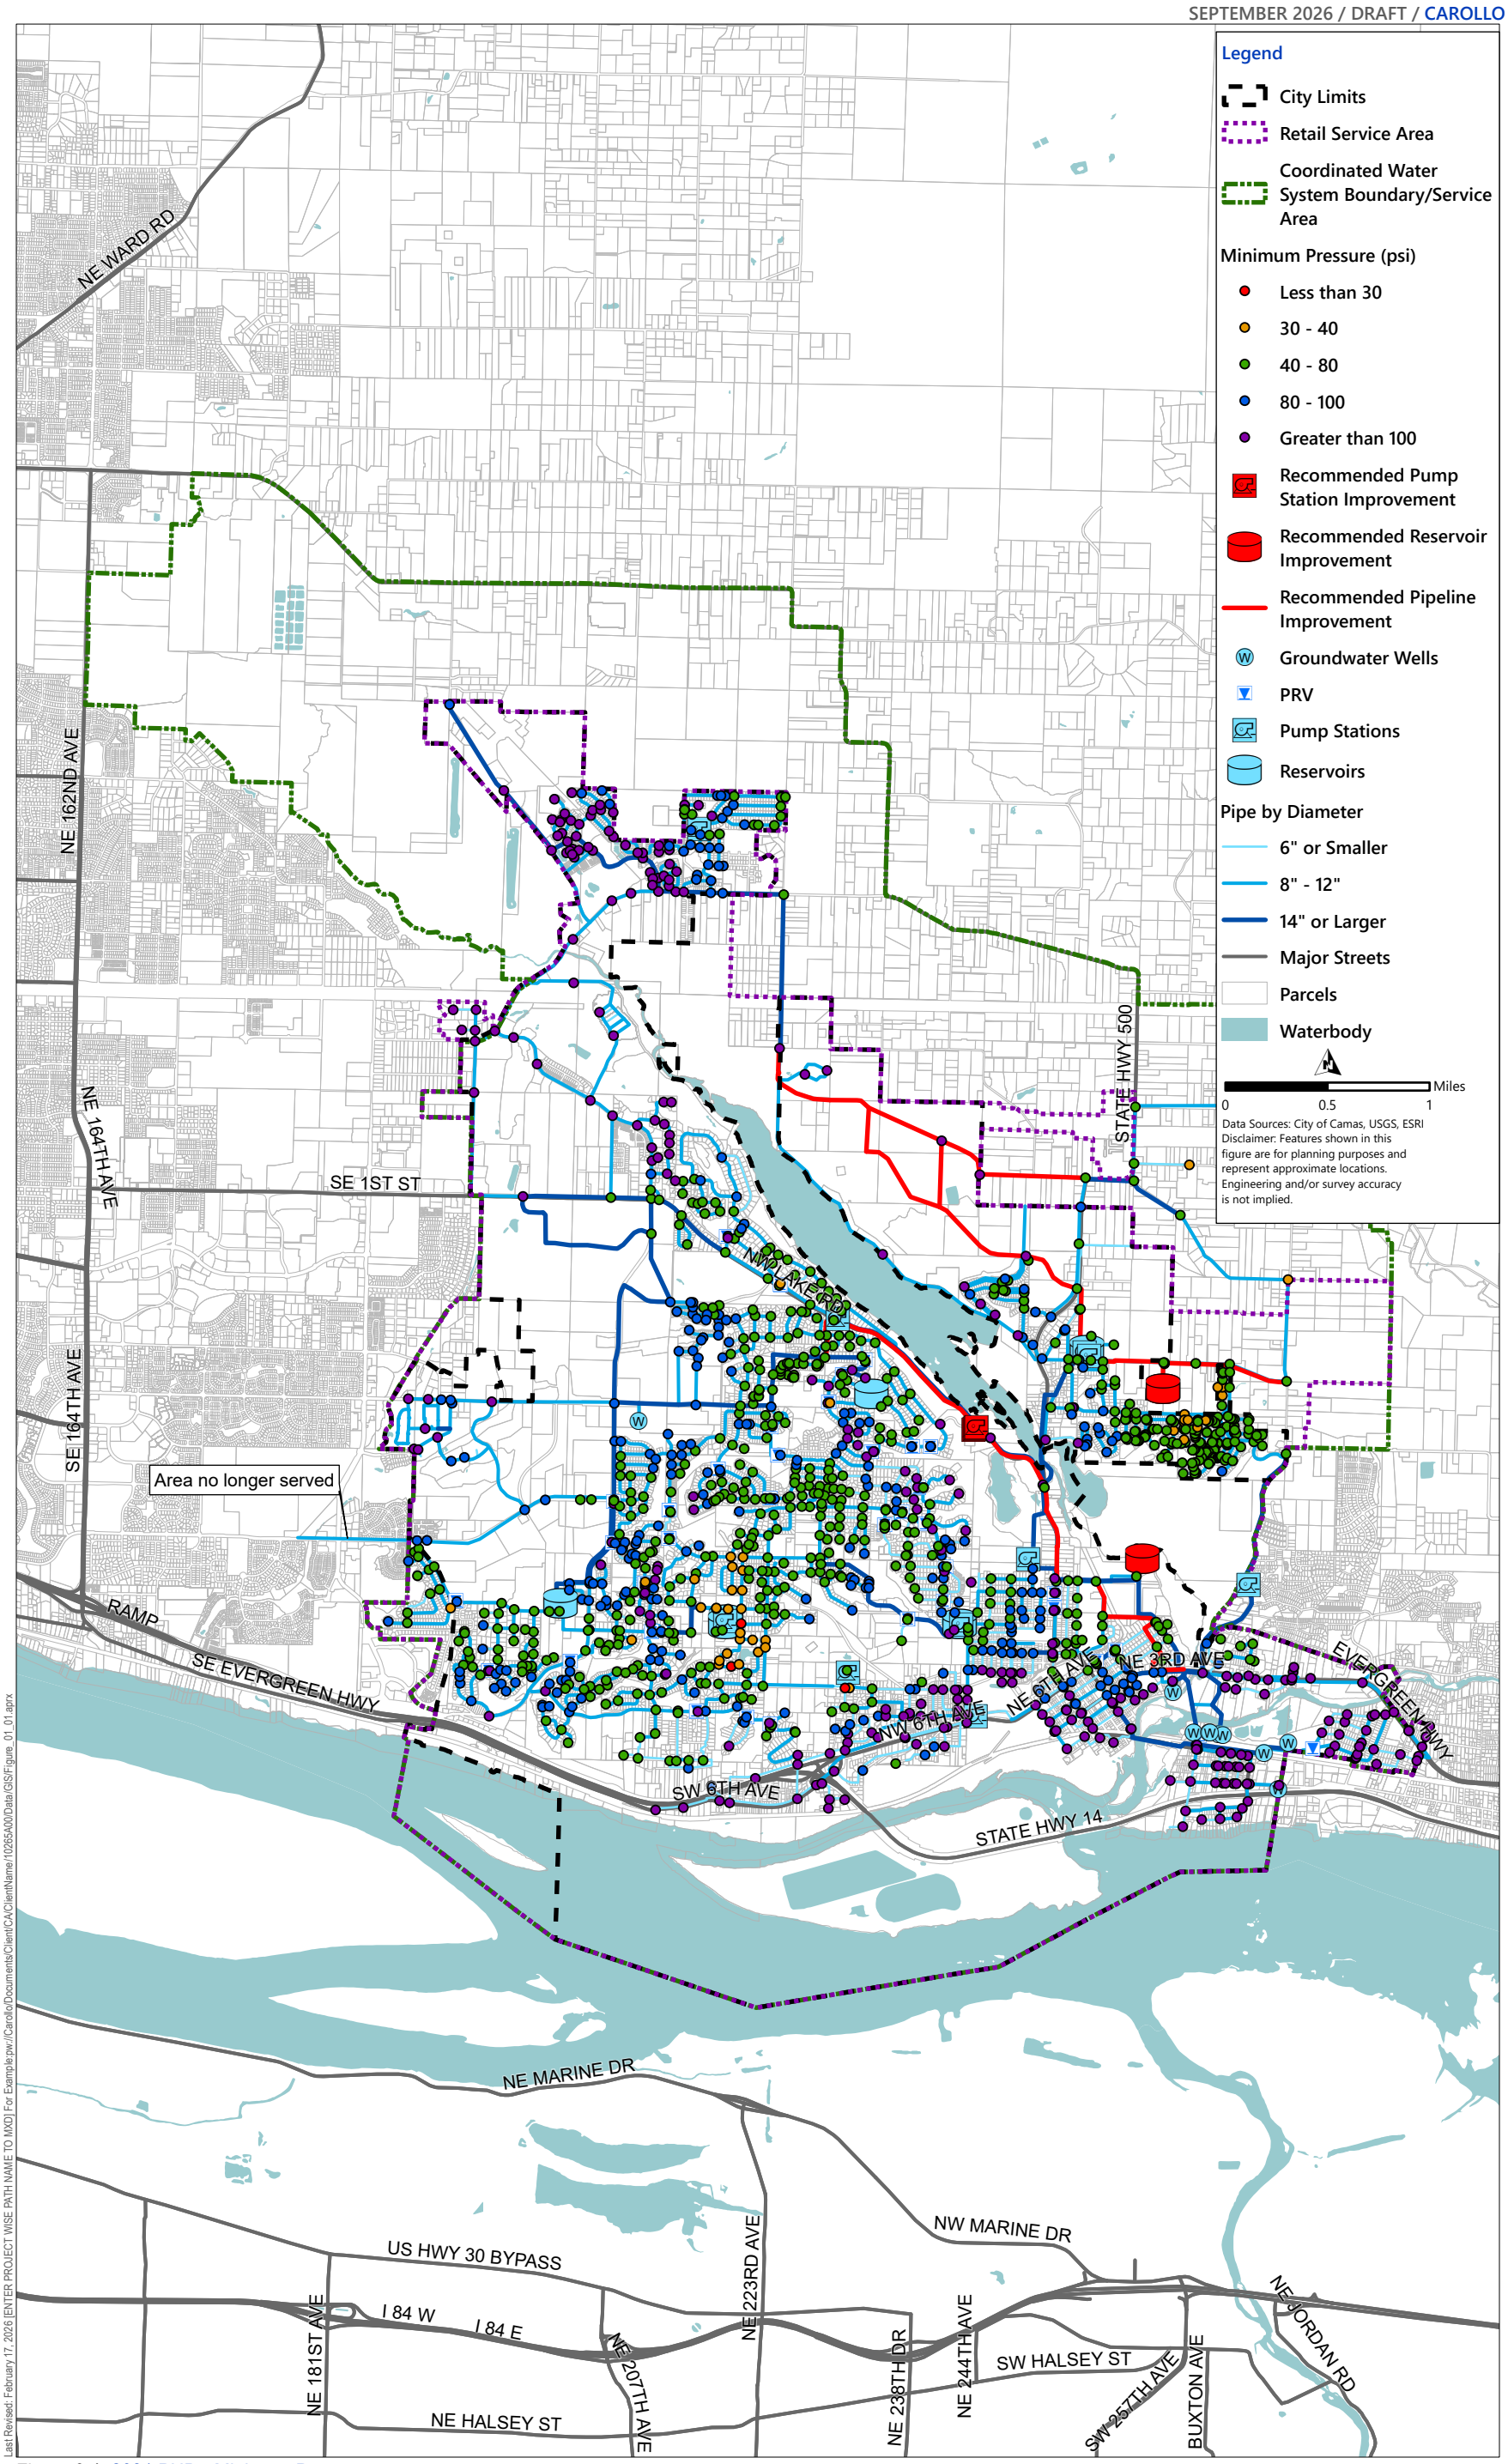

Figure 9.4 2031 PHD - Minimum Pressures

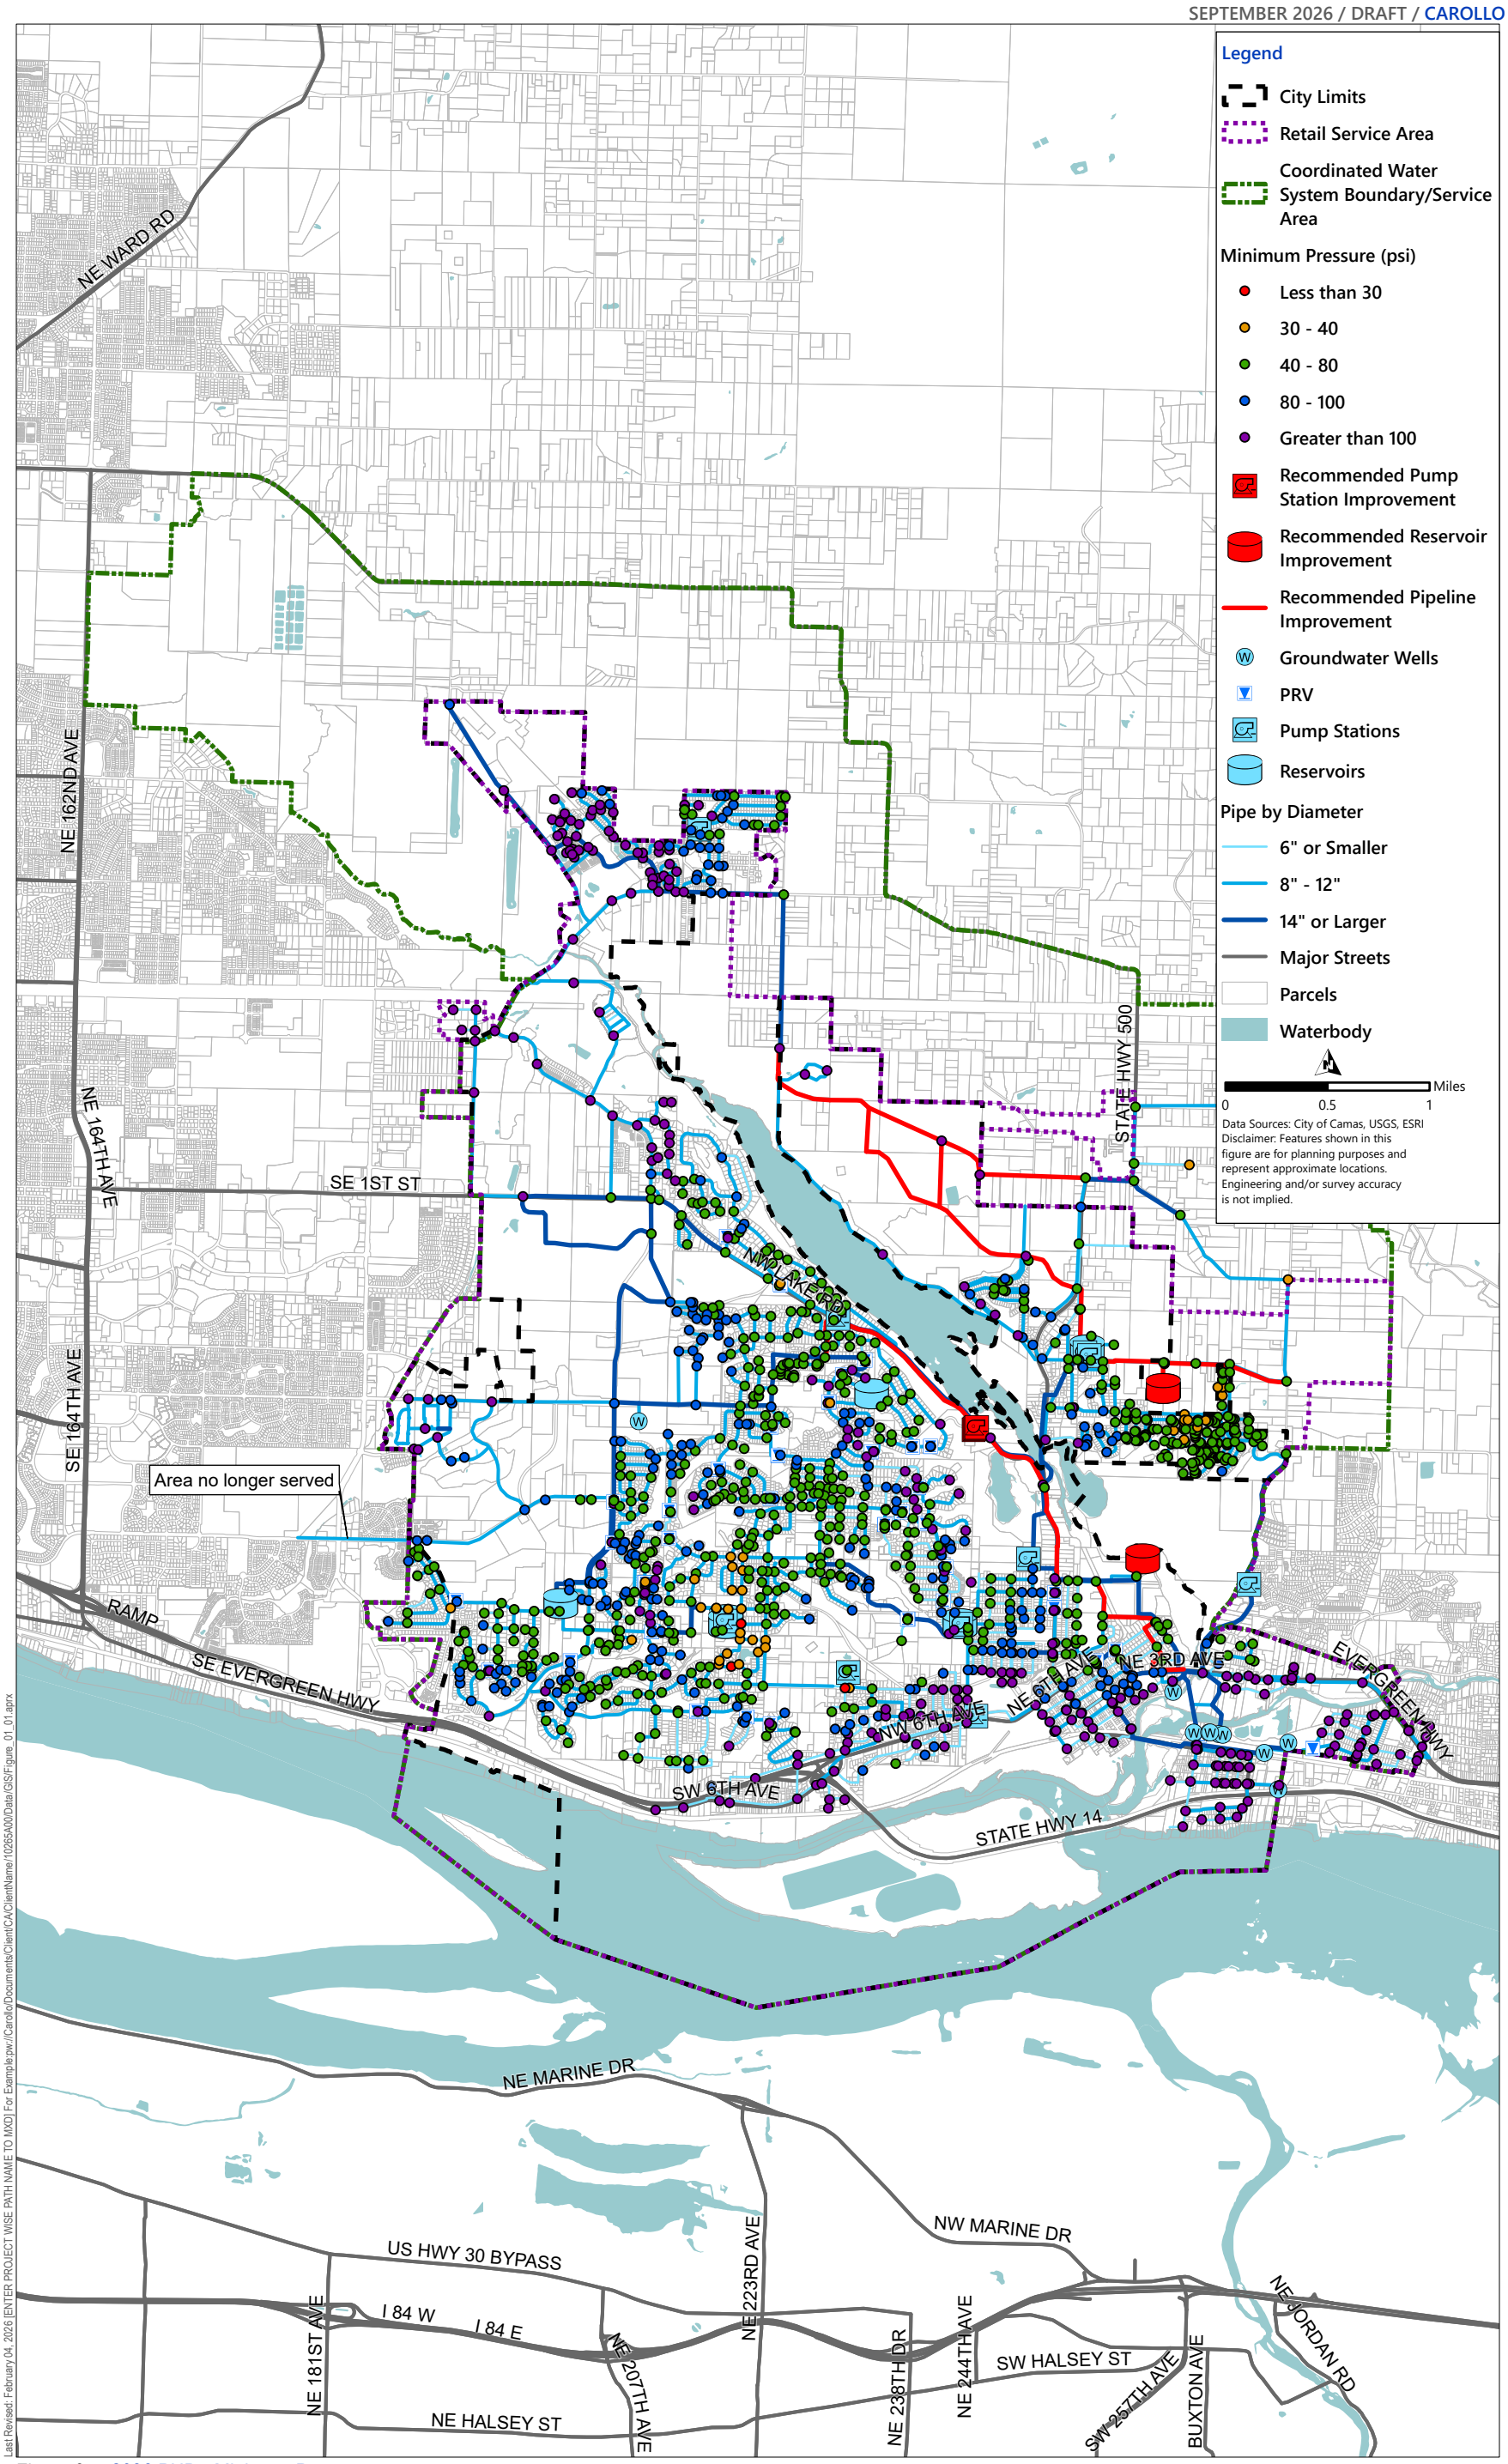

Figure 9.5 2036 PHD - Minimum Pressures

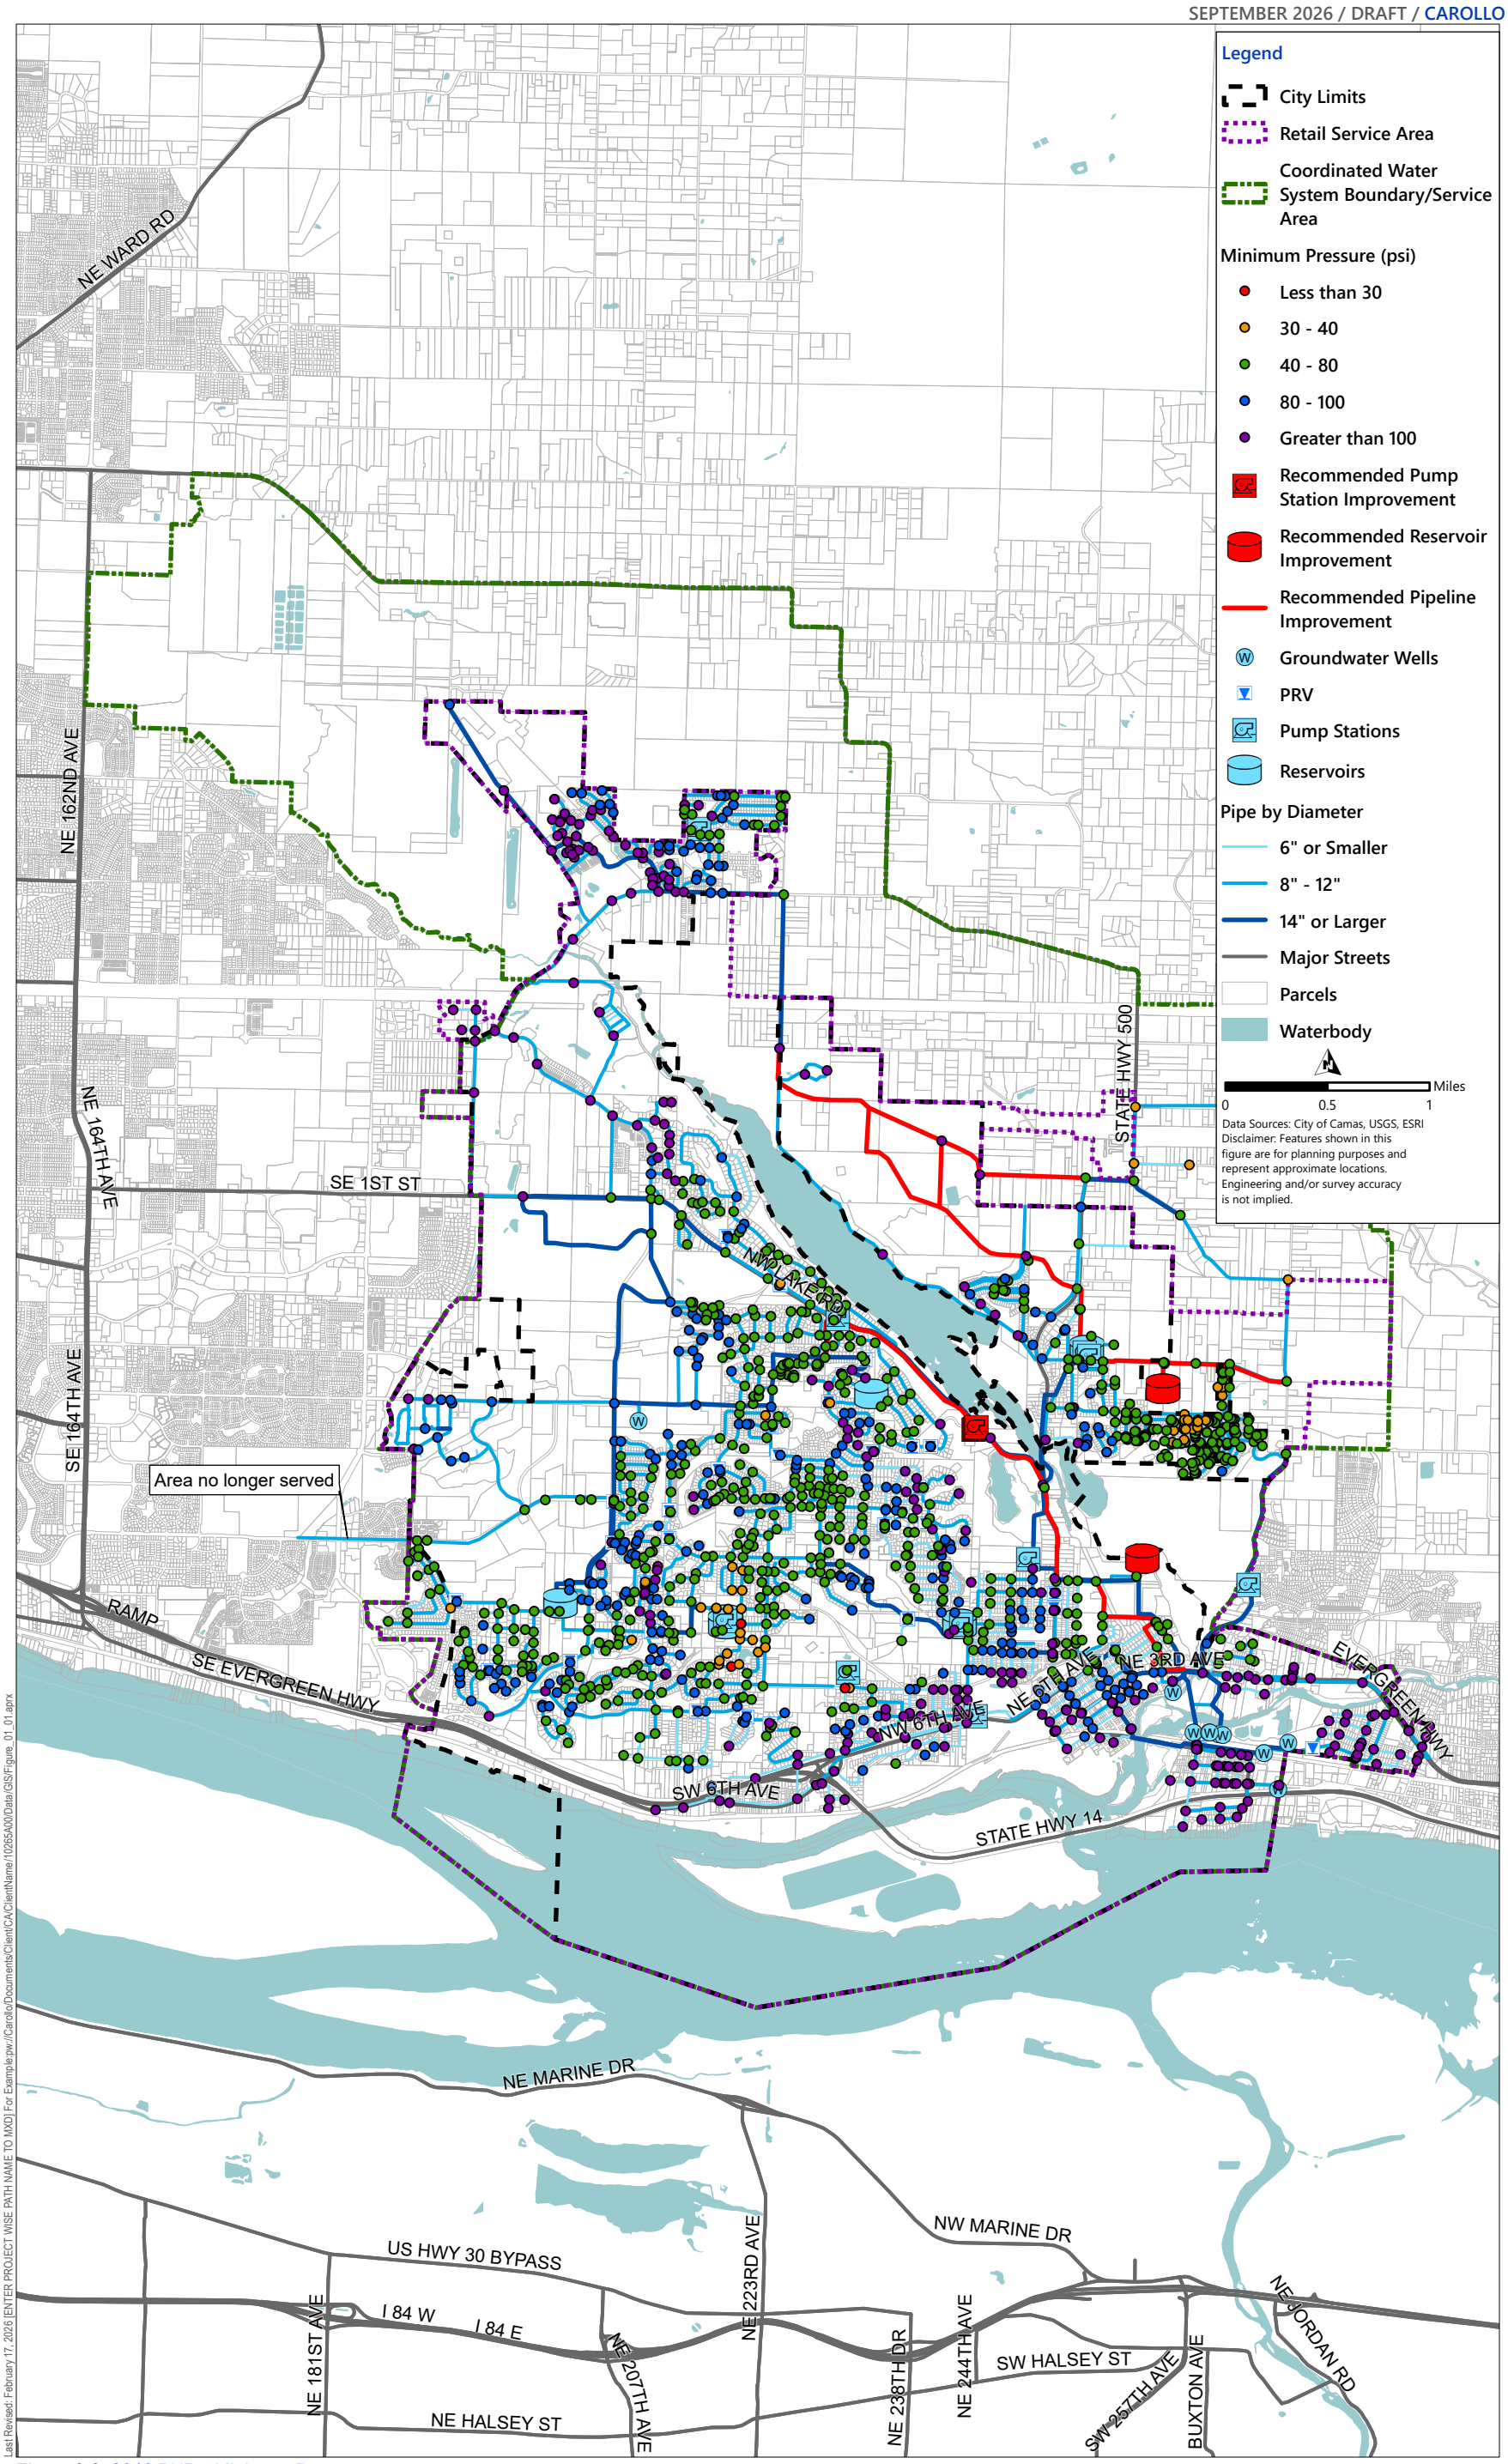

Figure 9.6 2046 PHD - Minimum Pressures

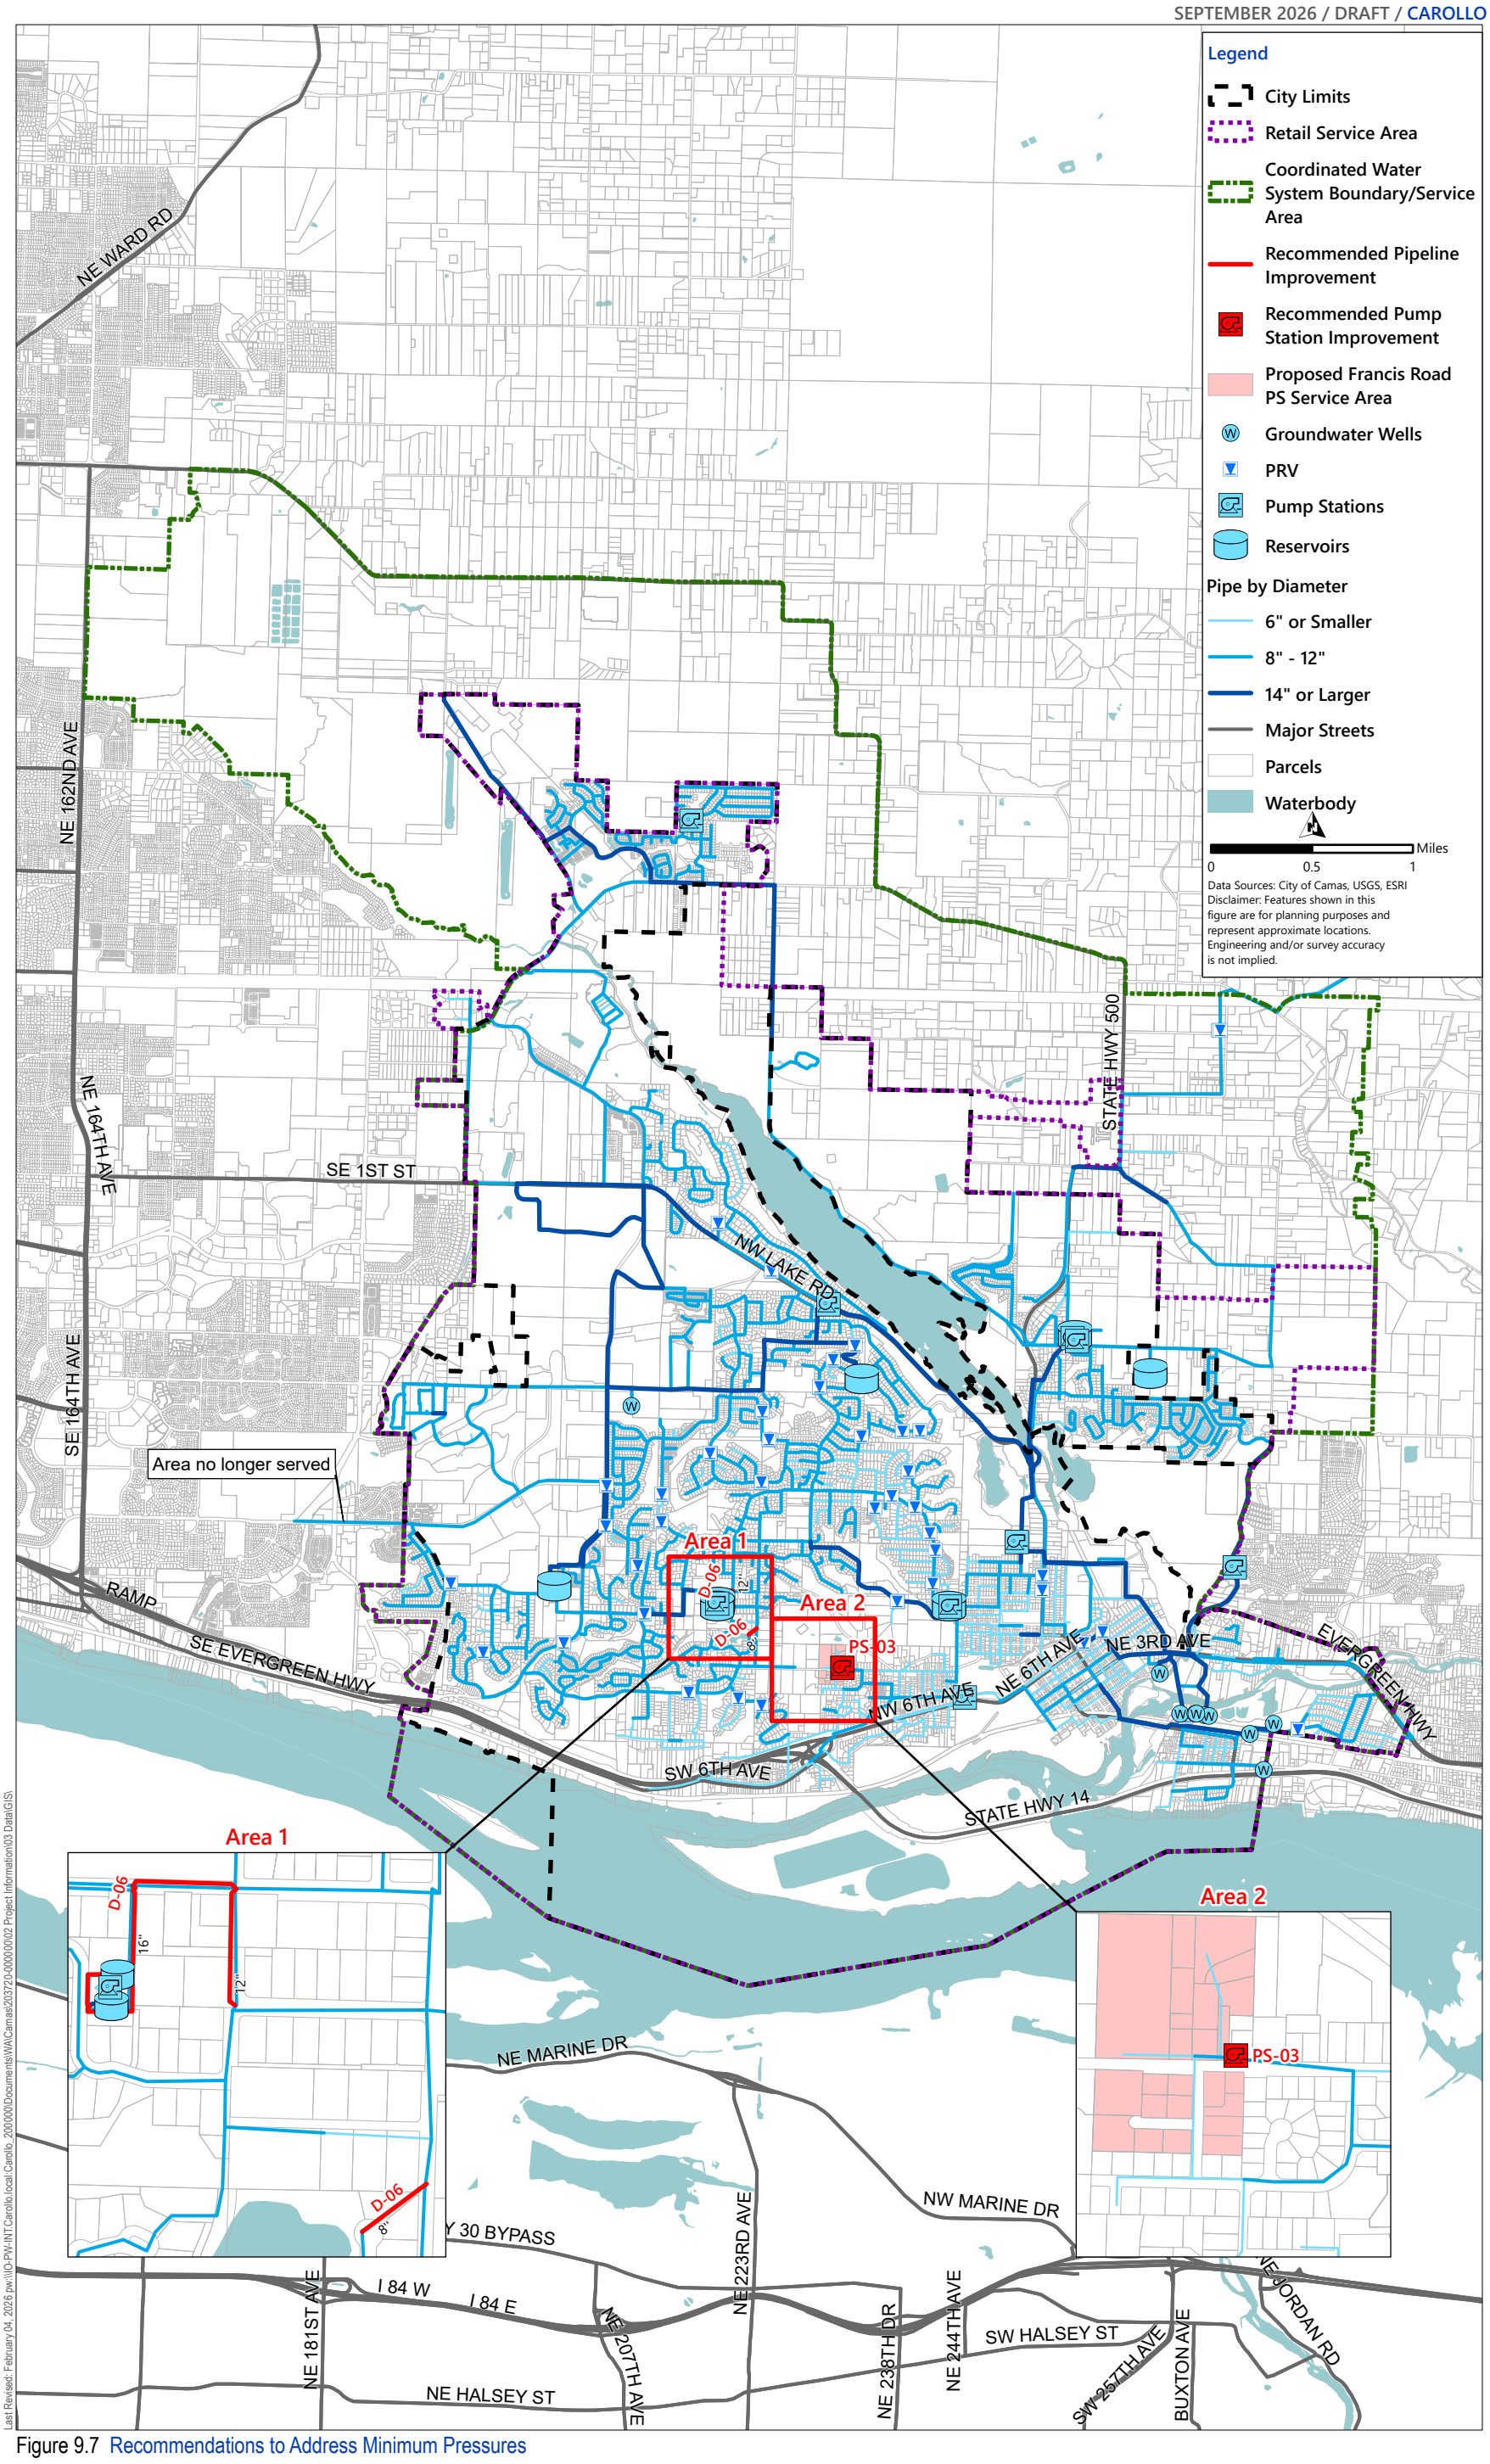

Figure 9.7 Recommendations to Address Minimum Pressures

9.2.4 Fire Flow Evaluation

9.2.4.1 Fire Flow Results

Figures 9.8, 9.9, and 9.10 show the model nodes that do and do not meet the criteria from the fire flow analysis conducted under MDD conditions for the 2031, 2036, and 2046 planning years, respectively.

9.2.4.2 Fire Flow Recommendations

This section outlines the recommendations to address all the fire flow deficiencies predicted in the hydraulic model. Fire flow deficiencies are junctions where the pressure dropped below 20 psi when simulating a fire at their location. Fire flow recommendations are either distribution pipeline upsizing or pump station projects.

- D-01 through D-10: individual distribution system projects upsizing pipeline to address fire flow deficiencies.
- PS-03: pump station project aimed to address fire flow deficiencies and meet the City's level of service goals. This pump station would include the addition of a fire pump with capacity to serve the required fire flow. Additionally, this pump station would have domestic pumps to serve typical demands. More details regarding this project are provided in Section 9.3.

Figure 9.11 outlines all projects recommended to address fire flow deficiencies, showing extent and location for each pipeline upsizing project. Figure 9.12 shows all fire nodes after recommended projects were implemented.

Figure 9.11 Fire Flow Recommendations

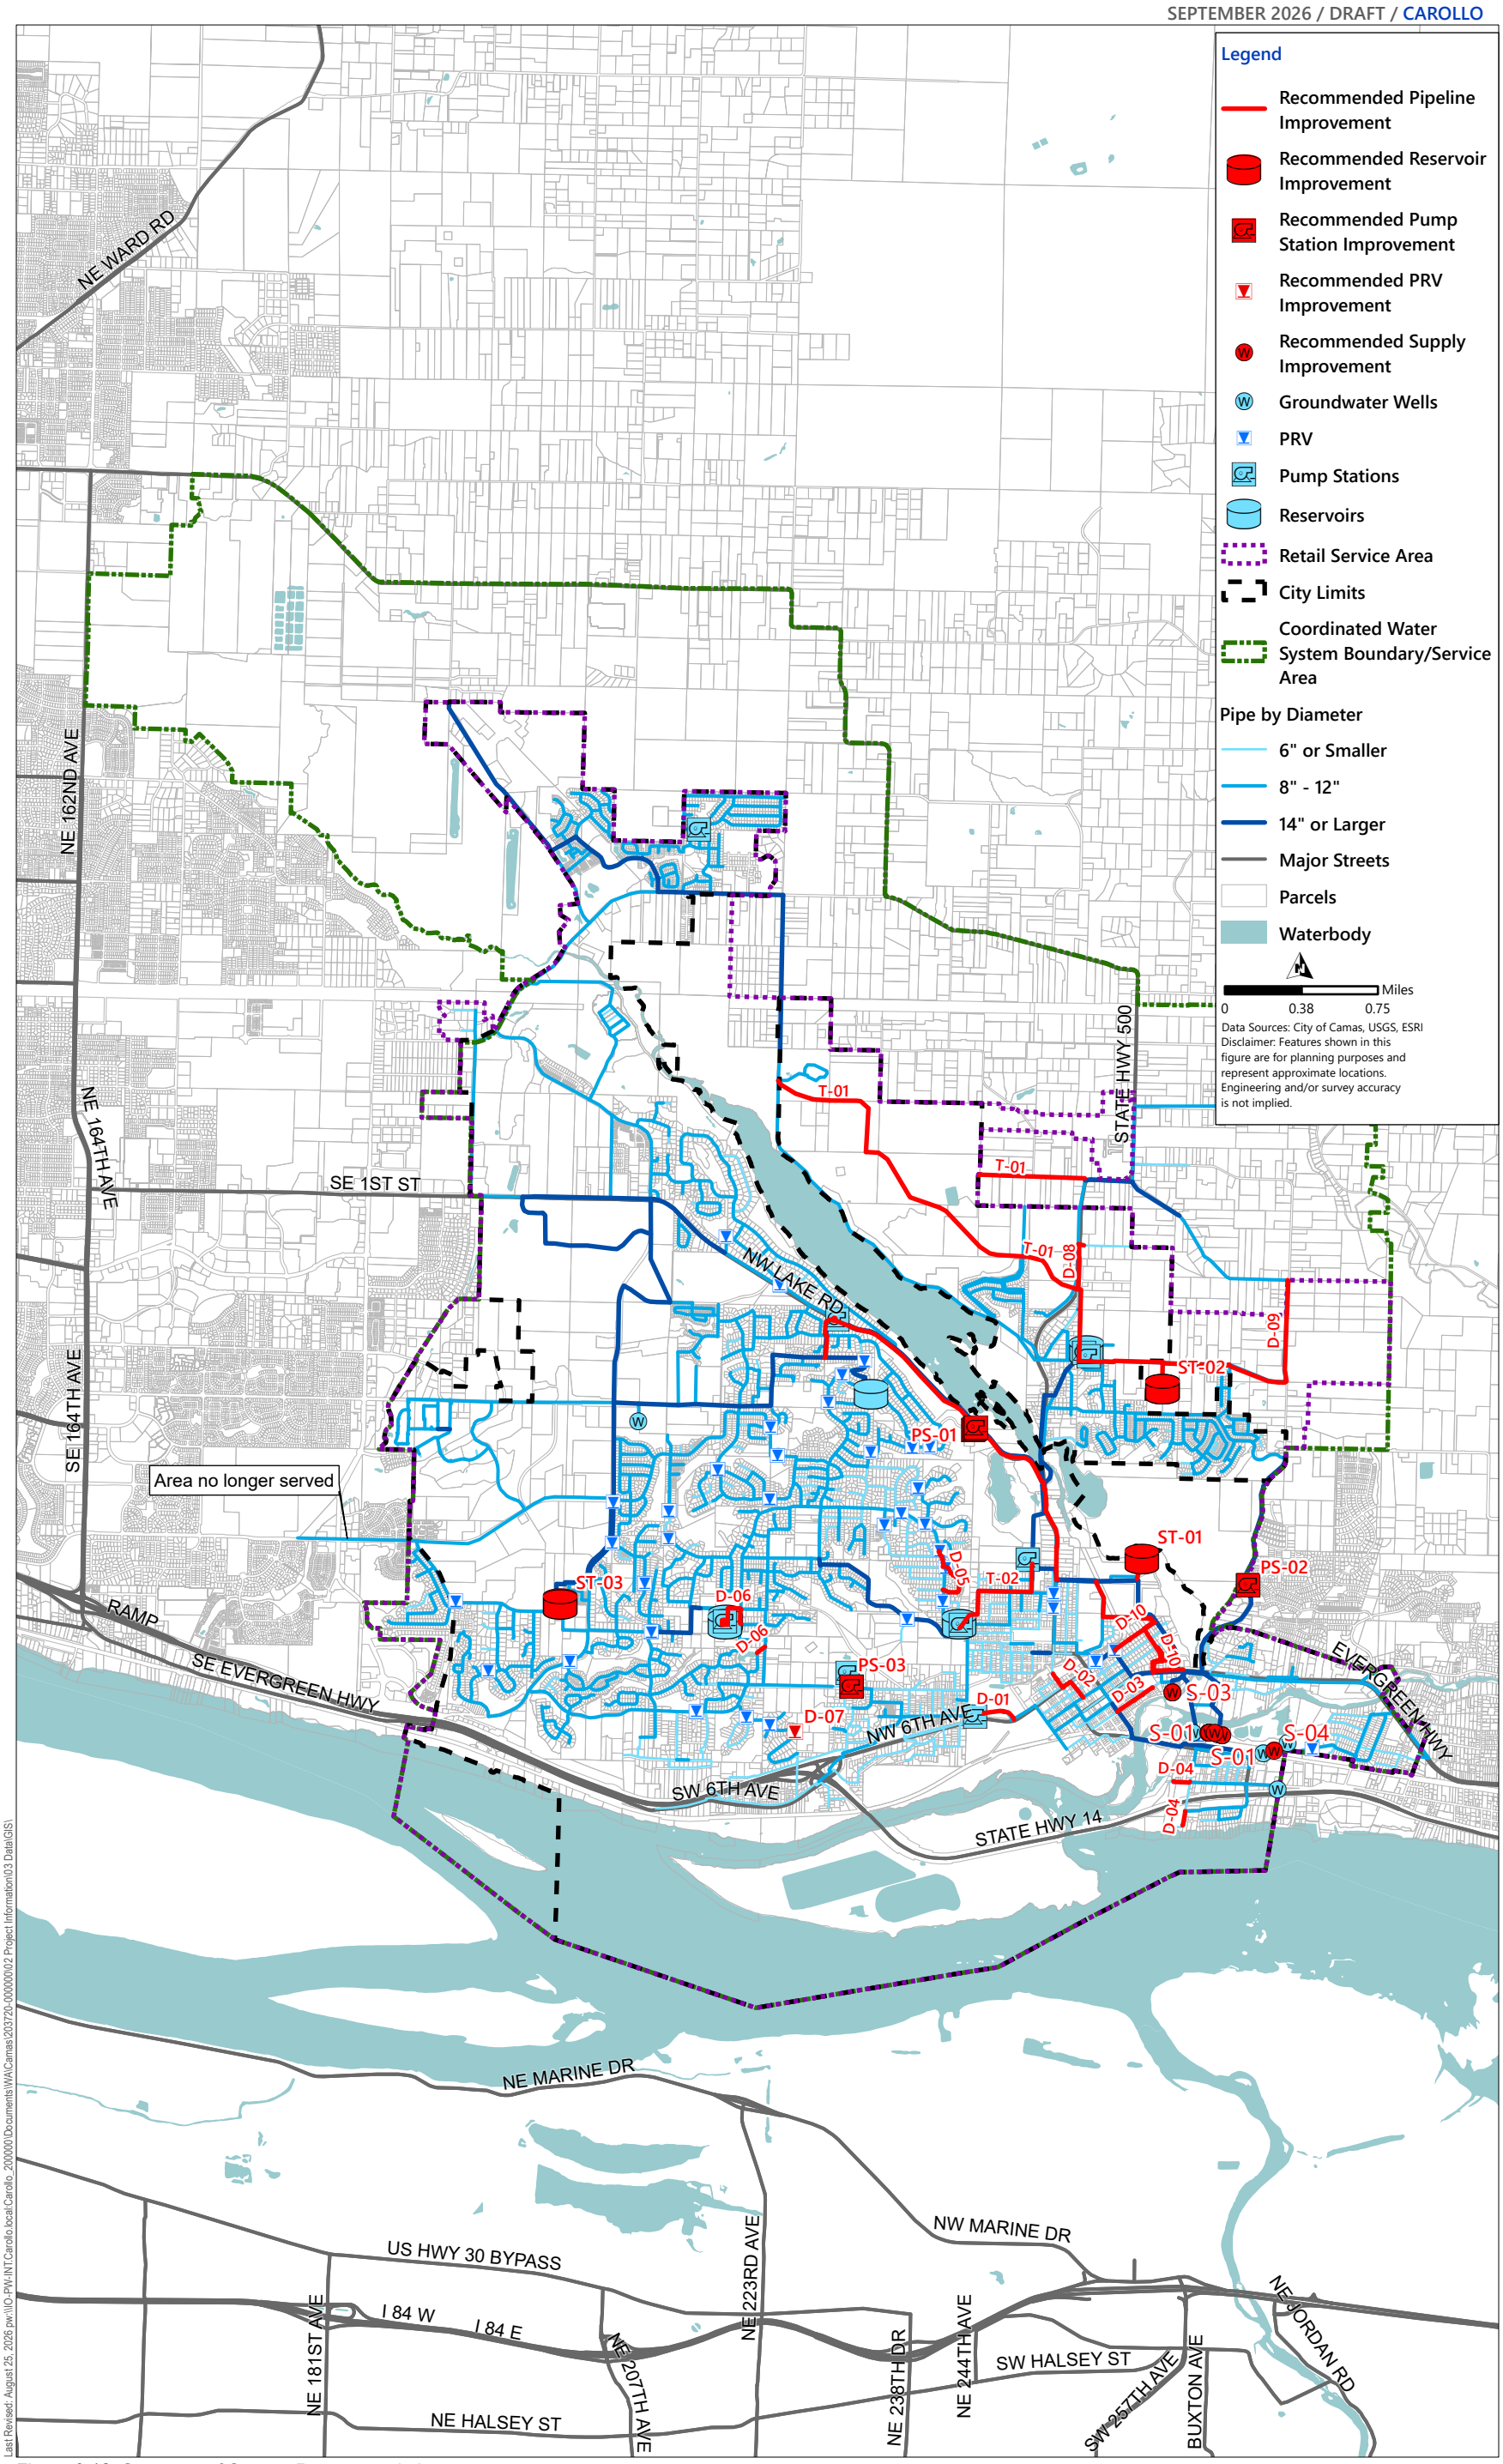

Figure 9.12 Summary of System Recommendations

9.3 Pumping Analysis

To evaluate pump station capacities, the City's water distribution system was divided into seven different pumping areas containing nine total pump stations. The 343 pumping area is supplied by groundwater wells and although not considered a pump station, was evaluated under both supply specific criteria in Chapter 8 and pumping criteria defined herein. For this water system plan update, the City utilized pumping reliability and redundancy criteria described below. A third criterion was added to evaluate wells and/or pump stations supplying closed zones against minimum DOH requirements.

1. Pumping Reliability. Wells and booster pumps with back-up power should be capable of supplying MDD for the water system while concurrently replenishing fire suppression storage within 72 hours.
2. Pumping Redundancy. With the largest pump supplying each service area out of service, the remaining pumps should provide MDD while concurrently replenishing fire suppression storage within 72 hours.
3. For wells or booster pump stations serving closed zones/systems:
    a. Supply MDD + Fire Flow.

Supply PHD with the largest pumping unit out of service. City specific pumping criteria only address MDD conditions. It is assumed if the City meets their MDD pumping reliability and redundancy goals, they will by default also be able to supply ADD reliably and redundantly.

Table 9.2 describes the relationship between pumping areas and pump stations. Pumping areas are defined as open or closed zones. Open zones are ones with adequate equalizing storage, so the pump stations are only required to supply the MDD and replenish fire suppression storage of the pumping area. Closed zones are areas that are supplied solely through a pump station; therefore, the pump station is required to supply PHD and fire flow.

Table 9.2 Pumping Area Summary

Pumping Area	Pump Stations Included	Open or Closed?
343	Lower Washougal Wellfield	Open
455	Forest Home and Angelo	Open
542	Crown Road, Butler, and New Gregg	Open
544	Lacamas	Open
852	Lower Prune Hill	Open
695 – GME	GME	Closed
Francis Road	Francis Road	Closed

9.3.1 343 Pumping Area

The 343 pumping area is an open zone that includes eight production wells: Well 5 (675 gpm), Well 6 (1,200 gpm), Well 7 (950 gpm), Well 8 (1,250 gpm), Well 10 (900 gpm), Well 11 (1,000 gpm), Well 12 (1,000 gpm), Well 13 (1,350 gpm), and Well 14 (850 gpm) with a total pumping capacity of 9,175 gpm. Total firm capacity is reflective of all total pumping capacity less the capacity of Well 13, the largest pump considered offline and Well 14, which was excluded because of a hydraulic limitation restricting the simultaneous operation of Well 6 and Well 14. Since Well 6 has the larger capacity of the two, its production capacity was used in the evaluation. Total reliable capacity is reflective of Well 8, 11, 12, 13, and 14 capacities, which are the facilities with backup power on-site. This pumping area serves the entire

distribution system. Table 9.3 shows the projected demands for the 2031, 2036, and 2046 scenarios compared to the total reliable capacity, with generators, and the total firm pumping capacity, with the largest pump offline. The 343 pumping area supplies show deficiencies for all planning year scenarios. Recommendations to address deficiencies related to the City's water supply are previously detailed in Chapter 8.

Table 9.3 343 Pumping Area Evaluation

343	2031	2036	2046
MDD (gpm)	7,995	9,195	11,685
Fire Replenishment Flow (gpm)	220	220	220
Total Demand(1) (gpm)	8,215	9,415	11,905
Total Firm Capacity (gpm)	6,975	6,975	6,975
Total Reliable Capacity(2) (gpm)	5,450	5,450	5,450
Pumping Redundancy - Surplus/Deficit (gpm)	-1,240	-2,440	-4,930
Pumping Reliability - Surplus/Deficit (gpm)	-2,765	-3,965	-6,455

Notes:
(1) Sum of MDD and Fire Replenishment Flow.
(2) Pumps with backup power. Currently, only Wells 8, 11, 12, 13, and 14 have backup power.

9.3.2 455 Pumping Area

The 455 pumping area is an open zone that includes three pump stations: Angelo, which houses four pumps each with a capacity of 1,000 gpm, Butler, which houses two pumps, one with a capacity of 600 gpm and the other with 800 gpm, and Forest Home, which houses a single 1,000 gpm pump. This pumping area directly serves the 455 pumping area and provides suction to the pump stations serving the 542, 544, 695, and 852 pumping areas. Table 9.4 shows the projected demands for the 2031, 2036, and 2046 scenarios compared to the total reliable capacity, with generators, and the total firm pumping capacity, with the largest pump offline. The 455 area pump stations currently have insufficient capacity for all planning scenarios. Sections 9.3.3.1 and 9.3.4.1 describe the recommended projects and system reconfigurations in the 542 and 544 pumping areas which will eliminate the intermediate pumping demands on this area, therefore, there are no recommendations for the 455 pumping area. Discharge pipeline upsizing described in Section 9.2.3.3 will also increase available pumping capacity at Angelo.

Table 9.4 455 Pumping Area Evaluation

455	2031	2036	2046
MDD (gpm)	6,850	7,890	10,220
Fire Replenishment Flow (gpm)	55	55	55
Total Demand(1) (gpm)	6,905	7,945	10,275
Total Firm Capacity (gpm)	5,400	5,400	5,400
Total Reliable Capacity(2) (gpm)	3,000	3,000	3,000
Pumping Redundancy - Surplus/Deficit (gpm)	-1,505	-2,545	-4,875
Pumping Reliability - Surplus/Deficit (gpm)	-3,905	-4,945	-7,275

Notes:
(1) Sum of MDD and Fire Replenishment Flow.
(2) Angelo PS has backup power to operate at firm capacity (3,000 gpm) and is the only facility in the pumping area with a backup power source.

9.3.3 542 Pumping Area

The 542 pumping area is an open zone including two pump stations: Crown Road and New Gregg, with each containing a total of three pumps. Crown Road has three pumps, each with a capacity of 800 gpm. New Gregg has two fire pumps with a capacity of 1,500 gpm each and a jockey pump with a capacity of 500 gpm. This pumping area serves the 542 pressure zone. Table 9.5 shows the projected demands for the 2031, 2036, and 2046 scenarios compared to the total reliable capacity, with generators, and the total firm pumping capacity, with the largest pump offline. The pump capacities for New Gregg were not considered in this evaluation due to concerns with intermediate pumping from the 455 zone discussed in the previous section. The 542 pumping area shows insufficient capacity for the 2046 redundancy scenario.

Table 9.5 542 Pumping Area Evaluation

542	2031	2036	2046
MDD (gpm)	665	1,130	1,930
Fire Replenishment Flow (gpm)	220	220	220
Total Demand(1) (gpm)	885	1,350	2,150
Total Firm Capacity (gpm)	1,600	1,600	1,600
Total Reliable Capacity(2) (gpm)	2,400	2,400	2,400
Pumping Redundancy - Surplus/Deficit (gpm)	715	250	-550
Pumping Reliability - Surplus/Deficit (gpm)	1,515	1,050	250

Notes:
(1) Sum of MDD and Fire Replenishment Flow.
(2) All pumps at Crown Road have backup power.

9.3.3.1 542 Pumping Area Recommendations - Project PS-02

The 542 pumping area shows insufficient pumping capacity under redundancy criteria in the 2046 scenario. Under normal operating conditions, this area is typically served by the jockey pump at New Gregg PS, which takes suction from the 455 pumping area. As a result, the added demand from the 542 pressure zone creates large deficiencies for the 455 area pump stations.

Additionally, the City has indicated that hydraulic limitations due to undersized pipelines on the discharge side of Crown Road pump station, preventing more than one pump operating at any given time. To reduce the reliance on intermediate pumping from the 455 pumping area and better utilize the available capacity at Crown Road pump station, it is recommended to add an 800 gpm pump in the remaining empty can at Crown Road pump station by 2046 and construct approximately 3,200 LF of 24-inch diameter transmission pipeline from the intersection of SE 283rd Avenue and SE Nourse Road to the new Gregg Reservoir (Phase 1 Pipeline). Phase 1 of the pipeline is recommended for completion in 2031 before the construction of the new storage reservoir in the 542 storage area..

These improvements will address the pumping deficiencies of the 542 area and the 455 area by eliminating intermediate pumping (Crown Road pump station pumps from the 343 zone directly to the 542 zone) and provide capacity for projected growth in the area.

9.3.4 544 Pumping Area

The 544 pumping area is an open zone that includes one pump station, Lacamas, which has three pumps. One pump has a 1,500 gpm capacity while the other two pumps have capacities of 500 gpm each. This pumping area directly serves the 544 pumping area and provides suction to the pump station for the 695 – GME pressure zone. Table 9.6 shows the projected demands for the 2031, 2036, and 2046 scenarios compared to the total reliable capacity, with generators, and the total firm pumping capacity, with the largest pump offline. Lacamas pump station has insufficient capacity for all planning year scenarios.

Table 9.6 544 Pumping Area Evaluation

544	2031	2036	2046
MDD (gpm)	3,530	3,985	5,260
Fire Replenishment Flow (gpm)	280	280	280
Total Demand(1) (gpm)	3,810	4,265	5,540
Total Firm Capacity (gpm)	1,000	1,000	1,000
Total Reliable Capacity(2) (gpm)	2,500	2,500	2,500
Pumping Redundancy - Surplus/Deficit (gpm)	-2,810	-3,265	-4,540
Pumping Reliability - Surplus/Deficit (gpm)	-1,310	-1,765	-3,040

Notes:
(1) Sum of MDD and Fire Replenishment Flow.
(2) All pumps have backup power.

9.3.4.1 544 Pumping Area Recommendation - Project PS-01

The 544 pumping area has insufficient pumping capacity under redundancy and reliability criteria for all planning year scenarios. Like the 542 pumping area, the 544 pumping area relies on intermediate pumping from the 455 pumping area. The City is currently under contract to design a new pump station that will pump directly from the 343 zone to the 544 zone. This project will also include transmission pipeline upgrades needed to increase conveyance capacity for future growth in the area.

9.3.5 695 - Green Mountain Estates Pumping Area

The 695 - GME pumping area is a closed zone that includes one pump station, GME, which contains five pumps. Three pumps are for domestic service and have capacity of 180 gpm each and the remaining two pumps are for fire service and have capacity of 650 gpm each. This pumping area serves the 695 - GME pressure zone. Table 9.7 shows the projected demands for the 2031, 2036, and 2046 scenarios compared to the total pumping capacity and firm capacity, with the largest pump offline. This table shows the GME pump station has adequate capacity for all planning year scenarios.

Table 9.7 695 - Green Mountain Estates Pumping Area Evaluation

695 - GME	2031	2036	2046
MDD + FF Demand (gpm)	1,605	1,610	1,620
PHD Demand (gpm)	520	545	595
Total Capacity (gpm)	1,840	1,840	1,840
Firm Capacity (gpm)	1,190	1,190	1,190
MDD + FF Surplus/Deficit (gpm)	235	230	220
PHD Surplus/Deficit (gpm)	670	645	595

9.3.6 Francis Road Pumping Area

The Francis Road pumping area is a closed zone that includes one pump station, Francis Road, housing a single 80 gpm pump in a small below grade vault. This pumping area serves a few homes along Francis Road. Table 9.8 shows the projected demands for the 2031, 2036, and 2046 scenarios compared to the total pumping capacity and firm capacity, with the largest pump offline. There is a fire hydrant within this pump station's service area therefore fire flow must be provided. Francis Road pump station has insufficient total and firm capacity for all planning year scenarios.

Table 9.8 Francis Road Pumping Area Evaluation

Francis Road	2031	2036	2046
MDD + FF Demand (gpm)	1,001	1,002	1,003
PHD Demand (gpm)	2	3	5
Total Capacity (gpm)	80	80	80
Firm Capacity (gpm)	0	0	0
MDD + FF Surplus/Deficit (gpm)	-921	-922	-923
PHD Surplus/Deficit (gpm)	-2	-3	-5

9.3.6.1 Francis Road Pumping Area Recommendation - Project PS-03

The Francis Road pumping area has insufficient pumping capacity and fire flow capacity for each planning year scenario. Discussion with the City indicated their preference to replace the existing Francis Road pump station with a new above grade pump station. The service area of the new pump station will be expanded to serve nearby customers with low pressures. To meet DOH criteria and the City's level of service goals, the new Francis Road pump station will be equipped with two 75 gpm capacity domestic pumps, two 1,000 gpm capacity fire pumps and a backup generator. These improvements will resolve the current fire flow and pressure deficiencies in this area.

9.4 Storage Analysis

The City's storage facilities were evaluated based on their criteria. To evaluate storage capacities, the City's distribution system was divided into five different storage areas containing 26 total pressure zones. Table 9.9 describes the relationship between pressure zones and storage areas.

Table 9.9 Storage Area

Storage Areas	Pressure Zones
343	285 - Downtown and 343 - Butler
455	455 – LPH and 550 – Francis Road
542	542 - Gregg
544	544 - Lacamas, 695 - GME, and one PRV subzone
852	852 - UPH and 17 PRV Subzones

The City's reservoir storage requirements depend on the water system's configuration, seasonal and daily variations in water-use patterns, and the reliability of various water system components. The following section describes the components of storage, summarizes the existing system's capacity to meet the storage needs of each operational area, and makes recommendations to address any identified storage deficits.

9.4.1 Components of Storage

Following the DOH storage volume requirements (WAC 246-290-235(3)) and the Water System Design Manual, Chapter 7, the five components of storage listed below must be evaluated for all water systems:

- Operational storage.
- Equalizing storage.
- Fire-suppression storage (FSS).
- Standby storage (SS).
- Dead storage.

DOH requires that operational and equalizing storage are available to all customers at a residual pressure of at least 30 psi under PHD flow conditions. The City has an increased level of service goal to provide standby and fire suppression storage to all customers at a residual pressure of at least 30 psi under MDD, which is above the DOH requirement of 20 psi. Therefore, all reservoir volumes above the 30 psi hydraulic grade line (HGL) are considered available storage. Dead storage is the volume in the reservoir that cannot be used to serve the highest customer in the water system with a pressure of at least 30 psi. The City also combines fire and standby into a single band for planning (i.e., nesting) and only the larger of the two volumes is used for analysis. Figure 9.13 schematically shows these components.

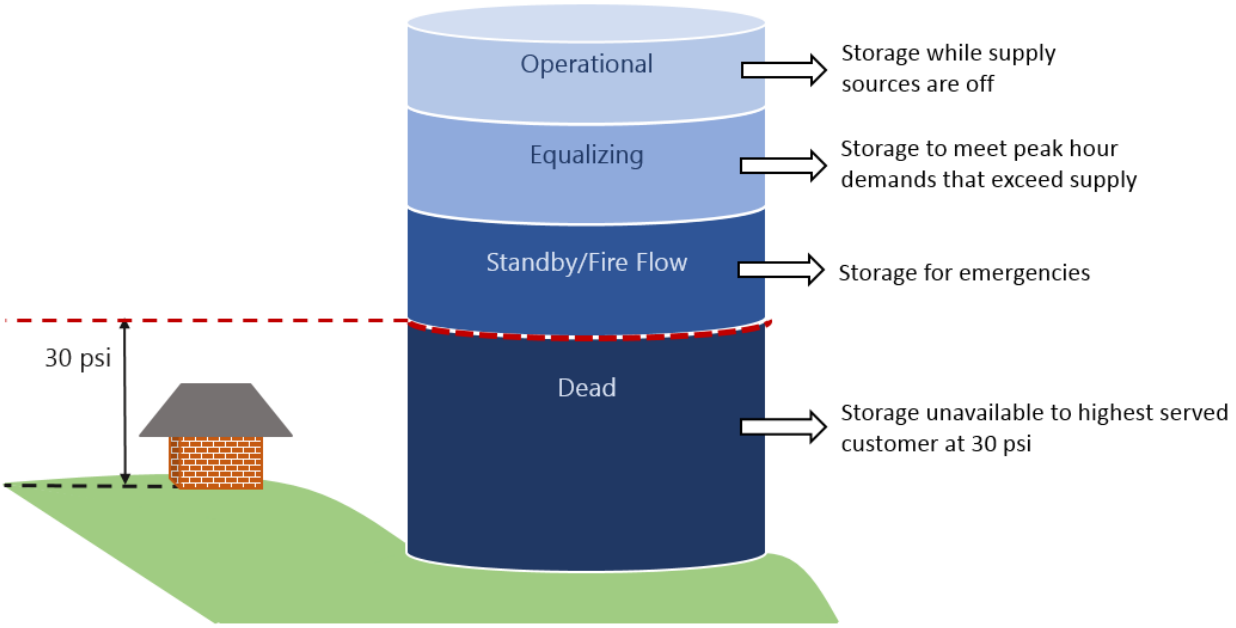

Figure 9.13 Illustration of Storage Components

9.4.1.1 Operational Storage

Operational storage is the volume of water used on a day-to-day basis to supply the water system while the sources of supply are in the "off" position. This volume is dependent on the settings of the water level sensors controlling the pumps and is designed to prevent the pump motors from excessive starts and stops (cycling).

Summarized in Table 9.10, the operational storage volume for reservoirs was determined from SCADA data and pump settings provided by the City and set up within the hydraulic model.

Table 9.10 Operational Storage Volumes

Reservoir	Storage Area	Total Volume (MG)	Operational Band (feet)	Operational Storage (MG)	Percent of Total Storage
Butler	343	1.2	1.3	0.10	9%
Lower Prune Hill #2	455	1.5	0.5	0.03	2%
Gregg	542	0.1	8	0.01	11%
Lacamas	544	2.0	4	0.17	8%
18th Avenue	544	2.0	1.2	0.06	3%
Upper Prune Hill #1	852	0.75	4	0.03	4%
Upper Prune Hill #2	852	2.4	6	0.21	9%
Total		**9.95**		**0.61**	**6%**

9.4.1.2 Equalizing Storage

Equalizing storage is the total volume needed to satisfy the peak hourly demands (PHD) that exceed the supply system's capacity. The WAC 236-290-235 requires that equalizing storage be provided for peak demands.

Equalizing volume requirements were calculated for each reservoir using the following equation using the storage area demands and are summarized in Table 9.11.

ES = (PHD – MDD) x 150 min, but in no case less than zero

Where:

- ES = Equalizing Storage component, in gallons.
- PHD = Peak hourly demand, in gpm.
- MDD = Sum of all installed and active source of supply capacities, except emergency sources of supply, in gpm.

PHD was calculated using the individual pressure zone peaking factors determined from the diurnal patterns used in system analysis.

Table 9.11 Equalizing Storage Volumes

Storage Area	2031 Equalizing Volume (MG)	2036 Equalizing Volume (MG)	2046 Equalizing Volume (MG)
343	0.14	0.16	0.18
455	0.09	0.09	0.09
542	0.08	0.14	0.24
544	0.33	0.37	0.47
852	0.37	0.39	0.43
Total	**1.01**	**1.15**	**1.41**

9.4.1.3 Standby Storage and Fire-Suppression Storage

Standby Storage volumes are required to supply reasonable system demands during a system emergency, such as the disruption of the water supply caused by a transmission pipeline or equipment failure, power outage, valve failure, or other system interruptions (as discussed in Chapter 2). The computation of emergency/standby storage requirements includes consideration of reasonable system disruptions that can be expected to occur within normal planning contingencies, and does not consider major system emergencies, such as earthquakes, which result in shutdown of water supplies and multiple distribution system breaks. These types of emergencies should be covered under emergency system operation planning. Table 9.12 shows the required standby storage capacity for each operational area.

The DOH Water System Design Manual recommends a minimum standby storage volume of no less than 200 gallons per ERU, which is the criteria adopted into City policy. However, as noted above, City policy states that standby storage should be available to the highest customer in the storage area at 30 psi.

Table 9.12 Standby Storage Volumes

Storage Area	2031 Standby Storage Volume (MG)	2036 Standby Storage Volume (MG)	2046 Standby Storage Volume (MG)
343	0.60	0.69	0.77
455	0.38	0.39	0.40
542	0.38	0.64	1.08
544	2.31	2.65	3.39
852	1.03	1.07	1.18
Total	**4.70**	**5.44**	**6.82**

Fire suppression storage is the quantity of water required for firefighting as defined by applicable water system criteria and fire codes. Firefighting often places the largest demand on a water system because a high volume of water must be supplied over a short time period. Such demands require each component of the system to operate at optimal condition.

DOH requires water systems to have storage reservoirs that can meet fire flow requirements while maintaining a level of 20 psi throughout the distribution system. However, City policy states storage reservoirs should have adequate capacity to supply required fire flow while maintaining a minimum of 30 psi at the highest customer. Table 9.13 outlines the required maximum fire flow, duration, and FSS volume for each operational area.

Table 9.13 Required Maximum Fire Flow

Storage Area	Required Fire Flow (gpm)	Required Duration (hours)	Required FSS (MG)
343	4,000	4	0.96
455	2,000	2	0.24
542	4,000	4	0.96
544	5,000	4	1.20
852	2,500	2	0.30

The City plans for single emergency at time per storage area. Either standby storage or fire-suppression storage, whichever volume is smaller, can be excluded from each zone's total storage requirement (this is also known as "nested" storage). Table 9.14 outlines the nested standby storage and fire-suppression storage requirements for each operational area.

Table 9.14 Nested Standby Storage and Fire-Suppression Storage

Storage Area	Volume (MG)			Controlling Factor (FSS or SS)		
	2031	2036	2046	2031	2036	2046
343	0.96	0.96	0.96	FSS	FSS	FSS
455	0.38	0.39	0.40	SS	SS	SS
542	0.96	0.96	1.08	FSS	FSS	SS
544	2.31	2.65	3.39	SS	SS	SS
852	1.03	1.07	1.18	SS	SS	SS

9.4.1.4 Dead Storage

Dead storage is the volume at the bottom of the storage reservoir that cannot reliably be used because it is physically too low to be withdrawn from the reservoir or, if withdrawn from the reservoir, would result in

water pressures in the distribution system below the acceptable criteria of 30 psi. Storage volume is considered dead if it is located below the outlet pipeline and cannot be used because of system's hydraulic limitations or if high elevations cause low pressures at customer connections.

Table 9.15 summarizes the dead volume calculations for each reservoir. Section 9.4.2 outlines the recommendations to mitigate these low pressure and dead storage issues for high elevation customers.

Table 9.15 Reservoir Dead Storage(1)

Reservoir	Storage Area	Storage Volume (MG)	Maximum Elevation Served (feet)	Available Storage at 20 psi (MG)	Percent Available at 20 psi %)	Available Storage at 30 psi (MG)	Percent Available at 30 psi (%)
Butler	343	1.20	234	1.20	100%	1.20	100%
LPH No. 2	455	1.50	392	1.10	73%	0.00	0%
Gregg	542	0.10	440	0.08	80%	0.05	47%
Lacamas	544	2.0	437	2.0	100	1.57	79%
18th Avenue	544	2.0	437	2.0	100%	1.84	95%
UPH No.1	852	0.75	757	0.37	49%	0.19	26%
UPH No. 2(1)	852	2.40	757	2.22	93%	2.22	93%

Notes:
(1) UPH Reservoir No. 2 has pump station to make all storage usable. The City maintains a minimum of 5 feet in the reservoir.

9.4.2 Storage Recommendations

A summary of the existing storage and storage needs in 2046 is shown in Table 9.16. This table assumes the recommended projects to address low pressures identified in Section 9.2.1 have been completed. Storage deficits were identified in the following storage areas: 343, 542, and 544. The identified storage deficits can be mitigated by constructing additional storage space. While adjustments in operational strategy could mitigate some storage requirements, additional storage construction would still be needed to address deficits in all zones.

All recommended projects are summarized in the sections below.

Table 9.16 2046 Storage Summary

Storage Area	Total Storage Volume (MG)	Available Storage at 20 psi (MG)	Available Storage at 30 psi (MG)	Operational Storage (MG)	Equalizing Storage (MG)	Fire-Suppression Storage (MG)	Standby Storage (MG)	Required Storage (MG)	Storage Volume to Add by 2046 (MG)
343	1.20	1.20	1.20	0.10	0.18	0.96	0.77	1.24	0.04
455(1)	1.50	1.50	1.50	0.03	0.09	0.24	0.40	0.52	0
542	0.10	0.08	0.05	0.01	0.24	0.96	1.08	1.33	1.28
544	4.00	4.00	3.46	0.23	0.47	1.20	3.39	4.09	0.63
852(1)	3.15	2.59	2.42	0.45	0.43	0.30	1.18	2.06	0
Total	**9.95**	**9.37**	**8.45**	**1.08**	**1.41**	**3.63**	**6.82**	**9.24**	**1.92**

Notes:
(1) Assumes projects to address low pressures and high elevation customers causing dead storage have been completed.

Table 9.17 outlines the storage requirements and deficits for each planning year, 2031, 2036, and 2046. The sections to follow outline storage recommendations for each storage area to alleviate identified storage deficits.

Table 9.17 Storage Requirements by Planning Year

Storage Area	Total Available Storage at 30 psi(1) (MG)	2031		2036		2046	
		Required Storage (MG)	Storage Surplus/Deficit (MG)	Required Storage (MG)	Storage Surplus/Deficit (MG)	Required Storage (MG)	Storage Surplus/Deficit (MG)
343	1.20	1.20	0	1.22	-0.02	1.24	-0.04
455	1.50	0.5	1.0	0.51	0.99	0.52	0.98
542	0.05	1.05	-1.0	1.11	-1.06	1.33	-1.28
544	3.46	2.87	0.59	3.25	0.21	4.09	-0.63
852	2.42	1.85	0.57	1.91	0.51	2.06	0.36

Notes:
(1) Assumes projects to address low pressures and high elevation customers causing dead storage have been completed.

9.4.2.1 343 Storage Area Recommendations - Project ST-01

By the 2036 and 2046 planning years there are slight storage deficits of 0.02 and 0.04 MG in the 343 area. The storage in this area is currently provided by Butler Reservoir, which is a 1.2 MG partially buried reservoir originally constructed in the early 1900s. The City has indicated Butler Reservoir is reaching the end of its useful life and will be decommissioned once a new 343 zone reservoir is constructed. The replacement reservoir project is currently in preliminary design phase. An alternatives analysis completed by the City's consultant Gray & Osborne (G&O) indicated the preferred alternative would be an elevated reservoir near the Camas Cemetery. The new reservoir would be sized for buildout and provide a minimum of 1.84 MG of usable storage for the 343 area alleviating deficits identified under this planning period. G&O provided preliminary costs for the project in their September 2025 alternatives analysis, which will be included in the City's CIP.

9.4.2.2 542 Storage Area Recommendations - Project ST-02

In 2031, there is a 1.0 MG deficit in the 542 storage area, increasing to a 1.28 MG deficit in 2046. To alleviate deficits in the area, an additional storage reservoir will need to be constructed. There are multiple alternatives for increasing storage capacity in this area. For planning purposes, an elevated reservoir with a nominal capacity of 1.5 MG was recommended and will be incorporated into the CIP as it was the costliest alternative. The City should complete an alternatives analysis before beginning the design phase of this project to identify the most feasible, cost-effective solution. Due to topography the new reservoir will likely need to be located at the existing Gregg Standpipe site which is the highest point in the area. Additionally, Phase 1 of the transmission pipeline project described in Section 9.3.3.1 should be completed with this storage project to mitigate potential hydraulic bottlenecks associated with filling the new reservoir. Phase 1 would include approximately 3,200 LF of 24-inch diameter transmission pipeline from the intersection SE 283rd Avenue and SE Nourse Road to the new Gregg Reservoir.

9.4.2.3 544 Storage Area Recommendations - Project ST-03

At the end of the planning period in 2046, there will be a deficit of approximately 0.63 MG in the 544 storage area. To address this deficit an additional reservoir with a nominal capacity of 0.75 MG is recommended at the 18th Avenue site, which has space on-site to accommodate the additional reservoir.

9.5 Limiting Capacity Analysis

The limiting capacity of the City's physical water system was determined for the 2031, 2036, and 2046 planning years with existing conditions and infrastructure. The limiting capacity was then calculated for the 2046 planning year with the assumption that all recommended improvement projects will be online. The limiting capacity analysis uses the methodology described in DOH Water System Design Manual (2009) Worksheet 6-1 and Table 6-1. Table 9.18 describes the method used to calculate capacity for each component.

Table 9.18 Limiting Capacity Calculations

Water System Component	Equation / Notes
Sources (ADD)	N = $\frac{Firm\ Source\ Capacity}{ADD\ ERU\ value}$ where: Firm source capacity = source capacity with largest source (Well 13) offline.
Sources (MDD)	N = $\frac{Firm\ Source\ Capacity}{MDD\ ERU\ value}$ where: Firm source capacity = source capacity with largest source (Well 13) offline.
Treatment	The City has designed treatment capacity with sufficient capacity to serve its sources.
Equalizing Storage (ES)	N = $\frac{1}{C}[\left(\frac{1440}{MDD}\right)\left(\frac{ES}{150}+Q_s-18\right)-F]$ where: MDD = MDD, gpd/ERUs. C = Coefficient associated with ranges of ERUs. F - Factor associated with ranges of ERUs. Q_s = Total source pumping capacity, gpm.
Standby Storage (SB)	N = $\frac{SB_t}{(SB_i)(t_d)}$ where: SB_t = total volume of water in standby storage component (gallons). SB_i = Design level of standby storage to meet reliability considerations per ERU (gpd/ERU). t_d = time that storage is to be used (days).
Distribution	Not considered capacity limited because the City has planned projects to address all identified deficiencies and design standards confirm all new development meets City standards.
Transmission	Assumed to be addressed as part of source and pumping capacity.

The capacity of many water system components can be expressed as the number of ERUs that can be served. As described in Chapter 5, an ERU for the City's system is one that consumes 242 gpd on an average demand day. On a maximum day, an ERU consumes 490 gpd.

To determine how many ERUs the City's sources can serve on a maximum demand day, the supply to each operational area was divided by the MDD ERU value of 490 gpd. The MDD ERU value was also used to calculate the capacity of the City's equalizing storage in ERUs. The ERU capacity of standby storage was calculated by subtracting out each reservoir's equalizing storage and operational storage under 2046 demand conditions from its total available storage capacity.

The capacity of each operational area is either limited by source supply or standby storage. None of the service areas are limited by the amount of equalizing storage available. In total, based on sources, equalizing storage, and standby storage, the City's water system has a limiting capacity of approximately 18,830 ERUs. This is shown in Table 9.19.

As presented in Chapter 5, the City predicts serving approximately 34,420 ERUs in 2046. Considering sources, equalizing storage, and standby storage, the City's water system is anticipated to have insufficient capacity to meet expected growth within the 20-year planning period due to standby storage and supply source capacity. This confirms the storage recommendations presented in Section 9.4.2 and the supply recommendations presented in Chapter 8.

Fire-suppression storage is not a function of ERUs and therefore is not represented in Table 9.19.

Table 9.19 Calculated Capacity in ERUs for Each Water System Component

Water System Component	2031 System-wide ERUs	2036 System-wide ERUs	2046 System-wide ERUs	2046 System-wide ERUs with Improvements
Projected ERUs	23,800	27,440	34,420	34,420
Sources(1) (ADD)	44,495	44,495	44,495	71,720
Sources (MDD)	24,705	24,705	24,705	42,645
Equalizing Storage	81,670	81,670	81,670	161,425
Standby Storage	20,055	19,665	18,830	49,910
Limiting Capacity	Standby/Sources (MDD)	Standby/Sources (MDD)	Standby/Sources (MDD)	None

Notes:
(1) Average day source capacity assumes supply facilities are operated 18 hours per day.

9.6 Summary of Recommendations

The system analysis yielded a number of recommended improvements for pump stations, storage reservoirs, and pipelines which are summarized in Table 9.20 and Figure 9.14. Supply projects identified in Chapter 8 are also shown on this figure. These recommendations are organized into a CIP with associated costs in Chapter 10.

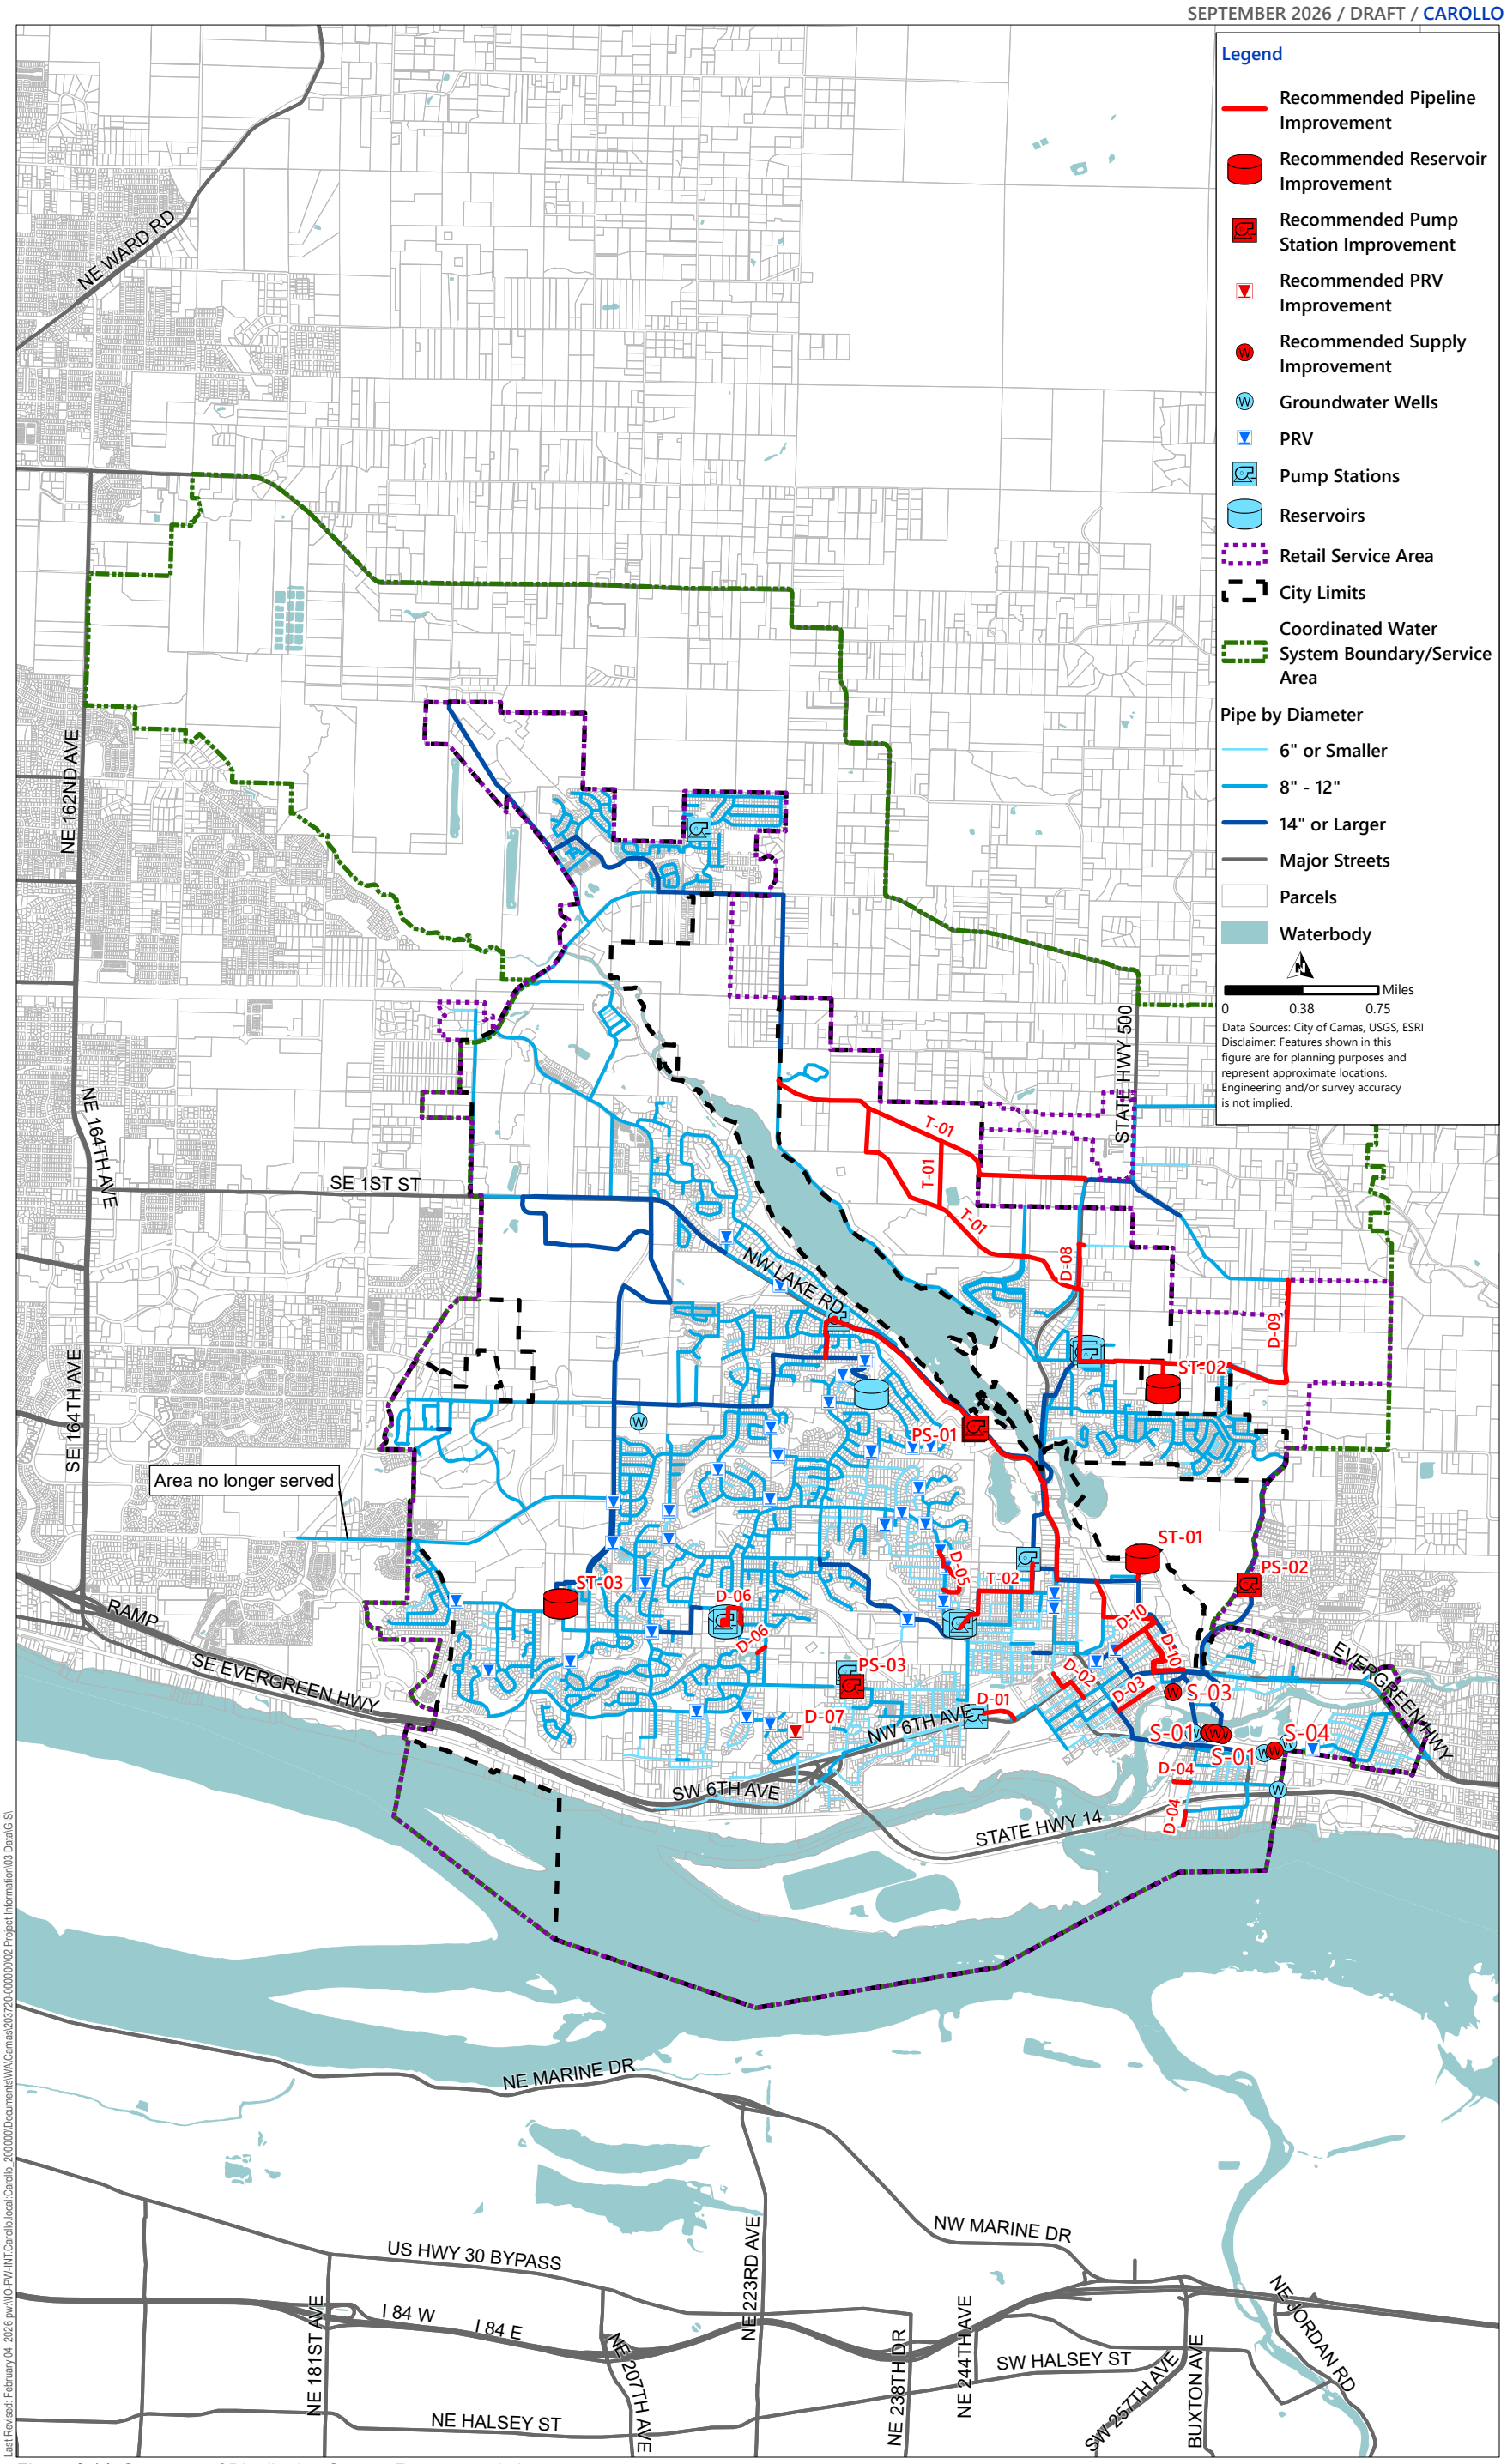

Figure 9.14 Summary of Distribution System Recommendations

Table 9.20 Summary of Recommended Improvement Projects

Project ID	Project Name	Improvement Type	Existing Diameter (inches)	Proposed Diameter (inches)	Description/Purpose
PS-01	544 Pumping Area Improvements	Pump Station and Transmission Pipeline			Construct Lake Road Pump Station, 30-inch suction and discharge pipeline, and 36-inch 343 zone transmission pipeline.
PS-02	542 Pumping Area Improvements	Pump Station Upsize and Transmission Pipeline			Add an additional 800 gpm pump at Crown Road pump station and construct 3,200 LF of 24-inch transmission pipeline.
PS-03	Francis Road Pumping Area Improvements	Pump Station Upsize			Replace Francis Road pump station with a new, above ground pump station sized to serve domestic connections and fire flow.
ST-01	343 Zone Storage Improvements	Storage			A 1.84 MG elevated reservoir in the 343 zone is recommended to address storage deficits in all planning years and replace the aging Butler Reservoir.
ST-02	542 Zone Storage Improvements	Storage			A 1.5 MG elevated reservoir in the 542 zone is recommended to address storage deficits in all planning years.
ST-03	544 Zone Storage Improvements	Storage			A 0.75 MG reservoir in the 544 zone is recommended to address the storage deficit in the 2046 planning year.
D-01	NW 7th Avenue Fire Flow Improvements	Pipeline Upsize	8	12	Upsize approximately 1,300 LF of pipeline from 6-inch to 12-inch to address fire flow deficiencies in the area.
D-02	NE Dallas Street Fire Flow Improvements	Pipeline Upsize	6	12	Upsize approximately 1,150 LF of pipeline from 6-inch to 8-inch to address fire flow deficiencies in the area.
D-03	E 1st Avenue Fire Flow Improvements	Pipeline Upsize	8	12	Upsize approximately 1,150 LF of pipeline from 6-inch to 8-inch to address fire flow deficiencies in the area.
D-04	Operations Center/WWTF Fire Flow Improvements	Pipeline Upsize	6	8	Upsize approximately 850 LF of pipeline from 6-inch to 8-inch to address fire flow deficiencies in the area.
D-05	NW Fargo Street Fire Flow Improvements	Pipeline Upsize	6, 8	12	1,700 LF of pipeline is being upgraded from 6-inch to 8-inch to address fire flow deficiencies in the area.
D-06	Upper Prune Hill Fire Flow Improvements	Pipeline Upsize	4	8	Upsize approximately 750 LF of pipeline from 12-inch to 16-inch and 450 LF of 8-inch pipeline to 12-inch to address fire flow and low-pressure deficiencies in the area.
D-07	Sierra Lane PRV Station	PRV Station	4	8	New PRV station to allow fire flow from the 542_S zone to the 455 zone.
D-08	SE 5th Street and SE Everett Road Fire Flow Improvements	Pipeline Upsize	4	8	Upsize approximately 1,200 LF of pipeline from 10-inch to 12-inch and 50 LF of 8-inch pipeline is recommended to address fire flow deficiencies in the area.
D-09	SE 283rd Avenue Fire Flow Improvements	Pipeline Upsize	16	20	2,700 LF of pipeline is being upgraded from 8-inch to 12-inch to address fire flow deficiencies in the area.
D-10	NE 6th Avenue and NE Nevada Street Fire Flow Improvements	Pipeline Upsize		8	Upsize approximately 3,600 LF of pipeline from 6-inch to 8-inch to address fire flow deficiencies in the area.
T-01	North Shore Transmission Pipeline	Transmission Pipeline		12,24	Construct approximately 6,300 LF of 12-inch pipeline and 16,600 LF of 24-inch pipeline to serve future North Shore development.
T-02	Angelo Pump Station Discharge Pipeline	Transmission Pipeline	Various	16	Upsize approximately 3,350 LF of various diameter pipeline to 16-inch pipeline to address high head loss and discharge pressures at Angelo PS.

CHAPTER 10 CAPITAL IMPROVEMENT PLAN

10.1 Introduction

This chapter combines the various projects recommended in the WSPU for the City's distribution system and presents them as a comprehensive CIP. With this CIP, the City will have guidelines to plan and budget for the distribution system over the next 20 years, along with the recommended timing and cost estimates for each identified project. Project phasing is described as either short-term (0 to 10 years, which corresponds to 2027 through 2036) or long-term (11 to 20 years, which corresponds to 2037 through 2046).

Appendix **[X]** lists each project with cost estimates in 2025 dollars and detailed implementation timing and prioritization.

10.1.1 Capital Project Categories

The WSPU's CIP projects are categorized as follows:

- Distribution System Improvements (D).
- Transmission Pipeline (T).
- Annual Repair and Replacement Programs (R).
- Pump Station (PS).
- Storage (ST).
- Supply and Treatment (S).
- General (G).

The abbreviations presented above were used during project identification to delineate each project category.

10.1.2 Capital Project Types

To support the City's financial evaluation, CIP projects were assigned need based on four types:

- **Growth:** Projects that add system capacity to meet future demand growth. These projects are typically funded with connection fees and are recommended to meet the analysis criteria detailed in Chapter 2.
- **Upgrade**: Projects necessary to improve the level of service (e.g., redundant pumping, backup power, pipe upsizing, fire flow, system reliability) of existing infrastructure. These projects are typically funded with rates and are needed whether demand increases or stays the same.
- **Replace and Repair (R&R)**: Projects that replace or maintain existing infrastructure without increasing capacity or level of service. These projects are typically funded with rates and are meant to renew aging infrastructure that is in poor condition.
- **General/Programmatic**: Projects that are intended to be studies, consisting of future water system plans and water supply feasibility studies.

Individual projects may include elements of multiple capital project types, meaning each project was defined as one or more of the four types and assigned a percentage of the total project cost to each type. The allocations between multiple types were made using professional judgment.

10.1.3 Capital Planning Periods

CIP projects were allocated into the planning periods referenced in previous chapters:

1. Short-term (2027-2036).
2. Long-term (2037-2046).

Projects recommended under this planning period have all been allocated to individual years. To better distribute costs, some larger projects have been spread across multiple years to account for longer design and construction periods. The project timing in this Chapter is subject to change, as the City regularly reviews and updates its CIP based on changing conditions and priorities.

10.1.4 Capital Project Cost Allocation

Discussed in Section 10.1.2, each CIP project was assigned to a capital project type. The allocated project type will help support the City in the development of rates and standard development charges. Each CIP project type was assigned a cost allocation. In general, CIP projects needed to support future growth and development are funded by developers and connection fees while projects needed to support existing infrastructure deficiencies or repair and replacement are funded by existing rate payers.

- Growth: Projects will be funded by developers and SDCs (connection charges).
- Upgrade: Projects will be funded by rates.
- R&R: Projects will be funded by rates.
- General: Projects will typically be funded by rates.

10.2 Cost Estimating Assumptions

10.2.1 Cost Estimate Level

The CIP cost estimates in this chapter are Class 5 (budget-level estimates from a -50 percent to +100 percent range). These costs were determined using both Carollo Engineers' (Carollo) understanding of project locations and current conditions and the City's costs for similar and recently constructed capital projects. Note actual costs may vary by -50 percent to +100 percent from these estimates.

All costs are given in 2025 dollars. The Handy-Whitman Index for Water Utility Construction in the Pacific Region for January 2025 is 1,401. As previously stated, the estimates are subject to change as the project design matures and because costs for labor, materials, and equipment may vary in the future.

10.2.2 Baseline Unit Cost

Baseline construction costs were estimated using unit costs with the assumptions presented in the following subsections.

10.2.3 Cost Estimates Elements

The total CIP cost estimates are based on construction costs that are inflated using cost factors to account for non-construction project elements. The cost factors for the WSPU are shown in Table 10.1. Note for pump station and supply projects, which typically rely heavily on mechanical components, a 25 percent factor for engineering and planning were allocated to account for project complexity. For pipeline and storage projects, 20 percent was allocated for engineering and planning. For pipeline and storage projects, the cost factors would increase the baseline construction costs by 80 percent to represent the total project cost. For pump station and supply projects, the cost factors would increase the baseline construction costs by 85 percent to represent the total project cost, respectively.

Table 10.1 Cost Factors

Adjustment Factors	Description	Factor
Contingency	Costs that may occur due to uncertainty in project scope and conditions.	30%
General Conditions and Overhead	Contractor costs indirectly related to construction.	25%
Engineering/Planning(1)	Cost for planning and design of project.	20%/25%
City Admin	Cost to administer the project.	5%

Note:
(1) Pump station and supply projects were assigned an engineering/planning factor of 25 percent to account for project complexity.

The costs presented in this CIP are high-level planning costs that will help the City make financial decisions.

The sample capital improvement project cost calculation shown below demonstrates how construction contingency as well as design and administrative costs were added to the baseline construction cost to determine the total project cost. The construction contingency plus design and administration costs make up just over 50 percent ($1,015,000/$2,015,000) of the total project cost estimate.

Example, assuming engineering/planning factors for pump stations and supply/treatment:

Baseline Construction Cost	**$1,000,000**
Construction Contingency (30%)	$300,000
Estimated Construction Cost	**$1,300,000**
General Conditions & Overhead (25%)	$325,000
Engineering/Planning (25%)	$325,000
City Admin (5%)	$65,000
Total Capital Improvement Cost	**$2,015,000**

10.2.4 Pipeline Unit Costs

Table 10.2 shows unit cost assumptions for pipelines. These costs were developed using Carollo's understanding of project locations and current conditions and the City's costs of similar and recently constructed capital projects. For planning purposes, these unit costs assume open-trench construction in improved areas. If trenchless construction is possible for some projects, the cost estimates may need to be modified. Costs include pavement cutting, excavation, hauling, shoring, ductile iron pipe, materials (i.e.,

valves, fittings, restraints, etc.) and installation, hydrant assemblies, backfill material and installation, and pavement replacement. The unit costs are for construction in stable soil at standard excavation depths for each pipe size. Additionally, costs reflect increased effort to construct on shallow bedrock that overlays large areas of the City and its Urban Growth Area. Steep slopes, extensive permitting, or acquisition of right of way may result in additional costs. These costs are construction costs only and do not reflect Contingency, General Conditions and Overhead, Engineering/Planning, and City Admin.

Table 10.2 Pipeline Unit Costs

Pipe Size (Inches)	Pipe Unit Cost(1) ($/Linear Foot)
8	$236
10	$268
12	$300
16	$404
20	$481
24	$575
30	$897
36	$1,203

Notes:
(1) Costs represent baseline construction costs and do not include additional cost factors for contingency, general conditions and overhead, engineering/planning, and City admin.

10.2.5 Pump Station Costs

Pump station projects costs were developed based on both site and project specific requirements. The costs account for Carollo's understanding of project locations and current conditions, as well as costs from recently completed Carollo projects.

10.2.6 Well Costs

Well drilling project costs were developed based on typical costs from past Strata Geosciences projects. Costs do not include mechanical equipping of well. Well equipping costs were site specific and developed based on Carollo's understanding of estimated well yields, project location, and the City's ongoing Well 13 construction project. Cost estimates for new well drilling is approximately $150,000.

10.2.7 Reservoir Costs

New reservoir project costs were developed based on typical costs from past Carollo projects. Conceptual costs for reservoirs vary by type: ground and elevated. Costs are estimates based on reservoir volume in gallons, as presented in Table 10.3. Reservoir costs are sensitive to site-specific geotechnical and seismic considerations; therefore, it is recommended that a reservoir siting study that addresses these issues be conducted at the initiation of a new reservoir project.

Table 10.3 Reservoir Unit Costs

Reservoir Type	Cost per gallon[1] ($/gallon)
Ground[2]	$3
Elevated	$10

Notes:
(1) Costs represent baseline construction costs and do not include additional cost factors for contingency, general conditions and overhead, engineering/planning, and City admin.
(2) Unit costs for ground reservoirs are based on welded steel construction.

10.2.8 Additional Costs

Other common costs for the CIP include those associated with onsite generators and PRV stations. Conceptual costs were estimated based on recent Carollo projects and presented in Table 10.4.

Table 10.4 Additional Costs

Reservoir Type	Cost[1](Lump Sum)
Onsite Generator	$500,000 per generator installation
PRV Station	$400,000 per station

Notes
(1) Costs represent baseline construction costs and do not include additional cost factors for contingency, general conditions and overhead, engineering/planning, and City admin.

10.3 CIP Development and Implementation

The capital improvement implementation was separated into three priorities:

- Short-term: 0 to 10 years.
- Long-term: 10 to 20 years.
- Annual.

Table 10.5 summarizes the priorities associated with all projects and recommendations from this WSPU, based on the City's water system needs.

Table 10.5 CIP Prioritization Summary

Project Types	0-10 years	10-20 years
Pipeline upsize for fire flow only.	X	
Pipeline upsize for fire flow and low pressure.	X	
Pipeline repair and replacement.	Annual	
Transmission pipeline projects	X	X
Pump station projects.	X	X
Storage projects.	X	X
Supply and treatment projects.	X	X
General projects.	X	X

The following sections summarize recommended projects identified in previous chapters and incorporated in the summary in Section 10.5.

10.3.1 Recommended Distribution Projects

Distribution system projects (D) were developed using the hydraulic model and were identified for areas not meeting velocity and pressure criteria, as detailed in Chapter 9. These projects also took City staff input into account during development.

10.3.1.1 D-01 through D-10 - Fire Flow Recommendation Projects

To address the fire flow deficiencies identified in Chapter 9, the projects and recommendations presented in that chapter should be implemented. Namely, projects will upsize pipelines or add piping to create looped piping. Once implemented, these projects will address the identified deficiencies. Appendix **[X]** details each fire flow project and references it according to its respective project identification. In the CIP, these are projects D-01 through D-10.

In summary, these projects will replace or upsize approximately 15,500 LF of pipelines. Projects D-01 through D-05 and project D-10 include replacing aging cast iron or steel pipe to address fire flow deficiencies. Costs for these projects have been incorporated into the pipeline replacement program. The remaining projects, D-06 through D-09 are estimated to be a total of $4.4 million (including all applicable cost factors) and are recommended for completion in 2034 as part of the short-term planning period.

10.3.1.2 Distribution System Recommendations Summary

Table 10.6 summarizes recommended distribution system projects along with their respective priorities and costs. As discussed in the previous section, costs for projects D-01 through D-05 and project D-10 have been incorporated into the pipeline replacement program and therefore are not presented in Table 10.6.

Table 10.6 Distribution System Recommendations

Project Number	Project Name	Timing(2)	Priority	Cost(1)(2)
D-01	NW 7th Avenue Fire Flow Improvements	-	0-10 years	$-
D-02	NE Dallas Street Fire Flow Improvements	-	0-10 years	$-
D-03	E 1st Avenue Fire Flow Improvements	-	0-10 years	$-
D-04	Operations Center/WWTF Fire Flow Improvements	-	0-10 years	$-
D-05	NW Fargo Street Fire Flow Improvements	-	0-10 years	$-
D-06	Upper Prune Hill Fire Flow Improvements	2034	0-10 years	$1.3 million
D-07	Sierra Lane PRV Station	2034	0-10 years	$0.8 million
D-08	SE 5th Street and SE Everett Road Fire Flow Improvements	2034	0-10 years	$0.74 million
D-09	SE 283rd Avenue Fire Flow Improvements	2034	0-10 years	$1.6 million
D-10	NE 6th Avenue and NE Nevada Street Fire Flow Improvements	-	0-10 years	$-

Notes:
(1) The cost includes 30 percent construction contingency and 20 percent Engineering, Legal, and Administration (ELA) contingency.
(2) Costs and timings for projects D-01 through D-05 and D-10 are incorporated into the pipe replacement program and not reported in this table.
WWTF - wastewater treatment facility.

10.3.2 Recommended Transmission Pipeline

Transmission pipe projects (T) were developed using the hydraulic model and input from City staff. Table 10.7 summarizes transmission pipeline projects identified for this planning period.

Table 10.7 Transmission Pipe Recommendations

Project Number	Project Name	Timing	Priority	Cost(1)
T-01	North Shore Transmission Pipeline	2032	0-10 years	$20.5 million
T-02	Angelo Pump Station Discharge Pipeline	2037-2038	10-20 years	$2.7 million

Notes:
(1) The cost includes 30% construction contingency and 20% ELA contingency.

10.3.2.1 T-01 - North Shore Transmission Pipeline

Large development, both residential and commercial, is expected in the City's North Shore area. Geographically located in the area north of Leadbetter Road, the development will be connected to the existing distribution system via transmission pipeline. Detailed in Chapter 9, approximately 1,600 LF of 12-inch diameter pipe and 13,200 LF of 24-inch diameter pipeline will be needed to connect the area to the existing system. Additionally, to convey water to the development area approximately 4,200 LF of existing pipeline between Gregg Reservoir and the proposed North Shore roundabout needs to be upsized to 24-inch diameter pipeline (Phase 2 Pipeline).

The estimated cost for the North Shore transmission pipeline is approximately $20.5 million and recommended for completion when needed to support development in the area. This is expected to be in approximately 2032 as part of the short-term planning period.

10.3.2.2 T-02 - Angelo Discharge Pipeline

Discharge piping for Angelo Pump Station in the distribution system network is undersized for future demands causing concerns with high head loss and discharge pressures. Detailed in Chapter 9, approximately 3,350 LF of 16-inch diameter pipeline will be needed to address these concerns.

The estimated total project cost for the Angelo discharge pipeline is approximately $2.7 million and recommended in the long-term. As this project is due to an existing system deficiency, this project can be completed as soon as funds are available, however, this is a lower priority project. Therefore, to distribute costs for this project across multiple planning years, design is recommended for 2037 and is assumed to be approximately $0.3 million, which is 10 percent of the total project costs. Construction was assumed to be the remaining $2.4 million and would occur the following year in 2038.

10.3.3 Recommended Annual Repair and Replacement Programs

Table 10.8 summarizes the two annual program projects (R) being recommended: pipeline replacement program and miscellaneous facility projects.

Table 10.8 Annual Repair and Replacement Program Recommendations

Project Number	Project Name	Priority	Cost(1)
R-01	Pipeline Replacement Program	Annual	$84 million
R-02	Miscellaneous Facility Projects	Annual	$3 million

Notes:
(1) The cost includes 30% construction contingency and 20 percent ELA contingency.

10.3.3.1 R-01 - Pipeline Replacement Program

The City has approximately 165,000 LF (31.3 miles) of cast iron and steel pipe in their distribution system. These pipes are reaching the end of their useful life and deteriorating conditions have caused the City's distribution system leakage to increase. It is recommended the City implement a pipeline replacement program aimed at replacing these pipes to reduce the risk of failure. Overall, the total estimated cost to replace all cast iron and steel pipe is approximately $84 million. Over the 20 year period of this WSPU, it is recommended the City replace approximately 1.5 miles of pipe and budget approximately $4.2 million per year. However, it was determined that budgeting this amount in the short-term would be difficult given the City's expected short-term CIP project list. To better align the pipeline replacement program with these projects, it is recommended that the City budget $0.2 million for the program per year through 2034. From 2035 through 2046, the City can budget the remaining costs for the program which equates to approximately $6.9 million per year over this twelve year period.

10.3.3.2 R-02 - Miscellaneous Facility Projects

Discussions with the City indicated they complete two R&R type projects annually at major distribution system facilities (wells, reservoirs, pump stations, etc.). On average each of these projects typically cost the City approximately $75,000. The overall CIP allocated $150,000 per year for the completion of two miscellaneous facility "improvement type" projects in each planning year. Over the 20-year period, miscellaneous facility projects are estimated to cost approximately $3 million.

10.3.4 Recommended Pump Station Projects

This section summarizes the recommended pump station projects (PS), identified through the desktop pumping analysis detailed in Chapter 9. Table 10.9 summarizes three PS projects, all of which are prioritized in the short-term.

Table 10.9 Pump Station Recommendations

Project Number	Project Name	Timing	Priority	Cost(1)
PS-01	544 Pumping Area Improvements	Segment 1: 2027-2028 Segment 2: 2031-2033 PS: 2032-2034	0-10 years	$37.9 million
PS-02	542 Pumping Area Improvements	2045	10-20 years	$0.72 million
PS-03	Francis Road Pumping Area Improvements	2035	0-10 years	$3.4 million

Notes:
(1) The cost includes 30% construction contingency and 25% ELA contingency.

10.3.4.1 PS-01 - 544 Pumping Improvements

The 544 pumping area has insufficient pumping capacity for all planning years and scenarios. To address this deficiency, the Lake Road pump station is recommended to pump directly from the 343 Zone to the 544 Zone. Currently in the preliminary design phases, the new pump station will have a firm capacity of 9,000 gpm and include approximately 1,250 LF of 24-inch, 9,850 LF of 30-inch, and 6,000 LF of 36-inch diameter transmission pipeline.

A cost estimate developed by Carollo in summer 2025 for the pump station portion of the project estimated construction costs at $7.3 million. The estimated cost of the transmission pipeline is approximately $31.8 million. Both portions of the project are recommended to be completed in the short-term. Given the City's short-term CIP project list, it will be difficult to construct the entirety of this project in a single phase. Therefore, it was recommended that the pipeline portion of this project be divided into multiple segments to be constructed across various years. Additionally, it was determined that some segments of the pipeline and the pump station could be delayed to allow for other projects to be prioritized. Segment 1 of the pipeline is the highest priority and includes approximately 6,000 LF of 36-inch pipeline between the intersections of NE 3rd Avenue/E 1st Avenue and NE Everett Street/ NE 22nd Avenue. Funds have already been allocated for the design of this pipeline, which is currently in progress. Construction of this segment of pipeline is recommended to start in 2027 and cost approximately $13.7 million with completion in 2028. While the City initially planned on constructing this project in the 2027 and 2028 timeframe, due to other budget priorities, it is recommended that the City considered delaying segments 2 through 4 and the pump station. For purposes of this WSP, approximately $1.8 million has been allocated in 2031 for design of Segments 2 through 4 of the pipeline, which is 10 percent of the cost for these segments. Construction for these segments would occur in 2032 and 2033 and cost approximately $15.7 million. For the pump station portion of the project, approximately $0.7 million would occur in 2032 for design with construction in 2033 and 2034 making up the remaining $6.6 million.

10.3.4.2 PS-02 - 542 Pumping Improvements

The 542 pumping area has insufficient pumping capacity under redundancy criteria in the 2046 scenario. To address this deficiency, an additional 800 gpm pump is recommended at Crown Road pump station.

The total estimated cost of the project is approximately $0.72 million and is recommended for completion in 2045 as part of the long-term planning period.

10.3.4.3 PS-03 - Francis Road Pumping Improvements

The Francis Road pumping area has insufficient pumping capacity and fire flow capacity for each planning year scenario. Discussion with the City indicated their preference to replace the existing Francis Road pump station with a new above grade pump station. The service area of the new pump station will be expanded to serve nearby customers with low pressures. To meet DOH criteria and the City's level of service goals, the new Francis Road pump station will be equipped with two 75 gpm capacity domestic pumps, two 1,000 gpm capacity fire pumps and a backup generator. These improvements will resolve the current fire flow and pressure deficiencies in this area.

As this is an existing deficiency, it is recommended that the City perform this project as budget allows. The estimated cost for the Francis Road pump station replacement is approximately $3.4 million, and for purposes of this WSP is schedule for 2035 as part of the short-term planning period.

10.3.5 Recommended Storage Projects

This section summarizes the recommended storage projects (ST), identified through the desktop storage analysis detailed in Chapter 9. Table 10.10 shows the three recommended storage capacity projects, two of which are prioritized for the short-term and one in the long-term.

Table 10.10 Storage Recommendations

Project Number	Project Name	Timing	Priority	Cost(1)
ST-01	343 Zone Storage Improvements(2)	2030-2031	0-10 years	$25.7 million
ST-02	542 Zone Storage Improvements	Pipeline:2029-2030 Reservoir: 2034-2036	0-10 years	$33.6 million
ST-03	544 Zone Storage Improvements	2045	10-20 years	$4.5 million

Notes:
(1) The cost includes 30% construction contingency and 20% ELA contingency.
(2) The cost was provided in Gray and Osborne's, New 343 Reservoir Alternatives Analysis, September 2025.

10.3.5.1 ST-01 - 343 Zone Storage Improvements

By the 2036 and 2046 planning years there are slight storage deficits of 0.02 and 0.04 MG in the 343 area. The storage in this area is currently provided by Butler Reservoir, which is a 1.2 MG partially buried reservoir originally constructed in the early 1900s. The City has indicated Butler Reservoir is reaching the end of its useful life and will be decommissioned once a new 343 zone reservoir is constructed. The replacement reservoir project is currently in preliminary design phase. An alternatives analysis completed by the City's consultant Gray & Osborne indicated the preferred alternative would be an elevated reservoir near Camas Cemetery. The new reservoir, being sized for buildout conditions, would provide a minimum of 1.84 MG of usable storage for the 343 area alleviating deficits identified under this planning period.

The estimated total project cost for the elevated reservoir (ST-01) is approximately $25.7 million and is expected to be completed in the short-term. Costs for this project were provided in Gray and Osborne's, New 343 Reservoir Alternatives Analysis, completed in September 2025. While the City was planning to construct this project immediately, due to budgetary limitations, this project is scheduled for construction to occur in 2030 and 2031 to balance out the City's CIP, equaling approximately $12.9 million per year. Funds for the design of this project have already been allocated and therefore were not considered in the cost distribution.

10.3.5.2 ST-02 - 542 Zone Storage Improvements

In 2031, there is a 1.0 MG deficit in the 542 storage area, increasing to a 1.28 MG deficit in 2046. To alleviate deficits in the area, an additional storage reservoir will need to be constructed. There are multiple alternatives for increasing storage capacity in this area. For planning purposes, an elevated reservoir with a nominal capacity of 1.5 MG was recommended and will be incorporated into the CIP as it was the

costliest alternative. Additionally, 3,800 LF of 24-inch diameter transmission pipeline is recommended between Crown Road pump station and the new reservoir. This will address the hydraulic limitation and allow for multiple pumps at Crown Road to operate simultaneously to fill the new reservoir.

The estimated cost for the reservoir portion of the project is approximately $29.3 million and approximately $4.3 million for the pipeline. Both elements of the project are recommended for completion in the short-term. However, the pipeline should be prioritized before the reservoir to address the existing hydraulic limitation as previously noted. Since this is an existing deficiency, design of the pipeline is recommended for 2029 and is assumed to be approximately $0.4 million, which is 10 percent of the pipeline cost. Construction was assumed to be the remaining $3.9 million and would occur the following year in 2030. To distribute the total project costs, it is recommended that the design and construction of the reservoir should be delayed, allowing for the completion of other higher priority projects. Under this timeline, design of the reservoir is slated for 2034 and is assumed to be approximately $2.9 million, which is 10 percent of the reservoir cost. Construction of the reservoir is expected to take multiple years, so the remaining reservoir costs are divided across 2035 and 2036, equating to approximately $13.2 million per year.

10.3.5.3 ST-03 - 544 Zone Storage Improvements

At the end of the planning period in 2046, there will be a deficit of approximately 0.63 MG in the 544 storage area. To address this deficit, an additional reservoir with a nominal capacity of 0.75 MG is recommended at the 18th Avenue site, which has space on-site to accommodate the additional reservoir.

The estimated cost for the 544 zone storage improvements (ST-03) is approximately $4.5 million and is recommended in 2045 as part of the long-term planning period.

10.3.6 Recommended Supply and Treatment Projects

This section summarizes the recommended supply and treatment projects that were identified through the supply analysis detailed in Chapter 8 and Chapter 9. Table 10.11 shows the four recommended projects with detailed descriptions in the sections to follow.

Table 10.11 Supply and Treatment Recommendations

Project Number	Project Name	Timing	Priority	Cost(1)
S-01	Well 8, 11, and 12 Expansion and PFAS Treatment	2027-2030	0-10 years	$40.3 million
S-02	Well 18 Development	2037	10-20 years	$9.5 million
S-03	Well 13B Development	2044	10-20 years	$8.7 million
S-04	Well 19 Development	2046	10-20 years	$8.7 million
S-05	LWWF PFAS Treatment Facility Expansion Phase 1	2032-2034	0-10 years	$9.3 million
S-06	LWWF PFAS Treatment Facility Expansion Phase 2	2036-2038	10-20 years	$9.3 million
S-07	LWWF PFAS Treatment Facility Expansion Phase 3	2040-2042	10-20 years	$9.3 million

Notes:
(1) The cost includes 30% construction contingency and 25% ELA contingency.

10.3.6.1 S-01 - Well 8, 11, and 12 Expansion and PFAS Treatment

By 2030, the City will need additional supply capacity to meet projected maximum day demands (MDD). From the water supply strategy detailed in Chapter 8, hydrogeologic investigation identified expansions at Wells 8, 11, and 12 would be capable of providing sufficient capacity and have lower associated risks than developing a new well in the short-term. Additionally, treatment is recommended for wells with the highest PFAS detections. This project is expected to consist of well upgrades, PFAS treatment with an initial capacity of 2,725 gpm, an intermediate reservoir/pump station, chemical facility upgrades, and standby power improvements.

The estimated cost for this project is approximately $40.3 million and recommended for completion in the short-term. This project is expected to be one of the largest projects undertaken by the City to date, and implementation of the project is expected to take multiple years. Due to the need for additional water supply by 2030 and an imminent MCL for PFAS, design is recommended for completion in 2027 and is assumed to be approximately $4 million, which is 10 percent of the total project cost. Construction for this project is expected to occur between 2028 and 2030, making up the remaining $36.3 million. In 2028, it is expected that well upgrades, intermediate reservoir/PS, and chemical facility upgrade components will be in construction, therefore a cost of approximately $11.9 million is expected. In 2029, the well upgrades, intermediate reservoir/PS, and chemical facilities would be completed, and construction would begin on the PFAS treatment and standby power components. Approximately $18.1 million is expected for construction in 2029. In 2030, it is assumed that PFAS treatment and standby power improvements would be completed and therefore the remaining $6.3 million is expected for construction.

10.3.6.2 S-02 - Well 18 Development

By 2037, the City will need an additional supply capacity to meet projected MDD. It is recommended to drill and develop Well 18 in the Lower Washougal Wellfield to increase capacity by approximately 2,000 gpm. This project will include well drilling, mechanical equipping, PFAS treatment, and a generator for backup power.

The estimated cost for this project is approximately $9.5 million and recommended for completion in 2037 as part of the long-term planning period.

10.3.6.3 S-03 - Well 13B Development

By 2044, the City will need additional supply capacity to meet projected MDD. It is recommended to drill and develop Well 13B assumed to be located at the existing Well 13 site or Louis Bloch Park. This project is estimated to increase capacity by 1,000 gpm and will include well drilling, mechanical equipping, PFAS treatment, and a generator for backup power.

The estimated cost for this project is approximately $8.7 million and recommended for completion in 2044 as part of the long-term planning period.

10.3.6.4 S-04 - Well 19 Development

By 2046, the City will need additional supply capacity to meet projected MDD. It is recommended to drill and develop Well 19 assumed to be located near Well 6 and 14, in the City's eastern wellfield. This project

is estimated to increase capacity by 1,000 gpm and will include well drilling, mechanical equipping, PFAS treatment, and a generator for backup power.

The estimated cost for this project is approximately $8.7 million and recommended for completion in 2046 as part of the long-term planning period.

10.3.6.5 S-05 through S-07 - LWWF PFAS Treatment Facility Expansion Phase 1-3

To reduce the initial project cost of the well expansions and PFAS treatment (Project S-01), it was recommended PFAS treatment facility capacity be sized to only treat wells with the highest PFAS detections. Due to the uncertainty around future PFAS detections, the LWWF PFAS treatment facility will be designed to accommodate expansion to an initial buildout capacity of 9,925 gpm. To reach this capacity, expansions to the treatment facility are recommended in three phases, with each phase increasing capacity by approximately 2,400 gpm. Further expansion to ultimate buildout may occur when Well 18 (Project S-02) and Well 19 (Project S-04) are drilled and developed, depending on PFAS concentrations of new wells.

The estimated cost for each phase of expansion is approximately $9.3 million, resulting in a total cost for all three phases of approximately $27.9 million. The implementation for each phase is assumed to take three years, allowing one year for design and two years for construction. For budgetary purposes, design is approximately $0.9 million, which is 10 percent of the cost per phase. Construction for each phase will make up the remaining $8.4 million with $4.2 million allocated per year. For purposes of this CIP, it is assumed that design for Phases 1, 2, and 3 would occur in 2032, 2036, and 2040, with construction occurring in 2033-2034, 2037-2038, and 2040-2041.

10.3.7 Recommended General Projects

Four general projects (G) were recommended for this CIP and are summarized in Table 10.12.

Table 10.12 Recommended General Projects Summary

Project Number	Project Name	Timing	Priority	20-year Total Cost(1)
G-01	2036 WSP	2035-2036	0-10 years	$0.53 million
G-02	2046 WSP	2045-2046	10-20 years	$0.53 million
G-03	Water Rights Investigation	2027-2028	0-10 years	$0.29 million
G-04	Pipe Replacement Prioritization Study	2034	0-10 years	$0.16 million

Notes:
(1) All general project costs include an additional 10% for City costs to administer the project.

10.3.7.1 G-01 and G-02 - Water System Plan Updates

The City's WSP will need to be updated every 10 years to comply with WAC 246-290-100. It is expected an update will occur by 2036 and 2046, respectively. The estimated cost for each WSP update is approximately $0.53 million. These projects are expected to be two year projects, which result in a cost of approximately $0.27 million per year.

10.3.7.2 G-03 - Water Rights Investigation

To fully utilize potential yields from the LWWF, it was recommended the City complete a water rights investigation. The investigation would target acquiring additional groundwater rights for the LWWF or transferring surface water rights to the LWWF for use during the period where surface water withdrawals are prohibited. The estimated cost for the water rights investigation is approximately $0.29 million. This project was recommended to start in 2027 and is expected to be completed by 2028, resulting in cost of $0.15 million per year.

10.3.7.3 G-04 - Pipeline Replacement Prioritization Study

To assist the City in developing a schedule of prioritization of the pipeline replacement program discussed in Section 10.4.3.1, it is recommended a pipeline replacement prioritization study be conducted. The estimated cost for the pipeline replacement prioritization study is approximately $0.16 million and recommended for completion in 2034 under the short-term planning period.

10.4 CIP Program Summary

This section summarizes the City's CIP program described in the previous sections. Tables 10.13 and 10.14 summarize the CIP projects by project category and priority, respectively. Figures 10.1 and 10.2 summarize the percentage of each project identified by project category and project type, respectively.

When considering CIP costs by project category as shown in Table 10.13 and Figure 10.1, the majority of CIP costs are accrued from supply and treatment projects (30 percent) and annual programs (27 percent). Pump station projects and storage projects comprise the other high-cost categories and account for 13 percent and 20 percent of the CIP, respectively.

When considering CIP costs by priority as shown in Table 10.14 and Figure 10.2, approximately 29 percent of the CIP costs are annual programs, as previously stated. The total water CIP cost over the next 20 years is approximately $317 million, which equates to approximately $15.9 million per year for the planning period. Of the total cost, approximately $177 million is budgeted for the short-term, approximately $53 million is budgeted for the long-term, and approximately $87 million is budgeted for the annual category.

When considering CIP costs by cost allocation as shown in Table 10.15 and Figure 10.3, approximately 53 percent of total CIP costs are allocated to existing rate payers. Annual programs account for a large portion of this percentage.

Table 10.13 CIP Summary Table by Cost Category

Project Category	Total Cost	Average Annual Cost	Percentage
Distribution System	$4,340,000	$220,000	1.4%
Annual Programs	$87,000,000	$4,350,000	27.4%
Transmission Pipeline	$23,200,000	$1,160,000	7.3%
Pump Station	$42,020,000	$2,100,000	13.3%
Storage	$63,800,000	$3,190,000	20.1%
General	$1,500,000	$80,000	0.5%
Supply and Treatment	$95,130,000	$4,760,000	30.0%
Total Cost	**$317,000,000**	**$15,860,000**	**100.0%**

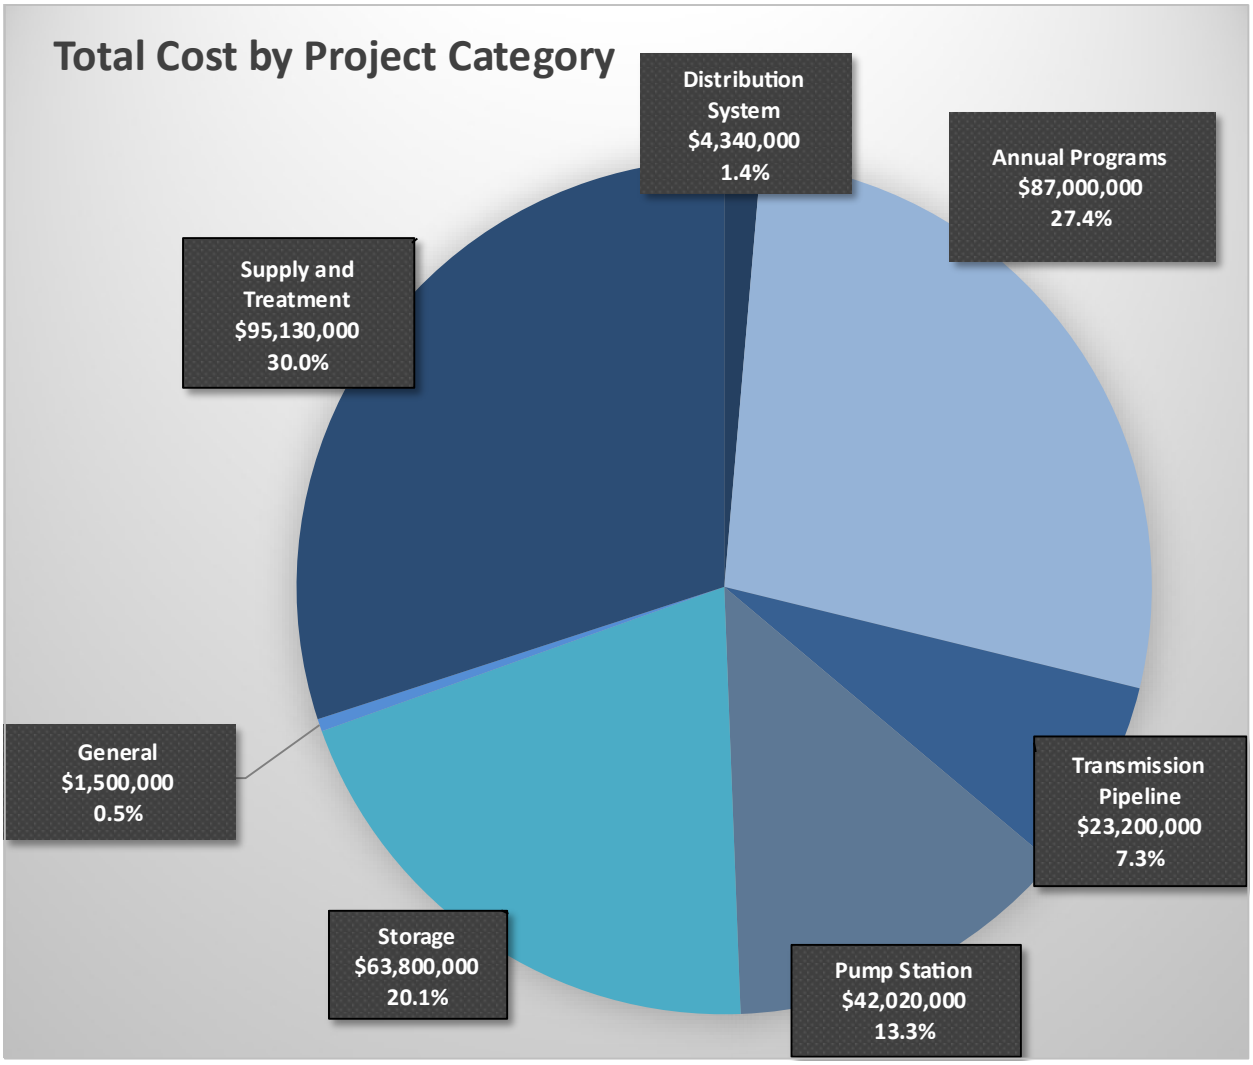

Figure 10.1 CIP Summary Table by Project Category

Table 10.14 CIP Summary Table by Project Priority

Project Priority	Total Cost	Percentage
0-10 years	$177,000,000	55.8%
10-20 years	$53,000,000	16.7%
Annual	$87,000,000	27.4%
Total Cost	**$317,000,000**	**100.0%**

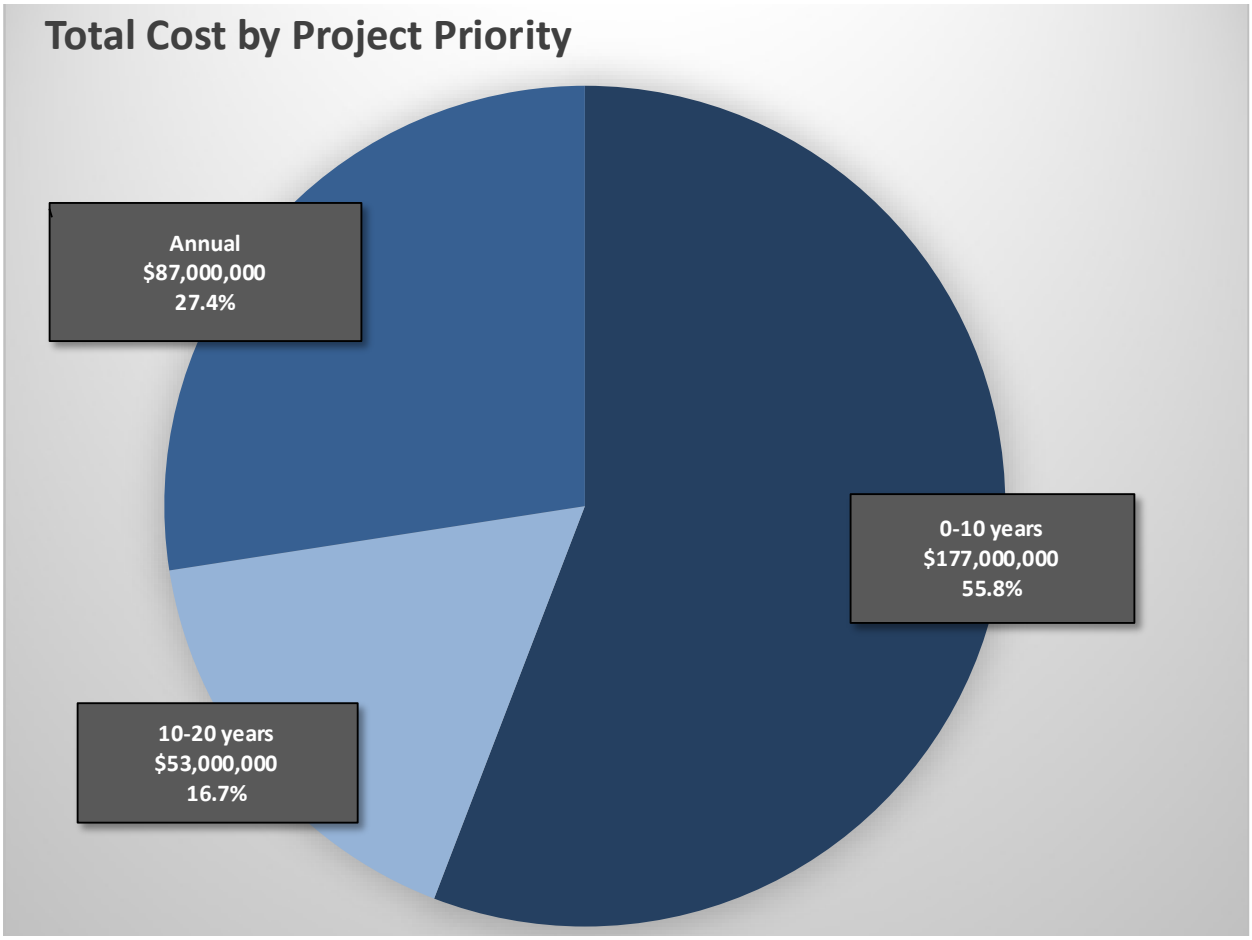

Figure 10.2 CIP Summary Table by Project Priority

Table 10.15 CIP Summary Table by Cost Allocation

Project Priority	Total Cost	Percentage
SDC	$148,900,000	47.0%
Rates	$168,100,000	53.0%
Total Cost		

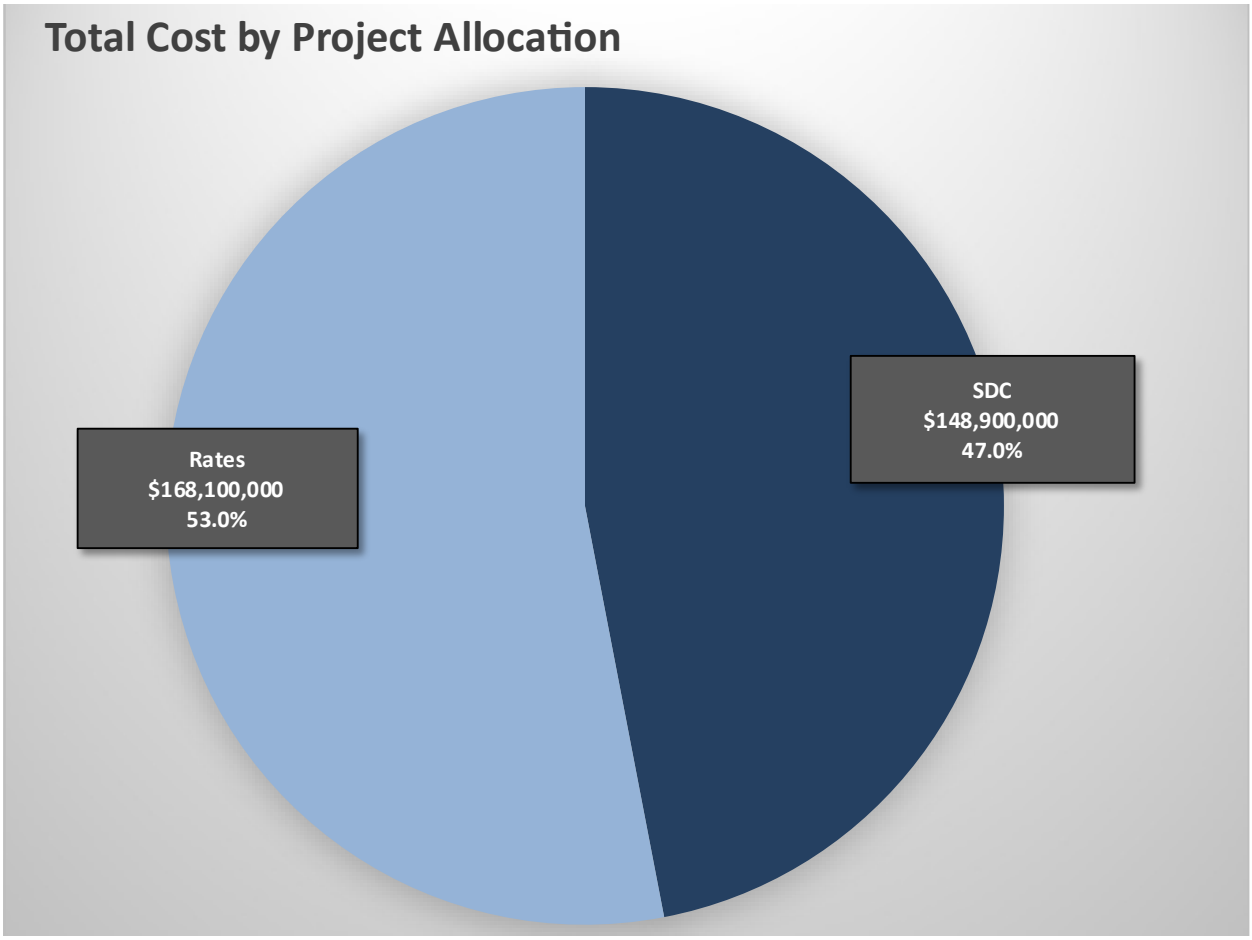

Figure 10.3 CIP Summary Table by Cost Allocation

10.4.1 CIP Project Summary

Section 10.1 summarizes the CIP projects and labels them as D, T, R, PS, ST, S, or G with each project assigned a unique CIP Identification. Table 10.16 shows all CIP projects developed for this WSPU along with associated costs and priority. Figure 10.4 presents annual costs for the City's CIP for each year of this WSPU, while Figure 10.5 illustrates annual cost breakdowns for projects funded by rates and SDCs.

An individual project sheet was generated for each CIP project and includes project identifier, description, costs, project type, timeline, and comments to help with future implementation. To help the City identify individual projects, project sheets are separated by project category. Appendix **[X]** includes all the project sheets.

Table 10.16 CIP Project Summary

Project Number	Project Name	Timing(1)	Priority	20-year Total Cost(1)
D-01	NW 7th Avenue Fire Flow Improvements	-	0-10 years	$-
D-02	NE Dallas Street Fire Flow Improvements	-	0-10 years	$-
D-03	E 1st Avenue Fire Flow Improvements	-	0-10 years	$-
D-04	Operations Center/WWTF Fire Flow Improvements	-	0-10 years	$-
D-05	NW Fargo Street Fire Flow Improvements	-	0-10 years	$-
D-06	Upper Prune Hill Fire Flow Improvements	2034	0-10 years	$1.3 million
D-07	Sierra Lane PRV Station	2034	0-10 years	$0.80 million
D-08	SE 5th Street and SE Everett Road Fire Flow Improvements	2034	0-10 years	$0.74 million
D-09	SE 283rd Avenue Fire Flow Improvements	2034	0-10 years	$1.6 million
D-10	NE 6th Avenue and NE Nevada Street Fire Flow Improvements	-	0-10 years	$-
T-01	North Shore Transmission Pipeline	2032	0-10 years	$20.5 million
T-02	Angelo Discharge Pipeline	2037-2038	10-20 years	$2.7 million
R-01	Pipe Replacement Program	-	Annual	$84 million
R-02	Miscellaneous Facility Projects	-	Annual	$3 million
PS-01	544 Pumping Area Improvements		0-10 years	$37.9 million
PS-02	542 Pumping Area Improvements	2045	10-20 years	$0.72 million
PS-03	Francis Road Pumping Area Improvements	2035	0-10 years	$3.4 million
ST-01	343 Zone Storage Improvements	2030-2031	0-10 years	$25.7 million
ST-02	542 Zone Storage Improvements	Pipeline:2029-2030 Reservoir: 2034-2036	0-10 years	$33.6 million
ST-03	544 Zone Storage Improvements	2045	10-20 years	$4.5 million
S-01	Well 8, 11, and 12 Expansion and PFAS Treatment	2027-2030	0-10 years	$40.3 million
S-02	Well 18 Development	2037	10-20 years	$9.5 million
S-03	Well 13B Development	2044	10-20 years	$8.7 million
S-04	Well 19 Development	2046	10-20 years	$8.7 million
S-05	LWWF PFAS Treatment Facility Expansion Phase 1	2032-2034	0-10 years	$9.3 million
S-06	LWWF PFAS Treatment Facility Expansion Phase 2	2036-2038	10-20 years	$9.3 million
S-07	LWWF PFAS Treatment Facility Expansion Phase 3	2040-2042	10-20 years	$9.3 million
G-01	2036 WSP	2035-2036	0-10 years	$0.53 million
G-02	2046 WSP	2045-2046	10-20 years	$0.53 million
G-03	Water Rights Investigation	2027-2028	0-10 years	$0.29 million
G-04	Pipe Replacement Prioritization Study	2034	0-10 years	$0.16 million

Notes:
(1) Costs and timings for projects D-01 through D-05 and D-10 are incorporated into the pipe replacement program and not reported in this table.

PROJECT APPROVAL APPLICATION (PAA) FORM

Drinking Water

Project Approval Application (PAA) Form

331-149 F • Revised 3/24/2026

Instructions

Please complete all appropriate sections of this application form and include them with your project. You must submit them electronically. Before submitting your documents and the PAA form, please check with your Drinking Water staff contact. An administrative staff member will set up a free Box.com folder to transfer your project documents to us electronically.

Use the interactive map on our Drinking Water Contacts and Office Location webpage to find program staff assigned to your county. Email ODWOperations@doh.wa.gov Phone 360-236-3100

General Submittal Information

Does this water system or owner have other projects currently under review with unpaid invoices? ☐ Yes ☒ No

Is this a new water system? *(If so, include a completed Water Facilities Inventory Report Form with your project).* ☐ Yes ☒ No

If submitting an engineering project, is it included in an approved plan? (as applicable) ☐ Yes ☐ No ☒ N/A

Select Submittal General Category

(Complete the corresponding section of this form. Planning and engineering submittals must be submitted separately.)

☐ Engineering Submittal for Group A System

☐ Group B Workbook

☒ Water System Plan (WSP)

☐ Small Water System Management Program (SWSMP)

☐ Satellite Management Agency Plan

Is the submittal DWSRF funding related?

☐ Intention to apply for DWSRF Construction Loan (*Contact a regional planner on the timing for review/approval for funding applications.)*

☐ Existing DWSRF Application ..... Enter Application Number

☐ Existing DWSRF Loan ..... Enter Loan Number

Is the submittal related to formal enforcement?

☐ Enforcement Docket #:..... Enter Docket Number

Engineering Submittal Information

Select Type of Engineering Submittal (select one):

☐ Design Project Report
☐ Pre-Design Project Report
☐ Construction Documents
☐ Bid Documents (for SRF funding)
☐ Combined Design Project Report and Construction Documents
☐ Combined Design Project Report and Bid Documents (for SRF Funding)
☐ Non-Design Submittal (i.e. operations plan, pilot study protocol, or watershed plan)

Select Subject Matter (choose all that apply):

☐ Annual Unfiltered Surface Water Report
☐ Blending Plan
☐ Booster Station
☐ Capacity Analysis
☐ Chemical Addition Only (for groundwater)
☐ Corrosion Control Recommendation
☐ Corrosion Control Study
☐ Distribution Mains
☐ Other (Please Describe): _____
☐ Groundwater Filtration Treatment
☐ Group B System Approval
☐ GWI Determination
☐ Major System Modification
☐ Monitoring Plan (DBP, LCR, Coliform)
☐ Operations Plan
☐ Pilot Study Protocol
☐ Pilot Study Report
☐ Sanitary Control Area Mitigation
☐ Source Approval
☐ Storage Reservoir/Tank
☐ Surface Water/GWI Treatment – New
☐ Surface Water/GWI Treatment – Modified
☐ Tracer Study Plan
☐ Watershed Plan
☐ Well Site Inspection
☐ Wellfield Designation

Planning Submittal Information *(Water System Plans and Small Water System Management Programs)*

Date of DOH preplan meeting 5/6/2025. Does your plan follow the preplan checklist?	☒ Yes ☐ No
Is the system regulated by the Utilities and Trade Commission (UTC)?	☐ Yes ☒ No
Is the system proposing to do any of the following:	
• Increase in the number of approved connections?	☒ Yes ☐ No
• Expand the service area or water rights place of use?	☒ Yes ☐ No
(If yes, the plan must include completed Local Government Consistency Determination Forms from all local governments within the proposed water rights place of use, including Coordinated Water System Plan (CWSP) responsible agency, if located within a CWSSA).	
• Add a new intertie to a wholesale customer?	☐ Yes ☒ No
• Request approval for distribution main submittal exception?	☐ Yes ☒ No
• Request an "Unspecified" approval designation?	☐ Yes ☒ No
Has the WSP or SWSMP been sent to the following organizations for review/comment:	
• Adjacent utilities for review or a letter notifying them that a copy is available for their review?	☐ Yes ☐ No
• All local governments within the service area?	☐ Yes ☐ No
• County and/or city planning department (as applicable)?	☐ Yes ☐ No
• Federal governments, including tribes (as applicable)?	☐ Yes ☐ No
Is the system located in a Critical Water Supply Service Area with a Coordinated Water System Plan (CWSP)?	☐ Yes ☒ No
• If yes, have you sent a copy of the WSP or SWSMP to the county or agency responsible for the CWSP?	☐ Yes ☐ No
What year are the important projections in the plan dated to (water demands, CIP, and budget)? *(WSPs can be approved for up to 10 years from date of approval [not date of submittal], but approval will be limited to the projections provided in the plan. This does not apply to SWSMPs.)*	2046

Satellite Management Agency Plan Information

☐ Ownership only ☐ Management and Operations only ☐ Ownership, Management & Operations

Are you requesting approval as a new SMA?	☐ Yes ☐ No
If the SMA plan is combined with a water system plan submittal, where is the SMA Notice of Intent Form located in the plan? *SMA Notice of Intent* 331-590	Enter Location in Plan

List the counties the SMA is requesting approval to serve: Enter Counties

APPENDIX G

DOH WATER SYSTEM PLAN CHECKLIST

Department of Health, Office of Drinking Water
Southwestern Regional Office
Pre-Plan Agreement

Water system name:	Camas Municipal Water Sewer System	**Preplan date:**	May 6, 2025
PWS ID#/County:	108002	**WSP submittal due date:**	May 6, 2026
Planning Purpose:	Large System WAC 246-290-100(2)(a)	**Target year of approval:**	2026-2027
Operating Permit Color:	Green	**Existing WSP expiration date:**	August 1, 2030
Initial/Update/Amend:	Update	**End of "plan approval period":**	up to 2038 (last year of all projections)
Number of Connections:	11842		

WAC 246-290-100 requires purveyors of new water systems, systems in a water coordination act area, systems serving 1,000 or more service connections, systems with an unspecified number of approved connections and systems that are growing or experiencing capacity problems to gain approval for a Water System Plan (WSP). The purpose of this preplan is to determine the level of detail of the WSP and establish an approval schedule. This agreement is valid until the WSP submittal due date above. After that date, the agreement will need to be renegotiated. The operating permit color may change to yellow if the WSP is not approved by the existing WSP expiration date noted above.

Planning forms and other resources, including the current Water System Planning Guidebook and additional information can be found HERE.

Include in plan	Content Description	*WSP Page #*
Y	Project Approval Application (PAA, DOH Pub 331-149 F)	
Y	Signed and dated stamp from a Professional Engineer licensed in the State of Washington	
Chapter 1 – Description of Water System		
Y	Ownership and management, including Satellite Management Agency (SMA), if applicable	
Y	System history and background	
Y	Related plans	
Y	Service area and land uses: • Service area map including retail service area, service area, future service area, water rights place of use • DOH Pub. 331-432 – Service Area Guidance • Existing zoning map(s) for all jurisdictions within future service area • Future land use map(s) for all jurisdictions within future service area (CWSP Counties Only)	
Y	Service area and other applicable policies	
Y	Duty to serve statement for the retail service area • How does the system define "timely and reasonable"? • Are there appeals processes for when a customer disagrees with a timely and reasonable determination?	
Y	Consistency with the watershed plan for Salmon/Washougal WRIA #28.	

Chapter 2 – Basic Planning Data		
Y	Existing population, service connections & equivalent residential units (ERUs) • ERUs must be based on full-time residential connections only.	
Y	Existing production/usage: monthly/annual per source, annual usage by customer class, distribution system leakage (DSL) • Authorized Use and DSL, rather than "unaccounted-for water". • Additional information is available in our WUE Guidebook, Chapter 6, beginning on page 28 (PDF page 33).	
Y	Seasonal variations in use by customer class (1000+ connections)	
Y	Water supply characteristics	
Y	Water supply reliability evaluation: Include depth-to-water measurements	
Y	Interties: agreements, existing/proposed, emergency, metering	
Y	**Plan approval period & 20-year projections for:** Population, service connections, & ERUs (Recommend 13- and 23-year)	
Y	Projections and land use discussion	
Y	Future water demand without water use efficiency savings	
Y	**Water rights self-assessment: Consult with Ecology prior to plan submittal** Describe water rights and complete water rights self-assessment form for existing, plan approval period, and 20 years.	
Chapter 3 – System Analysis		
Y	Asset Management Inventory: text description and facilities map of major assets, asset management table or spreadsheet	
Y	Asset condition assessment and criticality ratings (recommended)—RCAC Template (optional format)	
Y	Water quality analysis	
Y	System design standards	
Y	Capacity analysis (Must include WSDM Worksheet 4-1, ERU Capacity Summary)	
Y	Hydraulic analysis	
Y	Summary of system deficiencies	
Chapter 4 – Water Use Efficiency (WUE)		
Y	**Metering Program:** sources, services, and non-emergency interties	
Y	**Distribution System Leakage (DSL)** Summarize DSL and compare to WUE annual reports; discuss DSL calculation methodology, leak detection plan	
Y	**Water Loss Control Action Plan (WLCAP) – 3-year average 13.1% (2021, 2022, 2023)** If DSL exceeds 10 percent (3-year average), submit the WLCAP per WAC 246-290-820(4) • Include implementation schedule and budget items, as applicable.	
Y	**Water Use Efficiency WUE Program**	
Y	Describe the current (WUE) program	
Y	Updated WUE goal(s). Document public adoption process (include public notice, signed minutes, signed resolution). • Consider doing this after our review of your first draft.	
Y	Describe measure(s) that will be implemented to achieve the goal(s). Include schedule & costs in the budget – 10,000 to 49,999 connections: 9 additional measures.	
Y	Describe the process used to evaluate WUE measure(s) you did not implement	
Y	Describe or provide an example of yearly consumer education (cannot count as a measure)	
Y	Estimate projected water savings from selected WUE measure(s)	

Y	Describe process that will be used to determine effectiveness of the WUE program	
Y	Plan approval period and 20-year water demand projection with WUE savings (recommend 13- and 23-year)	

Y	**Additional WUE for systems with 1000+ Connections**
	• Estimate water saved from implemented WUE measure(s) during the previous plan approval period
	• Water demand forecast (if all cost-effective WUE measure(s) are implemented)
	• For WUE measure(s) evaluated, but not implemented:
	  ○ Quantitative evaluation of WUE measure(s) cost-effectiveness, including marginal costs of water production
	  ○ Evaluate WUE measure(s) for cost-effectiveness if shared with other systems
	  ○ Quantitative/qualitative evaluation of measure(s) to determine cost-effectiveness from societal perspective
	• Explore reclaimed water opportunities	

Chapter 5 – Source Water Protection		
Y	Sanitary Control Area (SCA): description of physical and legal protections for each groundwater source, including deeds, covenants, easements, restrictions, fencing, signage, etc.	
Y	Wellhead protection program/update: must include updated TOT map, contaminant source inventory, and notifications • WAC 246-290-135: Source Water Protection • 331-106 Wellhead Protection Requirements	
***N**	Watershed control program for all surface water/GWI sources— *Please include watershed and other information relative to your two emergency surface water sources.	
Chapter 6 – Operation and Maintenance Program		
Y	Water system management and personnel, including operator certification and CCS	
Y	Operations and preventative maintenance schedule	
Y	Comprehensive water quality monitoring: • Water Quality Monitoring Schedule (WQMS) • Provide LCR and DBP monitoring schedule(s), map(s), and letters. • Coliform monitoring plan, including addresses and map. Update for RTCR. DOH Guidance and Template	
Y	Emergency response program, including Water Shortage Response Plan per WAC 246-290-420. • Consider Tier 1 Public Notification process, and multiple channels for notification.	
Y	Cross-connection control (CCC) program • Systems with 1000+ connections: provide a copy of your CCC annual summary report form	
Y	Sanitary survey findings	
Y	Recordkeeping, reporting, and customer complaint program	
Y	Water treatment (surface, disinfection, contaminant) operations	
Y	Summary of O&M deficiencies; include cost in budget	
Chapter 7 – Distribution Facilities Design and Construction Standards (optional)		
Y	Project review procedures	
Y	Policies and requirements for outside parties	
Y	Design and construction standards for distribution-related projects.	
Y	Construction certification	

Chapter 8 – Capital Improvement Program (CIP) (Recommend 13- and 23-year CIP info.)		
Y	CIP summary and schedule for the plan approval period (discuss prioritization, project assessment and value planning) • Include any items that were identified as required for addressing capacity-related deficits.	
Y	20-year (minimum) CIP for projects beyond the plan approval period	
Chapter 9 – Financial Program (Recommend 13- and 23-year financial info.)		
Y	Financial viability (discuss full cost of service, cost recovery, reserves)	
Y	Summary of past income and expenses, sufficient to establish trends (previous plan approval period or minimum 3 years)	
Y	Balanced operational and capital budget projections for plan approval period	
Y	Show operational, capital, and emergency reserve goals. Describe the revenue requirements to achieve them. Demonstrate annual progress toward goals.	
Y	Debt-financed capital improvements	
Y	Water rate evaluation: • Describe current rate structure: **Block rate based on meter size and rate class**. (Not inclining block rate.) • Evaluate the feasibility of implementing a rate structure that encourages water demand efficiency. • Evaluate rate affordability and customer assistance programs. Provide rate that would be unaffordable, income below which current and future rates are unaffordable, and programs available for low income customers.	
N	~~Water system regulated by the Utilities and Transportation Commission (UTC)?~~	
Chapter 10 – Miscellaneous Documents		
Y	Updated Water Facilities Inventory (WFI) with authorized signature	
Y	Local Government Consistency Determination Forms: City and County planning departments.	
Y	Informational meeting for the consumers (include public notice and signed minutes)	
Y	Adjacent utilities notice, review, and comment of draft WSP. Attach notice and comments received.	
Y	SEPA: Signed Environmental Checklist and Threshold Determination. The water system is lead agency.	
Y	Agreements: SMA, intertie, service area, franchise, wheeling, mutual aid, inter-local and other agreements	
Y	Correspondence	
Y	Supporting documents	
Miscellaneous Documents – Post review		
	Plan approval by water system governing body. Include signed meeting minutes or signed resolution. NOTE: DO NOT approve the plan until after the draft review is completed and you have received authorization to proceed with approval from the Regional Planner.	

GENERAL INFORMATION AND REQUIREMENTS:

- **Copies – Provide an electronic copy of the WSP. DOH will send to Ecology. Contact DOH SWRO admin for box.com login swro.admin@doh.wa.gov**
- **Provide this document with first draft.** Use the right side column of the checklist to provide page numbers for required content.
- **Fee – The total review fee for the first and second drafts for 10,000 or more connections is $5,484. Additional drafts are an additional $1,371. Fees are subject to change.**
- **REVIEW TIMELINE – Plans are reviewed in the order received.** DOH will respond within ninety (90) days of receiving draft plans (i.e. 90 days after the first draft, and again, 90 days after the second draft). Dept. of Ecology has 60 days to review, and that is concurrent with the DOH 90-day period.

Additional Notes:

- What are 3 things the City has accomplished in this past planning period that you're proud of or that have made a positive impact on the system and/or customers?
  - Wrapping up reservoir reconstruction, with booster station.
  - Working on interconnection between wells 6 and 14, which will enable more water going into distribution system.
  - PFAS treatment system. Project has been approved and going to bid soon.
- What are 3 things the City would like to accomplish in the next planning period?
  - Address water rights issues.
    - New source in existing wellfields.
    - Well 13 or Well 13B.
    - Steigerwald.
- What are your top concerns for this upcoming planning period?
  - Other wellfields that will need PFAS treatment.

APPENDIX H

INTERTIE AGREEMENTS

INTERLOCAL AGREEMENT: EMERGENCY INTERTIE BETWEEN WATER SYSTEM OPERATIONS OF THE CITY OF VANCOUVER AND THE CITY OF CAMAS

THIS AGREEMENT is made and entered into this 2nd day of ~~September~~ October, 2017, by and between the City of Camas, a municipal corporation of the State of Washington, and the City of Vancouver, a municipal corporation of the State of Washington, hereinafter referred to as the "Parties".

IN CONSIDERATION of the mutual promises, agreements, and covenants contained herein, it is hereby agreed, by and between the Parties, as follows:

RECITALS

WHEREAS, the Parties have developed a Coordinated Water System Plan ("CWSP") pursuant to the Public Water System Coordination Act of 1977, RCW Chapter 70.116; and

WHEREAS, the CWSP designates individual water service areas to avoid unnecessary duplication; and

WHEREAS, the CWSP anticipates the development of physical interconnection of those water systems at points known as interties; and

WHEREAS, water system interties provide mutual benefits to water system operators by creating water supply redundancies; and

WHEREAS, the City of Vancouver and the City of Camas are authorized by Chapter 39.34 RCW, the Interlocal Cooperation Act, to enter into cooperative agreements to jointly exercise their powers, privileges and authorities; and

WHEREAS, the Parties are entering into this Agreement to provide water service to each other during emergency conditions.

NOW THEREFORE, the City of Vancouver and the City of Camas having entered into this Agreement by their signature, agree with the following:

Section 1. PURPOSE

The purpose of this Agreement is to provide emergency water service to the requesting Party at a mutually acceptable intertie location. The intertie location is identified on Exhibit 'A.'

Section 2. CONDITIONS OF SERVICE

A. Metering

A water meter that can serve water flowing in both directions will be installed at the intertie location. The City of Vancouver will set, own and maintain the water meter.

B. Other Infrastructure

Each purveyor will own and maintain the intertie infrastructure on its respective side up to the intertie meter, including all fittings, valves, pressure reducing valves, booster pumps, piping, electrical connections, and pressure gauges. The City of Vancouver will own and maintain the meter and the meter vault and all other associated appurtenances within the vault.

C. Cost of Service

The cost of the water supplied though an intertie shall be based on the supplying Party's then current service rates, as follows:

1. When the City of Camas supplies water to the City of Vancouver, the usage charge will be based on the most current schedule of rates for the size of the meter installed based on the Inside City Commercial rate.

2. When the City of Vancouver supplies water to the City of Camas, the usage charge will be based on the inside city limits commercial rate.

Charges will be limited to water usage. There will be no monthly or system development charges.

D. Service Limitations

The Parties will use the intertie only for emergency water service. Emergency water service is defined as service during any event that requires either Party's water supply to be augmented on a temporary emergency basis and is not intended to supply base or peak supply. Because this Agreement covers only emergency water service, there is no specific time period in which water will be provided; emergency water service may be requested at any time.

Either Party can refuse to provide emergency water service if such use could result in a degradation of water quality. The City of Vancouver and the City of Camas will monitor water quality at the intertie and each water purveyor will continue to be responsible for water quality monitoring within their system. Each Party shall immediately notify the other in the event of any failed coliform bacteria sample within the system and shall discuss any potential necessary actions.

Either Party can refuse to provide emergency water service if the water is needed for their own system.

Each Party shall use reasonable efforts to provide an uninterrupted supply of water. However, neither Party guarantees the availability of water through the intertie at all times because of each Party's respective needs and water demands. Further, either Party may close the intertie until sufficient water supply exists to make water available for use by the other Party.

The volume of water made available by the supplying utility will be dependent on the size of the intertie meter and the capacity available from the supplying water system.

Neither Party will be liable for any loss or damage attributed to their failure to provide water through the intertie.

Either Party can choose to abandon the intertie if the cost to alter, maintain or replace the connection exceeds the benefit to either Party.

The City of Vancouver and the City of Camas will work together to design, construct and maintain future interties where financially feasible.

Operation of the intertie shall be under the mutual consent of the City of Vancouver Water Operations Superintendent and City of Camas Utilities Manager. Each Party shall notify the other Party in writing at least twelve (12) hours in advance of the time either party desires to receive water through the intertie. Such notice shall be delivered in person to ensure it is timely received. If an emergency requires immediate use of the intertie, verbal notification and approval will be permitted, with follow-up written notification to occur as soon as practicable under the circumstances. Follow-up written notification of such emergency request shall be made by each Party to the other party within not more than three (3) days after the initiation of such emergency water usage. Upon receiving a request, the responding Party will provide available water service within a reasonable amount of time.

Section 4. GENERAL TERMS

A. Force Majeure

Notwithstanding anything contained in this Agreement to the contrary, neither Party will be deemed liable or to be in default for any delay or failure in performance under this Agreement deemed to result from acts of God, acts of civil and military authority, acts of public enemy, war, or any like cause beyond the Parties reasonable control.

B. Parties' Interests

Neither Party shall by virtue of this Agreement acquire any proprietary or governmental interest in the water system of the other Party. Each Party shall be solely responsible for the operation and maintenance of its own system of water distribution.

C. Water Use Efficiency Programs

Water use efficiency programs, data collection, water demand forecasting and other operational matters will be coordinated between the City of Vancouver and the City of Camas through the CWSP. Additional coordination activities are not necessary for emergency interties.

D. Severability

Should any provision of this Agreement be held by a tribunal of competent jurisdiction to be invalid or unenforceable, the remainder of the Agreement will remain in full force and effect.

E. Assignment

Neither Party shall assign this Agreement, or any rights under it, or delegate any obligations under it, without first obtaining the written consent of the other Party.

F. Amendments

This Agreement may only be changed, modified, or amended upon the unanimous written approval of both parties.

G. Third Parties

The terms of this Agreement are not intended to establish or create any rights in any persons or entities other than the Parties to this Agreement.

H. Employment Status

In providing services under this Agreement, none of the officers, officials, agents or employees of the parties hereto are employees of the other party to this Agreement for any purpose, including responsibility for any Federal or State tax, industrial insurance, or Social Security liability.

I. Administration

No new or separate legal or administrative entity is created to administer the provisions of this Agreement. This Agreement shall be administered by the respective parties to this

Agreement, which shall each be individually responsible for financing its own actions pursuant to this Agreement.

J. Choice of Law

This Agreement is made and entered in the State of Washington. Any dispute concerning its terms shall be determined by the courts of competent jurisdiction in and for Clark County, Washington.

K. Effective Date and Duration

This Agreement shall become effective upon the occurrence of the approval of this Agreement by the Parties' respective governing bodies, execution of this document by their authorized representatives, and recording with the County auditor. This Agreement shall remain in effect until terminated by either Party in accordance with this Agreement.

L. Termination

Either party may terminate this Agreement by providing sixty (60) days prior written notice to the other party. Upon termination, each party continues to own, is responsible for, and may dispose of the intertie infrastructure for which they are the designated owner through this Agreement.

M. Notices

Any notice to be given or any documents to be delivered by any party to the other shall be delivered in person or, if not urgent, sent by regular U.S. mail and addressed to the parties to this Agreement at the following addresses:

For the City of Vancouver:

Director of Public Works
City of Vancouver
415 W. 6th Street
P.O. Box 1995
Vancouver, WA 98668-1995

For the City of Camas:

Public Works Director
City of Camas
616 NE 4th Avenue
Camas, WA 98607

N. Entire Agreement

This Agreement comprises the entire understanding between the City of Vancouver and the City of Camas with respect to the subject matter hereof, and there are no representations, inducements, promises, or agreements, oral or otherwise, not embodied herein. Any and all prior negotiations, discussions, commitments, and understandings relating hereto are merged herein.

O. Counterparts

This Interlocal Agreement may be executed simultaneously in several counterparts, each of which shall be deemed an original, and all of which together shall constitute one and the same instrument.

P. Filing

The Parties agree that there shall be two (2) duplicate originals of this Interlocal Agreement procured and distributed for signature by the necessary officials of the parties. Upon execution, one executed original of this Interlocal Agreement shall be retained by each Party. Within five (5) days from the date of execution of this Interlocal Agreement, the Parties will cause a copy of this Agreement to be filed with the County auditor in accordance with Chapter 32, Laws of Washington 2006 (RCW 39.34.040). Upon execution of the originals and filing of a copy with the County auditor, each such duplicate original shall constitute an agreement binding upon all Parties.

IN WITNESS WHEREOF, the parties have executed this agreement at Vancouver, Washington this 2nd day of September, 2017. October 3

INTERLOCAL AGREEMENT FOR ADJUSTING WATER UTILITY SERVICE BOUNDARIES AND WATER SERVICE SHUT OFF

BETWEEN

City of Vancouver and City of Camas

THIS AGREEMENT, entered into by and between City of Vancouver ("Vancouver") and City of Camas ("Camas"), (hereinafter referred to collectively as the Water Purveyors), WITNESS THAT:

WHEREAS, Clark County and the Water Purveyors conduct capital facilities and land use planning under the Growth Management Act as adopted by the State of Washington and subsequently amended; and

WHEREAS, RCW 70.116, *Public Water System Coordination Act*, and WAC 246-293-250 require development of a Coordinated Water System Plan, including establishment of service area boundaries by written agreement among purveyors; and

WHEREAS, the designation of water service area boundaries helps facilitate efficient planning and delivering of water services within Clark County, avoid unnecessary duplication of water services, and provide water operation predictability to the water purveyors, Clark County, and the residents served by the public water system; and

WHEREAS, the designation of water service area boundaries helps assure that available water supply sources of the Water Purveyors will be utilized in an efficient manner; and

WHEREAS, Vancouver and Camas entered an Interlocal Agreement for Adjusting or Confirming Future Water Utility Service Boundaries, effective January 10, 2012, which designated service area boundaries for the east boundary for Vancouver and the west boundary for Camas; and which was reviewed and approved by the Clark County Board of Commissioners pursuant to RCW 70.116.040; WAC 246-293-250; and 246-293-290; and

WHEREAS, without the installation of additional tanks and pumps, Vancouver cannot provide reliable water service at an adequate pressure to a portion of land currently located within Vancouver's water service area boundary, which is shown as the "Area Proposed to be Transferred to Camas" in Exhibit 'A' (hereinafter "Affected Area"); and

WHEREAS, Camas's water system has water supply at adequate pressure to provide the Affected Area with reliable water service; and

WHEREAS, it is in the best interests of Vancouver and Camas to make adjustments to the water service area boundaries such that Camas will now provide water service to the Affected Area; and

WHEREAS, Vancouver will provide sewer, stormwater and other municipal services within the Affected Area; and

WHEREAS, Vancouver engages in a lengthy process including multiple steps and actions to collect delinquent sewer and stormwater service charges. This process consists of the following, (1) past due reminder sent 25 days after the bill date to both the service address and the property owner of record, (2) past due final notice is sent 37 days after the bill date to both the service address and the property owner of record to notify that water service will be shut-off if payment is not received, (3) after the 45th day the account is past due, water service is shut-off, (4) after 12 months of non-payment, a notice of intent to file lien is mailed, (5) 30 days after the intent to file lien is sent, lien is filed with the Clark County Auditor and property owner notified, (8) after 24 months of non-payment, foreclosure process commences; and

WHEREAS, almost all of the delinquent sewer and stormwater service charges are paid during this lengthy collection process, and prior to the filing of a foreclosure action; and

WHEREAS, when other efforts fail, a cost effective mechanism for collecting payment of delinquent sewer and stormwater service charges is Vancouver's ability to shut off (terminate) water service to a property; and

NOW THEREFORE, in consideration of covenants, conditions, performances, and promises hereinafter contained the undersigned Water Purveyors hereto agree as follows:

I. Purpose

The purpose of this Agreement is to adjust Water Service Area boundaries of the Water Purveyors that are parties to this Agreement and to provide a mechanism for shut off of water service by Camas at the request of Vancouver for delinquent sewer and/or stormwater service charges.

II. Effective Date

This Agreement shall become effective upon the occurrence of the approval of this Agreement by the individual Water Purveyors' governing bodies, execution of this document by their authorized representatives, the approval of this Agreement by the Clark County Board of County Council, and recording with the County auditor.

III. Duration

This Agreement shall remain in effect with regard to the individual Water Purveyors until terminated. Such termination shall occur through the establishment of future water service boundaries with the next update of the Coordinated Water System Plan.

IV. Property

Nothing in this Agreement shall create or transfer any interest in real or personal property among Water Purveyors. In the event any adjustment of a Future Water Service Area boundary requires transfer of water facility assets from one Water Purveyor to another Water Purveyor, a separate written agreement shall address the transfer of such assets.

V. Administration

No new or separate legal or administrative entity is created to administer the provisions of this Agreement. This Agreement shall be individually administered by the respective Water Purveyors, which shall each be individually responsible for financing its own actions under this Agreement.

VI. Scope

1. **Service Area Boundaries**. The undersigned acknowledge that the map attached to this agreement identified as Exhibit 'A" clearly identifies the current western water service boundary for Camas and eastern water service boundary for Vancouver as well as the proposed water service boundary to be established through this Agreement. In addition, Exhibits B and C identify the final service boundaries for Vancouver and Camas, respectively, which will become effective upon execution of this Agreement. This signed Interlocal Agreement verifies that there are no service area conflicts with adjacent water utilities.

2. **Boundary Adjustments.** If, at some time in the future, it is in the best interests of the undersigned parties to make service area boundary adjustments, such modifications must have the written concurrence of all involved parties and the proper legislative authority/authorities, and must be noted and filed with Clark County and Washington State Department of Health.

3. **Water Service Shut Off.** After Vancouver has completed its delinquent sewer and/or stormwater service charge collection process for property that has delinquent charges, Vancouver's Public Works Director or designee may file a written request with the Camas Public Works Director or designee to shut off water service for such property. Upon receipt of the request, the Camas Public Works Director or designee will shut off the water service following the Camas procedure and requirements for shutting off water service for nonpayment of Camas water service charges. The water service shall remain shut off until the delinquent sewer and/or stormwater service charges, plus penalties, interest and fees, have been paid in full or the property owner and Vancouver have entered into a payment arrangement. The Vancouver Public Works Director or designee shall notify the Camas Public Works Director or designee when the charges have been

paid in full or the payment arrangement has been entered into. Vancouver estimates that requests to shut off water service will be infrequent.

VII. Interpretation

This Agreement has been and shall be construed as having been made and delivered in the State of Washington and it is mutually agreed and understood by the Water Purveyors that this Agreement shall be governed by the laws of the State of Washington. Venue for any lawsuit arising from or related to this Agreement shall be the Superior Court of Clark County, Washington.

VIII. Amendments/Modification

The provisions of this Agreement may be amended only upon the mutual consent of the Water Purveyors. No amendments to the terms of this Agreement shall be valid unless made in writing and formally approved and executed by the duly authorized agents of the Water Purveyors and Clark County, and recorded with the Clark County Auditor.

IX. Severability

If any section or part of this Agreement is held by a court to be invalid, such action shall not affect the validity of any other part of this Agreement.

X. Entire Agreement

This Agreement contains all of the agreements of the Water Purveyors with respect to the subject matter covered or mentioned herein, and no prior Agreement shall be effective to the contrary.

XI. Counterparts

This Interlocal Agreement may be executed simultaneously in several counterparts, each of which shall be deemed an original, and all of which together shall constitute one and the same instrument.

XII. Document Filing

The Water Purveyors agree that there shall be one (1) original of this Agreement procured and distributed for signature by the necessary officials of the Water Purveyors. Upon execution, this Agreement shall be retained by the Clark County Community Planning and each Water Purveyor shall retain one (1) copy. The Parties shall cause a copy of this Agreement to be recorded with the Clark County Auditor.

As specified in WAC 246-293-250, Service Area Agreements-Requirements, this Agreement shall become effective once this document is approved by the Clark County

Board of County Council. The Parties will ensure this Agreement is filed with the County auditor within five (5) days of approval by the Clark County Board of County Council.

This Interlocal Agreement for Adjusting Water Utility Service Boundaries and Water Service Shut Off is hereby approved.

INTER-LOCAL COOPERATION AGREEMENT

THIS AGREEMENT made this day by and between the CITY OF CAMAS, a municipal corporation organized under the laws of the State of Washington, hereinafter referred to as "Camas", and the CITY OF WASHOUGAL, a municipal corporation organized under the laws of the State of Washington, hereinafter referred to as "Washougal",

In accordance with the Inter-Local Cooperation Act (RCW Chapter 39.34), Camas and Washougal, in consideration of the payments, covenants and agreements hereinafter mentioned, to be made and performed by the parties, do covenant and agree as follows:

Section 1. **PURPOSE:** The purpose of this agreement is to allow Camas and Washougal to sell water to the other due to the occurrence of an emergency situation where either city is unable to meet their service demands within internal water sources. The designation of an emergency shall be made by the respective Public Works Directors of each city and shall include, but not be limited to, drought conditions or a break in a water main. The delivery of water upon the designation of an emergency shall be through Inter-Ties between the respective water systems of Camas and Washougal at locations approved by the Public Works Directors of each city.

Section 2. **DURATION:** This agreement shall be for an indefinite duration.

Section 3. **ADMINISTRATION:** No new or separate legal or administrative entity is created to administer the provisions of this agreement. This agreement shall be administered jointly by Camas and Washougal by and through the Public Works Directors of both cities, who shall jointly administer this undertaking in accordance with the terms and conditions of this agreement.

Section 4. **FINANCING:** In the event either Camas or Washougal receives water

pursuant the provisions of this agreement then the receiving city shall remit payment in full for the water received at a rate equivalent to the receiving city's residential, inside city, water volume rate at the time of provision of the water. Invoicing shall be on a monthly basis.

Section 5. **WATER QUALITY:** The water supplied by either Camas or Washougal, in accordance with the terms of this agreement, shall be deemed "finished and treated" drinking water at the point of delivery. The city providing water shall have no responsibility to maintain drinking water quality standards once the water has been provided to the receiving city's distribution system. The receiving city shall be solely responsible to maintain drinking water quality standards upon receipt.

Section 6. **INDEMNIFICATION:** Camas and Washougal shall indemnify and hold harmless the other, its officers, agents, and employees, or any of them, from any and all claims, actions, suits, liability, loss, costs, expenses and damage of any nature whatsoever, by reason of or arising out of any action or omission of the respective employees, officers and agents, in the execution and administration of this agreement.

Section 7. **INSURANCE:** Each city shall obtain and keep in full force and effect liability insurance protecting itself and its employees, officers and agents, and the party, its employees, officers and agents, for claims of any persons for injuries to life, person or property by reason of anything done or permitted to be done or suffered or admitted to be done by the parties in the administration of the project. If either party withdraws from the Washington Cities Insurance Authority, that party shall deliver a certificate of insurance showing compliance with this section.

Section 8. **TERMINATION:** Each party shall have the right to terminate this entire agreement, with or without cause, upon 180 days written notice to the other party. Such notice shall be sufficient if it is in writing and deposited in the United States mail, certified mail, return receipt requested, with postage fully prepaid and addressed to the parties at their last known addresses as follows:

City of Camas
P.O. Box 1055
Camas, WA 98607

City of Washougal
1701 "C" Street
Washougal, WA 98671

Section 9. **FILING:** This agreement shall be filed with the city clerks of Camas and Washougal and with the Clark County Auditor and the Washington Secretary of State.

Section 10. **EFFECTIVE DATE:** This agreement shall be effective upon signing by the respective parties hereto.

DATED this 7 day of August, 2006.

Gentlemen/Mike

Enclosed please find an executed copy of the *INTERLOCAL AGREEMENT BETWEEN the CITY OF WASHOUGAL and the CITY OF CAMAS.* Said agreement designates the City of Washougal as the utility service (water and sewer) provider to the land located north of the intersection of Shepherd Road and 3rd Avenue.

Any questions pertaining to this agreement may be directed to Eric Levison, our Assistant City Engineer, at 834-3451.

Sincerely,

Douglas A. Quinn, P.E.
Director

enclosure

RECEIVED

INTERLOCAL AGREEMENT BETWEEN
the
CITY OF WASHOUGAL and the CITY OF CAMAS

The corporate limits of the cities of Camas and Washougal are irregular along their common boundary. In particular, an area within the Camas corporate limits (herein referred to as "subject area", as described in attached Exhibit "A") located north of the intersection of Shepherd Road and 3rd Avenue is currently surrounded on approximately eighty-four (84) percent of its perimeter by Washougal's corporate limits.

Further, the cities have mutually entered into an Interlocal Agreement which designates the City of Washougal as the utility service (water and sewer) provider to the land located within the subject area.

The City of Washougal is in the process of preparing a Comprehensive Subarea Plan for an area lying north of the subject area, including the land surrounding the subject area. The Subarea Plan will address land uses, environmental protection, storm water drainage and infrastructure impacts for the area. Including the subject area would assure the orderly and logical progression of land development under the jurisdiction of the City of Washougal.

The purpose of this agreement is to establish the City of Washougal as the presiding jurisdiction with respect to land use planning and implementation, including, but not limited to the following:

1. Implementation of land division regulations.
2. Imposition and implementation of zoning regulations
3. Implementation of development standards, including streets, storm and sanitary sewer, water and other utility provision.

Pursuant to this, the City of Washougal and the City of Camas hereby agree to the following:

1. Presiding Jurisdiction. The City of Washougal shall be the presiding jurisdiction in all planning programs, land use designations and land use application processing for land within the subject area.

2. Land Use Planning and Implementation. All land use actions shall be processed under the rules and regulations of the City of Washougal, including but not limited to Titles 15 (Building), 16 (Environmental), 17 (Land Divisions) and 18 (Zoning) of the Washougal Municipal Code, the City of Washougal Engineering Standards for Public Works Construction and any and all provisions of the Woodburn Hill Comprehensive Subarea Plan. No provision of this agreement shall preclude future revisions, amendments or addenda to these regulations from being implemented by the City of Washougal within the subject area without prior written consent of the City of Camas.

3. Annexation. Both the City of Camas and the City of Washougal agree to pursue the necessary routes to transfer true corporate jurisdiction for the subject area from the City of Camas to the City of Washougal.

4. Effective Date and Duration. This agreement shall be effective upon signature by the presiding officer of both the City of Camas and the City of Washougal, and shall be in effect until terminated by one of the following methods:

   a. Ninety (90) day written notice of termination by either party subject to the agreement.
   b. Termination of agreement upon formal annexation of the subject area by the City of Washougal, said termination being effective concurrent with the effective date of the annexation.

5. Application Processing Upon Termination. Upon termination of this agreement, the city of Washougal shall complete processing of any technically complete land use application filed with the City of Washougal pursuant to the provisions of this agreement.

APPROVED this 4th day of August, 1997 by:

City of Washougal

Mayor Charles Crumpacker

City of Camas

Mayor Dean Dossett

CITIES OF CAMAS AND WASHOUGAL, WASHINGTON
UTILITIES COOPERATION AGREEMENT
FOR WATER SYSTEM DEVELOPMENT
PHASE 2

1. AGREEMENT

This Utilities Cooperation Agreement for Water System Development ("Agreement") is made by and between the CITY OF CAMAS, a Washington municipal corporation ("Camas"), and the CITY OF WASHOUGAL, a Washington municipal corporation ("Washougal"). Camas and Washougal are each a "Party" and collectively the "Parties" (or "Cities") to this Agreement. The Parties agree as follows.

2. RECITALS

2.1 This Agreement is entered by the Parties under their authority to contract, including but not limited to RCW 35A.11.010 and RCW 35.21.210.

2.2 For a number of years, Camas and Washougal have been jointly addressing the Parties' ongoing water supply needs. The Cities participated in Water Resource Inventory Area (WRIA) planning in the Salmon-Washougal (WRIA 28) and Lewis (WRIA 27) watersheds. Clark, Cowlitz and Skamania Counties adopted the Salmon-Washougal & Lewis Watershed Management Plan on July 21, 2006. The Salmon-Washougal & Lewis Watershed Management Plan guides future water rights development in the community, and identifies the Steigerwald area in Clark County as a regional water source.

2.3 Washougal identifies current average daily water demand of approximately 2.0 million gallons per day, with an estimated 50-year need of 10 million gallons per day. Camas identifies current average daily water demand of approximately 3.7 million gallons per day, with an estimated 50-year need of 15 million gallons per day. To meet these needs, the Parties initiated efforts to develop and operate water system wells and well fields near the Steigerwald Wildlife Refuge to be supplied by the Pleistocene Alluvial Aquifer (the "Project").

2.4 The Parties began Project development efforts at Phase 1, in part, by entering into an Option to Purchase Exclusive Easement for Well Site with the Port of Camas-Washougal ("Port," July 17, 2006 (now expired)), and Inter-Local Cooperation Agreement (July 17, 2006) between the Parties to provide for drilling, testing, and evaluation of drinking water wells in the Steigerwald Lake area. The testing revealed sufficient water supplies for the Project. The 2011 Clark County Coordinated Water System Plan Update identifies the Steigerwald well field as a regional water source and further identifies it as a capital project (SR-11).

2.5 As components of the Project, the Parties now are (i) jointly seeking new water rights sufficient for the Project under an Application for Water Right Permit (Washington Ecology No. G2-30528, August 2009); (ii) acquiring from Port the property rights necessary for the Project; (iii) updating their comprehensive water plans; and, (iv) planning to acquire, develop

and operate necessary water system facilities and improvements. Collectively, these efforts and this Agreement are Phase 2 of the Project.

2.6 The Camas 2010 Water System Plan identifies the Steigerwald well field as a regional water source and further identifies it as a capital project (SR-11). The Washougal Water System Plan identifies the Steigerwald well field as a regional water source and further identifies it as a capital project. Camas intends to update its Water System Plan by 2016. Washougal intends to update its Water System Plan, beginning in 2017.

2.7 The Steigerwald well field site is to be acquired and developed by the Parties, with Washougal acting as lead agency and title holder. The general allocation of rights and responsibility for the Project is 60% to Camas and 40% to Washougal.

2.8 In accordance with their history of cooperation and consistent with the 2006 Inter-Local Agreement for good faith negotiations toward a revised agreement to allocate the costs and distribution of Project water resources, the Parties enter into this Agreement to terminate the 2006 Inter-Local Agreement, except as it relates to unreimbursed costs otherwise allocated thereto which shall be subject to further negotiations, and to set forth the rights and obligations of the Parties for the next phase of the Project. This is another in a series of agreements, and the Parties will consider in the future Phase 3 and other forms of management and/or governance of water systems, including the potential of forming a joint municipal services authority under Chapter 39.106 RCW. This Agreement also provides a protocol in the event future agreements are not reached.

3. DEFINITIONS

3.1 "Capacity Allocation" means the percentage of the Steigerwald Water System's design capacity that a Party is authorized by this Agreement to use. A Capacity Allocation does not convey ownership interest in any of the Steigerwald Water System.

3.2 "Steigerwald Water System" or "Project" means the Real Property and System Facilities subject to this Agreement.

3.3 "Real Property" means that certain real property located in Clark County, Washington, identified as Clark County Tax parcel No. 135307000, consisting of approximately 19.65 acres of land, which is legally described and generally depicted in Exhibit A.

3.4 "System Facilities" means all water system facilities and improvements located on the Real Property and, to the extent agreed upon by the Parties in the future, any other facilities that Camas or Washougal may construct for joint use by the Parties, including without limitation facilities not located on the Real Property.

4. OWNERSHIP OF THE STEIGERWALD WATER SYSTEM

4.1 Capacity Interest and Allocation. Each Party owns a capacity interest in the Steigerwald Water System. The Camas capacity interest and Capacity Allocation is 60% and the Washougal capacity interest and Capacity Allocation is 40%.

4.2 Title to Property. Title to the Real Property shall be held in the name of the City of Washougal. Each Party's interest in the Real Property is defined in this Agreement by its Capacity Allocation.

4.3 Sale of Property. The Real Property, the Steigerwald Water System or any part of either the Property or System may be sold or transferred upon the written approval of both Parties, subject to any rights held by the Port of Camas-Washougal, if then applicable.

5. ALLOCATION OF COSTS, SYSTEM CAPACITY, AND WATER RIGHTS

5.1 Purchase Price. Each Party is obligated to pay its portion of the total purchase price for the Real Property (estimated to be $667,619.90 plus costs), divided as follows: Camas – 60% / Washougal – 40%. The allocable share of the Purchase Price shall be included in each Party's capital contributions if the Real Property is purchased over a term of years. Camas shall pay its share to Washougal under Agreement Section 7. Camas' payments for the real property are an obligation of Camas' water system and shall be considered as junior debt for the water utility.

5.2 Capacity Allocation. Subject to modification in future agreement, each Party's Capacity Allocation is divided as follows: Camas – 60% / Washougal – 40%.

5.3 Water Rights. Subject to modification in future agreement, each Party's interest in the water rights associated with the Steigerwald Water System is divided as follows: Camas – 60% / Washougal – 40%.

6. ADMINISTRATION

6.1 Administration.

6.1.1 Lead Agency. No new or separate legal or administrative entity is created by this Agreement. Washougal serves as lead agency for Project. As lead agency, Washougal shall be responsible for continued process for the Application for Water Right Permit, Real Property acquisition, Project design and Development and other Project related actions, all upon consultation with Camas.

6.1.2 Meetings/System Planning. The Public Works Director of each City shall meet regularly, generally monthly, regarding the Project. Additionally, the Parties shall hold regular meetings, to direct planning related to the Steigerwald Water System and to develop and review future actions, including relevant comprehensive plans, other planning documents and budgets. Each Party shall cooperate with the other Party's water comprehensive planning.

6.1.3 Phase 3. Following the adoption by each Party of the Party's updated water comprehensive plan, or earlier as the Parties determine, the Parties shall begin negotiations for development of a Phase 3 agreement. A Phase 3 agreement is to address the next phase of the water resource development and System Facilities, and System management. A Phase 3 agreement is expected to address such issues as organization and governance; budget and finance; water interties and wheeling; System Facilities planning and development; management and operation; repair and replacement of System Facilities; termination of this

Agreement; and related matters. The Parties intend to enter a Phase 3 Agreement no later than eighteen (18) months following the commencement of negotiations. Each Party commits to good faith and diligent effort to reach a Phase 3 agreement.

6.2 Other Uses. The Real Property is acquired by the Parties for development and operation of well fields and other utility purposes. The Parties may, however, agree to make the Real Property available for either or both Parties' general municipal purposes.

6.3 Water Rights Approval Process. In the event the Parties determine to request accelerated review of their Application for Water Right Permit, all costs of such process shall be allocated between the Parties based on Capacity Allocation.

7. BUDGETING AND INVOICING

7.1 Invoicing and Payment. Monthly, as expenses are incurred, Washougal will invoice Camas for its pro rata share of costs for the Project in accordance with Washougal's standard invoicing procedures for public works projects. Camas must remit payment in full for each invoice no later than thirty (30) days after the receipt of the invoice from Washougal.

7.2 Reimbursement. It is the intent of the Parties that Washougal be reimbursed for (and Camas pay for) only Camas' pro rata share of costs reasonably incurred by Washougal in performing its duties under this Agreement.

7.3 Taxes. Washougal shall not assess its utility tax on revenues from any service to Camas under this Agreement. Other taxes such as state, county and those imposed by other third parties related to the Project shall apply. Each Party retains all rights and authority to levy and collect utility taxes associated with retail or contract water service.

8. DISPUTE RESOLUTION

8.1 Negotiations. The Parties agree to make all reasonable efforts to resolve through informal, good faith negotiations any disputes concerning the terms and conditions or performance of this Agreement. In the event of a dispute, including a claimed breach of this Agreement, notice of the dispute shall be provided in writing and shall be delivered in the manner set forth in Section 12.4. The notice shall set forth with reasonable specificity the factual basis for the claimed dispute. Both Parties shall jointly cooperate to informally resolve any disputes as quickly and efficiently as possible, but in any event not more than sixty (60) days from the date of the notice unless extended by mutual agreement of the Parties.

8.2 Voluntary Mediation. If a dispute cannot be resolved through direct discussions, mediation may, by mutual consent, be initiated. In the event the Parties determine to initiate mediation, a mutually acceptable mediator shall be selected by the Parties for the purpose of facilitating the mediation process. The mediator shall be selected based on his or her expertise with the nature of the matter in dispute and their ability to facilitate a settlement. The Parties agree to provide all documentation and information requested by the mediator and in all other regards to cooperate fully with the mediator. The costs of mediation shall be shared equally between the Parties.

8.3 Other Relief. In the event the dispute is not resolved in mediation, or the Parties do not agree to mediation, the Parties may pursue any other form of relief provided by this Agreement.

8.4 Specific Performance. If a Party continues in default in the performance of any material and substantial covenant or agreement herein contained for a period of thirty (30) days after written notice specifying such default, and following such reasonable time under Agreement Sections 8.1 and 8.2; or as is necessary to cure such default or a Party's failure to commence a cure within sixty (60) days of notice, a Party may, at its option, immediately commence an action for specific performance to compel performance or take any other action available at law or in equity, including an action for damages. The Parties agree that the continued delivery of water from the Steigerwald Water System cannot be terminated without jeopardizing the public health and safety. As a result, termination of the Agreement is not an adequate remedy; and an action for specific performance, in addition to other remedies, is authorized to compel performance under this Agreement.

8.5 Compliance with Order. The Parties shall be bound by the outcome of litigation (or other process) under Agreement Section 8, including all appeals, at the conclusion of the litigation (the "Order"). The first remedy available to a Party under an Order shall be specific performance. If a Party does not comply with the Order within the time specified for compliance in the Order, the prevailing Party may elect to terminate the Agreement without further process under this Agreement. If a Party chooses to not terminate the Agreement, the Party may pursue such other remedies as are available under law or this Agreement.

8.6 Force Majeure. No period of performance required by this Agreement shall run during periods of force majeure.

8.7 No Waiver; Prevailing Party Costs. If a Party incurs attorney fees, costs, or other legal expenses to enforce the provisions of this Agreement against another Party, all fees, costs, and expenses are recoverable by the prevailing Party as against the offending Party. The failure of a Party to exercise any right or enforce any provision of this Agreement is not a waiver of that right or enforcement remedy.

8.8 Jurisdiction and Venue. This Agreement must be interpreted in accordance with the laws of the state of Washington. As against the other Party, Camas and Washougal may file suit to enforce this Agreement only in the Superior Court for Clark County, Washington.

9. ASSETS

9.1 Existing Assets. Subject to Agreement Section 4, this Agreement does not transfer any existing assets between the Parties. The Parties retain all rights, title, and interest in their separate municipal water systems, including without limitation all real and personal property, investments, cash accounts and reserves, and contract and intangible rights.

9.2 Steigerwald Water System Assets. The Parties each have an ownership interest in the assets of the Steigerwald Water System based on Capacity Allocation. Upon termination or dissolution of this Agreement, the Parties will work in good faith toward an asset allocation plan for the Steigerwald Water System and to administer the approved plan. In the event the Parties

cannot reach agreement, then Washougal shall pay to Camas the full amount of prior Camas payments to Washougal for the Real Property and any System Facilities constructed prior to Agreement termination. After payment by Washougal, Camas shall have no interest in the Steigerwald Water System.

10. INSURANCE

10.1 Property Insurance. Washougal must insure, at replacement cost value, any Steigerwald Water System Facilities.

10.2 Liability Insurance. Each Party shall obtain and keep in full force and effect liability insurance protecting itself and its employees, officers and agents, and the party, its employees, officers and agents, for claims of any persons for injuries to life, person or property by reason of anything done or permitted to be done or suffered or admitted to be done by the parties in the administration of the project. If either party withdraws from the Washington Cities Insurance Authority, that party shall deliver a certificate of insurance showing compliance with this section.

10.3 Cost. Any additional cost for liability, property or other insurance required for the System will be included as an operating cost and payable by each Party under Capacity Allocation.

11. UTILITY TAXES

The Parties recognize that the Steigerwald Water System is being developed to provide wholesale water supplies to the Parties. Accordingly, revenues generated by the Steigerwald Water System, if characterized as such, are exempt from certain taxes. Each Party will therefore pay its own share of utility taxes, when owed, for revenue generated by their separate municipal water utilities.

12. GENERAL

12.1 Execution of Documents. The Parties will cooperate fully in executing documents that are necessary to develop and implement the Steigerwald Water System.

12.2 Filing. Prior to or on the Effective Date, the City Clerks of Camas and Washougal must list this Agreement by subject on that city's website or other electronically retrievable public sources. Washougal shall record this Agreement with the deed or other documents transferring title to the Real Property.

12.3 Records.

12.3.1 Washougal must maintain accounts and records that sufficiently and properly document its services and costs under this Agreement.

12.3.2 Upon reasonable notice, each Party may inspect and copy, without charge, all non-privileged records held by any other Party relating to this Agreement.

12.4 Notices. All notices required by this Agreement must be in writing by hand delivery, email, regular U.S. mail, or certified mail, return receipt requested.

If to Camas, notice must be sent to:

City Administrator
City of Camas
616 N.E. 4th Avenue
Camas, WA 98607

If to Washougal, notice must be sent to:

City Administrator
City of Washougal
1701 "C" Street
Washougal, WA 98671

Notice is considered given upon delivery or, if mailed, upon the earlier of actual receipt or three (3) business days after the date of mailing.

12.5 Indemnification. To the maximum extent permitted by law, Camas and Washougal indemnify and hold harmless the other Party and all of its officers, officials, employees, and volunteers from any and all claims, demands, injuries, losses, suits, actions, fines, penalties, and liability of any kind, including attorney fees, to the extent they arise out of or are related to the performance of this Agreement by the indemnifying Party or its officers, officials, employees, volunteers, agents, representatives, consultants, contractors, or subcontractors. This indemnity is not limited by a limitation on amount or type of damages, compensation, or benefits payable by or for the indemnifying Party under workers' compensation acts, disability benefit acts, or other employee benefit acts. This indemnity is specifically and expressly intended to constitute a waiver of the indemnifying Party's immunity under Washington Industrial Insurance (Title 51 RCW) with respect to only the other Party, and only to the extent allowable by law and necessary to provide the indemnified Party with a full and complete indemnity of claims made by the indemnifying Party's employees. This waiver has been mutually negotiated. The provisions of this Subsection 12.5 survive the expiration or termination of this Agreement.

12.6 Non-Waiver. The failure on the part of any Party to enforce its right as to any provision of the Agreement shall not be construed as a waiver of its rights to enforce such provision in the future.

12.7 Force Majeure. If a Party is rendered unable by Force Majeure, to carry out, in whole or part, its obligations under this Agreement and such Party gives notice and full details of the event to the other Party as soon as practicable after such occurrence, the obligations of the Party affected by the event (other than the obligation to make payments due for performance prior to the event) shall be suspended to the extent required. Under this Agreement, "force majeure" shall mean acts of God, wars, strikes, lockouts, labor disputes, civil disorder, acts of terrorism, fires, floods, volcanic eruptions, earthquakes or other causes beyond the reasonable control of the affected Party.

terrorism, fires, floods, volcanic eruptions, earthquakes or other causes beyond the reasonable control of the affected Party.

12.8 Entire Agreement; Amendment. This Agreement contains the entire written agreement among the Parties and supersedes all prior discussions and agreements. This Agreement may be amended only in writing, signed by all Parties.

12.9 Termination of Existing Agreement. On the Effective Date, that 2006 Inter-Local Cooperation Agreement between the City of Camas and the City of Washougal (July 17, 2006) terminates. All cost and responsibility allocations with respect to the Steigerwald Water System are governed by this Agreement.

12.10 Authorship. This Agreement reflects the Parties' joint drafting efforts. In the event any dispute, disagreement, or controversy arises regarding this Agreement, the Parties will consider each other as joint authors and no provision may be interpreted against any Party because of authorship.

12.11 Successors and Assigns. All of the provisions contained in this Agreement are binding upon the successors and assigns of the Parties.

12.12 No Third Party Rights. This Agreement is solely for the benefit of the Parties and does not confer rights to any other individual or person.

12.13 No Joint Venture. This Agreement does not form any joint venture, partnership, administrative entity, or separate municipal corporation between the Parties. Washougal's officers, officials, employees, volunteers, agents, representatives, consultants, contractors, and subcontractors will not be deemed, and may not represent themselves as, employees of Camas.

12.14 Severability. If any section or part of this Agreement is held by a court of competent jurisdiction to be invalid or unenforceable, that action will not affect the validity or enforceability of any other section or part of this Agreement.

13. TERM AND TERMINATION

13.1 Effective Date. This agreement shall be effective upon last signature by the respective Parties hereto.

13.2 Term. The term of this Agreement is ten (10) years plus the remainder of the calendar year in which it becomes effective, ending on December 31, 2025. The term will automatically extend for two (2) consecutive terms of ten (10) years unless at least one Party gives the other Party notice of intent to terminate the Agreement on or before December 31 of the year prior to the year in which the Agreement will expire. Upon expiration of the second extension of ten (10) years, this Agreement will automatically extend for additional calendar-year terms until at least one Party gives the other Party notice of intent to terminate the Agreement on or before December 31 of the year prior to the year in which the Agreement will expire.

13.3 Termination. Either Party may terminate this Agreement for a default by the other Party if the defaulting Party has not cured the default or complied with the Order as provided in Agreement Section 8. Prior to termination, the Public Works Directors of the Parties will propose for approval by the governing bodies of each Party a plan to wind up the Project affairs, allocate assets of the Steigerwald Water System and administer the approved plan. Failure to agree on a plan is governed by Agreement Section 9.2. All applicable costs generated up to and including the date of termination shall be and remain the responsibility of the terminated Party to pay.

13.4 Withdrawal. Either Party may elect to withdraw from this Agreement as follows. The withdrawing Party shall provide at least five (5) years' advance written notice of its intent to withdraw. Such notice shall be delivered consistent with Section 14.4. The effective date of withdrawal shall be 11:59 PM on December 31 of the year following the five (5) years' notice is issued. Withdrawal has the same effect as termination and shall be governed by Agreement Sections and 9.2 and 13.3.

EXHIBIT A:
REAL PROPERTY

A tract of land together with an easement for access and transmission main located in portions of Sections 17, 20 and 21, Township 1 North, Range 4 East, Willamette Meridian, Clark County, Washington; said tract is a portion of that particular parcel shown on the official record of survey recorded in Book 43 at Page 9, Records of Clark County, Washington, being more particularly described as follows:

Beginning at the Northwest corner of said Section 21 per said record of survey in Book 43 at Page 9;
Thence South 62°02'18" East a distance of 3,104 . 73 feet to the northerly right of way line of the dike road as shown in said survey and the point of beginning of this description;
Thence along the following described courses:
North 10°34'45" East a distance of 461 . 58 feet;
South 88°36'01" East a distance of 347 . 39 feet;
South 68°07'52" East a distance of 343.29 feet;
South 73°19'26" East a distance of 198.86 feet;
South 73°26'56" East a distance of 160.51 feet;
North 17°28'45" East a distance of 102.65 feet;
South 67°16'49" East a distance of 31. 65 feet;
South 65°33'04" East a distance of 376.31 feet;
North 63°42 ' 19" East a distance of 112.43 feet;
South 01°23'59" West a distance of 292.78 feet to a point here and after referred to as Point "A" said point also being located on the northerly dike road right of way line; Thence following along said northerly line the following described courses:
North 88°35'14" West a distance of 850.42 feet to the beginning of a curve concave to the north having a radius of 2,782.47 feet;
Thence northwesterly 113.96 feet along said curve through a central angle of 2°20'10";
Thence North 86°15'03" West a distance of 141.48 feet;
Thence North 03°44'56" East a distance of 30.00 feet;
Thence North 86°15'03" West a distance of 516.09 feet to the TRUE POINT OF BEGINNING.

Together with an easement beginning at said Point "A"; Thence South a distance of 35.00 feet to the centerline of said dike road and the beginning of this easement description; being 20 feet in width and lying 10 feet on each side of the following described centerline: Following westerly and northwesterly on and along the centerline of said dike road to a point due South of said Northwest corner of Section 21; Thence North 38°03'10" West leaving said dike road centerline a distance of 432 . 82 feet to a concrete monument with brass cap located in the centerline of Index Street as shown on Record of Survey recorded in Book 14 at Page 50, Records of Clark County, Washington, and the terminus of this easement description.

APPENDIX I

EMERGENCY RESPONSE PLAN

OCTOBER 2019

WATER SYSTEM EMERGENCY RESPONSE PLAN

FEDERAL AND STATE REQUIREMENTS

FEDERAL REQUIREMENTS

Under the Public Health Security and Bioterrorism Preparedness and Response Act (Bioterrorism Act), Public Law 107-122 of June 12, 2002, drinking water systems serving more than 3,300 but less than 50,000 customers must complete a vulnerability assessment by June 30, 2004 and an emergency response plan (ERP) by December 30, 2004.

The U.S. Environmental Protection Agency (EPA) considers completion to mean the date on which the vulnerability assessment and certification were sent to EPA. The City submitted its vulnerability assessment on June 30, 2004, and the City completed its ERP certification by December 30, 2004.

The Bioterrorism Act requires the ERP to incorporate the results of the vulnerability assessment and include the following:

- Plans, procedures and equipment that can be implemented or utilized in the event of a terrorist or other intentional attack on the public water system.

- Actions, procedures and identification of equipment that can obviate or significantly lessen the impact of terrorist attacks or other intentional actions on the public health and the safety and supply of drinking water provided to communities and individuals.

STATE REQUIREMENTS

The operations and maintenance section of Chapter 246-290-415 (2)(b) WAC requires public water systems in Washington to have an emergency response plan as part of a water system plan. It also requires that systems employ reasonable security measures to protect the raw water intake facilities, water treatment processes, storage facilities, pump houses, and distribution systems from possible damage or intruders. The State requirements for emergency response must address all applicable hazards that could lead to abnormal operating conditions, such as flood, fire, unscheduled power outages, facility failure and system maintenance.

WATER SYSTEM EMERGENCY RESPONSE PLAN OUTLINE

Both the EPA and Washington State Department of Health (DOH) have prepared guides to develop emergency response plans that will comply with the Bioterrorism Act.

- *Emergency Response Guidance for Small and Medium Community Water Systems to Comply with the Public Health Security and Bioterrorism Preparedness and Response Act of 2002*, EPA 816-R-04-002, April 2004.

- *Emergency Response Planning Guide for Public Drinking Water Systems*, DOH Publication 331-211, May 2003.

The City's water system emergency response plan is based primarily upon the EPA guidance document, which establishes eight basic elements for an ERP:

1. System Specific Information
2. Community Water System Roles and Responsibilities
3. Water System Communication Procedures
4. Personal Safety
5. Identification of Alternative Water Sources
6. Replacement of Equipment and Chemicals
7. Property Protection
8. Water Sampling and Monitoring

The DOH planning guidance has been utilized to develop the eight elements of this ERP. Whenever possible, terminology used by the Department of Homeland Security and its sub-agency, the Federal Emergency Management Agency (FEMA) as well as the Occupational Safety and Health Administration (OSHA) and the National Fire Protection Association (NFPA) has been used relative to emergency management principles, hazardous materials response, mass casualty response and emergency medical response.

The following documents from EPA Water Security website were a technical resource for this ERP as well:

(Reference: http://cfpub.epa.gov/safewater/watersecurity/index.cfm)

Planning for and Responding to Drinking Water Contamination Threats and Incidents Response Protocol Toolbox (December 2003)

- Overview and Application
- Module 1: Water Utility Planning Guide
- Module 2: Contamination Threat Management Guide
- Module 3: Site Characterization and Sampling Guide
- Module 4: Analytical Guide
- Module 5: Public Health Response Guide

- Module 6: Remediation and Recovery Guide

EMERGENCY PLANNING AND OPERATION PRECEPTS

To be effective in a resource-constrained environment where multiple response agencies are involved, emergency planning for a water system must be considered in the context of the community's overall planning for emergency operations. The following sections identify and discuss the various plans that the City utilizes in its "all hazards" emergency management program.

CITY OF CAMAS DISASTER MANUAL

The City's Disaster Manual identifies the Emergency Response functions within the City based on a modified Incident Command System. The City Fire Chief is designated as the Incident Commander. The five functions coordinated by the incident commander are as follows:

- Police
- Public Information Officer
- Resource Officer (includes Public Works)
- Communications
- Disaster Control Officer

Emergency Operations Center (EOC)

The EOC is located at the City Police Department Headquarters building and provides overall direction, control and coordination of an incident. The EOC is primarily concerned with resource management and coordination between City Departments and other County/Regional, State and Federal emergency response and management agencies.

On-Scene Emergency Management

On scene management of emergencies is the responsibility of the Disaster Control Officer, who has a number of functions to coordinate, including:

- Suppression (includes rescue and control)
- Safety
- Triage

The City does not have its own hazardous materials response capability. This response capability is available from the City of Vancouver and the Georgia Pacific paper mill through a coordinated response plan that was development by the County Regional Emergency Services Agency.

CLARK COUNTY REGIONAL EMERGENCY SERVICES AGENCY (CRESA)

The City utilizes the Clark County Regional Emergency Services Agency (CRESA) as its emergency management agency. CRESA also serves as the Local Emergency Planning Authority under the Superfund Amendments and Reauthorization Act (SARA) Title III (also known as the Emergency Planning and Community Right to Know Act – EPCRA) for communities in Clark County, including the City of Camas, the City of Washougal and the City of Vancouver. The CRESA website is:

http://www.cresa911.org/

RELATED COUNTY AND REGIONAL PLANS

In the event local capabilities to manage an incident are exceeded, the City will utilize mutual aid partners through the following plans and guidance documents:

- Clark County Regional Hazardous Materials Response Plan
- Washington State Department of Transportation Public Works Emergency Response Mutual Aid Agreement
- Interlocal Agreement between the City of Camas and the City of Washougal for Equipment Acquisition
- Reimbursable Services Agreement between Clark County Department of Public Works and the City of Camas

HAZARD IDENTIFICATION AND VULNERABILITY ANALYSIS

The City of Camas utilizes the Clark County Hazard Identification and Vulnerability Analysis as the primary means for identifying hazards and vulnerabilities. The Clark County HIVA was last updated in 2003.

To comply with the Bioterrorism Act, the City completed a water system vulnerability assessment (WSVA) in June 2004. The results of the WSVA are considered confidential and will not be addressed as to their specific finding and recommendations in the ERP. However, the ERP must incorporate the WSVA results in terms of providing response plans that address the general categories of vulnerabilities identified in the WSVA.

Table 5-1 summarizes all hazards identified in the County HIVA and the City's WSVA that have been considered in the development of the City's ERP; the final column identifies those hazards considered significant enough to address in the City's water system ERP. Clark County has assigned probability, vulnerability and risk levels to each hazard. Each of these parameters is discussed in greater detail below.

Probability

An adjective description (High, Moderate, or Low) of the probability of a hazard impacting Clark County within the next 25 years is assigned to each hazard. Probability is based on an assessment of a hazard's frequency using information provided by relevant sources, observations and trends.

- HIGH: There is great likelihood that a hazardous event will occur within the next 25 years.

- MODERATE: There is moderate likelihood that a hazardous event will occur within the next 25 years.

- LOW: There is little likelihood that a hazardous event will occur within the next 25 years.

Vulnerability

An adjective description (High, Moderate, or Low) of the potential impact a hazard could have on Clark County is assigned to each hazard. It is the ratio of population, property, commerce, infrastructure and services at risk relative to the entire County.

- HIGH: The total population, property, commerce, infrastructure and services of the county are uniformly exposed to the effects of a hazard of potentially great magnitude. In a worst case scenario there could be a disaster of major to catastrophic proportions.

- MODERATE**:** The total population, property, commerce, infrastructure and services of the county are exposed to the effects of a hazard of moderate influence;

  or

  The total population, property, commerce, infrastructure, and services of the county are exposed to the effects of a hazard, but not all to the same degree;

  or

  An important segment of population, property, commerce, infrastructure, or service is exposed to the effects of a hazard. In a worse case scenario there could be a disaster of moderate to major, though not catastrophic proportions.

- LOW: A limited area or segment of population, property, commerce, infrastructure, or service is exposed to the effects of a hazard. In a worse case scenario there could be a disaster of minor or moderate proportions.

Risk Rating

An adjective description (High, Moderate, or Low) of the overall threat posed by a hazard over the next 25 years. It is a subjective estimate of the combination of probability of occurrence and vulnerability.

- HIGH: There is strong potential for a disaster of major proportions during the next 25 years;

  or

  History suggests the occurrence of multiple disasters of moderate proportions during the next 25 years. The threat is significant enough to warrant major program effort to prepare for, respond to, recover from, and mitigate against this hazard. This hazard should be a major focus of the emergency management training and exercise program.

- MODERATE: There is moderate potential for a disaster of less than major proportions during the next 25 years. The threat is great enough to warrant modest effort to prepare for, respond to, recover from, and mitigate against hazard. This hazard should be included in an emergency management training and exercise program.

- LOW: There is little potential for a disaster during the next 25 years. The threat is such as to warrant no special effort to prepare for, respond to, recover from, or mitigate against this hazard. This hazard need not be specifically addressed in the county's emergency management training and exercise program except as generally dealt with during hazard awareness training.

TABLE 5-1

Hazard Identification and Vulnerability Assessment Summary City of Camas

Hazard Classification	Hazard	Probability	Vulnerability	Risk	Applies to City of Camas Water System
Drinking Water Unique	Bacteriological Contamination	MODERATE	MODERATE	MODERATE	X
Natural Disaster	Drought	HIGH	MODERATE	MODERATE	X
	Earthquake	HIGH	HIGH	HIGH	X
	Flood	HIGH	MODERATE	HIGH	X
	Forest/Wildland Fire	MODERATE	MODERATE	MODERATE	X
	Landslide	HIGH	LOW	MODERATE	X
	Severe Local Storm	HIGH	HIGH	HIGH	X
	Tornado	HIGH	LOW	LOW	X
	Volcano	LOW	MODERATE	LOW	X
Technological Hazards	Airplane Crash	MODERATE	LOW	MODERATE	X
	Dam Failure	LOW	LOW	LOW	X
	Hazardous Materials	HIGH	MODERATE	HIGH	X
	Energy Emergency	MODERATE	MODERATE	MODERATE	X
	Transportation Accident	MODERATE	LOW	MODERATE	X
	Urban Fire	MODERATE	MODERATE	MODERATE	X
Criminal Activity	Terrorist Use of Chemical, Biological, Radiological, Nuclear Agents and Explosives	LOW	MODERATE	MODERATE	X
	Cyber Attack	LOW	MODERATE	MODERATE	X
	Vandalism	LOW	MODERATE	MODERATE	X

SYSTEM SPECIFIC INFORMATION

Chapter 3 of this manual provides a complete description of the City's water system facilities.

Interties

The City currently has an emergency intertie agreement with the City of Washougal to the east. The City has two one-way PRV interties with Washougal, located on SE Shepherd Street and at the intersection of SE 3rd Street and Whitney Street. These interties provide water from the City of Camas to the City of Washougal under low pressure conditions. The City also has an intertie agreement with the City of Vancouver located east of SE 192nd Ave just north of Brady Road in the Columbia Palisades development.

Telemetry and Control System

The City's telemetry system monitors levels in the storage facilities and the status of the booster pump stations and groundwater wells. Installed in 1988 and continually upgraded, the system allows the City to record various systems such as pump runs, reservoir drain and fill and other metering information. The system also has the capability of reading instantaneous flow from individual pumps. The system allows the City to monitor and control the operation of these facilities from the office and over the Internet from home. The chemical feed system for the Washougal wellfield and can be remotely monitored in its operations in the same manner as the wells, reservoirs and booster stations.

Supervisory Control and Data Acquisition (SCADA) System

The City has a SCADA system with master control located at the City Operations Center. The system uses programmable control software, which can be controlled by a personal computer at the operations center or remotely by a modem connected to a remote computer. The system monitors reservoir levels, well status, well flow rate, booster pump flow rate when metered, pump status, run time and alarm conditions. Reservoir levels are recorded on circular charts on a continual basis. The City also has the ability to monitor the drawdown level in the aquifer at Washougal Well field.

WATER SYSTEM ROLES AND RESPONSIBILITIES

PUBLIC WORKS DIRECTOR

The City water system is operated by the Public Works Department. In the event of an emergency sufficient to activate the EOC, the City's Public Works Director or designated representative will locate to the EOC at the Police Department. The Public Works EOC representative is responsible for coordinating all public works functions with other

members of the EOC Operations Group. The Public Works Director also serves as the Public Information Officer for all Public Works matters.

UTILITIES MANAGER

The water system is one of several utilities within the Public Works Department that is managed by the Utilities Manager, who reports directly to the Public Works Director. In the event of an emergency involving the water system, the Utilities Manager will serve as the on-scene Incident Commander until properly relieved by an appropriate Police or Fire Department representative. The Utilities Manager is responsible for all aspects of the water system during an emergency, including damage assessments, assessing customer impacts, coordinating with jurisdictional public health agencies and adjacent water utilities, keeping the public and media informed through the City's Public Information Officer, and working with the Public Works Engineering Manager for design and construction services required for repair and recovery operations.

OPERATIONS LEAD

The water utility has a Lead operator reporting to the Utilities Manager, who is responsible for operating the water system during an emergency. The Lead Operator assists the Utilities Manager in damage assessments and coordinating repair and recovery operations.

WATER QUALITY MONITOR

Within the water division a water system operator is assigned responsibility for water quality monitoring. The responsibilities for water quality monitoring for routine compliance sampling and testing are outlined in the Operations and Maintenance manual. Positive coliform events of the water system require the water quality monitoring operator to follow procedures as outlined in the water sampling and monitoring section within this plan. Intentional contamination of the water system is covered in a separate incident specific plan at the end of this plan.

WATER SYSTEM COMMUNICATION PROCEDURES

The City Disaster Manual establishes communications procedures during an emergency. The City utilizes a 911 call service operated by CRESA, which provides dispatch services for fire police and emergency medical services.

The City maintains emergency phone number lists for use by City personnel. The list contains City staff home phone numbers, addresses and cell phone numbers. The second list includes the numbers for emergency services, generator rentals, adjacent utilities, fuel suppliers, parts supplies, safety equipment, pumper trucks, and contractors. The emergency phone numbers are updated frequently as phone numbers change. These lists are provided in the Appendix G.

The employee on-call will be the first person notified in the event of an emergency, disaster, or incident. The responding party shall report to the command center for a briefing and further instructions. The on-call employee shall be in charge of all Public Works functions until relieved by a higher-ranking Public Works employee.

At the command center, the on-call employee will receive a "Public Works Department Duty Checklist." A copy of this form is provided in the Appendix H. The employee is to fill out the checklist. The employee is to determine if it is within the employee's capabilities to handle the incident requirements of the Public Works Department. If the employee is unable to fill the needs of the incident, the employee shall notify the Water/Sewer Supervisor. The Water/Sewer Lead Operator shall notify the Public Works Utilities Manager of the incident.

The City of Camas Disaster Manual provides additional procedures for Public Works response. A copy of this document can be found in the offices of the Public Works Director and the Public Works Operations Manager. It is an orange manual and all Public Works employees should be familiar with the contents and procedures.

In the event that public notification is required during a water system emergency, the Public Works Director provides information to the media for this purpose.

Liaison with the Washington State Department of Health (DOH) is normally the responsibility of the Public Works Director. An emergency contact list for DOH is presented in Table 5-2.

TABLE 5-2

Emergency Contact List for DOH

Agency/Contact	Contact Telephone Number	Purpose
DOH Hot Line DOH SWRO After Hours	(877) 481-4901 (360) 236-3030	After Hours Emergencies.
DOH/Regional Engineer	(360) 236-3018	Regulatory Assistance
DOH/Coliform Program Manager - SWRO	(360) 236-3044	Coliform Monitoring

The City has entered into a mutual aid agreement with the City of Vancouver and several other public works organizations. The contact names and phone numbers for the responsible individuals for those purveyors are presented in Table 5-3.

TABLE 5-3

Mutual Aid Water Utility and Public Works Contacts

Utility	Contact Person	Contact Number	
		Phone	FAX
City of Vancouver	Tyler Clary	(360) 487-7169 (360) 989-6381	(360) 696-8002
City of Washougal	Trevor Evans	(360) 835-2662 (360) 835-8501	(360) 835-8808
Clark County	Ahmad Quayomi	(564) 397-4358	(360) 397-6051
Clark Public Utilities	Doug Quinn	(360) 992-8022 (360) 992-3000(1)	(360) 992-8027
Washington State Department of Transportation	Bob Kofstad	(360) 905-2007 (360) 921-9119(1)	(360) 905-2075

(1) After hours

PERSONAL SAFETY

EVACUATION PLANS

The City's Disaster Manual provides limited guidance for evacuation operations. The Police Department has overall responsibility for evacuation operations. Each City Department and Division is responsible for developing emergency evacuation plans for its department/division.

The on-scene incident commander will normally direct evacuation operations. The Incident Commander at the scene will initially be the senior City employee at the scene; the on-scene incident commander duties will eventually be assumed by a Police or Fire Department representative depending upon the nature of the emergency.

The Occupational Safety and Health Administration (OSHA) provides guidance on developing evacuation plans for terrorist incidents:

http://www.osha.gov/dep/evacmatrix/index.html

Per the City's Disaster Manual, the Fire Department will be responsible for incident command during a hazardous materials (HAZMAT) release as this duty requires specific training and certification under federal regulations. City and Regional Emergency Plans for terrorist incident response also require that HAZMAT protocols and procedures be followed for incidents involving the intentional release of chemical and biological agents.

EVACUATION ROUTES AND EXITS

Evacuation routes and exits for City facilities are to be posted at each facility. In the event of an evacuation from an area that encompasses more than one facility, the City Police or Fire Department will identify additional evacuation routes as needed. During an incident involving the release of hazardous materials, the Fire Department is responsible for identifying evacuation routes that mitigate hazards to evacuees. In the absence of direction from the Fire Department, the general rule for evacuation during a hazardous materials release is to travel uphill and upwind of the release.

ASSEMBLY AREAS AND ACCOUNTABILITY

Assembly areas for evacuation from City facilities are posted along with evacuation routes and exits at City facilities. In the event of an evacuation from an area that encompasses more than one facility, the City Police or Fire Department will identify additional assembly areas as needed. The senior water division employee is responsible for ensuring that all personnel are accounted for at the assembly area after an evacuation has been conducted.

SHELTER

Sheltering is not addressed in the City's Disaster Manual. The City defers to CRESA for emergency sheltering operations. The City is responsible for sheltering of City employees; this responsibility includes identifying City facilities that may be used for sheltering during a emergency.

TRAINING AND INFORMATION

All water utility employees are provided with the following training:

- Blood borne pathogens
- Cardiopulmonary resuscitation (CPR)
- Defensive driving
- Emergency first aid
- Emergency response awareness (including FEMA ICS - IS195)
- Equipment lock-out/tag-out procedures
- Fall protection
- Fire extinguishers/evacuation
- Hazard communication
- Hearing conservation and testing
- Protection from water borne pathogens

When appropriate for their duties, water utility employees are provided training in:

- Bucket truck
- Confined space (aerial platform)

- Forklift operation
- Respiratory protection and fit testing
- Trenching and shoring

Water utility employees are issued protective equipment appropriate to their job responsibilities including hard hats, safety goggles, work gloves and safety boots.

Recommended training: The water quality monitor should be trained in hazardous materials awareness (reference: 29 CFR 1910.120). This training is available from the City Fire Department.

Emergency Equipment

The water utility has a hoist, harness and gas detection equipment for confined space entry. All employees are issued hard hats and reflective safety vests. All trucks are equipped with emergency first aid kits.

FIRST AID

Water utility employees are trained in emergency first aid that includes the following:

- How to determine the safe response to an emergency situation.
- Recognizing and caring for life-threatening emergencies in adults, such as respiratory, choking, and cardiac problems.
- Caring for injuries including severe cuts and burns, sprains and strains.
- Caring for sudden illnesses such as poisonings, bites, and stings.
- Recognizing and caring for heat- and cold-related emergencies.
- Workplace emergency procedures, including notifications for medical emergencies.

The Fire Department provides emergency medical services for trauma victims whose injuries exceed emergency first aid treatment.

IDENTIFICATION OF ALTERNATIVE WATER SOURCES

INTERTIES

The City has interties with the City of Washougal and the City of Vancouver that would normally be used to supply water to either City. The City has no other interties and therefore, must generally be self-sufficient in the event of a water shortage or water system failure. If necessary, the City would consider attempting to pump (boost) water from either Washougal or Vancouver into the City's system.

REDUNDANCY IN CITY WATER SYSTEM

The City has several wells and a surface water source that provide some redundancy in the event certain elements of the water system fail. For example, if the Washougal Wellfield is flooded, the surface water source may serve as a backup, with water conservation measures in place to offset the loss of the wellfield.

Emergency Water Supplies

Under the County's CEMP, citizens are urged to keep a 72-hour supply of food and water in the event of an emergency. The City will endeavor to supply potable water to support emergency operations within its capabilities.

TRANSPORT OF POTABLE WATER DURING EMERGENCIES

If the City obtains potable water by transporting from another source, DOH has issued guidelines for water system utilities that deliver potable water to the public during emergencies. This guidance is found at the following website and are summarized below:

http://www.doh.wa.gov/ehp/dw/Publications/Truck_Transport.htm

General

- DOH recommends that someone with water treatment expertise be responsible for the operation and management of trucked potable water.

- The City should contact the regional office of the DOH Division of Drinking Water (DOH-DDW) or local health department to discuss current requirements and approve the proposed operation. [see WAC 246-290-415(2)(d) and 246-290-451(4)]. Northwest Regional Office (Kent) – (253) 395-6750.

Truck Container

- The truck container must be contaminant-free and capable of being maintained so that water contamination is prevented.

- If a truck container has been previously used only for potable water and has been protected from possible contamination, it may be used without disinfection and testing for bacteria.

- Truck containers that cannot pass the initial testing criteria after disinfection (i.e. absence of coliforms) shall not be used.

- Trucks previously used for substances other than potable water will be evaluated on an individual basis. Consult with DOH before using trucks that may have previously carried toxic or other non-potable liquids.

- All truck containers must be filled or emptied through an air gap or approved double-check valve assembly, in accordance with WAC 246-290-490.

Initial Truck Disinfection

- The tank and all hoses, pumps, and other equipment used in handling water should disinfected by filling with water containing at least 50 to 60 parts per million (ppm) of chlorine and then held in the tank for at least 24 hours.

- One gallon of liquid bleach is required in every 1,000 gallons of water to produce 50 to 60 ppm. Bleach should be 5.25 to 6 percent hypochorite with no additives. Bleach should be added in proportion to the water as the tank is being filled, e.g., add approximately one-half gallon of bleach with each 500 gallons of water.

- The chlorine solution must be flushed from the tank after 24 hours.

- Once the tank is emptied, refill it with the water to be transported, and test for coliform bacteria. If coliforms are present, repeat the process. If the tank cannot be disinfected to eliminate coliforms, it must not be used.

- Water to be transported by tank trucks should contain a free chlorine residual of about one part per million (1 ppm or 1 mg/L) at the beginning of the haul.

Source of Water

- The source for emergency trucked water must come from an approved public water supply, unless otherwise approved by DOH.

- Every precaution should be taken to ensure that the water remains potable once it is collected and transported.

Receiving Tank

- The water system's receiving tanks must be inspected to assure that water quality issues will not occur during filling and later distribution to consumers.

- Receiving tanks must be cleaned and disinfected using the procedures for truck containers (see "Initial Truck Disinfection" guidelines).

- The receiving tanks must be kept secure and protected from contamination throughout the emergency response.

- The customer's receiving tank must be filled through an air gap or an approved double-check valve assembly in accordance with WAC 246-290-490.

Documentation and Record Keeping

- The receiving water system is responsible for documenting and keeping proper records of the emergency trucked water operation.

- Records should be retained for at least 6 months for review upon request by health agencies, haulers, or the supplying water system.

REPLACEMENT OF EQUIPMENT AND CHEMICALS

EQUIPMENT AND SUPPLIES

A list of equipment suppliers that the City has access to for emergencies is provided in Appendix I.

CHEMICALS

Table 5-4 lists chemicals used by the City in its water treatment processes. Appendix J provides a list of chemical suppliers.

To assist the City in identifying chemicals with emergency planning implications, threshold quantities under EPCRA, the Comprehensive Environmental Response

Compensation and Liability Act (CERCLA), and the Clean Air Act (CAA) are also shown in Table 5-4, where applicable.

The applicability of each regulation is briefly discussed below.

Use and Storage – EPCRA governs reporting requirements for chemicals, either in use or in storage, that pose a significant environmental or health hazard.

Liquid Spill – In the event of a spill where the quantity exceeds the CERCLA threshold, certain reporting requirements will be in effect.

Risk of Air Release – Gaseous chemicals will require a risk management plan if they exceed threshold quantities.

Explanatory notes following Table 5-4 provide greater detail regarding reporting requirements.

The City should coordinate all EPCRA, CERCLA and CAA planning and reporting requirements with CRESA.

Hazardous substance releases should be reported to the Washington State Department of Ecology (Ecology) and responses coordinated with CRESA through the City Fire Department.

CRESA Phone: (360) 737-1911

Ecology 24-Hour Spill Response Phone: (800) 258-5990
National Response Center (800) 424-8802

TABLE 5-4

Water Treatment Chemicals used by the City of Camas

Name[1]	Use[2]	CAS/EPCRA Section 313 Category Codes[3]	EPCRA Section 302 EHS TPQ[4] (pounds)	EPCRA Section 304 EHS RQ[5] (pounds)	CERCLA RQ[6] (pounds)	EPCRA Section 313[7]	CAA 112(r) TQ[8] (pounds)
Sodium fluoride (> 99%)	F	7681-49-4	N/A	N/A	**1,000**	N/A	N/A
Sodium hydroxide (20 – 30%)	CO/pH	1310-73-2	N/A	N/A	**1,000**	N/A	N/A
Sodium hypochlorite (5-12.5%)	DI	7681-52-9	N/A	N/A	**100**	N/A	N/A

All reporting quantities noted in **bold** font n/a = not applicable.

(1) The chemicals listed above were taken from an extensive inventory of chemicals provided in a document titled *List of Lists, Consolidated List of Chemicals Subject to the Emergency Planning and Community Right-to-Know Act (EPCRA) and Section 112(r) of the Clean Air Act (consolidated list), EPA,550-B-01-003, October 2001.* EPA put the list together to help chemical handling firms determine what reporting requirements apply under sections 302, 304, or 313 of EPCRA and if they are subject to the accident prevention regulations under CAA section 112(r). The chemical names are those that are generally used in the regulatory programs developed under EPCRA, CERCLA, and CAA section 112(r)

(2) Use Definitions: Coagulant (CG); Corrosion Control (CO); Disinfection (DI); Fluoridation (F); pH Adjustment (pH).

(3) The chemicals above are organized under the Chemical Abstracts Service (CAS) registry number and the EPCRA Section 313 category codes.

(4) EPCRA Section 302 includes a list of *Extremely Hazardous Substances* (EHSs). The presence of EHSs in quantities at or above the Threshold Planning Quantity (TPQ) require local emergency planning committees to develop emergency response plans and notify State emergency response committees. Facilities with a listed EHS are subject to the reporting requirements of EPCRA section 311. The facility must provide a material safety data sheet or a list of covered chemicals to State and local emergency response committees and the local fire department. The minimum TPQ for section 311 reporting is 500 pounds or the TPQ, whichever is less. EHS TPQ and RQ are represented in pounds.

(5) Under EPCRA Section 304, releases of reportable quantities (RQ) of EHSs are subject to State and local reporting.

(6) Under Section 304 of EPCRA, releases of hazardous substances listed in the Comprehensive Environmental Response, Compensation, and Liability Act of 1980 (CERCLA) are to be reported to the National Response Center, as well as to the State and local emergency response committees. The CERCLA RQ column shows the reportable quantities (in pounds) for chemicals that are CERCLA hazardous substances as listed in 40 CFR Part 302, Table 302.4. Solid metals listed under CERCLA, with mean diameters greater than 100 micrometers, are not reported. The CERCLA RQs listed above apply to smaller particles.

(7) Under the column titled Section 313, the notation "313" means that the chemical is required to report under section 313 and 6607 of the Pollution Prevention Act. An "X" indicates that this chemical may have a second name or that the same chemical may have the same CAS number listed under a different name. The lower case "c" indicates that a chemical must report under one or more of the EPCRA section 313 chemical categories even though it has no CAS number.

(8) Under CAA section 112(r) EPA identified 77 toxic substances and 63 flammable substances, including their threshold quantities (TQs), which are subject to accident prevention provisions. The requirements for risk management programs for accidental release prevention are found in 40 CFR Part 68. CAA section 112(r) lists several substances in solution that are covered only in concentrations above a specific level. Most of these chemicals are listed above and include ammonia CAS #7664-41-7 (concentrations 20 percent or greater); hydrochloric acid CAS #7647-01-0 (concentrations 37 percent or greater); hydrogen fluoride/hydrofluoric acid CAS #7664-39-3 (concentrations 50 percent or greater); and nitric acid CAS #76997-37-2 (concentrations 80 percent or greater). CAA section 112(r) TQs are in pounds and apply to those quantities within a process and not at the facility as a whole.

PROPERTY PROTECTION

The City controls access to its water facilities using barriers and locks. Reservoirs are fenced, with access controlled by locked gates. Utility vaults are covered and locked. The City maintains strict control over its keys. Employees are issued keys only to those facilities they are required to access to perform their duties. The City has also partnered with residential customers to be vigilant of the areas around its well and reservoir sites to alert the City if they notice any suspicious activity.

WATER SAMPLING AND MONITORING

Water sampling for routine compliance is described in Chapter 2 of this manual.

Water sampling and monitoring for a coliform incident is described below under incident specific plans (bacteriological contamination).

Water sampling and testing for a suspected intentional contamination incident is described below under incident specific plans.

MAJOR WATER SUPPLY INTERRUPTIONS

WATER MAIN BREAKS

Depending on the location where the main break occurs, if susceptible populations are impacted, use contact list in Appendix B (Coliform Monitoring Plan) for notification. City will provide bottled water for lengthy outages. Depending on circumstances, portable toilets may be supplied as well. Trucked potable water may be provided. If the City uses trucked potable water, the guidelines in DOH Publication #331-063 will be followed.

The City maintains an inventory of piping and fittings to address most emergency repair requirements and has a list of vendor telephone numbers to obtain supplies when existing material stocks are inadequate for emergencies. When repairs are too large for City crews to manage, the City will contact contractors from its small works roster.

When water supply interruptions for a pressure zone are expected to be lengthy, the City will consider instituting measures to allow customers to come to a reservoir and obtain water directly from a reservoir. Any water dispensed in this manner will be done under the supervision of a City employee.

BOOSTER STATIONS

The City has developed detailed written procedures for operating the water system when booster stations are not in service and has figures showing locations of pumps, piping, meters, shut off valves and other key features of each facility, such as valve size/type, motor manufacturer/type/hp and pump capacity/type. Copies of these procedures, technical details and figures are kept at each facility.

A brief summary of the booster station emergency procedures follows.

Butler Booster Station

Auxiliary Power

The Butler Booster Station does not have an auxiliary power system.

HOA Setting

Emergency operation of the booster station may require the pump to be operated in the HAND mode to compensate for distribution system problems in other areas of the system during a power outage.

Backup Operations

Angelo Booster Station serves as a backup for feeding the Lower Prune Hill (455) Zone if the Butler Booster Station is out of service. The City has a standby pump for the 455 Zone at the Angelo Booster Station in the event that a pump is out of service. There is sufficient pumping capacity to the 455 Zone to operate with the largest pump out of service under normal system demands, including fire flow.

Gregg Booster Station

Auxiliary Power

The New Gregg Booster Station has a diesel powered 300-kW generator with automatic transfer switch capable of operating the New Gregg Booster Station pumps during a power outage.

HOA Setting

Emergency operation of the booster station may require the pump to be operated in HAND mode to compensate for distribution system problems in other areas.

Backup Operations

There is no back up in the event Gregg Booster Stations are out of service; however, there is sufficient pumping capacity at the Gregg Booster Stations to operate with the largest pump out of service under normal system demands, including fire flow.

Angelo Booster Station

Auxiliary Power

The Angelo Booster Station is equipped with a 200-kW diesel generator with an automatic transfer switch. This generator is capable of providing power to three of the pumps, the lighting, and the HVAC system.

Backup Operations

If Angelo Booster Station is out of service, Butler Booster Station and Forest Home Booster Station serve as back up to feed the upper zones (Lower Prune Hill, Lacamas, Upper Prune Hill) from the lower zone (Butler). The City has a standby pump at the Angelo Booster Station in the event that a pump is out of service. There is sufficient pumping capacity to the 455 Zone to operate with the largest pump out of service under normal system demands, including fire flow.

Lower Prune Hill Reservoir Out of Service

If the Lower Prune Hill Reservoir is out of service, one pump at the station will be placed into hand mode and operated with the reservoir isolated. The pressure relief valve at the station will bleed excess pressure to the inlet piping. This will allow the system to maintain a constant pressure in the zone. During this operation, the pump and pressure need to be monitored every two hours.

Forest Home Booster Station

Auxiliary Power

Auxiliary power is not available for the Forest Home Booster Station.

HOA Settings

During emergencies the booster station may need to be operated in the HAND mode to compensate for distribution system problems in other areas of the system.

Backup Operations

If the Forest Home Booster Station is out of service, Butler Booster Station and Angelo Booster Station serve as back up to feed the upper zones (Lower Prune Hill, Lacamas, Upper Prune Hill) from the lower zone (Butler). The City has a standby pump at the Angelo Booster Station in the event that a pump is out of service. There is sufficient pumping capacity to the 455 Zone to operate with the largest pump out of service under normal system demands, including fire flow.

Lacamas Booster Station

Auxiliary Power

The Lacamas Booster Station has an auxiliary generator with automatic transfer switch available to provide power. This generator is a 60 kW natural gas generator and is capable of running the two 500-gpm pumps, the building lights and ventilation system. This generator is able to provide the Lacamas Booster Station with power as long as natural gas service is not interrupted. If the generator fails during a power outage, water service can be maintained through the pressure reducing valve (PRV) stations that that connected to the system that feeds down from the Upper PruneHill Reservoir. Well No. 9 also serves the area supplied by Lacamas Booster Station, but since it does not have auxiliary power, it is more than likely unavailable during a power outage.

Lacamas Reservoir Out of Service

When the Lacamas Reservoir is out of service, pressure to the Lacamas (544) Zone can be maintained by operating one of the pumps in the Lacamas Booster Station. The pressure relief valve will return excess pressure to the inlet piping while maintaining the downstream pressure. Under this operating condition, the pump operation and pressure need to be checked every 2 hours. The 544 Zone can also be served from Upper Prune Hill through PRV stations.

Backup Operations

When the Lacamas Booster Station is out of service Well No. 9 and the Lower Prune Hill Booster Station can be used to feed the Lacamas (544) Zone.

Lower Prune Hill Booster Station

Auxiliary Power

This facility is equipped with a 300-kW diesel powered generator with an automatic transfer switch to operate the three pumps in the event of a power failure.

Temporary Pump

During high seasonal demands a mobile skid mounted pump is rented by the City to supplement the LPH Booster Station. This pump is installed via connections constructed for this purpose near the entrance to the pump station. It is operated in a manual mode and has a capacity between 600 and 700 gpm. This pump is not powered by the auxiliary power generator. The City also has pumping capacity available at the Upper Prune Hill Booster Station to serve the Upper Prune Hill area for temporary losses of service at the Lower Prune Hill Booster Station, but this is limited and cannot provide supply for extended interruptions in service or extended periods of high demands.

Upper Prune Hill Booster Station

Auxiliary Power

The Upper Prune Hill Booster Station is equipped with a manual transfer switch to allow the City to bring in a portable generator to supply power to the booster station. The portable generator used by the City can operate two of the 20-hp pumps.

RESERVOIR EMERGENCY PROCEDURES

General

The City has developed detailed written procedures for operating the water system when reservoirs are not in service. These procedures are kept at each facility. If a reservoir must be taken off line isolation valves are used to prevent water from being pumped into the reservoirs and the reservoirs are allowed to empty into the distribution system.

A brief summary of the reservoir emergency procedures follows.

Butler Reservoir

Water service is maintained to the system during cleaning / draining / disinfection of the reservoir with the following procedures.

- Connect 6-inch overflow piping to the 12-inch main in the Butler Yard.
- Open the 6-inch overflow valve.
- Open the 4-inch main connecting line valve between the 12-inch and 14-inch mains until water comes out of the 6-inch overflow.
- Close the two 12-inch valves in the reservoir valve pit to take the Butler Reservoir offline.

- Adjust the 4-inch connecting valve to maintain a small amount of water flow from the 6-inch overflow. As long as water flows from the overflow, water service will be maintained to the 343 Zone.

- Depending on the season and the demand, a well may need to be in operation to maintain system pressure in the 343 Zone.

- The pressure reducers on NE 22nd Avenue and NE Everett Street regulate pressure and keep the 343 Zone served.

Reverse the order to place the reservoir back online.

Gregg Reservoir

Water service can be maintained to the Gregg area by running a pump in the HAND position in the Gregg Booster Station. The pressure relief/bypass valve at the Gregg Booster Station will maintain pressure in the service area and also keep it from over pressurizing the zone. The Gregg Reservoir can be isolated after the pump in the Booster Station is placed into operation. Close attention will be paid to the system pressure and the pump to provide uninterrupted service.

Lacamas Reservoir

The Lacamas Reservoir is supplied from the Upper Prune Hill Zone via PRVs, from the Lower Prune Hill Zone via the Lacamas Booster Station, or from Well No. 9. As long as one of these facilities is in operation, the reservoir can be filled.

Water service can be maintained to the Lacamas area (544 Zone) by running a pump in the HAND position in the Lacamas Booster Station or Well No. 9. The pressure relief/bypass valve at the Lacamas Booster Station will maintain pressure in the service area and also keep it from over pressurizing the zone. The Lacamas Reservoir can be isolated after the pump in the Booster Station is placed into operation. Close attention must be paid to the system pressure and the pump to provide uninterrupted service.

Lower Prune Hill (LPH) Reservoirs

Emergency operation of the reservoir would be required if a problem were to occur with one of the reservoirs. If a reservoir were to experience a physical or water quality problem, one reservoir could be taken out of service and the remaining one could be used to supply water until the problem is solved. If the smaller of the two tanks was used alone, the start levels for the Butler, Forest Home, and the Angelo Booster will be raised to keep the reservoir full at all times.

Upper Prune Hill (UPH) Reservoirs

UPH 2.4-MG Reservoir

The 2.4-MG reservoir inlet has an altitude valve that closes to allow the UPH standpipe to fill when the reservoir is full (63-foot level). The UPH 2.4-MG reservoir outlet valve is normally opened, but is seismically controlled and will close in a seismic event. The UPH booster pumps will also be turned off in a seismic event.

If both the Lower Prune Hill and Upper Prune Hill Booster Stations are out of service and the Upper Prune Hill Standpipe level drops low enough, site valves can be opened to allow both the standpipe and the 2.4-MG Reservoir to float on the system.

Two of the booster pumps (No. 2 and No. 3) are equipped with modified pump control valves that employ two valves that are adjusted to drain the UPH 2.4-MG reservoir. Detailed procedures for using these pump control valves are provided at the UPH booster station.

UPH Standpipe

The UPH standpipe inlet valve is a spring-activated altitude valve that is designed to shut off when the standpipe is full. This valve is not controlled by the telemetry system. When the UPH standpipe altitude valve is closed, the UPH booster pumps operate based on the pump discharge pressure.

If the Upper Prune Hill Standpipe is out of service, the UPH area can be supplied by the UPH Booster Station and the LPH Booster Station. The LPH Booster Station operates based on reservoir level in the 2.4 MG UPH Reservoir. If the LPH Booster Station flows exceed system demands, the 2.4 MG UPH Reservoir will fill. If the 2.4 MG UPH Reservoir is full, the LPH Booster Station will shut off and the UPH Booster Station will be called in pressure mode and will supply the system. If system demands exceed the supply of the LPH Booster Station while it is in operation, the UPH Booster Station will be called in pressure mode to provide additional supply. Pressure mode for the UPH Booster Station is discussed below.

At the Upper Prune Hill Pump Control Panel Screen, the operator selects this setting at the pump control panel, which is a six step operating sequence (numbered 0 to 5) that is based satisfying a minimum pressure of the pump discharge. The operator sets the pressure at 40 psi, which simulates a full standpipe.

- Step 0 – no pumps on (40 psi is satisfied)
- Step 1 – pump 1 on and runs till 40 psi is satisfied
- Step 2 – pump 1 and 2 on if 40 psi is not satisfied after Step 1
- Step 3 – pump 1 and 3 on if 40 psi is not satisfied after Step 2
- Step 4 – pump 1, 2 and 3 on if 40 psi is not satisfied after Step 3
- Step 5 – all pumps on if 40 psi not satisfied after step 4

There is a 15 second delay built in between each step. Pumps turn off sequentially in 15 second intervals once 40 psi is satisfied.

WELLS

Detailed written operating instructions are maintained at each well. These instructions cover normal operations as well as response to pump and power failure. For wells with treatment facilities, written descriptions of shutdown and start up of treatment equipment is included with the written procedures. A brief summary of emergency operations at each well is provided below.

Well No. 5

There is neither a generator nor an angle drive to operate Well No. 5 during a power outage. Well No. 5 can be used to maintain pressure in the lower grid when the Butler Reservoir is out of service. Under these conditions, Well No. 5 has to be run from the HAND position from the pump house or the Operation Center master telemetry unit.

Well No. 6

There is neither a generator nor an angle drive to operate Well No. 6 during a power outage. Well No. 6 can be used to maintain pressure in the lower grid when the Butler Reservoir is out of service. Well No. 6 has to be run from the HAND position from the pump house or the Operation Center master telemetry unit.

Well No. 7

There is not a generator or an angle drive to operate Well No. 7 during a power outage. Well No. 7 can be used to maintain pressure in the lower grid when the Butler Reservoir is out of service. Well No. 7 has to be run from the HAND position from the well facility or the Operations Center master telemetry unit.

Well No. 8

During a power outage, Well No. 8 has an auxiliary engine and angle drive. Well No. 8 can be used to maintain pressure in the lower grid when the Butler Reservoir is out of service. Well No. 8 has to be run from the HAND position from the pump house or the Operation Center master telemetry unit during a power outage. The backup chlorination system is also run by the generator.

Well No. 9

There is neither a generator nor angle drive to operate Well No. 9 during a power outage.

Well No. 10

There is neither a generator nor angle drive to operate Well No. 10 during a power outage.

Well Nos. 11 and 12

The Washougal Wellfield Facility has its own diesel powered auxiliary generator with an automatic transfer switch. This generator is 350 kW and is designed to serve the Washougal Wellfield Treatment Facility during a power outage, to include the two well pumps, chemical feed pumps, controls for the well pumps and chemical feed system, HVAC system and lighting.

Well No. 13

The Well No. 13 Facility has its own diesel powered auxiliary generator with an automatic transfer switch and acoustical enclosure. This generator is 250 kW and is designed to serve the Well 13 Facility during a power outage, to include the well pump, chemical feed pumps, controls for the well pump and chemical feed system, HVAC system and lighting.

Well 14

The Well No. 14 Facility has its own diesel powered auxiliary generator with an automatic transfer switch and acoustical enclosure. This generator is 250 kW and is designed to serve the Well 14 Facility during a power outage, to include the well pump, chemical feed pumps, controls for the well pump and chemical feed system, HVAC system and lighting.

SURFACE WATER FILTRATION PLANT

Detailed written operating instructions are maintained at the Slow Sand Water Treatment Facility. These instructions cover normal operations as well as start up and shut down procedures. The plant is equipped with a 45 kW propane powered auxiliary generator in event of a power outage.

INCIDENT SPECIFIC RESPONSE PLANS

Per the hazard assessment summarized in Table 5-1, the following incident specific response plans are outlined below:

- Drinking Water Unique: bacteriological contamination

- Natural Disasters: drought, earthquake, flood, landslide/mudflow/debris flow, severe snow storm, tsunami, volcano

- Technological Hazards: power failure, dam failure, hazardous materials, urban fire, transportation accident

- Criminal Acts: Terrorism, cyber attack, vandalism

BACTERIOLOGICAL CONTAMINATION

WAC 246-290-320 establishes specific procedures for water utilities to follow should bacteriological contamination be detected in the water system. These procedures are outlined in Figure 5-1. If the chlorine disinfection residual in the distribution system is lost, it may be necessary to batch chlorinate the reservoirs and flush distribution piping.

For every 1.0 million gallons of storage, approximately 17 lbs. of 70 percent calcium hypochlorite (HTH) is necessary to provide a 1.0 mg/L chlorine residual. As an alternative, 18 gallons of 5.25 percent sodium hypochlorite, available as household bleach in the supermarket, can be added to 1.0 million gallons to provide a dose of 1.0 mg/L.

In the event of a suspected intentional contamination with a microbial agent, the protocols for intentional contamination shall be followed in addition to the procedures outlined here. Law enforcement authorities will need to be consulted prior to making public notifications as discussed further in the intentional contamination incident plan.

Boil Water Notification

Emergencies such as floods, earthquakes, and other disasters can result in damage to water system infrastructure, thereby warranting a boil water notice as a cautionary measure. A suggested boil water notification form is presented in Appendix K. The City would issue the order through radio, television and newspapers serving the local area. Prior to the issuance of a boil water notice, the City should consider the experience gained by other communities in the past. A summary of pertinent information follows:

- An initial press conference should be held following issuance of the boil water notice to advise the public of the situation. All press releases will go the City's Public Information Officer.

- Consolidated press releases, announced on morning and evening television and radio news broadcasts, can also be used to keep the public informed.

- A 24-hour telephone hotline will be established to respond to public and media inquiries regarding the notice. The hotline should be staffed with knowledgeable representatives from the City and other governmental

agencies. In order to maintain the consistency of information released, hotline operators should be provided with standard question and answer sheets and briefed as new information becomes available. The hotline should remain available for 24 hours after the boil water notice has been rescinded to provide relevant information and reassurance for concerned customers. All media inquiries shall be directed to the Public Information Officer.

- Other State, County, and City agencies will be consulted prior to release of information to the public, including DOH and the Clark County Health Agency. A consensus will be reached among the jurisdictional agencies regarding information to be released and actions to be taken. It is important not to release conflicting information so as not to confuse the public.

- Agencies and hot line phone operators should be aware of difficult questions that could be asked by the public or the press. A few examples follow:

    1. What other utilities are affected?

    2. What should be done about coffee and ice machines that use water directly from the system?

    3. How did the system get contaminated and what is being done about it?

- Protocol should be developed for rescinding the boil water notice. One example includes two consecutive days of no detection of Cryptosporidium, Giardia, or coliform bacteria in the system.

- Once the boil water notice is rescinded, a notice should be developed to inform the public regarding appropriate measures for use of the water supply including flushing of pipes and fixtures as required.

A thorough investigation of the contamination source should be conducted and strategies developed to avoid similar future occurrences. The public should be informed and given updates regarding investigation findings in order to restore confidence in the quality of water provided by the water system.

DROUGHT

The Clark County Hazard Identification and Vulnerability Analysis states that nearly all areas of the county are vulnerable to drought.

History suggests a high probability of occurrence in Clark County. Although the entire population of the county is considered vulnerable to the effects of drought, severity has historically been low. Actual drought conditions have been limited to a few days, even during extended dry periods.

The hazard of a short-term drought will be addressed through water conservation measures outlined in the Water Conservation Chapter of the Water System Plan. The City will need to coordinate with adjacent water users in developing an effective drought response. This type of coordination will become essential with longer drought periods when more stringent water conservation measures may become necessary. Additionally, extended droughts may also increase fire hazards, particularly in the heavily wooded areas of the City.

EARTHQUAKE

The County's assessment indicates that of all potential disasters, the City is most vulnerable to a severe earthquake. However, the ability of the City's water system facilities to withstand a major earthquake has not been fully characterized.

The Northridge earthquake, which struck on January 17, 1994, left the Metropolitan Water District of Southern California (MWDSC) facing a major disaster. Fortunately, the MWDSC had established emergency planning procedures that proved to be essential to restoring water service to its customers. Two essential components were an Emergency Response Center and pre-established reconnaissance patrols that were able to quickly conduct damage inspections. The MWDSC had also stockpiled considerable repair parts and materials in order to be virtually self-sufficient in an emergency. Following the Northridge earthquake, however, the MWDSC found that most parts and equipment were readily available via overnight shipping from around the nation, indicating that stockpiling does not need to be wholly relied on for effecting repairs.

The Pacific Northwest is a very seismically active area. The Clark County HIVA states that potential earthquake sources in Clark County are not well characterized because of their infrequent occurrence compared to California. Estimations of possible earthquake sources are limited to studies of many small earthquakes, investigations of known faults, and other geological surveys.

CRESA indicates that earthquakes in Clark County are most likely to originate from three sources: (1) the Mt. St. Helens seismic Zone; (2) the Portland/Vancouver Seismic Zone; and (3) the Cascadia Subduction Zone. Descriptions of each of these seismic zones are summarized from the Clark County HIVA below.

1. Mt. St. Helens Seismic Zone – This seismic zone is most commonly a source of several small earthquakes (<4 M). The strongest earthquake associated with this zone was the Elk Lake earthquake of February 13, 1981. This was approximately 5.5 M magnitude earthquake. While this

was just a moderate earthquake it was felt over an area of about 104,000 km^2 that ran as far north as Ferndale, Washington and as far South as Salem, Oregon. Geologists suggest that the possibility exist for an earthquake as great as 6.5 M originating from this zone.

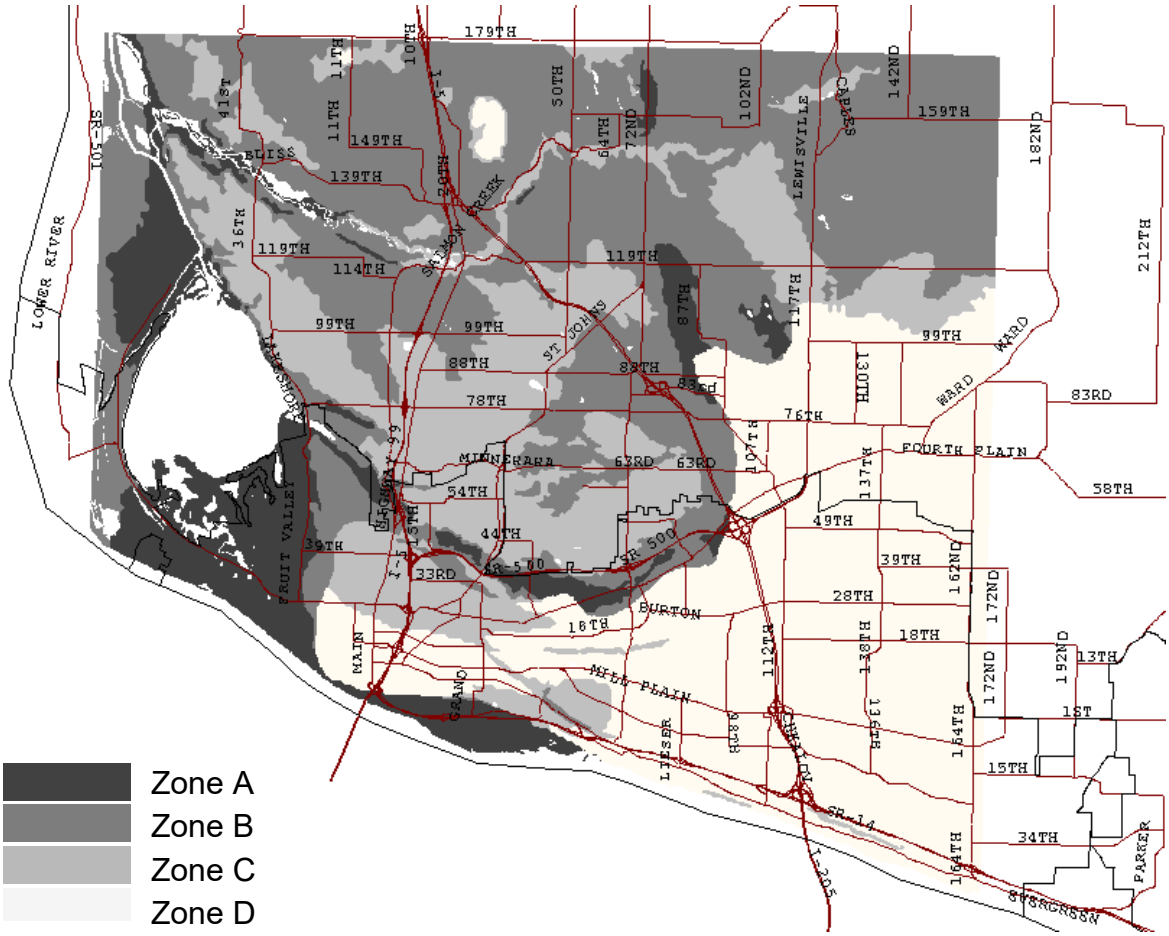
2. Portland/Vancouver – The Portland metropolitan area is the most seismically active region in Oregon in historic times. In the past 150 years there have been six earthquakes of magnitude 5 or greater. The Washington side of the seismic area is the second most seismically active area in Washington (the Puget Sound area is the most seismically active area in the state). The area between the Lacamas Creek Fault and the Portland Hills Fault borders this seismic region. The existence of the Portland Hills fault was only recently confirmed by the digging of the light rail tunnel through the West Hills of Portland. This discovery, matched with other geophysical studies suggest that earthquakes as large as 6 M or larger should occur in the Portland region every 300 to 350 years and an event of M 6.5 or larger about every 800 to 900 years. Earthquakes in this area present what may be the worst-case scenario for Clark County because the epicenters may be quite close. Geologists theorize there may be faults directly underneath the cities of Portland and Vancouver. Recent studies suggest that the epicenter for the 5.5 M earthquake in November 5, 1962, was located underneath the City of Vancouver.

3. Cascadia Subduction Zone – The Cascadia Subduction Zone lies about 50 miles offshore, extending from near Vancouver Island to northern California. The zone is where the oceanic Juan de Fuca plate dives beneath the continental North American plate. These plates are converging at a rate of 1 to 1.5 inches per year.

CRESA considers the entire county population, property, commerce, infrastructure and services as vulnerable to an earthquake. The scope of damage will be a function of earthquake magnitude and level of preparedness. Damage could range from minimal to extreme loss of life and destruction of property.

Most injury, death, and property damage in an earthquake result from seismic impacts on structural and non-structural materials. The vulnerability of certain areas partially depends on the types of structures in that area. A wood frame residential structure that is adequately secured to the foundation is relatively safe. An un-reinforced masonry building is at greatest risk from seismic impacts. Most injuries in earthquakes result from non-structural materials such as light fixtures, equipment, and furniture, falling on people and causing injury.

Another factor in earthquake vulnerability is soil type. Water-saturated loose sand and silt lose their ability to support structures in an earthquake. Areas in Clark County that



are near flood plains or areas with silt deposits are at the greatest risk during an earthquake.

Within the limits of predictability, CRESA assigns a high probability of occurrence for a damaging earthquake during the next 25 years. A large earthquake could have a catastrophic impact on Clark County suggesting high vulnerability. Accordingly, a high-risk rating is assigned.

Figure 5-2 shows a map of Clark County with zones of relative hazards for earthquakes. Based on evaluation of soil liquifaction, ground amplification, and earthquake induced landsliding hazards. Zone A is area of greatest relative hazard. Zone D is area of least relative hazard. The City of Camas is primarily in Zone D.

FIGURE 5-2

Relative Earthquake Hazard Map, Clark County, Washington

Earthquake response measures for the City's water system are shown in Table 5-5.

TABLE 5-5

Earthquake Response City of Camas Water System

Water System Component	Potential Effects	Recommended Actions
Transmission and Distribution System	Transmission and distribution system mains may be broken and the City's ability to monitor and respond to these incidents may be limited.	Isolate the major broken sections of piping throughout the system as they are located and repair as necessary and possible. Contact DOH.
Storage Facilities	Reservoirs may be leaking or structurally damaged	Inspect each reservoir for structural damage or cracks and leaks. Seal or drain these reservoirs as required. Contact DOH.
Booster Stations	Booster stations may be structurally damaged or mechanical damage to pumps and piping may have occurred.	Check booster stations and shut down pumps as required. If zones can be fed by alternate methods, implement those procedures. Contact DOH.
Wells	Unable to supply additional water to system. Well casings may be broken. Pumping capacity may be lost.	Investigate situation. Determine which wells can be utilized. Determine if surface water source still available. Contact DOH.
Treatment Facilities	Damage may have occurred to the treatment building, piping, or filters at the Slow Sand filter plant. May be unable to supply water from surface water source.	Shut down the equipment at the treatment facility. Attempt to repair. Check possibility of supplying City with groundwater sources. Contact DOH.

FLOOD

The Clark County HIVA states that floods are the most common disaster in Washington State and Clark County. The County's climate, topography, and geology are conducive to flooding. Normal annual precipitation ranges from 38 inches on the western floodplains to over 114 inches in the mountainous northeastern part of the county.

History of Flooding in Clark County and Adjacent Areas

- **December 1933** – The largest flood of record on the Lewis River.

- **May 30, 1948** – Columbia River crested at 34.4 ft. Flood stage at that time was 15 ft. This is the flood that destroyed the City of Vanport. Vanport, with a population at the time of the disaster of 18,500, was the second largest City in Oregon. The destruction of the town occurred when a 600-foot section of dike protecting the settlement from the rising Columbia River broke. Unfortunately, few people evacuated Vanport prior to the dam rupture. Evacuation was hampered by the fact that there were very few good evacuation routes. Fifteen people died in the flood.

- **June 1956** – Columbia River flooded due to snowmelt runoff.

- **January 1972** – A combination of intense rainfall and snowmelt caused major East Fork of the Lewis River floods.

- **December 1977** – Heavy rainfall and snowmelt caused flooding on the East Fork of the Lewis River. Salmon Creek had largest flood since gages were placed on Salmon Creek. The Washougal River also received its largest flood since gages were placed in 1944. This flood was an extremely rare event, greater than a 500-year flood.

- **February 8, 1996** – The Columbia River crested at 27.1 feet on February 9. This flood produced some of the worst flooding seen in the County since 1948. Approximately 1,500 people were evacuated, and 177 homes were destroyed. This flood occurred because of the confluence of several factors. The winter of 1995/96 was extremely rainy. Prior to the flooding period, the region experienced a cold snap with low elevation freezing, ice, and snow. This was followed by a strong warming trend with heavy precipitation.

In Clark County, the weather that produces the most serious flooding events are extensive wet conditions that follow a period of mid and high elevation ice and snow pack development. Many rivers in Clark County historically flood every few years. These include the East Fork of the Lewis River, Washougal River, Salmon Creek, and the Columbia River. Flooding on these rivers usually occurs between October and February. Long periods of heavy rainfall and mild temperatures coupled with snowmelt contribute to flooding.

There are three types of flood threats:

- Riverine
- Tidal
- Flash and Surface

The greatest threat of flooding in the City will be flash and surface flooding due to inundation of stormwater collection and conveyance systems. This may impact the water system operation through a number of mechanisms, including:

- Restricting access to water system facilities due to flooded streets
- Flooded valve and meter vaults
- Flooded City facilities
- Increasing groundwater levels that threaten contamination of leaking underground water lines

Actions the City will consider depending on the extent of flooding and the risks that might be mitigated include:

Pre-Flood

- Sandbagging around City facilities, such as the Public Works Operations Center
- Securing large pieces of equipment and materials that could be carried off by floodwaters
- Raising electronic equipment and computers off the floor
- Moving valuable records to locations expected to remain dry

Post-Flood

- Checking coliform levels in the water system for contamination (see incident specific plan for bacteriological contamination)
- Inspecting meters and PRV stations to ensure proper operation
- Cleaning debris from around reservoirs

Figure 5-3 includes a flood map of the City of Camas. As the flood map indicates areas susceptible to flooding include the Washougal Wellfield (Well Nos. 5, 6, 7, 8, 10 and 12 as well as the new chemical feed building).

Historically, flooding occurs along one or more of the County's waterways every few years, suggesting a high probability of occurrence. Because of the relative land area and population affected, the County is exposed to moderate vulnerability. Although the vulnerability is moderate, the frequency of flooding, the potential for simultaneous flooding events, plus the historical record of recurrent flooding and cumulative costs, all suggest the assignment of a high risk rating.

Table 5-6 lists flood response measures specific to the City's water system.

TABLE 5-6

Flood Response City of Camas Water System

Water System Component	Potential Effects	Recommended Actions
Transmission and Distribution System	Transmission and distribution mains could be affected by landslides or high water levels. City staff transportation for monitoring the system and making repairs may be limited.	Monitor possible areas of concern for waterline conditions. Monitor waterline bridge crossings for possible damage. Prepare to valve off any washed out or damaged waterlines. Contact DOH.
Storage Facilities	Minimum physical/structural impact due to locations. Flooding could cause elevated coliform levels in water system.	Monitor coliform levels. Contact DOH to advise of acute of non-acute coliform violations.
Booster Stations	Minimal operational impact.	None.
Wells	Facilities could be overwhelmed by flood waters.	Prepare to disconnect any well affected by flood waters. Contact DOH.
Treatment Facilities	Heavy rainfall or snow melt may overwhelm the capacity of the water treatment facility. Flooding in the vicinity of the plant is a risk.	Allow the water to bypass the filtration plant by closing intake facilities. Use wells as source of water for City. Contact DOH.

LANDSLIDE/MUDFLOW/DEBRIS FLOW

The term landslide includes a wide range of ground movement, such as rock falls, deep failure of slopes, and shallow debris flows. Landslides commonly occur on water-saturated slopes when the base of the slope can no longer support the weight of the soil above it, thus their frequency increases during or after periods of heavy rain and flooding. Though commonly associated with heavy rain and flooding conditions, landslides may also be associated with earthquakes (the 1994 Northridge Earthquake caused an estimated 11,000 landslides) and volcanic activity.

CRESA indicates that Clark County experienced the greatest number of landslides from 1996 to 1997. One of the largest landslides in the area occurred just outside of Clark

County, two miles north of Woodland on February 8 and 9 when 32,000 yd^3 of earth fell across all lanes of I-5 and the adjacent railroad tracks, disrupting traffic until February 19. In the same flooding period there were also several landslides that disrupted railroad operations in the area adjacent to Vancouver Lake. The following year, which was marked by heavy rains but no significant flooding, there were several landslides. Clark County has several areas where landslides have taken place and several areas that are susceptible to landslides. The hills north of La Center and the slopes north of Camas and Washougal are particularly susceptible.

Slides in Clark County generally range in size from thin masses of soil of a few yards wide to deep-seated bedrock slides more than six miles across. Travel rate may range in velocity from a few inches per month to many feet per second, depending largely on slope, material, and water content. The recognition of ancient dormant slide masses is important as they can be reactivated by earthquakes or unusually wet winters. Also, because they consist of broken materials and disrupted ground water, they are more susceptible to construction-triggered sliding than adjacent undisturbed material.

CRESA states that typical effects of landslides include damage or destruction of portions of roads and railroads, sewer lines, pipelines, and water lines, electrical and communications distribution lines, and destroyed homes and public buildings, but the most significant effect of landslides is the disruption of transportation and the destruction of private and public property.

The Clark County HIVA indicates the County has a history of landslides and their numbers are increasing, suggesting a high probability of occurrence. Landslides tend to occur in isolated, sparsely developed areas threatening individual structures and remote sections of the transportation, energy and communications infrastructure suggesting low vulnerability. Because of the high probability of occurrence and the trend to more frequent landslides, a moderate risk rating is assigned.

The risk to the water system is considered low because of the lack of steep slopes in the Camas area. Flooding and Earthquakes will increase the risk of landslides. Refer to Tables 5-5 and 5-6 for response measures that may be appropriate for landslides induced by those event categories.

SEVERE SNOWSTORM

The most significant anticipated impact of a severe snowstorm is limiting access to the City's facilities. City personnel may not be able to access water mains, reservoirs or valves for maintenance and/or manual operation of system components. During a severe snowstorm the City will rely on the telemetry system for information on the major system components. Additional hazards to be considered with severe winter storms include:

- Freezing in City Reservoirs – Mitigated by ensuring continuous turnover.

- Water service line breaks – Mitigated by asking customers to be vigilant for flooding around homes and businesses.
- Roof Collapse on City buildings and reservoirs – Mitigated by observing snow levels and having City crews remove when snow load may be exceeded.

Table 5-7 lists water system response measures associated with winter storms.

TABLE 5-7

Severe Snowstorm Response City of Camas Water System

Water System Component	Potential Effects	Recommended Actions
Transmission and Distribution System	City staff transportation for monitoring system and making repairs will be limited.	Contact City street department to expedite plowing of critical water system component access. Maintain chains and other snow gear for maintenance equipment on hand. Be able to provide accurate locations of valving for maintenance purposes.
Storage Facilities	Snow may prevent access.	Clear snow from access roads. Three 4 x 4 vehicles are available for water department use to access critical sites.
Booster Stations	Snow may prevent access.	Clear snow from access roads. Three 4 x 4 vehicles are available for water department use to access critical sites.
Wells	Snow may prevent access.	Clear snow from access roads. Three 4 x 4 vehicles are available for water department use to access critical sites.
Treatment Facilities	Snow may prevent access.	Clear snow from access roads. Three 4 x 4 vehicles are available for water department use to access critical sites.

TORNADO

Tornadoes are characterized by funnel clouds of varying sizes that generate winds as fast as 500 miles per hour. They can affect an area of 1/4 to 3/4 of a mile and seldom more than 16 miles long. Tornadoes normally descend from the large cumulonimbus clouds that characterize severe thunderstorms. They form when a strong crosswind (sheer) intersects with strong warm updrafts in these clouds causing a slowly spinning vortex to

form within a cloud. Eventually, this vortex may develop intensity and then descend to form a funnel cloud. When this funnel cloud touches the ground or gets close enough to the ground to affect the surface it becomes a tornado. Tornadoes can come from lines of cumulonimbus clouds or from a single storm cloud. Tornado hazards are measured using the Fujita Scale ranging from F0 to F6.

A history of tornadoes in Clark County follows:

- October 1951 – Battle Ground (F0 on the Fujita Scale). 8-miles long and 25-yards wide, which uprooted trees and destroyed a two-story barn.

- August 26, 1953 – Ridgefield (F0 on the Fujita Scale). Lasted 3 minutes and severely damaged a farm.

- April 5, 1972 – Vancouver (F3 on the Fujita Scale). This was the most disaster to occur in Clark County and the most serious tornado in Washington State. Six people died and 300 were injured when a tornado cut a swath of destruction through East Vancouver. The tornado's path was 9-miles long, from the Columbia River, just east of Andresen Road up to Fourth Plain Blvd. Peter S. Ogden Elementary, a shopping center, and a bowling alley were severely damaged.

- December 1974 – Camas (F0 on the Fujita Scale). Windows were broken and walls collapsed but there was no serious damage.

- October 1984 – Woodland (F1 on the Fujita Scale). A funnel cloud touched down several times, snapping and overturning trees, and ripping up fence lines. A barn roof was torn off, corrals flattened and a pump house lifted and exploded.

- June 29, 1989 – La Center (F1 on the Fujita Scale). Uprooted several trees and tossed one car off the road causing minor injuries to the driver.

- May 31, 1997 – Vancouver (F0 on the Fujita Scale). Caused $10,000 in property damage.

- September 15, 1997 – Yacolt (F0 on the Fujita Scale). No reported damage.

- May 11, 2000 – Battleground (F0 on the Fujita Scale). Caused $10,000 in property damage.

- May 27, 2004 – La Center (F0 on the Fujita Scale). No reported damage.

- September 2004 – Ridgefield (F0 on the Fujita Scale). No reported damage.

- January 10, 2008 – Vancouver, (F1 on the Fujita Scale). Damage reports showed widespread downed power lines, malfunctioning traffic lights, and roofing that had been ripped off. Although the majority of damage was light in nature, in at least one case a home was completely demolished. At least 2,500 homes and businesses had lost power because of the storm. Property damage estimated to total $525,000.

- December 2015 – Battle Ground (F1 on the Fujita Scale). Damage reports showed downed power lines, malfunctioning traffic lights, damaged fences and roofing that had been ripped off. Although the majority of damage was light in nature, two businesses were damaged and deemed to be unsafe. No injuries were reported.

Table 5-8 provides definitions of tornado hazards.

TABLE 5-8

Tornado Hazard Scale

F-Scale Number	Intensity Phase	Wind Speed	Type of Damage Done
F0	Gale Tornado	40-72 mph	Some damage to chimneys; breaks branches off trees; pushes over shallow-rooted trees; damages sign boards.
F1	Moderate Tornado	73-112 mph	The lower limit is the beginning of hurricane wind speed; peels surface off roofs; mobile homes pushed off foundations or overturned; moving autos pushed off the roads; attached garages may be destroyed.
F2	Significant Tornado	113-157 mph	Considerable damage. Roofs torn off frame houses; mobile homes demolished; boxcars pushed over; large trees snapped or uprooted; light object missiles generated.
F3	Severe Tornado	158-206 mph	Roof and some walls torn off well constructed houses; trains overturned; most trees in forest uprooted.

Tornadoes are not normal occurrence in the Northwest as they require a confluence of warm surface temperatures and warm fronts coming from the south with cold fronts coming from the north. Northwest climates do not normally generate the temperature variations conducive to tornado formation. Washington is ranked 43 in the US for total number of tornadoes. Nonetheless, CRESA states that the tornado threat should be taken very seriously. The conditions conducive to tornado formation may develop in Southwest Washington and it is common for funnel clouds to be reported in this region. During severe thunderstorms it is possible for tornadoes to occur.

With the exception of the April 1972 disaster, tornadoes in Washington and Oregon tend to be light or moderate, with winds ranging from 40 to 112 mph. There are a notable

minority of tornadoes that cause significant to severe damage with winds going as high as 200 mph. The peak season for tornadoes is April through July. However, in Washington tornadoes may occur in the late summer months and, in a few rare cases, may occur in the winter months. While tornadoes are sometimes formed in association with large Pacific storms, most of them are caused by intense local thunderstorms. Tornadoes almost exclusively occur in the late afternoon and early evening.

It is possible for a tornado to occur anywhere in the lower elevations of Clark County. Normally, Pacific Northwest tornadoes are moderate but it is possible for serious tornadoes to develop, causing death and serious injury as well as property damage.

Water systems most vulnerable to tornadoes will be reservoirs, booster stations and treatment facilities. Reservoirs are not designed to withstand the high winds possible with tornadoes and buildings that house well pumps, booster pumps and treatment facilities may be damaged or destroyed by a severe tornado.

VOLCANO

According to the Clark County HIVA, the most likely scenarios for volcanic eruptions that will impact the County are as follows:

- Ashfall and *tephra* (the ash, rock and boulder-sized debris from an exploding volcano) from Mt. St. Helens.

- Ashfall and the generation of *lahars* (volcanic mud/debris flows) from the Sandy River in Oregon due to volcanic activity at Mt. Hood.

The most severe impacts in Southwest Washington from another major eruption from Mt. St. Helens eruption would be in Cowlitz County. In this event, Clark County emergency managers and responders may support Cowlitz County agencies and the Forest Service in assisting in evacuation, perimeter control, search and rescue and other operations. Drawing from these resources may leave the City of Camas potentially vulnerable to an inability to respond should emergencies arise that require local response assets.

The vulnerability to damage from lahars is greatest in southern Clark County, due to potential impacts from lahars in the Sandy River. Since the Sandy River empties into the Columbia across from Camas, lahar deposits could influence the flow of the Columbia River and possibly affect low lying areas of Camas near the Columbia. However, the potential exists for ashfall from volcanic activity to impact the entire county by creating a respiratory hazard and potentially adding weight to the roofs of City facilities (including the water reservoirs) that will increase significantly if it becomes wet. Wet ash also creates a slipping hazard and will create traffic problems and make water system maintenance hazardous.

URBAN FIRE

In the 2019 Water System Plan, a hydraulic analysis was conducted in several areas throughout the system to determine if the water system had adequate capacity to provide fire flow. Deficiencies were noted in the following areas:

- PRV Systems – Lacking pressure-sustaining features to prevent fire flows in lower pressure zones from causing unacceptable service pressures in upper pressure zones.
- West of Fargo (19th thru 22 Ave) – Fire flow limitations.
- Various pockets in Downtown – Fire flow limitations.
- Pacific Rim Blvd near Parker Street – Fire Flow limitations

The modeling of the water system is generally based on single event structural fires. In addition to the areas with fire flow deficiencies noted above, multiple structural fires occurring simultaneously in the same pressure zone could conceivably overwhelm the water system's capacity. If mutual aid agreements are invoked, the City would need to consider the potential for a water shortage in a coordinated fire response.

However, in the event of a fire City personnel monitor reservoir levels and system performance with the telemetry system, which allows the Fire Department to understand the limitations of water supplies available for fire suppression and to operate accordingly. It is also important to note that the City's Municipal Code also requires that all buildings, including residential structures, are required to be sprinklered, which significantly reduces the potential for large structure fires.

Other issues to consider with fires include:

- Creating a vacuum on waterlines due to high fire demand; this may create a cross-contamination hazard.
- Water quality complaints from customers due to high pipe velocities scouring inner pipe surfaces.

Table 5-9 lists water system response measures for urban fires.

TABLE 5-9

Urban Fire Response City of Camas Water System

Water System Component	Potential Effects	Recommended Actions
Transmission and Distribution System	Low pressure may result in the extremities of the system depending on the extent of the fire incident.	Monitor system and adjust pumps if applicable.
Storage Facilities	Draw down will occur in the reservoirs with increased demand.	Monitor reservoir levels.
Booster Stations	Additional pumps called on.	Monitor pump station to ensure proper operation.
Treatment Facilities	Fire in watershed could cause increased sediment in the surface water source. Turbidity levels may exceed acceptable levels.	Use groundwater sources until surface water sources available. Provide silt fences along areas that have lost vegetation due to fire. Contact DOH.

POWER FAILURE

Various types of severe weather can cause loss of electrical power. In order to alleviate the effects of a power outage, the City has installed auxiliary generators at the Chlorination Plant, the Filter Plant, Butler/Gregg Booster Stations, Angelo Booster Station, Lacamas Booster Station and the Lower Prune Hill Pump Station. Well Nos. 8, 11 and 12 also have an auxiliary power source to allow the wells to operate during an electrical outage. The Washougal Wellfield Treatment Facility obtains auxiliary power from the generator for Wells 11 and 12.

Table 5-10 presents the potential effects of a lengthy power failure on the water system components.

TABLE 5-10

Power Failure Response City of Camas Water System

Water System Component	Potential Effects	Recommended Actions
Transmission and Distribution System	No effect	None.
Storage Facilities	Telemetry system may be inoperable.	Manually check reservoir levels. Some reservoirs can provide water to lower areas.
Booster Stations	Booster stations inoperable without auxiliary power.	Operate booster station with auxiliary power.
Wells	Unable to supply additional water to system.	Well Nos. 8, 11 and 12 Auxiliary Power
Treatment Facilities		Auxiliary generator.

DAM FAILURE

Dam failures are the release of impounded water due to structural deficiencies, which can affect lives and property downstream. Dam failures are caused by flooding, earthquakes, lack of maintenance and repair, misoperation, poor construction, vandalism, or terrorism.

According to the Clark County HIVA, several dam failures have occurred in Washington State over the last 40 years, some of which been catastrophic, but none have occurred in or has impacted Clark County.

There are 36 dams in Clark County. These dams are used for hydroelectric power generation, irrigation, and recreation. Table 5-11 shows dams that could potentially impact the City of Camas.

TABLE 5-11

Clark County Dams Upstream of the City of Camas

Name of Dam	Year Built	Type	Nearest City Downstream	Distance in Miles	River	Downstream Hazard Category
Clark Reservoir Dam	1948	RE	Camas	4	Robinson Creek	3
Lacamas and Round Lakes, Lower Dam	1936	BU	Camas	1	Lacamas Creek	2
Lacamas and Round Lakes, Upper Dam	1936	BU	Camas	1	Lacamas Creek	2
Price Reservoir Dam	1950	RE	Camas	3	Tributary - Lacamas Creek	3

Dam Type: BU – Buttressed Dam, RE – Reinforced Earth Dam.
Hazard Category:
1 = High; 2 = Significant; 3 = Low
(reference: Washington State Department of Ecology Dam Safety Guidelines, July 1992, revised Sept 2004)
2 = 1 to 6 lives at risk, appreciable economic loss, limited or short term water quality degradation
3 = No lives at risk, minimal economic losses, no significant water quality impacts

Washington State uses a Downstream Hazard Classification system for dams, which assigns a Low, Significant or High rating for populations at risk of economic loss and environmental damage should the dam fail. In Clark County, most dams are rated low, three are significant and three high. (The three potential high hazard dams are the Merwin Dam on the Lewis River, Erickson on Rock Creek and Tsugawa Brothers Reservoir Dam on Mason Creek.) The three potential significant hazard dams are the Elmer Dam on Mason Creek and the Lacamas and Round Lakes, upper and lower dams on Lacamas Creek; these latter two dams pose a downstream hazard to the City of Camas.

In addition to the dams located in Clark County, the county can also be affected by dam failures of dams on the Columbia River upstream from Clark County. CRESA considers these dams to be well maintained, operated with 24-hour staffing and inspected on a regular basis.

CRESA states that Washington experiences a dam failure on a frequency of approximately once every two years. The majorities of failures were in whole or part the result of a failure to perform adequate maintenance and monitoring of the facilities. Dam failure can have many effects such as loss of life, damage to structures, roads, utilities, and crops. Economic losses can also result from a lowered tax base and lack of power profits.

History suggests a low probability of occurrence. The failure of a high hazard dam would threaten a small segment of the County suggesting low vulnerability. Because there has not been a major dam failure in Clark County, and the three high hazard dams are well maintained and operated providing no reason to suspect a compromise in

structural integrity baring a natural disaster or terrorist action, a low risk rating is assigned.

For response measures in the event of a dam failure, refer to Table 5-7 (flood response).

TRANSPORTATION ACCIDENT (AIRPLANE CRASH)

Although there have been no major airplane crashes in Clark County, the scope of the impact of such an event and the potential complexities of the response require the City to consider how such an incident could impact the water system operation.

The City of Vancouver is across the river from Portland International Airport. The airspace over the Columbia River and Vancouver is heavily used by all types of aircraft flying into Pearson Airpark, Portland Air National Guard Base and Portland International Airport. Most airplane accidents occur during arrival and departure so the City of Vancouver is at a greater risk than any other area in the County. Considering the flight paths of aircraft into and out of Portland International Airport, Vancouver has the potential for a major airplane crash with mass casualties, hazardous materials incidents, and fires. Accordingly, response assets from the City of Camas may be drawn to a crash site and leave the City potentially vulnerable if another emergency arises that requires those assets. Additionally, an airplane crash could cause major transportation routes to be closed for significant periods of time, resulting in significant delays for contractors, equipment and chemical suppliers to access the City of Camas.

TRANSPORTATION ACCIDENT (HIGHWAY OR RAIL)

City water lines cross a number of well-trafficked thoroughfares through the City, including SR 14 and the railroad that runs parallel to SR14. It is conceivable that a major accident on one of these thoroughfares would damage a water line. The Public Works component of the response to a transportation incident includes the following:

- Coordinate damage assessments, emergency road clearing and road repair activities
- Provide contracts for repair and recover work, including damaged utilities
- Provide maps for transportation route planning

The water utility will need to be assessed rapidly in the event of a major transportation incident to determine if water lines have either been damaged or are at risk of being damaged due to the incident. It may become necessary to isolate damaged or at-risk water lines until the incident has been cleared and emergency repairs have been made to allow recovery efforts to proceed.

HAZARDOUS MATERIALS (HAZMAT) INCIDENT

According to the Clark County HIVA, as of 1998, Clark County had approximately 77 entities, at 117 facility locations, which filed an Emergency and Hazardous Chemical Inventory Form (known as a Tier Two Form) with Washington State Department of Ecology. Of these 117 facilities about 58 of them use chemicals on the Environmental Protection Agencies list of Extremely Hazardous Substances.

The City may obtain Clark County Tier Two Hazardous Chemical Inventories from CRESA:

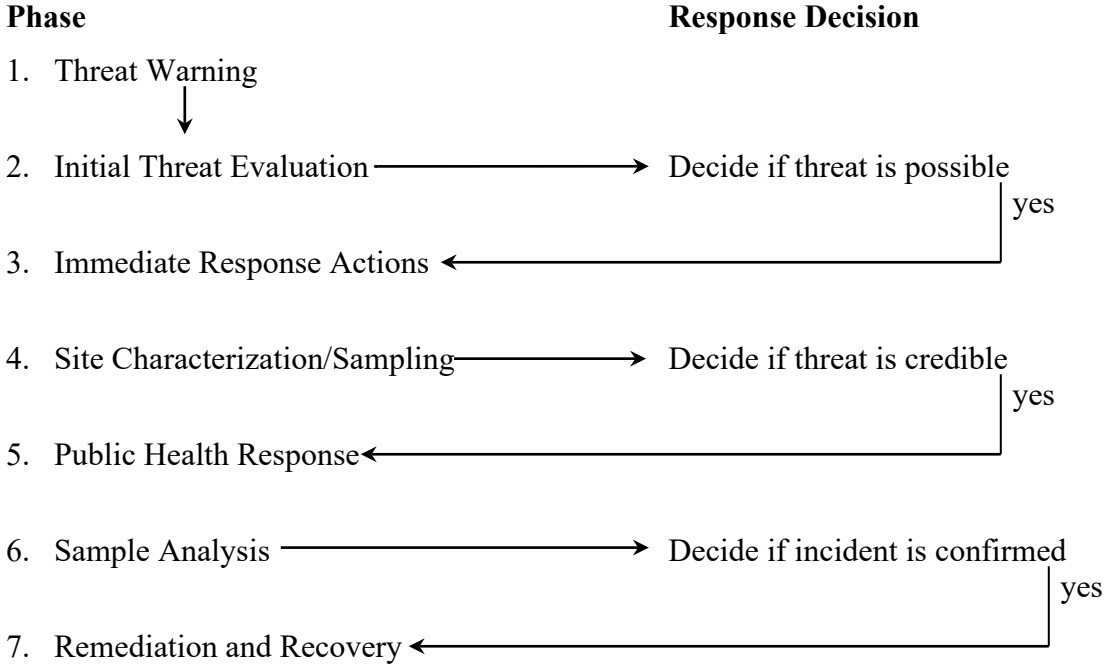
Phone: (360) 737-1911 Email: cresa@clark.wa.gov

Statistics show that nearly half of all hazardous materials incidents occur during transit. Large quantities of HAZMAT are transported through and in the close vicinity of the City via the interstate highway and by rail. In the event of a HAZMAT spill, the Fire Department will be the City's lead department for incident response within the City limits. A large spill will trigger the need for mutual response under the Regional HAZMAT response agreement.

The City of Camas Fire Department has no HAZMAT response capability. A HAZMAT response capability permits offensive operations necessary to perform the following operations:

- Preliminary hazard characterization
- Safely enter the hazardous area
- Mitigate the effects of the release prior to recovery operations
- Exit the hazard area employing a deliberate and thorough decontamination process

The above capabilities can only be provided by HAZMAT teams that are equipped and trained to Occupational Safety and Health Agency regulations (29 CFR 1910.120) and National Fire Protection Association competency levels (NFPA 471 and 472). The City of Vancouver and the Georgia Pacific Mill have such response capabilities. The City Fire Department will coordinate all HAZMAT support with this units working with CRESA under the regional HAZMAT response plan. Telephone numbers for the City of Vancouver and Georgia Pacific HAZMAT teams leaders are as follows:



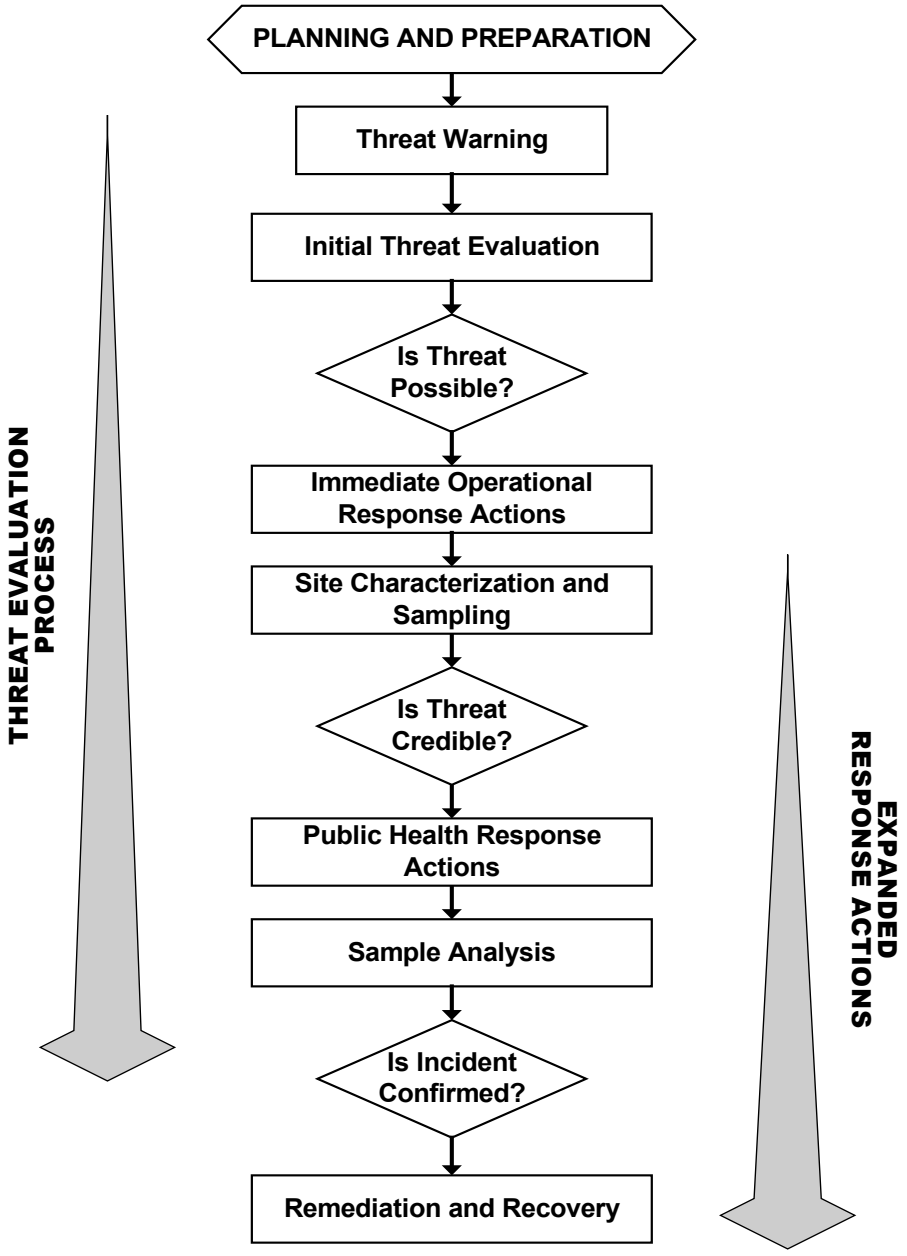
City of Vancouver (360) 619-4165
Georgia Pacific (360) 834-8465

The Public Works and Fire Departments will communicate during a HAZMAT spill to determine if the incident poses a hazard to water system personnel and facilities. It may become necessary to isolate water lines that are at risk of contamination due to a HAZMAT spill in order to prevent contamination of the water system.

INTENTIONAL CONTAMINATION

This type of incident could accompany a terrorist incident involving chemical, biological or radiological agents as well as vandalism. It is treated as a unique class of incident due to the complexities of the response from an operational, public health, law enforcement and physical recovery standpoint.

The EPA recommended protocols for managing a suspected intentional contamination incident are summarized in Figure 5-4. The EPA protocol has seven phases with three response decision points:



In no case should the utility pursue these actions unilaterally. Jurisdictional law enforcement agencies and public health agencies must be involved in each phase of the process. There are legal and practical requirements for this involvement, including rules of evidence for criminal investigations, balancing the need to protect law-enforcement sensitive information with public-right-to-know provisions in the Safe Drinking Water Act, obtaining specialized technical advice for sampling procedures and protecting the safety and health of water system personnel when taking water samples to test for suspected contamination.

Terrorism is a Federal crime and will require the involvement of federal law enforcement (Federal Bureau of Investigation).

FIGURE 5-4

Protocol for Managing an Intentional Contamination Incident

Reference: Planning for and Responding to Drinking Water Contamination Threats and Incidents Response Protocol Toolbox, USEPA, December 12, 2003.

Additionally, it is always recommended that the water utility consult with the HAZMAT team leader during the characterization and sampling process since, depending on the exposure hazard, it may become necessary for HAZMAT technician trained personnel to perform the site assessment and collect samples wearing OSHA compliant personal protective equipment.

Threat Warning

This is any unusual occurrence, observation, or discovery that indicates a potential contamination incident and initiates actions to address this concern. Such a warning would typically come in the form of an apparent security breach in the water system. Evidence of a security breach could come in the form of a telephone call threatening contamination or stating that intentional contamination has occurred; statements by witnesses who have seen water facilities being tampered with or broken into; physical evidence at a water facility indicating water facilities have been intentionally damaged or tampered with; and reports of increased illnesses from local hospitals or the Clark County Health Department.

Initial Threat Evaluation

This is the part of the threat management process in which all available and relevant information about the threat is evaluated to determine if the threat is possible. This is an iterative process in which the threat evaluation is revised as additional information becomes available. The conclusions from the threat evaluation are considered when making *response decisions*.

Immediate Response Actions

These are actions taken in response to a possible contamination threat in an attempt to minimize the potential for exposure to the potentially contaminated water. Immediate operational response actions will generally have a negligible impact on consumers. These actions will include estimating the potential area(s) within the water system that may have been subject to contamination and isolating these areas from the system to contain the contamination. This process must be performed quickly and generally will not allow modeling tools to be used unless the scenarios have been developed and modeled prior to the suspected contamination event.

Immediate Characterization and Sampling

This is the process of collecting information from an *investigation site* in order to support the evaluation of a drinking water contamination threat. Site characterization activities include the site investigation, *field safety screening*, *rapid field testing* of the water, and sample collection.

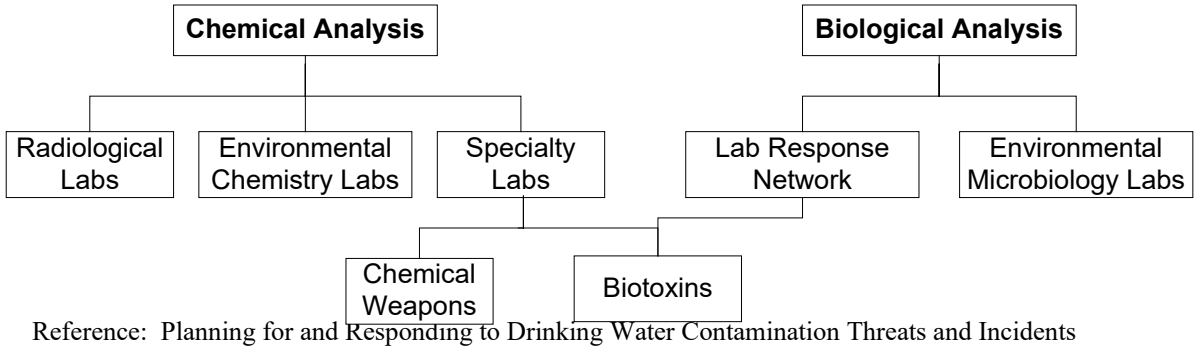
Field Safety Screening

Screening performed to detect any environmental hazards (i.e., in the air and on surfaces) that might pose a threat to the *site characterization* team. Monitoring for radioactivity as the team approaches the site is an example of field safety screening.

Rapid Field Testing

Analysis of water during *site characterization* using rapid field water testing technology in an attempt to tentatively identify contaminants or unusual water quality.

Public Health Response



This encompasses all actions taken to mitigate consequences resulting from threats or incidents involving biological, chemical, or radiological contaminants. These actions include public notification, using an alternative water supply, boil water notices and chemical sterilization.

Sample Analysis

This step involves laboratory analysis that is undertaken to confirm the presence/absence of contamination such that specific decisions can be made by law enforcement and public health officials and allow the water utility to proceed with definitive response and recovery actions. It is important to keep in mind that not all labs can definitively confirm a potential contamination agent. Figure 5-5 shows the types of laboratories and their general capabilities.

FIGURE 5-5

Types of Laboratories by Contaminant Class

Reference: Planning for and Responding to Drinking Water Contamination Threats and Incidents Response Protocol Toolbox, Module 4: Analytical Guide, USEPA, December 12, 2003

Definitions for terms used in Figure 5-5 are provided below. The EPA Environmental Laboratory Compendium provides a national listing of laboratories and their capabilities. The City may sign up for this list by going to the EPA's water security website:

http://cfpub.epa.gov/safewater/watersecurity/index.cfm

Environmental Chemistry Laboratory

This is any laboratory, either commercial or government-operated that is able to perform analysis of water samples for compliance with the Safe Drinking Water, Clean Water Acts, or other applicable environmental regulation, as well as other chemical parameters that are important to system operation and overall water quality. These laboratories have the instrumentation necessary to implement methods for chemical analysis of a water sample.

Environmental chemistry laboratories perform water analyses to support regulatory compliance and they are familiar with the need to treat samples with precautions necessary for legal defensibility. Analysis for regulatory compliance purposes, however, may proceed differently than analysis of emergency samples in response to a contamination threat, which has the dual role of both providing an emergency response to protect public health and also providing legally defensible evidence to support a criminal investigation. Additionally, no commercial environmental chemistry laboratories can analyze chemical warfare agents (e.g., nerve, mustard and blood/choking agents); this latter type of analysis can only be performed by a small number of government-operated laboratories in the United States whose access is restricted to law enforcement and military agencies.

Environmental Microbiological Labs

These labs include those of EPA, state environmental agencies, and the commercial sector, that typically perform analyses for waterborne pathogens. Most of these laboratories have the equipment and staff necessary to analyze for indicators of fecal contamination such as fecal and total coliforms and *E. coli*. Culture techniques are available for many of the more common waterborne pathogens such as *Vibrio cholerae, Salmonella enteriditis,* Typhi, and *Shigella* spp.; however, analyses for these pathogens are not routinely performed in most environmental microbiological laboratories. While some environmental microbiological laboratories have expanded capabilities to analyze for parasites such as *Cryptosporidium* and *Giardia* or to perform molecular assays for some organisms, these capabilities are not widespread.

Only laboratories registered for the analysis of select agents are legally permitted to analyze for those agents, and currently most registered labs reside in the LRN. Thus, even if environmental microbiological laboratories develop additional capabilities for pathogen analysis, they could not perform such analyses without registering for select agents.

Laboratory Response Network (LRN)

This is a network of laboratories developed by the Centers for Disease Control (CDC), Association of Public Health Laboratories (APHL), and the Federal Bureau of Investigation (FBI) for the express purpose of dealing with bioterrorism threats, including pathogens and some biotoxins.

Radiological Labs

These laboratories specialize in the analysis and handling of radiological materials. For radionuclides, analytical confirmation may be viewed differently than most chemicals because radionuclide analysis can take the form of screens for gross alpha, beta, or gamma radiation, and/or it can take the form of analysis for the specific radionuclides themselves, such as strontium-90. Thus, analytical confirmation may involve the process of confirming quantity of gross radiation or identifying the radionuclide. The type of analysis that is performed will be based on the analytical goals. For example, radionuclides in drinking water regulation are often characterized by their gross alpha and gross beta emissions.

For the purpose of emergency analysis of water contaminants, a tiered approach is suggested, with screening for gross radiation in the field or upon receipt by the laboratory followed by identification of the radionuclide, which may be important for a more complete understanding of risks to public health as well as potential criminal actions against perpetrators.

Specialty Labs

These are laboratories that are capable of analyzing samples for chemical, biological and radiological agents that cannot be analyzed by commercial laboratories. These labs require special safety certifications for operation and their access is controlled by law enforcement agencies and the military.

Remediation and Recovery

The remediation process involves: system characterization; selection of remedy options; provision of an alternate drinking water supply during remediation; and monitoring to demonstrate that the system has been remediated. This process will follow a process similar to the US EPA's Superfund program's approach to hazardous waste site cleanup to include *risk assessment*, *system characterization*, *feasibility study*, analysis of alternatives, *remedy* selection, *remedial design*, *remedial action*, and post-remedial monitoring and operations.

EXPLOSIVES INCIDENT

A bomb threat will be handled by the City Police Department. If the call is received at the CRESA 911 call center, the call center staff is trained regarding information to be obtained and questioning techniques. If the call is received by a City employee they will follow procedures as shown in Appendix L.

In the event of an attack on the water system with explosive devices, the response will, like a contamination incident, be complex and multidisciplinary (police, fire, public works, emergency medical services (EMS), public information, etc.). Important issues to be considered in the response include:

- Assignment of the Incident Commander (will depend on the situation/risks) – the incident commander is responsible for overall command and control at the incident scene and the health and safety of all response personnel.

- Presence of casualties and proper procedures for casualty extraction and emergency medical treatment at the incident site.

- The risk of fire/explosion presented by flammable materials in the vicinity of the explosion.

- Threat of a secondary device (a device that is placed at the scene to kill or injure emergency responders after their arrival).

- Physical hazards associated with collapsed structures.

- Evidence preservation requirements.

- Respiratory, ocular and skin hazards associated with vapors and fine particulate matter generated by the explosion and subsequent fires and what personal protective equipment (PPE) levels are appropriate for the hazards – note that "escape" respirators (e.g., Quickmask 2000), are <u>not</u> designed for prolonged exposures necessary for intentional entry into a hazardous area, they are designed solely to allow movement away from the incident site to a safer location. Additionally, as of late 2004, no escape masks have received federal certification (the approval agency is NIOSH – National Institute of Occupational Safety and Health) for an independently recognized and tested level of performance.

- The need to maintain communication between all response units (especially police, fire, public works and EMS) to ensure different response units all have the same hazard assessment and understand which response units are being allowed at the incident site, their locations and

basic tasks; this becomes even more critical as mutual aid from other agencies and jurisdictions arrive at the site.

- The need to isolate damaged elements of the water system to make emergency repairs and minimize impact to undamaged elements of the water system.

- The need to maintain a single spokesperson for the City to release information to the public and the news media.

CYBER ATTACK

The City maintains an IT network separate from the water system SCADA network. The network is used for intracity business and is password protected. Firewall protection is used and no outside access for third parties is allowed.

If a cyber attack is successful, the response will require the IT-System Administrator to assess the extent of impact and develop a plan to restore damaged or compromised files and attempt to recover lost files.

If the SCADA system is compromised it will become necessary to monitor the water facilities by periodic and direct visual contact until the system is restored to normal operations.

DOCUMENTATION PROCEDURES

During an emergency, precise documentation of actions taken and materials used will greatly increase the efficiency with which the City handles the situation. Detailed recording and reporting of events, such as shut downs, valve isolations, sampling events and reservoir operations, enables repairs to be made quickly keeping down time to a minimum. The detailed reports are invaluable in making certain that the system is quickly and efficiently returned to pre-emergency operating status. To aid employees, an Operating and Damage Report form is included in Appendix M.

The Federal Emergency Management Agency (FEMA) requires proper documentation of damage for the City to file claims in the event the City is covered by a Presidential Disaster Declaration. Photographic evidence of “before” and “after” an event as well as equipment purchase records will strengthen any justification for compensation from the Federal government.

The FEMA disaster assistance website for public agencies can be consulted for further information:

APPENDIX J

MAINTENANCE ACTIVITIES

Daily Maintenance Activities

Well No. 5, 6, 9, 13, 14, and Washougal Wellfield (Wells 7, 8, 10, 11, 12)

- Check motor oil level at each well.
- Verify proper pumping operations.
    - Read upstream and downstream pressure gauges to see if pressures are in normal operating range.
    - Read flow meters for instantaneous and totalized flow to verify flow.
    - Observe well pump and motor while operating for abnormal vibrations.
    - Check for signs of loose fittings (water on floor).
- Record sodium hypochlorite level in drum (Well 5, and 9 only).
- Test chlorine residual and record. Chlorine residual should be between 0.7 and 1.0 mg/L at the sample point.
- Check fluoride level in the saturator and fill as necessary.
- Test fluoride concentration and record. Fluoride concentration shall be between 0.5 and 0.9 mg/L at well sample point and in the distribution system.
- Record totalized flow meter reading from fluoride saturator.
- Check for proper operation of surge valves at each well. Inspect blow off discharge points to check if standing water is accumulating anywhere in the surge discharge system.
- Check for proper operation of chlorinator for each well.
- Check for proper operation of the fluoride system for each well.

Diesel Powered Auxiliary Generators (Washougal Wellfield Facility, Well No. 13, Well No. 14, Crown Road Booster Station, New Gregg Booster Station, Angelo Booster Station, Lower Prune Hill Pump Station)

- Perform general inspection.
- Perform Coolant heater inspection.
- Check oil level.
- Check coolant level.
- Check fuel level.
- Record hour meter.

Weekly Maintenance Activities

Jones and Boulder Creek Surface Water Sources

Twice per week (when in operation)

- Check impoundment structure for stability at both surface water intakes.
- Check for debris accumulation at intake screens at both sources.
- Read and record totalized flow on flowmeter.

Weekly

- Perform security check of facilities.

Reservoirs: Butler, Gregg, Upper & Lower Prune Hill, 18th Avenue, & Lacamas

- Perform full security check.
- Perform full structural check.

Booster Pump Stations: Butler, Old & New Gregg, Upper & Lower Prune Hill, Angelo Forest Home, Green Mountain Estates, Lacamas, & Francis Rd

- Perform full security check.
- Verify proper pumping operations.

    - Read upstream and downstream pressure gauges to see if pressures are in normal operating range.
    - Read flow meters for instantaneous and totalized flow to verify flow.
    - Observe well pump and motor while operating for abnormal vibrations.
    - Check for signs of loose fittings (water on floor).

Diesel Powered Auxiliary Generators (Washougal Wellfield Facility, Well No. 13, New Gregg Booster Station, Angelo Booster Station, Lower Prune Hill Pump Station)

- Air cleaner inspection.
- Air pipe inspection.
- Battery charger inspection.
- Drain fuel filters.
- Check block heater connections.

Monthly Maintenance Activities

Well No. 5, 6, 9, Washougal Wellfield (7, 8, 10, 11, 12) and Well 13

- Inspect property for security purposes.
- Check fluoride pump gear oil.
- Inspect pump packing lubrication for proper operation.
- Inspect cooling screens on Vertical Turbine pumps for blockage.

On-Site Sodium Hypochlorite Generation System (Washougal Wellfield and Well 13)

- Clean blower inlet screen.
- Check hardness of water from water softener – should be less than 10 mg/L.

Diesel Powered Auxiliary Generators (Washougal Wellfield Facility, Well No. 13, New Gregg Booster Station, Angelo Booster Station, Lower Prune Hill Pump Station)

- Drain exhaust condensate trap.
- Check starting batteries.
- Check antifreeze and DCA concentration.
- Drive belt inspection.
- Check block heater connections.

Semi-Annual Maintenance Activities

On-Site Sodium Hypochlorite Generation System (Washougal Wellfield and Well 13)

- Level switch – remove and clean calcification.
- Clean cells if needed.

Annual Maintenance Activities

Jones and Boulder Creek Surface Water Sources

- Jones Creek - close inlet valve to screen house so that no water is diverted to surface water filtration plant from May 15th to November 1.
- Boulder Creek - close outlet valve from screen house so no water is diverted to surface water filtration plant from May 15th to November 1.

Well No. 5, 6, 9, Washougal Wellfield (Wells 7, 8, 10, 11, 12) and Well 13

- Change oil on all oil lubricated equipment.
- Clean out fluoride saturator.
- Clean filter bags on ventilation fan.
- Infrared scan electrical panels.

- Exercise pump.
- Sample water.
- Inspect roof and building for maintenance requirements.
- Check control valves and piping for proper operation.

On-Site Sodium Hypochlorite Generation System (Washougal Wellfield and Well 13)

- Temperature switch – confirmation that the bi metal opens at 60º C when immersed in hot water.
- Replace bellows and poppets on water pump.
- Inspect water heater and perform the following as needed:
    - Descale the heating element
    - Change anode rod
    - Change heating element
    - Change thermostat
    - Reset high limit switch

Reservoirs: Butler, Gregg, Upper & Lower Prune Hill, 18th Avenue, & Lacamas

- Visually inspect inside of reservoir using Liquivision and/or Tank Divers.
- Inspect and remove sediment.

Booster Pump Stations: Butler, Old & New Gregg, Upper & Lower Prune Hill, Angelo Forest Home, Green Mountain Estates, Lacamas, & Francis Rd

- Pump and motor maintained per manufacturer's instructions.
- Check control valves for proper operation.
- Check Operations Center files for each of the booster stations for instructions concerning equipment at pump station.

Diesel Powered Auxiliary Generators (Washougal Wellfield Facility, Well No. 13, New Gregg Booster Station, Angelo Booster Station, Lower Prune Hill Pump Station)

- Inspect radiator hoses.
- Change air cleaner element.
- Change crankcase oil and filter.
- Change coolant filter.
- Change fuel filters.
- Clean cooling system.
- Check block heater connections.

Distribution System

- Leak detection survey (as determined by maintenance staff).

Five Year Maintenance Activities

Pressure Reducing Valves

- Perform a comprehensive evaluation of the PRVs in the system. This is contracted through GC Systems.
- Quarterly inspect each station.

The City of Camas has two sources that require disinfection with a CT of 6 per the Washington State Department of Health. These are the Washougal Wellfield, Well No. 13, and the Slow Sand Filtration Treatment Plant. A summary of the CT calculations for each source is provided below.

Wells 7, 8, 10, 11 and 12

The Washougal Wellfield disinfection system must be capable of treating all flows from Wells 7, 8, 10, 11 and 12, which totals 5,300 gpm if all wells are operated at their full capacity simultaneously. In reality the total capacity of these five wells is approximately 4,700 gpm, when Well 6 and 13 are not in operation, due to wellfield and transmission main limitations. For the Washougal Wellfield Treatment Facility, a CT of 6 is obtained from a chlorine residual of not less than 1.0 mg/L and a minimum CT volume of 31,800 gallons in the transmission pipeline up to the connection to the distribution system at NE 22nd Avenue and Everett Street.

$$1.0 \text{ mg/L} \times 31{,}800 \text{ gal} \div 5{,}300 \text{ gal/min} = 6 \text{ mg-min/L}$$

CT Volume from the Washougal Wellfield Treatment Facility to NE 22nd Avenue and Everett Street is calculated as follows:

From Washougal Wellfield Treatment Facility toward Well No. 10:

$$(24\text{-inch}/(2 \times 12 \text{ inch/ft}))^2 \times \pi \times 286.6 \text{ feet} \times 7.48 \text{ gal/ft}^3 = 900 \text{ gallons}$$

North under/across Washougal river to connection with the 12-in line going east to connect to new 24-inch river crossing:

$$(14\text{-inch}/(2 \times 12 \text{ inch/ft}))^2 \times \pi \times 1{,}566.9 \text{ feet} \times 7.48 \text{ gal/ft}^3 = 12{,}512 \text{ gallons}$$

North to the intersection of NE 3rd Ave and E 1st Ave

$$(14\text{-inch}/(2 \times 12 \text{ inch/ft}))^2 \times \pi \times 820.3 \text{ feet} \times 7.48 \text{ gal/ft}^3 = 6{,}550 \text{ gallons}$$

North from NE 3rd Ave and E 1st Ave, to intersection of NE 22nd Ave and NE Everett Street:

$$(18\text{-inch}/(2 \times 12 \text{ inch/ft}))^2 \times \pi \times 5{,}111.7 \text{ feet} \times 7.48 \text{ gal/ft}^3 = 67{,}472 \text{ gallons}$$

$$\text{Total} = 87{,}434 \text{ gallons}$$

Thus the pipeline between the Washougal Wellfield and the first connection at NE 22nd Avenue and Everett Street provides adequate CT volume.

Well No. 13

Water from Well No. 13 and all other groundwater sources from the Washougal wellfield will first enter the distribution system either at the pressure reducing valve on NE 21st and Everett.

$$1.0 \text{ mg/L} \times 7{,}950 \text{ gal} \div 1{,}325 \text{ gal/min} = 6 \text{ mg-min/L}$$

CT Volume from Well 13 to 3rd Avenue is calculated as follows:

12-inch DI line from Well No. 13 injection point to existing 18-inch water line on SE Cramer:

$$(12\text{-inch}/(2 \times 12 \text{ inch/ft}))^2 \times \pi \times 50 \text{ ft} \times 7.48 \text{ gal /ft}^3 = 330 \text{ gal}$$

18-inch DI water line from SE Cramer connection to 18-inch water transmission line on 3rd Avenue:

$$(18\text{-inch}/(2 \times 12 \text{ inch/ft}))^2 \times \pi \times (140 \text{ ft} + 500 \text{ ft}) \times 7.48 \text{ gal/ft}^3 = 9{,}386 \text{ gal}$$

Total = 9,716 gallons

The total CT volume between the injection point inside the Well No. 13 facility to the connection at the 18-inch transmission line in 3rd Avenue is 9,716 gallons, therefore, the required CT volume of 7,950 gallons is provided prior to the 14-inch transmission line connection when a chlorine dose of 1.0 mg/L is provided.

Slow Sand Filtration Treatment Plant

The transmission mains connecting the new Slow Sand Filtration Treatment Plant to the distribution system will provide a CT of 60. The transmission pipeline will comprise approximately 15,500 feet of existing 10-inch transmission pipeline and approximately 7,300 feet of new 12-inch transmission pipeline. The point of connection to the distribution system will be at the intersection of NE 14th street and NE 277th Avenue. At 1,570 gpm, the transmission pipelines will provide a total of approximately 66 minutes of contact time for disinfection. The required CT is based on a chlorine residual of 1 mg/L at the point of connection to the distribution system.

$$1.0 \text{ mg/L} \times 106{,}122 \text{ gal} \div 1{,}570 \text{ gal/min} = 67 \text{ mg-min/L}$$

CT Volume from the Washougal Wellfield Treatment Facility to NE 22nd Avenue and Everett Street is calculated as follows:

From Slow Sand Filtration Treatment Plant to new 12-inch transmission pipeline:

$$(10\text{-inch}/(2 \times 12 \text{ inch/ft}))^2 \times \pi \times 15{,}500 \text{ feet} \times 7.48 \text{ gal/ft}^3 = 63{,}236 \text{ gallons}$$

North under/across Washougal river to connection with the 12-in line going east to connect to new 24-inch river crossing:

$$(12\text{-inch}/(2 \times 12 \text{ inch/ft}))^2 \times \pi \times 7{,}300 \text{ feet} \times 7.48 \text{ gal/ft}^3 = 42{,}886 \text{ gallons}$$

Total = 106,122 gallons

APPENDIX K

ANNUAL SUMMARY REPORTS (2021-2025)

Cross-Connection Control Activities (Blue)
Annual Summary Report (ASR) for 2021

PWS ID: **108002** PWS Name: **CAMAS MUNICIPAL WATER SEWER SYSTEM** County: **CLARK**

Part 1: Designated Cross-Connection Control Specialist (CCS) Information

CCS Name	Allen Nelson	**CCS Phone**	360-817-7287	**CCS Cert. #**	8187	**BAT Cert. #**	
CCS is: PWS owner or employee							

Part 2: Status of Cross-Connection Control (CCC) Program at End of 2021

Provide information about the status of your CCC Program at the end of the reporting year.

PWS has:	**A written CCC Program Plan**[1] ◉ Yes ○ No **CCC implementation activities**[2] ◉ Yes ○ No	**Program Plan Last Updated**[3] 10/04/2019

[1] Enter "Yes" if PWS has **any** type of written CCC Program Plan, policies, or procedures. Written CCC Program Plan must be part of a Water System Plan (WSP) or Small Water System Management Program (SWSMP).

[2] Enter "Yes" if PWS implemented **any** CCC Program activities during the reporting year, such as establishing legal authority, conducting hazard evaluations, requiring installation of backflow assemblies to protect the PWS, requiring assembly testing, maintaining CCC records, or enforcing the PWS's or CCC Program requirements.

[3] PWS can update the CCC Program Plan at any time (independent of WSP or SWSMP update).

Provide information regarding PWS's specific CCC Program Elements

Program Element Number	Description of Element [See WAC 246-290-490(3)]	This Program Element is:	
		Included in Written Program Plan	Being Implemented or Is Completed
1	**Legal Authority Established**	◉ Yes ○ No	◉ Yes ○ No
2	**Hazard Evaluation Procedures and Schedules**	◉ Yes ○ No	◉ Yes ○ No
3	**Procedures/Schedules for Ensuring Installation of Backflow Preventers**	◉ Yes ○ No	◉ Yes ○ No
4	**Certified CCS Provided**	◉ Yes ○ No	◉ Yes ○ No
5	**Backflow Preventer Inspection and Testing**	◉ Yes ○ No	◉ Yes ○ No

6	**Assembly Testing Quality Assurance/Quality Control (QA/QC) Program**	◉ Yes ○ No	◉ Yes ○ No
7	**Backflow Incident Response Procedures**	◉ Yes ○ No	◉ Yes ○ No
8	**Public Education Program**	◉ Yes ○ No	◉ Yes ○ No
9	**CCC Records**	◉ Yes ○ No	◉ Yes ○ No
10	**Reclaimed Water Permit**	○ Yes ○ No ◉ N/A	○ Yes ○ No ◉ N/A

Part 3A: PWS Characteristics at End of 2021

Enter the number of connections (new and existing) served by the PWS by type.

Type of Service Connection	Number
Residential (As defined by PWS)	9722
All Other (include dedicated fire lines, dedicated irrigation lines, and PWS-owned facilities such as water and wastewater treatment plants and pumping stations, parks, piers, and docks)	228
Total Number of Connections	9950

Part 3B: Cross-Connection Control for Severe and High-Hazard Premises and High-Hazard Dedicated Lines Served by the PWS

Answer the following questions carefully. These answers control your access to pages 2 and 3 for data entry.

1. Does your PWS serve any severe or high-hazard premises or any high-hazard dedicated fire or irrigation lines? (●) Yes ( ) No

2. Does PWS serve any high-hazard medical premises? (●) Yes ( ) No

- If you answer Yes to both questions, you must enter data in at least one row on page 2 and one row on page 3.
- If you answer Yes to Question 1 and No to Question 2, you must enter data on page 2 only.
- If you answer No to both questions, pages 2 and 3 will be grayed out to prevent data entry.

- Count only premises PWS serves water to.
- Report data as accurately as possible. **DOH currently bases CCC compliance actions on this information.**

Type of Severe or High-Hazard Premises or Dedicated Lines [WAC 246-290-490(4)(b)]	Number of Connections at end of 2021			
	A. Being Served Water by PWS[1]	B. With Premises Isolation by AG/RP[2]	C. With Column B AG Inspected or RP Tested[3]	D. Granted Exception from Premises Isolation
Agricultural (farms and dairies)				
Beverage bottling plants (including breweries)				
Car washes	2	2	2	0
Chemical plants				
Commercial laundries and dry cleaners	2	2	2	0
Both reclaimed water and potable water provided				
Film processing facilities				
Dedicated fire lines with chemical addition or using unapproved auxiliary supplies				
Food processing plants (including canneries, slaughter houses, rendering plants)				
Hospitals, medical centers, medical, dental and veterinary clinics, mortuaries, nursing homes, etc., reported on Part 3C page 3 (totals imported from page 3)	20	6	6	0
Dedicated irrigation systems using purveyor's water supply and chemical addition[4]				

Laboratories	1	1	1	0
Metal plating industries				
Petroleum processing or storage plants	4	4	4	0
Piers and docks				
Radioactive material processing plants or nuclear reactors				
Survey access denied or restricted				
Wastewater lift/pump stations (non-residential only)	9	9	9	0
Wastewater treatment plants	1	1	1	
Unapproved auxiliary water supply interconnected with potable water supply				
Other				
Commercial	26	26	26	0
Manufacturing	75	75	75	0
Totals	140	126	126	0

[1] Count multiple connections or parallel installations to the same premises as **separate** connections.

[2]Count only connections with premises isolation AGs or RPs. Don't include connections with in-premises preventers only or connections with DCVAs or DCDAs installed for premises isolation. The number in Column B can't be larger than the number in Column A in the same row.

[3] Count only connections whose premises isolation preventers were inspected (AGs) or tested (RPs) during the reporting year.

[4] For example, dedicated irrigation lines to parks, playgrounds, golf courses, cemeteries, estates, etc.

[5] Premises with hazardous materials or processes (requiring isolation by AG or RP), such as aircraft and automotive manufacturers, pulp and paper mills, metal manufacturers, military bases, and wholesale customers that pose a high hazard to the PWS. May be grouped together in categories, for example:"Other manufacturing" or "Other commercial".

Part 3C: Cross-Connection Control for High-Hazard Medical Premises Served by the PWS

- Count only medical premises PWS serves water to.
- Don't count the same premises more than once. If you serve different medical category premises through a single connection, count the connection under the medical category you consider to pose the highest hazard to PWS.
- Report data as accurately as possible. **DOH currently bases CCC compliance actions on this information**

Type of High-Hazard Medical Premises [WAC 246-290-490(4)(b)]	Number of Connections at end of 2021			
	A. Being Served Water by PWS[1]	B. With Premises Isolation by AG/RP[2]	C. With Column B AG Inspected or RP Tested[3]	D. Granted Exception from Premises Isolation
Hospitals				
Hospitals (include psychiatric hospitals and alcohol and drug treatment centers)				
Facilities for Treatment and Care of Patients Not Located in Hospitals Counted Above				
Same day surgery centers				
Out-patient clinics and offices				
Alternative health out-patient clinics and offices				
Psychiatric out-patient clinics and offices				
Chiropractors with water-connected X-ray equipment	6	0	0	0
Hospice care centers				
Childbirth centers				
Kidney dialysis centers				
Blood centers				
Dental clinics and offices	6	1	1	0
Facilities for Housing Patients				
Nursing homes	2	2	2	0
Assisted Living Facilities (formerly Boarding Homes)	3	0	0	0
Residential treatment centers				
Other Medical-Related Facilities				
Mortuaries with embalming equipment	2	2	2	0
Morgues and autopsy facilities (not in hospitals)				

Veterinarian offices, clinics and hospitals	1	1	1	0
Totals	20	6	6	0

[1] Count multiple connections or parallel installations to the same premises as **separate** connections.

[2]Count only connections with premises isolation AGs or RPs. Don’t include connections with in-premises preventers only or connections with DCVAs or DCDAs installed for premises isolation. The number in Column B can’t be larger than the number in Column A in the same row.

[3]Count only connections with premises isolation AGs or RPs. Don't include connections with in-premises backflow preventers only or connections with premises isolation DCVAs or DCDAs isolation.

Part 4A: Backflow Preventer Inventory and Testing Information for 2021

- Complete all fields. Enter **zero (0)**, if no backflow preventers in a specific category.
- Count only backflow preventers relied on to protect the PWS.
- Count AVBs on *irrigation systems only*. Select No to AVB question above Table 2 if PWS doesn't track AVBs.
- Count multiple tests (or failures) for the same backflow preventer as one test (or failure) for that backflow preventer.
- For multiple service connections or parallel installations, count each assembly separately.
- Count RPDAs and DCDAs as ***single*** assemblies. Count the tests of the mainline assembly and bypass assembly as ***one test***. Count the failure of either the mainline or bypass assembly (or the failure of both) as ***one failure***. Count an entire detector assembly taken out of service as ***one assembly removed from service***.
- Count assemblies installed on dedicated fire or irrigation lines as **Premises Isolation Assemblies** in Table 1.

	Backflow Preventer Category and Inspection/Testing Information	Air Gap	RPBA	RPDA	DCVA	DCDA	PVBA	SVBA	AVB
Table 1: Premises Isolation Preventers (include preventers isolating PWS-owned facilities)									
Existing Premises Isolation Backflow Preventers									
1	In service at beginning of 2021	0	63	1	2201	23			
2	Inspected and/or tested in 2021[1]	0	44	0	1557	18			
3	Failed inspection or test in 2021	0	6	0	14	0			
New Premises Isolation Backflow Preventers									
4	Installed in 2021[2]	0	0	0	26	0			
5	Inspected and/or tested in 2021[1]	0	0	0	26	0			
6	Failed inspection or test in 2021	0	0	0	0	0			
Premises Isolation Backflow Preventers (existing or new)									
7	Removed from service in 2021[3]	0	0	0	16	0			
Total Premises Isolation Preventers at End of 2021		0	63	1	2211	23	0	0	0
	Does PWS track AVBs on irrigation systems? ○ Yes ◉ No								
Table 2: In-Premises Preventers (include preventers within PWS-owned facilities)									
Existing In-Premises Backflow Preventers									
8	In service at beginning of 2021	0	126	1	1104	21	10	1	unk
9	Inspected and/or tested in 2021[1]	0	109	1	907	18	10	0	unk
10	Failed inspection or test in 2021	0	8	0	9	0	0	0	unk

New In-Premises Backflow Preventers									
11	Installed in 2021[2]	0	3	0	167	2	1	0	unk
12	Inspected and/or tested in 2021[1]	0	3	0	164	2	1	0	unk
13	Failed inspection or test in 2021	0	2	0	0	0	0	0	unk
In-Premises Backflow Preventers (existing or new)									
14	Removed from service in 2021[3]	0	0	0	5	0	1	0	unk
Total In-Premises Preventers at End of 2021[4]		**0**	**129**	**1**	**1266**	**23**	**10**	**1**	**0**
Grand Totals at End of 2021		**0**	**192**	**2**	**3477**	**46**	**10**	**1**	**0**

[1] Initial and/or routine annual inspection (for proper installation and approval status) and/or test (for testable assemblies only, using DOH-approved USC field test procedures).

[2] Includes preventers installed on connections where backflow prevention was not previously required and any preventers that replaced those in service at the beginning of the reporting year. Replacement preventers may be of a different type than the originals.

[3] Existing or new preventers taken out of service, whether or not they were replaced by the same or a different type of preventer.

Part 4B: Other Implementation Activities in 2021

Complete all cells. Enter zero if not applicable.

Water Use Questionnaires	
Did your PWS send any water use questionnaires to customers during 2021?	○ Yes ◉ No

On-site Hazard Surveys				
Did your CCS conduct any on-site hazard surveys during 2021?				○ Yes ◉ No
	Service Connection Type			
	New	**Existing**	**Total**	
1. Number of connections surveyed for cross-connection hazards to PWS.			0	
2. Number of connections requiring backflow prevention to protect PWS.[1,2]			0	

New Exceptions to Premises Isolation	
Did your CCS grant any new premises isolation exceptions in 2021 to high-hazard premises?[3]	○ Yes ◉ No

CCC Enforcement Actions	
Did your PWS take any enforcement actions during 2021?[4]	○ Yes ◉ No

[1] Include services where either premises isolation or in-premises preventers were required to protect the PWS.

[2] Include existing services that need new, additional or higher level backflow prevention.

[3] Submit a completed DOH Exception Form (green) for each new exception granted in the reporting year.

[4] "Enforcement actions" means actions taken by the PWS (such as water shut-off, PWS installation or testing of backflow preventer, assessment of fines, etc.) when the customer fails to comply with the PWS's CCC requirements.

Part 5: Backflow Incidents and "Off-Normal" Events in 2021

	Backflow Incidents, Risk Factors, and Indicators during 2021	Number
Backflow Incidents during 2021		
1	Backflow incidents that contaminated the PWS[5].	0
2	Backflow incidents that contaminated the customer's drinking water system ***only***[5].	0

Risk Factors for Backflow during 2021		
3	Distribution main breaks per 100 miles of pipe.	10.00
4	Low pressure events (<20 psi in PWS distribution system).	0
5	Water outage events.	0
Indicators of Possible Backflow during 2021		
6	Total health-related complaints received by PWS.[6]	0
7	Received during BWA or PN events.[7]	0
8	Received during low pressure or water outage events.	0
9	Total aesthetic complaints (color, taste, odor, air in lines, etc.).	6
10	Received during BWA or PN events.[7]	0
11	Number of these complaints received during low pressure or water outage events.	0

[5] Purveyors must submit a Backflow Incident Report form for each backflow incident known to have contaminated the public water system. DOH is also interested in receiving incident report forms for backflow incidents that contaminated the customer's drinking water system only.

[6] Such as stomach ache, headache, vomiting, diarrhea, skin rashes, etc.

[7] **"BWA"** means **Boil Water Advisory** and **"PN"** means **Public Notification** for water quality reasons.

Part 6: Comments and Clarifications

- Enter comments to:
  - Explain or clarify information in this report.
  - Describe challenges faced or accomplishments made in this reporting year.
  - Share your goals and objectives for the coming reporting year.
- Delete comments that are no longer valid.

Part No.	Date Added	Comments
Pt 1	04-18-2019	Updated back flow software to XC2. in March 2019.Still working on migrating and merging.
Pt 1	05-07-2021	The numbers reflecting 2019 service connections is believed to have been an estimate. The actual number of service connections at the end of 2020 were obtained from our financial analyst who deals directly with the tracking of new and existing service connections.
Pt 1	05-07-2021	The actual number of service connections for 2019 is: Residential-8635 All Other: 273 esidential 8635
Pt 1	05-18-2021	Our previous Backflow manager just recently retired. And since I do not yet have a complete understanding of our new XC2 tracking program and I am unable to locate some of the information that may need to be 100% confident in my report for the 2020 ASR. My plan for 2021 is to ensure that we have at least one more CCS on board, dedicated to the cross connection program as well as finding classes for those who are not up to speed with all the regulations pertaining to cross connection control. And to begin conducting surveys at some the various facilities around the City. , in or to be as accurate as possible with our CCC program.
Pt 1	03-18-2022	We are still trying to get up to speed with our CCC program. Previous information beyond 2020 is still being corrected and numbers on record aren't entirely correct with what we are finding in the field when we are able to access. We are still working on building a stronger more stringent program and I hope to have a couple of certified operators this year dedicated to the program and begin overdo hazard assessments as well as working closer with the building department on new construction.

Part 7: Report Certification and Contact Information

I, Allen Nelson , certify that the information in this form is true, complete and accurate to the best of my knowledge.

Last Saved	03/21/2022	**All ASR Forms Certified/Submitted**	03/21/2022

Designated CCS/CCC Program Manager[1]					
Name	Allen Nelson	**Title**	Water Supply Operator	**CCS Cert #**	8187
Email Address	anelson@cityofcamas.us	**Phone**	360-817-7287	**Phone Ext**	

PWS Manager[2]					
Name	Allen Nelson	**Title**	Water Supply Operator	**Operator Cert #**	8187
Email Address	anelson@cityofcamas.us	**Phone**	360-817-7287	**Phone Ext**	

[1] The CCS responsible for developing and implementing the PWS's CCC program (CCC Program Manager).

[2] The person the designated CCS/CCC Program Manager reports to or other manager having direct oversight of the CCC Program.

Cross-Connection Control Activities (Blue)
Annual Summary Report (ASR) for 2022

PWS ID: **108002** PWS Name: **CAMAS MUNICIPAL WATER SEWER SYSTEM** County: **CLARK**

Part 1: Designated Cross-Connection Control Specialist (CCS) Information

CCS Name	Allen Nelson	**CCS Phone**	360-817-7287	**CCS Cert. #**	8187	**BAT Cert. #**	
CCS is: PWS owner or employee							

Part 2: Status of Cross-Connection Control (CCC) Program at End of 2022

Provide information about the status of your CCC Program at the end of the reporting year.

PWS has:	**A written CCC Program Plan**[1] ◉ Yes ○ No	**Program Plan Last Updated**[3] 10/04/2019	
	CCC implementation activities[2] ◉ Yes ○ No		

[1] Enter "Yes" if PWS has **any** type of written CCC Program Plan, policies, or procedures. Written CCC Program Plan must be part of a Water System Plan (WSP) or Small Water System Management Program (SWSMP).

[2] Enter "Yes" if PWS implemented **any** CCC Program activities during the reporting year, such as establishing legal authority, conducting hazard evaluations, requiring installation of backflow assemblies to protect the PWS, requiring assembly testing, maintaining CCC records, or enforcing the PWS's or CCC Program requirements.

[3] PWS can update the CCC Program Plan at any time (independent of WSP or SWSMP update).

Provide information regarding PWS's specific CCC Program Elements

Program Element Number	Description of Element [See WAC 246-290-490(3)]	This Program Element is:	
		Included in Written Program Plan	Being Implemented or Is Completed
1	**Legal Authority Established**	◉ Yes ○ No	◉ Yes ○ No
2	**Hazard Evaluation Procedures and Schedules**	◉ Yes ○ No	◉ Yes ○ No
3	**Procedures/Schedules for Ensuring Installation of Backflow Preventers**	◉ Yes ○ No	◉ Yes ○ No
4	**Certified CCS Provided**	◉ Yes ○ No	◉ Yes ○ No
5	**Backflow Preventer Inspection and Testing**	◉ Yes ○ No	◉ Yes ○ No

6	**Assembly Testing Quality Assurance/Quality Control (QA/QC) Program**	◉ Yes ○ No	◉ Yes ○ No
7	**Backflow Incident Response Procedures**	◉ Yes ○ No	◉ Yes ○ No
8	**Public Education Program**	◉ Yes ○ No	◉ Yes ○ No
9	**CCC Records**	◉ Yes ○ No	◉ Yes ○ No
10	**Reclaimed Water Permit**	○ Yes ○ No ◉ N/A	○ Yes ○ No ◉ N/A

Part 3A: PWS Characteristics at End of 2022

Enter the number of connections (new and existing) served by the PWS by type.

Type of Service Connection	Number
Residential (As defined by PWS)	9722
All Other (include dedicated fire lines, dedicated irrigation lines, and PWS-owned facilities such as water and wastewater treatment plants and pumping stations, parks, piers, and docks)	228
Total Number of Connections	9950

Part 3B: Cross-Connection Control for Severe and High-Hazard Premises and High-Hazard Dedicated Lines Served by the PWS

Answer the following questions carefully. These answers control your access to pages 2 and 3 for data entry.

1. Does your PWS serve any severe or high-hazard premises or any high-hazard dedicated fire or irrigation lines? (●) Yes ( ) No

2. Does PWS serve any high-hazard medical premises? (●) Yes ( ) No

- If you answer Yes to both questions, you must enter data in at least one row on page 2 and one row on page 3.
- If you answer Yes to Question 1 and No to Question 2, you must enter data on page 2 only.
- If you answer No to both questions, pages 2 and 3 will be grayed out to prevent data entry.

- Count only premises PWS serves water to.
- Report data as accurately as possible. **DOH currently bases CCC compliance actions on this information.**

Type of Severe or High-Hazard Premises or Dedicated Lines [WAC 246-290-490(4)(b)]	Number of Connections at end of 2022			
	A. Being Served Water by PWS[1]	B. With Premises Isolation by AG/RP[2]	C. With Column B AG Inspected or RP Tested[3]	D. Granted Exception from Premises Isolation
Agricultural (farms and dairies)				
Beverage bottling plants (including breweries)				
Car washes	2	2	2	0
Chemical plants				
Commercial laundries and dry cleaners	2	2	2	0
Both reclaimed water and potable water provided				
Film processing facilities				
Dedicated fire lines with chemical addition or using unapproved auxiliary supplies				
Food processing plants (including canneries, slaughter houses, rendering plants)				
Hospitals, medical centers, medical, dental and veterinary clinics, mortuaries, nursing homes, etc., reported on Part 3C page 3 (totals imported from page 3)	20	6	6	0
Dedicated irrigation systems using purveyor's water supply and chemical addition[4]				

Laboratories	1	1	1	0
Metal plating industries				
Petroleum processing or storage plants	4	4	4	0
Piers and docks				
Radioactive material processing plants or nuclear reactors				
Survey access denied or restricted				
Wastewater lift/pump stations (non-residential only)	9	9	9	0
Wastewater treatment plants	1	1	1	
Unapproved auxiliary water supply interconnected with potable water supply				
Totals	39	25	25	0

[1] Count multiple connections or parallel installations to the same premises as **separate** connections.

[2]Count only connections with premises isolation AGs or RPs. Don't include connections with in-premises preventers only or connections with DCVAs or DCDAs installed for premises isolation. The number in Column B can't be larger than the number in Column A in the same row.

[3] Count only connections whose premises isolation preventers were inspected (AGs) or tested (RPs) during the reporting year.

[4] For example, dedicated irrigation lines to parks, playgrounds, golf courses, cemeteries, estates, etc.

[5] Premises with hazardous materials or processes (requiring isolation by AG or RP), such as aircraft and automotive manufacturers, pulp and paper mills, metal manufacturers, military bases, and wholesale customers that pose a high hazard to the PWS. May be grouped together in categories, for example:"Other manufacturing" or "Other commercial".

Part 3C: Cross-Connection Control for High-Hazard Medical Premises Served by the PWS

- Count only medical premises PWS serves water to.
- Don't count the same premises more than once. If you serve different medical category premises through a single connection, count the connection under the medical category you consider to pose the highest hazard to PWS.
- Report data as accurately as possible. **DOH currently bases CCC compliance actions on this information**

Type of High-Hazard Medical Premises [WAC 246-290-490(4)(b)]	Number of Connections at end of 2022			
	A. Being Served Water by PWS[1]	B. With Premises Isolation by AG/RP[2]	C. With Column B AG Inspected or RP Tested[3]	D. Granted Exception from Premises Isolation
Hospitals				
Hospitals (include psychiatric hospitals and alcohol and drug treatment centers)				
Facilities for Treatment and Care of Patients Not Located in Hospitals Counted Above				
Same day surgery centers				
Out-patient clinics and offices				
Alternative health out-patient clinics and offices				
Psychiatric out-patient clinics and offices				
Chiropractors with water-connected X-ray equipment	6	0	0	0
Hospice care centers				
Childbirth centers				
Kidney dialysis centers				
Blood centers				
Dental clinics and offices	6	1	1	0
Facilities for Housing Patients				
Nursing homes	2	2	2	0
Assisted Living Facilities (formerly Boarding Homes)	3	0	0	0
Residential treatment centers				
Other Medical-Related Facilities				
Mortuaries with embalming equipment	2	2	2	0
Morgues and autopsy facilities (not in hospitals)				

Veterinarian offices, clinics and hospitals	1	1	1	0
Totals	20	6	6	0

[1] Count multiple connections or parallel installations to the same premises as **separate** connections.

[2]Count only connections with premises isolation AGs or RPs. Don’t include connections with in-premises preventers only or connections with DCVAs or DCDAs installed for premises isolation. The number in Column B can’t be larger than the number in Column A in the same row.

[3]Count only connections with premises isolation AGs or RPs. Don't include connections with in-premises backflow preventers only or connections with premises isolation DCVAs or DCDAs isolation.

Part 4A: Backflow Preventer Inventory and Testing Information for 2022

- Complete all fields. Enter **zero (0)**, if no backflow preventers in a specific category.
- Count only backflow preventers relied on to protect the PWS.
- Count AVBs on *irrigation systems only*. Select No to AVB question above Table 2 if PWS doesn't track AVBs.
- Count multiple tests (or failures) for the same backflow preventer as one test (or failure) for that backflow preventer.
- For multiple service connections or parallel installations, count each assembly separately.
- Count RPDAs and DCDAs as ***single*** assemblies. Count the tests of the mainline assembly and bypass assembly as ***one test***. Count the failure of either the mainline or bypass assembly (or the failure of both) as ***one failure***. Count an entire detector assembly taken out of service as ***one assembly removed from service***.
- Count assemblies installed on dedicated fire or irrigation lines as **Premises Isolation Assemblies** in Table 1.

	Backflow Preventer Category and Inspection/Testing Information	Air Gap	RPBA	RPDA	DCVA	DCDA	PVBA	SVBA	AVB
Table 1: Premises Isolation Preventers (include preventers isolating PWS-owned facilities)									
Existing Premises Isolation Backflow Preventers									
1	In service at beginning of 2022	0	63	1	2677	49			
2	Inspected and/or tested in 2022[1]	0	44	0	2275	22			
3	Failed inspection or test in 2022	0	6	0	109	1			
New Premises Isolation Backflow Preventers									
4	Installed in 2022[2]	0	6	0	419	0			
5	Inspected and/or tested in 2022[1]	0	6	0	419	0			
6	Failed inspection or test in 2022	0	0	0	2	0			
Premises Isolation Backflow Preventers (existing or new)									
7	Removed from service in 2022[3]	0	1	0	25	0			
Total Premises Isolation Preventers at End of 2022		0	68	1	3071	49	0	0	0
	Does PWS track AVBs on irrigation systems? ○ Yes ◉ No								
Table 2: In-Premises Preventers (include preventers within PWS-owned facilities)									
Existing In-Premises Backflow Preventers									
8	In service at beginning of 2022	0	72	1	510	21	10	1	unk
9	Inspected and/or tested in 2022[1]	0	70	1	499	18	10	1	unk
10	Failed inspection or test in 2022	0	2	0	11	0	0	0	unk

New In-Premises Backflow Preventers									
11	Installed in 2022[2]	0	0	0	11	0	0	0	unk
12	Inspected and/or tested in 2022[1]	0	0	0	11	0	0	0	unk
13	Failed inspection or test in 2022	0	0	0	2	0	0	0	unk
In-Premises Backflow Preventers (existing or new)									
14	Removed from service in 2022[3]	0	0	0	0	0	0	0	unk
Total In-Premises Preventers at End of 2022[4]		**0**	**72**	**1**	**521**	**21**	**10**	**1**	**0**
Grand Totals at End of 2022		**0**	**140**	**2**	**3592**	**70**	**10**	**1**	**0**

[1] Initial and/or routine annual inspection (for proper installation and approval status) and/or test (for testable assemblies only, using DOH-approved USC field test procedures).

[2] Includes preventers installed on connections where backflow prevention was not previously required and any preventers that replaced those in service at the beginning of the reporting year. Replacement preventers may be of a different type than the originals.

[3] Existing or new preventers taken out of service, whether or not they were replaced by the same or a different type of preventer.

Part 4B: Other Implementation Activities in 2022

Complete all cells. Enter zero if not applicable.

Water Use Questionnaires	
Did your PWS send any water use questionnaires to customers during 2022?	○ Yes ◉ No

On-site Hazard Surveys				
Did your CCS conduct any on-site hazard surveys during 2022?				○ Yes ◉ No
	Service Connection Type			
	New	**Existing**	**Total**	
1. Number of connections surveyed for cross-connection hazards to PWS.			0	
2. Number of connections requiring backflow prevention to protect PWS.[1,2]			0	

New Exceptions to Premises Isolation	
Did your CCS grant any new premises isolation exceptions in 2022 to high-hazard premises?[3]	○ Yes ◉ No

CCC Enforcement Actions	
Did your PWS take any enforcement actions during 2022?[4]	○ Yes ◉ No

[1] Include services where either premises isolation or in-premises preventers were required to protect the PWS.

[2] Include existing services that need new, additional or higher level backflow prevention.

[3] Submit a completed DOH Exception Form (green) for each new exception granted in the reporting year.

[4] "Enforcement actions" means actions taken by the PWS (such as water shut-off, PWS installation or testing of backflow preventer, assessment of fines, etc.) when the customer fails to comply with the PWS's CCC requirements.

Part 5: Backflow Incidents and "Off-Normal" Events in 2022

	Backflow Incidents, Risk Factors, and Indicators during 2022	Number
Backflow Incidents during 2022		
1	Backflow incidents that contaminated the PWS[5].	0
2	Backflow incidents that contaminated the customer's drinking water system ***only***[5].	0

Risk Factors for Backflow during 2022		
3	Distribution main breaks per 100 miles of pipe.	7.00
4	Low pressure events (<20 psi in PWS distribution system).	0
5	Water outage events.	0
Indicators of Possible Backflow during 2022		
6	Total health-related complaints received by PWS.[6]	0
7	Received during BWA or PN events.[7]	0
8	Received during low pressure or water outage events.	0
9	Total aesthetic complaints (color, taste, odor, air in lines, etc.).	1
10	Received during BWA or PN events.[7]	0
11	Number of these complaints received during low pressure or water outage events.	0

[5] Purveyors must submit a Backflow Incident Report form for each backflow incident known to have contaminated the public water system. DOH is also interested in receiving incident report forms for backflow incidents that contaminated the customer's drinking water system only.

[6] Such as stomach ache, headache, vomiting, diarrhea, skin rashes, etc.

[7] **"BWA"** means **Boil Water Advisory** and **"PN"** means **Public Notification** for water quality reasons.

Part 6: Comments and Clarifications

- Enter comments to:
  - Explain or clarify information in this report.
  - Describe challenges faced or accomplishments made in this reporting year.
  - Share your goals and objectives for the coming reporting year.
- Delete comments that are no longer valid.

Part No.	Date Added	Comments
Pt 1	04-18-2019	Updated back flow software to XC2. in March 2019.Still working on migrating and merging.
Pt 1	05-07-2021	The numbers reflecting 2019 service connections is believed to have been an estimate. The actual number of service connections at the end of 2020 were obtained from our financial analyst who deals directly with the tracking of new and existing service connections.
Pt 1	05-07-2021	The actual number of service connections for 2019 is: Residential-8635 All Other: 273 esidential 8635
Pt 1	05-18-2021	Our previous Backflow manager just recently retired. And since I do not yet have a complete understanding of our new XC2 tracking program and I am unable to locate some of the information that may need to be 100% confident in my report for the 2020 ASR. My plan for 2021 is to ensure that we have at least one more CCS on board, dedicated to the cross connection program as well as finding classes for those who are not up to speed with all the regulations pertaining to cross connection control. And to begin conducting surveys at some the various facilities around the City. , in or to be as accurate as possible with our CCC program.
Pt 1	03-18-2022	We are still trying to get up to speed with our CCC program. Previous information beyond 2020 is still being corrected and numbers on record aren't entirely correct with what we are finding in the field when we are able to access. We are still working on building a stronger more stringent program and I hope to have a couple of certified operators this year dedicated to the program and begin overdo hazard assessments as well as working closer with the building department on new construction.
Pt 1	01-19-2023	We are looking at a dedicated CCCS to hire this year that will begin a more in-depth investigation on the commercial and industrial side of our customers. We have also begun working closer with our building department regarding new construction.
Pt 1	04-10-2023	There are numbers this year that don't coincide with last year's numbers because we have someone dedidcated to data entry for our CCC program and she has been digging into past information and doing a bit of updating.

Part 7: Report Certification and Contact Information

I, Allen Nelson , certify that the information in this form is true, complete and accurate to the best of my knowledge.

Last Saved	04/10/2023	**All ASR Forms Certified/Submitted**	04/10/2023

Designated CCS/CCC Program Manager[1]					
Name	Allen Nelson	**Title**	Water Supply Operator	**CCS Cert #**	8187
Email Address	anelson@cityofcamas.us	**Phone**	360-817-7287	**Phone Ext**	

PWS Manager[2]					
Name	Allen Nelson	**Title**	Water Supply Operator	**Operator Cert #**	8187

3	**Procedures/Schedules for Ensuring Installation of Backflow Preventers**	◉ Yes ○ No	◉ Yes ○ No
4	**Certified CCS Provided**	◉ Yes ○ No	◉ Yes ○ No
5	**Backflow Preventer Inspection and Testing**	◉ Yes ○ No	◉ Yes ○ No

6	**Assembly Testing Quality Assurance/Quality Control (QA/QC) Program**	◉ Yes ○ No	◉ Yes ○ No
7	**Backflow Incident Response Procedures**	◉ Yes ○ No	◉ Yes ○ No
8	**Public Education Program**	◉ Yes ○ No	◉ Yes ○ No
9	**CCC Records**	◉ Yes ○ No	◉ Yes ○ No
10	**Reclaimed Water Permit**	○ Yes ○ No ◉ N/A	○ Yes ○ No ◉ N/A

Part 3A: PWS Characteristics at End of 2023

Enter the number of connections (new and existing) served by the PWS by type.

Type of Service Connection	Number
Residential (As defined by PWS)	9722
All Other (include dedicated fire lines, dedicated irrigation lines, and PWS-owned facilities such as water and wastewater treatment plants and pumping stations, parks, piers, and docks)	228
Total Number of Connections	9950

Part 3B: Cross-Connection Control for Severe and High-Hazard Premises and High-Hazard Dedicated Lines Served by the PWS

Answer the following questions carefully. These answers control your access to pages 2 and 3 for data entry.

1. Does your PWS serve any severe or high-hazard premises or any high-hazard dedicated fire or irrigation lines? (●) Yes ( ) No

2. Does PWS serve any high-hazard medical premises? (●) Yes ( ) No

- If you answer Yes to both questions, you must enter data in at least one row on page 2 and one row on page 3.
- If you answer Yes to Question 1 and No to Question 2, you must enter data on page 2 only.
- If you answer No to both questions, pages 2 and 3 will be grayed out to prevent data entry.

- Count only premises PWS serves water to.
- Report data as accurately as possible. **DOH currently bases CCC compliance actions on this information.**

Type of Severe or High-Hazard Premises or Dedicated Lines [WAC 246-290-490(4)(b)]	Number of Connections at end of 2023			
	A. Being Served Water by PWS[1]	B. With Premises Isolation by AG/RP[2]	C. With Column B AG Inspected or RP Tested[3]	D. Granted Exception from Premises Isolation
Agricultural (farms and dairies)				
Beverage bottling plants (including breweries)				
Car washes	2	2	2	0
Chemical plants				
Commercial laundries and dry cleaners	2	2	2	0
Both reclaimed water and potable water provided				
Film processing facilities				
Dedicated fire lines with chemical addition or using unapproved auxiliary supplies				
Food processing plants (including canneries, slaughter houses, rendering plants)				
Hospitals, medical centers, medical, dental and veterinary clinics, mortuaries, nursing homes, etc., reported on Part 3C page 3 (totals imported from page 3)	20	6	6	0
Dedicated irrigation systems using purveyor's water supply and chemical addition[4]				

Laboratories	1	1	1	0
Metal plating industries				
Petroleum processing or storage plants	4	4	4	0
Piers and docks				
Radioactive material processing plants or nuclear reactors				
Survey access denied or restricted				
Wastewater lift/pump stations (non-residential only)	9	9	9	0
Wastewater treatment plants	1	1	1	
Unapproved auxiliary water supply interconnected with potable water supply				
Totals	39	25	25	0

[1] Count multiple connections or parallel installations to the same premises as **separate** connections.

[2]Count only connections with premises isolation AGs or RPs. Don't include connections with in-premises preventers only or connections with DCVAs or DCDAs installed for premises isolation. The number in Column B can't be larger than the number in Column A in the same row.

[3] Count only connections whose premises isolation preventers were inspected (AGs) or tested (RPs) during the reporting year.

[4] For example, dedicated irrigation lines to parks, playgrounds, golf courses, cemeteries, estates, etc.

[5] Premises with hazardous materials or processes (requiring isolation by AG or RP), such as aircraft and automotive manufacturers, pulp and paper mills, metal manufacturers, military bases, and wholesale customers that pose a high hazard to the PWS. May be grouped together in categories, for example:"Other manufacturing" or "Other commercial".

Part 3C: Cross-Connection Control for High-Hazard Medical Premises Served by the PWS

- Count only medical premises PWS serves water to.
- Don't count the same premises more than once. If you serve different medical category premises through a single connection, count the connection under the medical category you consider to pose the highest hazard to PWS.
- Report data as accurately as possible. **DOH currently bases CCC compliance actions on this information**

Type of High-Hazard Medical Premises [WAC 246-290-490(4)(b)]	Number of Connections at end of 2023			
	A. Being Served Water by PWS[1]	B. With Premises Isolation by AG/RP[2]	C. With Column B AG Inspected or RP Tested[3]	D. Granted Exception from Premises Isolation
Hospitals				
Hospitals (include psychiatric hospitals and alcohol and drug treatment centers)				
Facilities for Treatment and Care of Patients Not Located in Hospitals Counted Above				
Same day surgery centers				
Out-patient clinics and offices				
Alternative health out-patient clinics and offices				
Psychiatric out-patient clinics and offices				
Chiropractors with water-connected X-ray equipment	6	0	0	0
Hospice care centers				
Childbirth centers				
Kidney dialysis centers				
Blood centers				
Dental clinics and offices	6	1	1	0
Facilities for Housing Patients				
Nursing homes	2	2	2	0
Assisted Living Facilities (formerly Boarding Homes)	3	0	0	0
Residential treatment centers				
Other Medical-Related Facilities				
Mortuaries with embalming equipment	2	2	2	0
Morgues and autopsy facilities (not in hospitals)				

Veterinarian offices, clinics and hospitals	1	1	1	0
Totals	20	6	6	0

[1] Count multiple connections or parallel installations to the same premises as **separate** connections.

[2]Count only connections with premises isolation AGs or RPs. Don’t include connections with in-premises preventers only or connections with DCVAs or DCDAs installed for premises isolation. The number in Column B can’t be larger than the number in Column A in the same row.

[3]Count only connections with premises isolation AGs or RPs. Don't include connections with in-premises backflow preventers only or connections with premises isolation DCVAs or DCDAs isolation.

Part 4A: Backflow Preventer Inventory and Testing Information for 2023

- Complete all fields. Enter **zero (0)**, if no backflow preventers in a specific category.
- Count only backflow preventers relied on to protect the PWS.
- Count AVBs on *irrigation systems only*. Select No to AVB question above Table 2 if PWS doesn't track AVBs.
- Count multiple tests (or failures) for the same backflow preventer as one test (or failure) for that backflow preventer.
- For multiple service connections or parallel installations, count each assembly separately.
- Count RPDAs and DCDAs as ***single*** assemblies. Count the tests of the mainline assembly and bypass assembly as ***one test***. Count the failure of either the mainline or bypass assembly (or the failure of both) as ***one failure***. Count an entire detector assembly taken out of service as ***one assembly removed from service***.
- Count assemblies installed on dedicated fire or irrigation lines as **Premises Isolation Assemblies** in Table 1.

	Backflow Preventer Category and Inspection/Testing Information	Air Gap	RPBA	RPDA	DCVA	DCDA	PVBA	SVBA	AVB
Table 1: Premises Isolation Preventers (include preventers isolating PWS-owned facilities)									
Existing Premises Isolation Backflow Preventers									
1	In service at beginning of 2023	0	183	3	4020	48			
2	Inspected and/or tested in 2023[1]	0	147	2	3418	37			
3	Failed inspection or test in 2023	0	21	1	91	3			
New Premises Isolation Backflow Preventers									
4	Installed in 2023[2]	0	3	0	100	0			
5	Inspected and/or tested in 2023[1]	0	3	0	100	0			
6	Failed inspection or test in 2023	0	0	0	6	0			
Premises Isolation Backflow Preventers (existing or new)									
7	Removed from service in 2023[3]	0	0	0	13	0			
Total Premises Isolation Preventers at End of 2023		0	186	3	4107	48	0	0	0

Does PWS track AVBs on irrigation systems? ○ Yes ◉ No

	Table 2: In-Premises Preventers (include preventers within PWS-owned facilities)								
Existing In-Premises Backflow Preventers									
8	In service at beginning of 2023	0	0	0	12	0	22	0	unk
9	Inspected and/or tested in 2023[1]	0	0	0	9	0	17	0	unk
10	Failed inspection or test in 2023	0	0	0	0	0	2	0	unk

New In-Premises Backflow Preventers									
11	Installed in 2023[2]	0	0	0	0	0	0	0	unk
12	Inspected and/or tested in 2023[1]	0	0	0	0	0	0	0	unk
13	Failed inspection or test in 2023	0	0	0	0	0	0	0	unk
In-Premises Backflow Preventers (existing or new)									
14	Removed from service in 2023[3]	0	0	0	0	0	0	0	unk
Total In-Premises Preventers at End of 2023[4]		**0**	**0**	**0**	**12**	**0**	**22**	**0**	**0**
Grand Totals at End of 2023		**0**	**186**	**3**	**4119**	**48**	**22**	**0**	**0**

[1] Initial and/or routine annual inspection (for proper installation and approval status) and/or test (for testable assemblies only, using DOH-approved USC field test procedures).

[2] Includes preventers installed on connections where backflow prevention was not previously required and any preventers that replaced those in service at the beginning of the reporting year. Replacement preventers may be of a different type than the originals.

[3] Existing or new preventers taken out of service, whether or not they were replaced by the same or a different type of preventer.

Part 4B: Other Implementation Activities in 2023

Complete all cells. Enter zero if not applicable.

Water Use Questionnaires	
Did your PWS send any water use questionnaires to customers during 2023?	○ Yes ◉ No

On-site Hazard Surveys				
Did your CCS conduct any on-site hazard surveys during 2023?				○ Yes ◉ No
	Service Connection Type			
	New	**Existing**	**Total**	
1. Number of connections surveyed for cross-connection hazards to PWS.			0	
2. Number of connections requiring backflow prevention to protect PWS.[1,2]			0	

New Exceptions to Premises Isolation	
Did your CCS grant any new premises isolation exceptions in 2023 to high-hazard premises?[3]	○ Yes ◉ No

CCC Enforcement Actions	
Did your PWS take any enforcement actions during 2023?[4]	○ Yes ◉ No

[1] Include services where either premises isolation or in-premises preventers were required to protect the PWS.

[2] Include existing services that need new, additional or higher level backflow prevention.

[3] Submit a completed DOH Exception Form (green) for each new exception granted in the reporting year.

[4] "Enforcement actions" means actions taken by the PWS (such as water shut-off, PWS installation or testing of backflow preventer, assessment of fines, etc.) when the customer fails to comply with the PWS's CCC requirements.

Part 5: Backflow Incidents and "Off-Normal" Events in 2023

	Backflow Incidents, Risk Factors, and Indicators during 2023	Number
Backflow Incidents during 2023		
1	Backflow incidents that contaminated the PWS[5].	0
2	Backflow incidents that contaminated the customer's drinking water system ***only***[5].	0

Risk Factors for Backflow during 2023		
3	Distribution main breaks per 100 miles of pipe.	7.00
4	Low pressure events (<20 psi in PWS distribution system).	0
5	Water outage events.	0
Indicators of Possible Backflow during 2023		
6	Total health-related complaints received by PWS.[6]	0
7	Received during BWA or PN events.[7]	0
8	Received during low pressure or water outage events.	0
9	Total aesthetic complaints (color, taste, odor, air in lines, etc.).	5
10	Received during BWA or PN events.[7]	0
11	Number of these complaints received during low pressure or water outage events.	0

[5] Purveyors must submit a Backflow Incident Report form for each backflow incident known to have contaminated the public water system. DOH is also interested in receiving incident report forms for backflow incidents that contaminated the customer's drinking water system only.

[6] Such as stomach ache, headache, vomiting, diarrhea, skin rashes, etc.

[7] **"BWA"** means **Boil Water Advisory** and **"PN"** means **Public Notification** for water quality reasons.

Part 6: Comments and Clarifications

- Enter comments to:
  - Explain or clarify information in this report.
  - Describe challenges faced or accomplishments made in this reporting year.
  - Share your goals and objectives for the coming reporting year.
- Delete comments that are no longer valid.

Part No.	Date Added	Comments
Pt 1	04-18-2019	Updated back flow software to XC2. in March 2019.Still working on migrating and merging.
Pt 1	05-07-2021	The numbers reflecting 2019 service connections is believed to have been an estimate. The actual number of service connections at the end of 2020 were obtained from our financial analyst who deals directly with the tracking of new and existing service connections.
Pt 1	05-07-2021	The actual number of service connections for 2019 is: Residential-8635 All Other: 273 esidential 8635
Pt 1	05-18-2021	Our previous Backflow manager just recently retired. And since I do not yet have a complete understanding of our new XC2 tracking program and I am unable to locate some of the information that may need to be 100% confident in my report for the 2020 ASR. My plan for 2021 is to ensure that we have at least one more CCS on board, dedicated to the cross connection program as well as finding classes for those who are not up to speed with all the regulations pertaining to cross connection control. And to begin conducting surveys at some the various facilities around the City. , in or to be as accurate as possible with our CCC program.
Pt 1	03-18-2022	We are still trying to get up to speed with our CCC program. Previous information beyond 2020 is still being corrected and numbers on record aren't entirely correct with what we are finding in the field when we are able to access. We are still working on building a stronger more stringent program and I hope to have a couple of certified operators this year dedicated to the program and begin overdo hazard assessments as well as working closer with the building department on new construction.
Pt 1	01-19-2023	We are looking at a dedicated CCCS to hire this year that will begin a more in-depth investigation on the commercial and industrial side of our customers. We have also begun working closer with our building department regarding new construction.
Pt 1	04-10-2023	There are numbers this year that don't coincide with last year's numbers because we have someone dedidcated to data entry for our CCC program and she has been digging into past information and doing a bit of updating.
Pt 1	04-15-2024	Our new CCCS and data entry person working together found approximately 400 assemblies that were already in the system, that we didn't know about. As we continue to strengthen our program, we will begin to conduct more hazard assessments in 2024 and hopefully start getting a better understanding of what we need to have a more complete program.

Part 7: Report Certification and Contact Information

I, Allen Nelson , certify that the information in this form is true, complete and accurate to the best of my knowledge.

Last Saved	04/15/2024	**All ASR Forms Certified/Submitted**	04/15/2024

Designated CCS/CCC Program Manager[1]					
Name	Allen Nelson	**Title**	Water Supply Operator	**CCS Cert #**	8187
Email Address	anelson@cityofcamas.us	**Phone**	360-817-7287	**Phone Ext**	

PWS Manager[2]					
Name	Allen Nelson	**Title**	Water Supply Operator	**Operator Cert #**	8187
Email Address	anelson@cityofcamas.us	**Phone**	360-817-7287	**Phone Ext**	

[1] The CCS responsible for developing and implementing the PWS's CCC program (CCC Program Manager).

[2] The person the designated CCS/CCC Program Manager reports to or other manager having direct oversight of the CCC Program.

Cross-Connection Control Activities (Blue)
Annual Summary Report (ASR) for 2025

PWS ID: **108002** PWS Name: **CAMAS MUNICIPAL WATER SEWER SYSTEM** County: **CLARK**

Part 1: Designated Cross-Connection Control Specialist (CCS) Information

CCS Name	Nick Mettler	**CCS Phone**	360-833-3188	**CCS Cert. #**	16006	**BAT Cert. #**	B8057
CCS is: PWS owner or employee							

Part 2: Status of Cross-Connection Control (CCC) Program at End of 2025

Provide information about the status of your CCC Program at the end of the reporting year.

PWS has:	**A written CCC Program Plan**[1] ◉ Yes ○ No **CCC implementation activities**[2] ◉ Yes ○ No	**Program Plan Last Updated**[3] 12/04/2023

[1] Enter "Yes" if PWS has **any** type of written CCC Program Plan, policies, or procedures. Written CCC Program Plan must be part of a Water System Plan (WSP) or Small Water System Management Program (SWSMP).

[2] Enter "Yes" if PWS implemented **any** CCC Program activities during the reporting year, such as establishing legal authority, conducting hazard evaluations, requiring installation of backflow assemblies to protect the PWS, requiring assembly testing, maintaining CCC records, or enforcing the PWS's or CCC Program requirements.

[3] PWS can update the CCC Program Plan at any time (independent of WSP or SWSMP update).

Provide information regarding PWS's specific CCC Program Elements

Program Element Number	Description of Element [See WAC 246-290-490(3)]	This Program Element is:	
		Included in Written Program Plan	Being Implemented or Is Completed
1	**Legal Authority Established**	◉ Yes ○ No	◉ Yes ○ No
2	**Hazard Evaluation Procedures and Schedules**	◉ Yes ○ No	◉ Yes ○ No

9	**CCC Records**	◉ Yes ○ No	◉ Yes ○ No
10	**Reclaimed Water Permit**	○ Yes ○ No ◉ N/A	○ Yes ○ No ◉ N/A

Part 3A: PWS Characteristics at End of 2025

Enter the number of connections (new and existing) served by the PWS by type.

Type of Service Connection	Number
Residential (As defined by PWS)	9645
All Other (include dedicated fire lines, dedicated irrigation lines, and PWS-owned facilities such as water and wastewater treatment plants and pumping stations, parks, piers, and docks)	585
Total Number of Connections	10230

Part 3B: Cross-Connection Control for Severe and High-Hazard Premises and High-Hazard Dedicated Lines Served by the PWS

Answer the following questions carefully. These answers control your access to pages 2 and 3 for data entry.

1. Does your PWS serve any severe or high-hazard premises or any high-hazard dedicated fire or irrigation lines? (●) Yes ( ) No

2. Does PWS serve any high-hazard medical premises? (●) Yes ( ) No

- If you answer Yes to both questions, you must enter data in at least one row on page 2 and one row on page 3.
- If you answer Yes to Question 1 and No to Question 2, you must enter data on page 2 only.
- If you answer No to both questions, pages 2 and 3 will be grayed out to prevent data entry.

- Count only premises PWS serves water to.
- Report data as accurately as possible. **DOH currently bases CCC compliance actions on this information.**

Type of Severe or High-Hazard Premises or Dedicated Lines [WAC 246-290-490(4)(b)]	Number of Connections at end of 2025			
	A. Being Served Water by PWS[1]	B. With Premises Isolation by AG/RP[2]	C. With Column B AG Inspected or RP Tested[3]	D. Granted Exception from Premises Isolation
Agricultural (farms and dairies)				
Beverage bottling plants (including breweries)	1	1	1	0
Car washes	1	1	1	0
Chemical plants				
Commercial laundries and dry cleaners	2	1	1	0
Both reclaimed water and potable water provided				
Film processing facilities				
Dedicated fire lines with chemical addition or using unapproved auxiliary supplies				
Food processing plants (including canneries, slaughter houses, rendering plants)				
Hospitals, medical centers, medical, dental and veterinary clinics, mortuaries, nursing homes, etc., reported on Part 3C page 3 (totals imported from page 3)	16	11	11	2
Dedicated irrigation systems using purveyor's water supply and chemical addition[4]				

Laboratories	0	0	0	0
Metal plating industries				
Petroleum processing or storage plants	4	4	4	0
Piers and docks				
Radioactive material processing plants or nuclear reactors				
Survey access denied or restricted				
Wastewater lift/pump stations (non-residential only)	9	9	9	0
Wastewater treatment plants	1	1	1	
Unapproved auxiliary water supply interconnected with potable water supply	1	1	1	0
Totals	35	29	29	2

[1] Count multiple connections or parallel installations to the same premises as **separate** connections.

[2]Count only connections with premises isolation AGs or RPs. Don't include connections with in-premises preventers only or connections with DCVAs or DCDAs installed for premises isolation. The number in Column B can't be larger than the number in Column A in the same row.

[3] Count only connections whose premises isolation preventers were inspected (AGs) or tested (RPs) during the reporting year.

[4] For example, dedicated irrigation lines to parks, playgrounds, golf courses, cemeteries, estates, etc.

[5] Premises with hazardous materials or processes (requiring isolation by AG or RP), such as aircraft and automotive manufacturers, pulp and paper mills, metal manufacturers, military bases, and wholesale customers that pose a high hazard to the PWS. May be grouped together in categories, for example:"Other manufacturing" or "Other commercial".

Part 3C: Cross-Connection Control for High-Hazard Medical Premises Served by the PWS

- Count only medical premises PWS serves water to.
- Don't count the same premises more than once. If you serve different medical category premises through a single connection, count the connection under the medical category you consider to pose the highest hazard to PWS.
- Report data as accurately as possible. **DOH currently bases CCC compliance actions on this information**

Type of High-Hazard Medical Premises [WAC 246-290-490(4)(b)]	Number of Connections at end of 2025			
	A. Being Served Water by PWS[1]	B. With Premises Isolation by AG/RP[2]	C. With Column B AG Inspected or RP Tested[3]	D. Granted Exception from Premises Isolation
Hospitals				
Hospitals (include psychiatric hospitals and alcohol and drug treatment centers)				
Facilities for Treatment and Care of Patients Not Located in Hospitals Counted Above				
Same day surgery centers				
Out-patient clinics and offices				
Alternative health out-patient clinics and offices				
Psychiatric out-patient clinics and offices				
Chiropractors with water-connected X-ray equipment	0	0	0	0
Hospice care centers				
Childbirth centers				
Kidney dialysis centers	1	1	1	0
Blood centers				
Dental clinics and offices	6	4	4	2
Facilities for Housing Patients				
Nursing homes	1	1	1	0
Assisted Living Facilities (formerly Boarding Homes)	5	2	2	0
Residential treatment centers				
Other Medical-Related Facilities				
Mortuaries with embalming equipment	2	2	2	0
Morgues and autopsy facilities (not in hospitals)				

Veterinarian offices, clinics and hospitals	1	1	1	0
Totals	16	11	11	2

[1] Count multiple connections or parallel installations to the same premises as **separate** connections.

[2]Count only connections with premises isolation AGs or RPs. Don’t include connections with in-premises preventers only or connections with DCVAs or DCDAs installed for premises isolation. The number in Column B can’t be larger than the number in Column A in the same row.

[3]Count only connections with premises isolation AGs or RPs. Don't include connections with in-premises backflow preventers only or connections with premises isolation DCVAs or DCDAs isolation.

Part 4A: Backflow Preventer Inventory and Testing Information for 2025

- Complete all fields. Enter **zero (0)**, if no backflow preventers in a specific category.
- Count only backflow preventers relied on to protect the PWS.
- Count AVBs on *irrigation systems only*. Select No to AVB question above Table 2 if PWS doesn't track AVBs.
- Count multiple tests (or failures) for the same backflow preventer as one test (or failure) for that backflow preventer.
- For multiple service connections or parallel installations, count each assembly separately.
- Count RPDAs and DCDAs as ***single*** assemblies. Count the tests of the mainline assembly and bypass assembly as ***one test***. Count the failure of either the mainline or bypass assembly (or the failure of both) as ***one failure***. Count an entire detector assembly taken out of service as ***one assembly removed from service***.
- Count assemblies installed on dedicated fire or irrigation lines as **Premises Isolation Assemblies** in Table 1.

	Backflow Preventer Category and Inspection/Testing Information	Air Gap	RPBA	RPDA	DCVA	DCDA	PVBA	SVBA	AVB
Table 1: Premises Isolation Preventers (include preventers isolating PWS-owned facilities)									
Existing Premises Isolation Backflow Preventers									
1	In service at beginning of 2025	0	39	0	1366	32			
2	Inspected and/or tested in 2025[1]	0	24	0	881	17			
3	Failed inspection or test in 2025	0	1	0	30	1			
New Premises Isolation Backflow Preventers									
4	Installed in 2025[2]	0	5	0	5	3			
5	Inspected and/or tested in 2025[1]	0	5	0	5	3			
6	Failed inspection or test in 2025	0	0	0	0	0			
Premises Isolation Backflow Preventers (existing or new)									
7	Removed from service in 2025[3]	0	0	0	2	0			
Total Premises Isolation Preventers at End of 2025		0	44	0	1369	35	0	0	0

Does PWS track AVBs on irrigation systems? ○ Yes ◉ No

	Table 2: In-Premises Preventers (include preventers within PWS-owned facilities)								
Existing In-Premises Backflow Preventers									
8	In service at beginning of 2025	0	156	3	2909	15	18	0	unk
9	Inspected and/or tested in 2025[1]	0	46	2	1805	8	13	0	unk
10	Failed inspection or test in 2025	0	7	1	43	0	2	0	unk

New In-Premises Backflow Preventers									
11	Installed in 2025[2]	0	13	0	276	0	0	0	unk
12	Inspected and/or tested in 2025[1]	0	13	0	272	0	0	0	unk
13	Failed inspection or test in 2025	0	1	0	2	0	0	0	unk
In-Premises Backflow Preventers (existing or new)									
14	Removed from service in 2025[3]	0	0	0	9	0	0	0	unk
Total In-Premises Preventers at End of 2025[4]		**0**	**169**	**3**	**3176**	**15**	**18**	**0**	**0**
Grand Totals at End of 2025		**0**	**213**	**3**	**4545**	**50**	**18**	**0**	**0**

[1] Initial and/or routine annual inspection (for proper installation and approval status) and/or test (for testable assemblies only, using DOH-approved USC field test procedures).

[2] Includes preventers installed on connections where backflow prevention was not previously required and any preventers that replaced those in service at the beginning of the reporting year. Replacement preventers may be of a different type than the originals.

[3] Existing or new preventers taken out of service, whether or not they were replaced by the same or a different type of preventer.

Part 4B: Other Implementation Activities in 2025

Complete all cells. Enter zero if not applicable.

Water Use Questionnaires	
Did your PWS send any water use questionnaires to customers during 2025?	○ Yes ◉ No

On-site Hazard Surveys				
Did your CCS conduct any on-site hazard surveys during 2025?				◉ Yes ○ No
	Service Connection Type			
	New	**Existing**	**Total**	
1. Number of connections surveyed for cross-connection hazards to PWS.	302	28	330	
2. Number of connections requiring backflow prevention to protect PWS.[1,2]	302	10	312	

New Exceptions to Premises Isolation	
Did your CCS grant any new premises isolation exceptions in 2025 to high-hazard premises?[3]	○ Yes ◉ No

CCC Enforcement Actions	
Did your PWS take any enforcement actions during 2025?[4]	○ Yes ◉ No

[1] Include services where either premises isolation or in-premises preventers were required to protect the PWS.

[2] Include existing services that need new, additional or higher level backflow prevention.

[3] Submit a completed DOH Exception Form (green) for each new exception granted in the reporting year.

[4] "Enforcement actions" means actions taken by the PWS (such as water shut-off, PWS installation or testing of backflow preventer, assessment of fines, etc.) when the customer fails to comply with the PWS's CCC requirements.

Part 5: Backflow Incidents and "Off-Normal" Events in 2025

	Backflow Incidents, Risk Factors, and Indicators during 2025	Number
Backflow Incidents during 2025		
1	Backflow incidents that contaminated the PWS[5].	0
2	Backflow incidents that contaminated the customer's drinking water system ***only***[5].	0

Risk Factors for Backflow during 2025		
3	Distribution main breaks per 100 miles of pipe.	0.00
4	Low pressure events (<20 psi in PWS distribution system).	0
5	Water outage events.	0
Indicators of Possible Backflow during 2025		
6	Total health-related complaints received by PWS.[6]	0
7	Received during BWA or PN events.[7]	0
8	Received during low pressure or water outage events.	0
9	Total aesthetic complaints (color, taste, odor, air in lines, etc.).	3
10	Received during BWA or PN events.[7]	0
11	Number of these complaints received during low pressure or water outage events.	0

[5] Purveyors must submit a Backflow Incident Report form for each backflow incident known to have contaminated the public water system. DOH is also interested in receiving incident report forms for backflow incidents that contaminated the customer's drinking water system only.

[6] Such as stomach ache, headache, vomiting, diarrhea, skin rashes, etc.

[7] **"BWA"** means **Boil Water Advisory** and **"PN"** means **Public Notification** for water quality reasons.

  - Explain or clarify information in this report.
  - Describe challenges faced or accomplishments made in this reporting year.
  - Share your goals and objectives for the coming reporting year.
- Delete comments that are no longer valid.

Part No.	Date Added	Comments
Pt 1	04-18-2019	Updated back flow software to XC2. in March 2019.Still working on migrating and merging.
Pt 1	05-07-2021	The numbers reflecting 2019 service connections is believed to have been an estimate. The actual number of service connections at the end of 2020 were obtained from our financial analyst who deals directly with the tracking of new and existing service connections.
Pt 1	05-07-2021	The actual number of service connections for 2019 is: Residential-8635 All Other: 273 esidential 8635
Pt 1	05-18-2021	Our previous Backflow manager just recently retired. And since I do not yet have a complete understanding of our new XC2 tracking program and I am unable to locate some of the information that may need to be 100% confident in my report for the 2020 ASR. My plan for 2021 is to ensure that we have at least one more CCS on board, dedicated to the cross connection program as well as finding classes for those who are not up to speed with all the regulations pertaining to cross connection control. And to begin conducting surveys at some the various facilities around the City. , in or to be as accurate as possible with our CCC program.
Pt 1	03-18-2022	We are still trying to get up to speed with our CCC program. Previous information beyond 2020 is still being corrected and numbers on record aren't entirely correct with what we are finding in the field when we are able to access. We are still working on building a stronger more stringent program and I hope to have a couple of certified operators this year dedicated to the program and begin overdo hazard assessments as well as working closer with the building department on new construction.
Pt 1	01-19-2023	We are looking at a dedicated CCCS to hire this year that will begin a more in-depth investigation on the commercial and industrial side of our customers. We have also begun working closer with our building department regarding new construction.
Pt 1	04-10-2023	There are numbers this year that don't coincide with last year's numbers because we have someone dedidcated to data entry for our CCC program and she has been digging into past information and doing a bit of updating.
Pt 1	04-15-2024	Our new CCCS and data entry person working together found approximately 400 assemblies that were already in the system, that we didn't know about. As we continue to strengthen our program, we will begin to conduct more hazard assessments in 2024 and hopefully start getting a better understanding of what we need to have a more complete program.
Pt 1	03-27-2025	As I am new to the CCCS position as of last June 2024 there will some changes coming to enforce testing coming the reporting year of 2025. We will be getting new Backflow Management Software installed and running within the next couple months. This outdated XC2 has been glitching and is time to replace. Information from the past has been getting corrected and updated to get the most accurate data. We now have in our municipal code that any non-compliance to test we can send a tester to test then bill the utility account for the test, that should help get our compliance percentage up as well. Looking forward to all the new changes coming into 2025. The 2 new exceptions/ green forms I filled out during some hazard surveys were both from dentist offices that

		both have self-contained chairs not connected to our PWS. I will be checking back on those annually for continued hazard surveys to ensure nothing has changed.
Pt 1	04-06-2026	this past year I have been correcting information within our backflow prevention management software, trying to get the information as correct as possible for our new software that went live at the beginning of 2026. This last year I have been busy combing through the data correcting information from the past several years of input, also doing several hazard surveys at all the new sites and few dozen existing high/severe health hazard sites. The new software is going to help with the organizing of the customer test reminders and failed assemblies to ensure that customers are staying compliant with the testing and maintenance for passing test reports per WAC and CMC. This last year has been a challenge to stay on top of everything as the software change has been rather time consuming and customer addresses have not been changed over to the new software as of today's date 4/6/2026. This next year (2026) is going to be a transition year for the customers to get used to the new testing schedule and non-compliance enforcement action. Good things are happening to ensure safe water for the City of Camas The new software will make tracking it easier, the Camas Municipal Code will make it easier to keep customers compliant on the Backflow assembly testing.

Part 7: Report Certification and Contact Information

I, Nick Mettler , certify that the information in this form is true, complete and accurate to the best of my knowledge.

Annual Summary Report (ASR) for 2024

PWS ID: **108002** PWS Name: **CAMAS MUNICIPAL WATER SEWER SYSTEM** County: **CLARK**

Part 1: Designated Cross-Connection Control Specialist (CCS) Information

CCS Name	Nick Mettler	CCS Phone	360-833-3188	CCS Cert. #	16006	BAT Cert. #	
CCS is: PWS owner or employee							

Part 2: Status of Cross-Connection Control (CCC) Program at End of 2024

Provide information about the status of your CCC Program at the end of the reporting year.

PWS has:	**A written CCC Program Plan**[1] ◉ Yes ○ No **CCC implementation activities**[2] ◉ Yes ○ No	**Program Plan Last Updated**[3] 12/04/2023

[1] Enter "Yes" if PWS has **any** type of written CCC Program Plan, policies, or procedures. Written CCC Program Plan must be part of a Water System Plan (WSP) or Small Water System Management Program (SWSMP).

[2] Enter "Yes" if PWS implemented **any** CCC Program activities during the reporting year, such as establishing legal authority, conducting hazard evaluations, requiring installation of backflow assemblies to protect the PWS, requiring assembly testing, maintaining CCC records, or enforcing the PWS's or CCC Program requirements.

[3] PWS can update the CCC Program Plan at any time (independent of WSP or SWSMP update).

Provide information regarding PWS's specific CCC Program Elements

Program Element Number	Description of Element [See WAC 246-290-490(3)]	This Program Element is:	
		Included in Written Program Plan	Being Implemented or Is Completed
1	**Legal Authority Established**	◉ Yes ○ No	◉ Yes ○ No
2	**Hazard Evaluation Procedures and Schedules**	◉ Yes ○ No	◉ Yes ○ No
3	**Procedures/Schedules for Ensuring Installation of Backflow Preventers**	◉ Yes ○ No	◉ Yes ○ No
4	**Certified CCS Provided**	◉ Yes ○ No	◉ Yes ○ No
5	**Backflow Preventer Inspection and Testing**	◉ Yes ○ No	◉ Yes ○ No
6	**Assembly Testing Quality Assurance/Quality Control (QA/QC) Program**	◉ Yes ○ No	◉ Yes ○ No
7	**Backflow Incident Response Procedures**	◉ Yes ○ No	◉ Yes ○ No
8	**Public Education Program**	◉ Yes ○ No	◉ Yes ○ No
9	**CCC Records**	◉ Yes ○ No	◉ Yes ○ No
10	**Reclaimed Water Permit**	○ Yes ○ No ◉ N/A	○ Yes ○ No ◉ N/A

Part 3A: PWS Characteristics at End of 2024

Enter the number of connections (new and existing) served by the PWS by type.

Type of Service Connection	Number
Residential (As defined by PWS)	10151
All Other (include dedicated fire lines, dedicated irrigation lines, and PWS-owned facilities such as water and wastewater treatment plants and pumping stations, parks, piers, and docks)	308
Total Number of Connections	10459

Part 3B: Cross-Connection Control for Severe and High-Hazard Premises and High-Hazard Dedicated Lines Served by the PWS

Answer the following questions carefully. These answers control your access to pages 2 and 3 for data entry.

1. Does your PWS serve any severe or high-hazard premises or any high-hazard dedicated fire or irrigation lines? ◉ Yes ○ No

2. Does PWS serve any high-hazard medical premises? ◉ Yes ○ No

- If you answer Yes to both questions, you must enter data in at least one row on page 2 and one row on page 3.
- If you answer Yes to Question 1 and No to Question 2, you must enter data on page 2 only.
- If you answer No to both questions, pages 2 and 3 will be grayed out to prevent data entry.

- Count only premises PWS serves water to.
- Report data as accurately as possible. **DOH currently bases CCC compliance actions on this information.**

Type of Severe or High-Hazard Premises or Dedicated Lines [WAC 246-290-490(4)(b)]	Number of Connections at end of 2024			
	A. Being Served Water by PWS[1]	B. With Premises Isolation by AG/RP[2]	C. With Column B AG Inspected or RP Tested[3]	D. Granted Exception from Premises Isolation
Agricultural (farms and dairies)				
Beverage bottling plants (including breweries)	1	1	1	0
Car washes	2	2	2	0
Chemical plants				
Commercial laundries and dry cleaners	2	2	2	0
Both reclaimed water and potable water provided				
Film processing facilities				
Dedicated fire lines with chemical addition or using unapproved auxiliary supplies				
Food processing plants (including canneries, slaughter houses, rendering plants)				
Hospitals, medical centers, medical, dental and veterinary clinics, mortuaries, nursing homes, etc., reported on Part 3C page 3 (totals imported from page 3)	16	11	11	0
Dedicated irrigation systems using purveyor's water supply and chemical addition[4]				
Laboratories	0	0	0	0
Metal plating industries				
Petroleum processing or storage plants	4	4	4	0
Piers and docks				
Radioactive material processing plants or nuclear reactors				
Survey access denied or restricted				
Wastewater lift/pump stations (non-residential only)	9	9	9	0
Wastewater treatment plants	1	1	1	
Unapproved auxiliary water supply interconnected with potable water supply				
Totals	35	30	30	0

[1] Count multiple connections or parallel installations to the same premises as **separate** connections.

[2] Count only connections with premises isolation AGs or RPs. Don't include connections with in-premises preventers only or connections with DCVAs or DCDAs installed for premises isolation. The number in Column B can't be larger than the number in Column A in the same row.

[3] Count only connections whose premises isolation preventers were inspected (AGs) or tested (RPs) during the reporting year.

[4] For example, dedicated irrigation lines to parks, playgrounds, golf courses, cemeteries, estates, etc.

[5] Premises with hazardous materials or processes (requiring isolation by AG or RP), such as aircraft and automotive manufacturers, pulp and paper mills, metal manufacturers, military bases, and wholesale customers that pose a high hazard to the PWS. May be grouped together in categories, for example:"Other manufacturing" or "Other commercial".

Part 3C: Cross-Connection Control for High-Hazard Medical Premises Served by the PWS

- Count only medical premises PWS serves water to.
- Don't count the same premises more than once. If you serve different medical category premises through a single connection, count the connection under the medical category you consider to pose the highest hazard to PWS.
- Report data as accurately as possible. **DOH currently bases CCC compliance actions on this information**

Type of High-Hazard Medical Premises [WAC 246-290-490(4)(b)]	Number of Connections at end of 2024			
	A. Being Served Water by PWS[1]	B. With Premises Isolation by AG/RP[2]	C. With Column B AG Inspected or RP Tested[3]	D. Granted Exception from Premises Isolation
Hospitals				
Hospitals (include psychiatric hospitals and alcohol and drug treatment centers)				
Facilities for Treatment and Care of Patients Not Located in Hospitals Counted Above				
Same day surgery centers				
Out-patient clinics and offices				
Alternative health out-patient clinics and offices				
Psychiatric out-patient clinics and offices				
Chiropractors with water-connected X-ray equipment	0	0	0	0
Hospice care centers				
Childbirth centers				
Kidney dialysis centers	1	1	1	0
Blood centers				
Dental clinics and offices	6	4	4	0
Facilities for Housing Patients				
Nursing homes	1	1	1	0
Assisted Living Facilities (formerly Boarding Homes)	5	2	2	0
Residential treatment centers				
Other Medical-Related Facilities				
Mortuaries with embalming equipment	2	2	2	0
Morgues and autopsy facilities (not in hospitals)				
Veterinarian offices, clinics and hospitals	1	1	1	0
Totals	16	11	11	0

[1] Count multiple connections or parallel installations to the same premises as **separate** connections.

[2]Count only connections with premises isolation AGs or RPs. Don't include connections with in-premises preventers only or connections with DCVAs or DCDAs installed for premises isolation. The number in Column B can't be larger than the number in Column A in the same row.

[3]Count only connections with premises isolation AGs or RPs. Don't include connections with in-premises backflow preventers only or connections with premises isolation DCVAs or DCDAs isolation.

Part 4A: Backflow Preventer Inventory and Testing Information for 2024

- Complete all fields. Enter **zero (0)**, if no backflow preventers in a specific category.
- Count only backflow preventers relied on to protect the PWS.
- Count AVBs on *irrigation systems only*. Select No to AVB question above Table 2 if PWS doesn't track AVBs.
- Count multiple tests (or failures) for the same backflow preventer as one test (or failure) for that backflow preventer.
- For multiple service connections or parallel installations, count each assembly separately.
- Count RPDAs and DCDAs as ***single*** assemblies. Count the tests of the mainline assembly and bypass assembly as ***one test***. Count the failure of either the mainline or bypass assembly (or the failure of both) as ***one failure***. Count an entire detector assembly taken out of service as ***one assembly removed from service***.
- Count assemblies installed on dedicated fire or irrigation lines as **Premises Isolation Assemblies** in Table 1.

	Backflow Preventer Category and Inspection/Testing Information	Air Gap	RPBA	RPDA	DCVA	DCDA	PVBA	SVBA	AVB
Table 1: Premises Isolation Preventers (include preventers isolating PWS-owned facilities)									
Existing Premises Isolation Backflow Preventers									
1	In service at beginning of 2024	0	29	0	1962	22			
2	Inspected and/or tested in 2024[1]	0	19	0	1533	15			
3	Failed inspection or test in 2024	0	4	0	32	1			
New Premises Isolation Backflow Preventers									
4	Installed in 2024[2]	0	2	0	4	0			
5	Inspected and/or tested in 2024[1]	0	2	0	4	0			
6	Failed inspection or test in 2024	0	0	0	0	0			
Premises Isolation Backflow Preventers (existing or new)									
7	Removed from service in 2024[3]	0	0	0	2	0			
Total Premises Isolation Preventers at End of 2024		0	31	0	1964	22	0	0	0
	Does PWS track AVBs on irrigation systems? ○ Yes ◉ No								
Table 2: In-Premises Preventers (include preventers within PWS-owned facilities)									
Existing In-Premises Backflow Preventers									
8	In service at beginning of 2024	0	164	3	2194	28	22	0	unk
9	Inspected and/or tested in 2024[1]	0	101	2	1526	20	13	0	unk
10	Failed inspection or test in 2024	0	24	1	39	1	0	0	unk
New In-Premises Backflow Preventers									
11	Installed in 2024[2]	0	3	0	130	2	0	0	unk
12	Inspected and/or tested in 2024[1]	0	3	0	130	2	0	0	unk
13	Failed inspection or test in 2024	0	0	0	1	0	0	0	unk
In-Premises Backflow Preventers (existing or new)									
14	Removed from service in 2024[3]	0	0	0	8	0	0	0	unk
Total In-Premises Preventers at End of 2024[4]		0	167	3	2316	30	22	0	0
Grand Totals at End of 2024		0	198	3	4280	52	22	0	0

[1] Initial and/or routine annual inspection (for proper installation and approval status) and/or test (for testable assemblies only, using DOH-approved USC field test procedures).

[2] Includes preventers installed on connections where backflow prevention was not previously required and any preventers that replaced those in service at the beginning of the reporting year. Replacement preventers may be of a different type than the originals.

[3] Existing or new preventers taken out of service, whether or not they were replaced by the same or a different type of preventer.

Part 4B: Other Implementation Activities in 2024

Complete all cells. Enter zero if not applicable.

Water Use Questionnaires	
Did your PWS send any water use questionnaires to customers during 2024?	○ Yes ◉ No

On-site Hazard Surveys			
Did your CCS conduct any on-site hazard surveys during 2024?			◉ Yes ○ No
	Service Connection Type		
	New	**Existing**	**Total**
1. Number of connections surveyed for cross-connection hazards to PWS.	5	12	17
2. Number of connections requiring backflow prevention to protect PWS.[1,2]	5	12	17

New Exceptions to Premises Isolation	
Did your CCS grant any new premises isolation exceptions in 2024 to high-hazard premises?[3]	◉ Yes ○ No Number 2

CCC Enforcement Actions	
Did your PWS take any enforcement actions during 2024?[4]	○ Yes ◉ No

[1] Include services where either premises isolation or in-premises preventers were required to protect the PWS.

[2] Include existing services that need new, additional or higher level backflow prevention.

[3] Submit a completed DOH Exception Form (green) for each new exception granted in the reporting year.

[4] "Enforcement actions" means actions taken by the PWS (such as water shut-off, PWS installation or testing of backflow preventer, assessment of fines, etc.) when the customer fails to comply with the PWS's CCC requirements.

Part 5: Backflow Incidents and "Off-Normal" Events in 2024

	Backflow Incidents, Risk Factors, and Indicators during 2024	Number
Backflow Incidents during 2024		
1	Backflow incidents that contaminated the PWS[5].	0
2	Backflow incidents that contaminated the customer's drinking water system ***only***[5].	0
Risk Factors for Backflow during 2024		
3	Distribution main breaks per 100 miles of pipe.	7.00
4	Low pressure events (<20 psi in PWS distribution system).	0
5	Water outage events.	0
Indicators of Possible Backflow during 2024		
6	Total health-related complaints received by PWS.[6]	0
7	Received during BWA or PN events.[7]	0
8	Received during low pressure or water outage events.	0
9	Total aesthetic complaints (color, taste, odor, air in lines, etc.).	8
10	Received during BWA or PN events.[7]	0
11	Number of these complaints received during low pressure or water outage events.	0

[5] Purveyors must submit a Backflow Incident Report form for each backflow incident known to have contaminated the public water system. DOH is also interested in receiving incident report forms for backflow incidents that contaminated the customer's drinking water system only.

[6] Such as stomach ache, headache, vomiting, diarrhea, skin rashes, etc.

[7] **"BWA"** means **Boil Water Advisory** and **"PN"** means **Public Notification** for water quality reasons.

Part 6: Comments and Clarifications

- Enter comments to:
  - Explain or clarify information in this report.
  - Describe challenges faced or accomplishments made in this reporting year.
  - Share your goals and objectives for the coming reporting year.
- Delete comments that are no longer valid.

Part No.	Date Added	Comments
Pt 1	04-18-2019	Updated back flow software to XC2. in March 2019.Still working on migrating and merging.
Pt 1	05-07-2021	The numbers reflecting 2019 service connections is believed to have been an estimate. The actual number of service connections at the end of 2020 were obtained from our financial analyst who deals directly with the tracking of new and existing service connections.
Pt 1	05-07-2021	The actual number of service connections for 2019 is: Residential-8635 All Other: 273 esidential 8635
Pt 1	05-18-2021	Our previous Backflow manager just recently retired. And since I do not yet have a complete understanding of our new XC2 tracking program and I am unable to locate some of the information that may need to be 100% confident in my report for the 2020 ASR. My plan for 2021 is to ensure that we have at least one more CCS on board, dedicated to the cross connection program as well as finding classes for those who are not up to speed with all the regulations pertaining to cross connection control. And to begin conducting surveys at some the various facilities around the City. , in or to be as accurate as possible with our CCC program.
Pt 1	03-18-2022	We are still trying to get up to speed with our CCC program. Previous information beyond 2020 is still being corrected and numbers on record aren't entirely correct with what we are finding in the field when we are able to access. We are still working on building a stronger more stringent program and I hope to have a couple of certified operators this year dedicated to the program and begin overdo hazard assessments as well as working closer with the building department on new construction.
Pt 1	01-19-2023	We are looking at a dedicated CCCS to hire this year that will begin a more in-depth investigation on the commercial and industrial side of our customers. We have also begun working closer with our building department regarding new construction.
Pt 1	04-10-2023	There are numbers this year that don't coincide with last year's numbers because we have someone dedidcated to data entry for our CCC program and she has been digging into past information and doing a bit of updating.
Pt 1	04-15-2024	Our new CCCS and data entry person working together found approximately 400 assemblies that were already in the system, that we didn't know about. As we continue to strengthen our program, we will begin to conduct more hazard assessments in 2024 and hopefully start getting a better understanding of what we need to have a more complete program.
Pt 1	03-27-2025	As I am new to the CCCS position as of last June 2024 there will some changes coming to enforce testing coming the reporting year of 2025. We will be getting new Backflow Management Software installed and running within the next couple months. This outdated XC2 has been glitching and is time to replace. Information from the past has been getting corrected and updated to get the most accurate data. We now have in our municipal code that any non-compliance to test we can send a tester to test then bill the utility account for the test, that should help get our compliance percentage up as well. Looking forward to all the new changes coming into 2025. The 2 new exceptions/ green forms I filled out during some hazard surveys were both from dentist offices that both have self-contained chairs not connected to our PWS. I will be checking back on those annually for continued hazard surveys to ensure nothing has changed.

Part 7: Report Certification and Contact Information

I, [Certified by] , certify that the information in this form is true, complete and accurate to the best of my knowledge.

Last Saved	03/28/2025	**All ASR Forms Certified/Submitted**	

Designated CCS/CCC Program Manager[1]					
Name	Nick Mettler	**Title**	Cross Connection Control Specialist	**CCS Cert #**	16006
Email Address	nmettler@cityofcamas.us	**Phone**	360-833-3188	**Phone Ext**	

PWS Manager[2]					
Name	Allen Nelson	**Title**	Water Supply Operator	**Operator Cert #**	8187
Email Address	anelson@cityofcamas.us	**Phone**	360-817-7287	**Phone Ext**	

[1] The CCS responsible for developing and implementing the PWS's CCC program (CCC Program Manager).

[2] The person the designated CCS/CCC Program Manager reports to or other manager having direct oversight of the CCC Program.

APPENDIX L

EXAMPLE BACKFLOW BROCHURE

WHAT IS A BACKFLOW ASSEMBLY TESTER (BAT)?

A person who has shown competence to test and maintain backflow prevention assemblies and who is certified in accordance with Washington State. Also referred to as Certified or Licensed BAT. The City of Camas makes no representation regarding the abilities, performance, or quality of service of the testers listed below.

ANNUAL REMINDER NOTICES ARE SENT BY THE PUBLIC WORKS DEPARTMENT AND TEST RESULTS MUST BE RETURNED TO THE CITY (WAC 246-290-490).

Submit test reports to backflow@cityofcamas.us

City of Camas WASHINGTON

BACKFLOW
& Cross Connection

WHAT IS BACKFLOW?

Backflow may occur due to either "backsiphonage" or "backpressure", in which the flow of water reverses from the normal direction of flow in a piping system. When water or other substances flow in the opposite direction than intended, this allows contaminants to enter the public water system or consumer's plumbing causing a backflow incident.

WHAT IS A BACKFLOW INCIDENT?

A backflow incident occurs anytime there is a water reversal in the drinking water supply (under backflow conditions) via unprotected cross connections. Backflow incidents may cause injury, illness, or death.

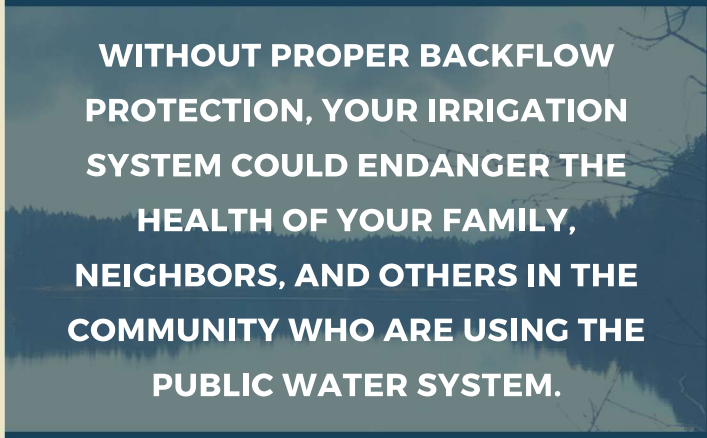
WHAT IS CROSS CONNECTION?

A cross connection is any actual or potential physical connection between a "potable water" line and any pipe, vessel, or machine containing a non potable fluid, solid or gas, allowing possible entry to the water system by backflow. This would include, but is not limited to, sewers, drains, conduits, pools, storage reservoirs, plumbing fixtures, or any other device. The non-potable or unapproved water supply system may contain contaminated liquids, solids, or gases, of unknown or unsafe quality. Bypass arrangements such as jumper connections, removable sections, swivel or changeover devices are considered to be a cross connection.

WHAT ARE BACKFLOW PREVENTION ASSEMBLIES?

Backflow Prevention Assemblies are installed on water service lines (or at plumbing fixtures) to prevent backflow of contaminants into drinking water through cross connections. Improper installation or failure to meet testing requirements are grounds for termination of water service. The three basic approved types of assemblies that follow are required to be installed per City of Camas standards and must be tested by a Washington State Certified Backflow Assembly Tester upon installation and yearly thereafter.

REDUCED PRESSURE BACKFLOW ASSEMBLIES (RPBA)



An RPBA is a mechanical backflow preventer that consists of two independently acting, spring-loaded check valves with a mechanically independent, hydraulically operated, spring-loaded pressure differential relief valve between the check valves and below the first check valve.
This assembly is designed to protect against low to high health hazards.

DOUBLE CHECK VALVE ASSEMBLIES (DCVA)

A DCVA is a mechanical backflow preventer that consists of two independently acting, spring-loaded check valves. This assembly should only be used to protect against low health hazards.

PRESSURE VACUUM BREAKER ASSEMBLIES (PVBA)

A PVBA is a mechanical backflow preventer that consists of an independently acting, spring-loaded check valve and an independently acting, spring-loaded, air inlet valve on the discharge side of the check valve. This assembly is designed to protect against a low health hazards under backsiphonage only.

WITHOUT PROPER BACKFLOW PROTECTION, YOUR IRRIGATION SYSTEM COULD ENDANGER THE HEALTH OF YOUR FAMILY, NEIGHBORS, AND OTHERS IN THE COMMUNITY WHO ARE USING THE PUBLIC WATER SYSTEM.

NOTE: Atmospheric Vacuum Breaker's (AVB) are not allowed in the City of Camas.

APPENDIX N

WATER USE EFFICIENCY MEETING MINUTES AND AGENDA

~ To be included in a future submittal. ~

APPENDIX O

WATER LOSS CONTROL ACTION PLAN

Water System Plan Update

Water Loss Control Action Plan

September 2026 / DRAFT

SECTION 1 INTRODUCTION

From 2022 to 2024, the average distribution system leakage (DSL) was approximately 11.2 percent for the City of Camas (City), triggering the requirement of a completion of a Water Loss Control Action Plan (WLCAP). In successive years, the DSL has decreased, and the standard of 10 percent or less is believed to be achievable within the next 10 years. This plan addresses how the City will mitigate DSL, sets a goal of when it will meet the regulation, and how it intends to fund necessary projects to support controlling water loss.

SECTION 2 WATER LOSS CONTROL METHODS

As mentioned above, the City is slightly over the 10 percent standard based on their Annual Water Use Efficiency Report data. Note that the 2025 DSL brings the three-year rolling average DSL under the 10 percent threshold; however, the data collected for 2025 seems unreliable. In 2025 the City underwent a billing system software change. Consumption data for 2025 is from two different sources which is believed to be the reason why consumption may be over-reported. Therefore, the City elected to complete a WLCAP to show their commitment to ensuring that DSL is consistently 10 percent or less.

To control water loss, the City intends to continue implementing leak detection and mitigation by alerting and visiting customers where leaks are detected as well as leveraging the advanced metering infrastructure (AMI) meters that have been installed for 100 percent of the City's customers. AMI meters collect and transmit data in real time to the finance department at the City, which will aid in detecting leaks quickly. Furthermore, these meters will be repaired and/or replaced per manufacturer recommendations as needed. Leakage has been decreasing in the distribution system already based on the Annual Water Use Efficiency Reports as outlined in Table 1.

Table 1 The City's Yearly DSL

Year	DSL (%)	3-Year Rolling Average DSL (%)
2021	14.7	14.2
2022	14.2	14.5
2023	10.3	13.1
2024	9.2	11.2
2025	0.7	6.7

Additionally, a pipeline replacement program will be included in the City's Capital Improvement Program (CIP) to replace aging cast iron and steel pipe installed before 1960, the majority of which were installed prior to 1940. This piping accounts for 19 percent of the system. By replacing the aging infrastructure, leakage should decrease further, improving the City's DSL.

With these measures and projects implemented, the City is committed to meeting the DSL standard on a consistent basis by 2036.

SECTION 3 DATA ACCURACY AND COLLECTION EVALUATION

As mentioned above, the AMI meters should improve the data accuracy and collection for the distribution system since data is collected in real time and transmitted to the finance department at the City. This reduces data errors caused by human error, such as manually inputting or collecting data. Furthermore, the City switched to monthly billing instead of bi-monthly billing, making it more manageable to verify data accuracy.

Data accuracy could be further improved simply by installing new meters when they start to fail since meters are designed to read low when this occurs. This could potentially lead to under reporting of consumption. The City will repair and/or replace meters in a timely manner to mitigate this implication.

It is believed that the low DSL value in 2025 was primarily due to a switch in billing systems. This could have led to errors in accounting of consumption and possibly double counting. The 92 percent reduction in DSL from 2024 to 2025 does not seem plausible. Therefore, the City considered the 2024 three-year rolling average instead of the 2025 three-year rolling average to err on the side of caution. Moving forward, it is expected that the data accuracy should be stable since continuity will be established using the new billing system.

SECTION 4 FUNDING FOR WATER LOSS CONTROL PROGRAM

The City realizes that funding is critical to apply successful measures and programs. Currently, it is not anticipated that alerting customers about leakage will need additional funding as this is a current practice done by the City. Also, the meters have been replaced with AMI meters recently as well, so this measure is also not expected to be a significant additional cost to the City in the near future.

The costliest method for controlling water loss is the pipe replacement program. By including this in the CIP, as mentioned above, the City is preparing a funding strategy for this program. Possible options that can be considered are modifying customer rates and applying for funding to replace the aging infrastructure. The City will assess which is the best option once the cost of the program is determined.

SECTION 1 INTRODUCTION

The City of Camas (City) promotes efficient water use to conserve and protect their existing water supplies for present and future residents. The City promotes water conservation and efficient use of water through a variety of activities that encompass their Water Use Efficiency (WUE) Program. The WUE Program encourages water conservation and utilizes continued improvements to reduce leakages and water loss in the City's system. This report details both the City's existing WUE programs.

SECTION 2 WUE PROGRAM BACKGROUND

In 2003, the Washington State Legislature passed the Engrossed Second Substitute House Bill 1338, known as the Municipal Water Law or the WUE rule, to address the increasing demand on Washington's water resources. This law established that all municipal water suppliers must use water more efficiently in exchange for water right certainty and flexibility to help them meet future demand.

The WUE rule, which became effective on January 22, 2007, emphasizes the importance of measuring water use and evaluating the effectiveness of the water supplier's WUE program. The intent is to minimize water withdrawals and water use by implementing water saving activities and adopting policies, resolutions, ordinances, or bylaws. This report follows the guidelines set forth in the *Water Use Efficiency Guide Book*, Fourth Edition, (January 2025) as well as the *Water System Planning Handbook* (April 1997).

SECTION 3 WATER SUPPLY CHARACTERISTICS

3.1 Source

The City obtains its water from two surface water sources and 10 wells. Eight of the groundwater sources (Wells 5, 6, 7, 8, 10, 11, 12, 14) are located in the City's Lower Washougal Wellfield (LWWF), in the lower Washougal floodplain near downtown Camas. Wells 7, 8, 10, 11 and 12 are often referred to as the City's "Oak Park" wellfield. Well 13 is north and west of the Oak Park wells and is effectively part of the same wellfield pumping center but is not typically referenced as being part of the LWWF. The remaining well (Well 9) is located in the uplands about two miles north of the Columbia River and 1.5 miles west of Lacamas Lake. Groundwater sources receive disinfection and other water quality treatment before entering the distribution system.

The City's Boulder and Jones Creek surface water diversions are located in the headwaters of the Washougal River drainage. These sources are treated at the City's slow sand filtration plant.

3.2 Water Rights Summary

The City's water system (Department of Health [DOH] ID 108002) currently has 2 water right claims which have been modified by Certificates of Change, 11 certificated water rights, and 5 water right permits. A summary of the City's water rights is provided in Table 1. Note, the City requested in March 2026 that the

Department of Ecology (Ecology) extend the development schedule on each of the City's five water right permits to 2031. The City's current plan for developing the wells is presented in Section 8.4 of the 2026 Water System Plan Update (2026 WSP).

The City has limitations on its water rights that complicate the calculation of total instantaneous water right (Qi) and annual water right (Qa) as described below:

- Jones and Boulder Creek surface water sources may only be operated seasonally from October 31 through May 15, as directed by Permit G2-30144. The Qa for periods outside of the operating time window are used to maintain instream flow in the Creeks (not for City use).
- Historically, water right permits and certificates with priority dates before 1979 were limited by Ecology to a "total combined maximum Qa of 5,750 acre-feet per year (AFY)". However, modifications to the City's water right claims resulted in the recognition of an additional 550 AFY which increased the total Qa to 6,300 AFY with priority dates before 1979.
- Withdrawals from Well 9 are considered non-additive. The certificate does not increase the cumulative annual total of all rights but does increase the Qi.
- Certificate CG2-20938 (an irrigation water right allocating 330 gallons per minute (gpm) and 106 AFY for use between May 1 to October 1) was acquired by the City in 2015 and transferred into permanent trust as instream baseflow support for Lacamas Creek. The City retains the option to request to apply the consumptive use portion of the right (90.3 AFY) as potential mitigation for future water use within the Lacamas Creek drainage downstream of the water right location.

The City's resulting water rights equate to a Qi of 14,045 gpm (20.2 million gallons per day [mgd]), an additive Qa of 11,090 AFY (9.9 mgd), and a non-additive Qa of 210 AFY (0.3 mgd) as described by Permit G2-30756 (see Page 2) and Certificate G2-27384 (Well 9).

Table 1 Water Right Summary

Source	ID Number	Priority Date	Instantaneous Qi (gpm)	Annual Qa (AFY)
Claims

Total[13]			**14,045**	**11,090 (A)[9]** **210 (N)**
Pending Applications				
Steigerwald Regional Supply[8]	G2-30528		17,213	13,555

Notes:
(1) Claims are considered valid until proven otherwise through an adjudication process.
(2) This source was formerly known as the Little Washougal River. The certificate refers to an Qi and does not specify an annual withdrawal. An Ecology Report of Examination for Well 7 (G2-00501) summarizes existing water rights, including 1,820 AFY for Boulder Creek (C-712), based on continuous withdrawal at the instantaneous right specified.
(3) The certificate refers to an Qi and does not specify an annual withdrawal. An Ecology Report of Examination for Well 7 (G2-00501) summarizes existing water rights, including 730 AFY for Jones Creek (C-711), based on continuous withdrawal at the Qi specified.
(4) The Permit and Report of Examination preceding this certificate limited water rights to “the total quantity withdrawn or diverted from all sources is not to exceed 3,300 AFY.
(5) The Permit and Report of Examination preceding this certificate limited water rights to “the total quantity withdrawn or diverted from all sources is not to exceed 5,750 AFY.
(6) Well 10, 11, and 12 were installed to replace Well 1, 2 and 3, which have failed due to collapsed well casings; see Pacific Groundwater Group report dated June 9, 2003. Well 13 replaced Well 4 after Well 4 was determined to be groundwater under the influence of surface water; see Pacific Groundwater Group report dated August 14, 2006. G2-CV1-2P160, which is now associated with Well 10, allowed for seasonal between May 1st and August 31st. Year-round operation of Well 10 is authorized under Permit G2-30144 for the LWWF.
(7) See Ecology agreement that limits withdrawal from the surface water sources from May 15 through October 31.
(8) Joint application with City of Camas and City of Washougal.
(9) (A) = Additive water right, additive to other rights.
(10) (N) = Non-additive water right, not included when summing a cumulative total of all rights.
(11) The original Ecology Report of Examination for these permits indicated a priority date of 08/21/2003. However, Ecology assigned a priority date of 08/13/1986 via amended permits to match with the date of the Clark County Reservation identified by watershed planning for WRIAs 27/28.
(12) Installation of one future well in the LWWF is included under this permit.
(13) Due to permit and certificate restrictions, the total Qi and Qa do not equal the sum of quantities for each column.
cfs - cubic feet per second.

3.3 Water Rights Analysis

The City's water rights were compared to existing, 5-year (2031), 10-year (2036), and 20-year (2046) demand projections to establish water right surplus or deficiency. Both Qi and Qa were considered and are summarized in Tables 2 and 3, respectively.

The City currently has surplus water rights based on the actual well pumping in 2024, which was considered to be the existing condition. Note, the reported values reflect the pumping over the entire year, where not all wells were pumped at the same time.

Table 2 Instantaneous Water Rights (Qi) Summary

Year	MDD – High Scenario(1) (gpm)	Instantaneous Water Right (Qi) (gpm)	Surplus/Deficiency (gpm)
Existing	6,765(2)	12,475(3)	5,710
2031	8,620	12,475 (3)	3,855
2036	10,490	12,475 (3)	1,985
2046	14,080	12,475 (3)	-1,605

Notes:
(1) Future values based on high MDD demand projection scenario.
(2) Based on actual 2024 maximum day production data.
(3) Instantaneous water rights of 14,045 gpm shown in Table 8.1 minus 1,570 gpm of surface water rights not available during the summer months.
MDD - maximum day demand.

Table 3 Annual Water Rights (Qa) Summary

Year	ADD - High Scenario(1) (AFY)	Annual Water Right (Qa) (AFY)	Surplus/Deficiency (AFY)
Existing	5,230(2)	11,090	5,860
2031	6,610	11,090	4,480
2036	8,070	11,090	3,020
2046	10,910	11,090	180

Notes:
(1) Future values based on high ADD demand projection scenario.
(2) Based on actual 2024 annual production data.
ADD - average day demand.

For the future water rights evaluation, the forecasted source production was based on the high demand projection scenario. The high demand scenario generally reflects the water use rates from the period of highest demands in the last eight years. Use of the highest projected demands is intended to support the City in planning for sufficient physical supplies to meet demands and provide sufficient time for phasing in new supplies, which is typically a multi-year process.

The City is expected to have sufficient Qa through the next 20 years; however, the City is expected to have a Qi deficiency of 1,605 gpm by 2046. The City plans to meet this deficiency by a combination of improving pumping yields from existing well facilities, developing all of its existing water rights, and securing water rights for additional supply sources. Additionally, the City will continue to encourage water use efficiency including the reduction of irrigation use, which is a major driver for the relatively high projected MDD.

3.4 Production and Delivery System

The City's water system has an available water production capacity of approximately 15.5 mgd and delivers potable water throughout 26 pressure zones. Water is conveyed through more than 159 miles of transmission and distribution pipelines and supported by seven storage reservoirs with a combined capacity of approximately 9.95 million gallons. Ten booster pumping stations and numerous pressure control facilities help move water between service areas, maintain system pressures, and meet varying customer demands across the system. System operations are monitored and controlled through the City's SCADA system, which provides real-time oversight of storage levels, pumping operations, flows, and other critical system functions.

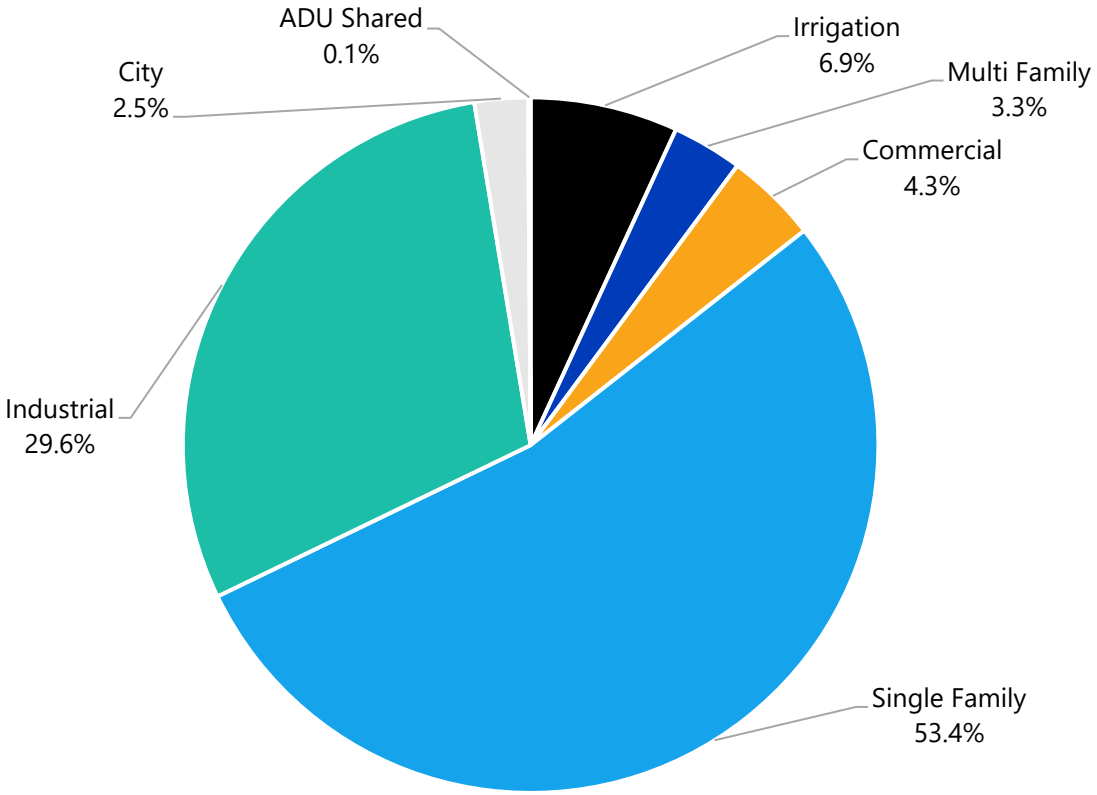

Figure 1 2017 to 2024 Average Water Demand by Customer Class

SECTION 4 2013 TO 2024 WUE PROGRAM SUMMARY

The previous program's demand-side goals were to reduce customer consumption per equivalent residential unit (ERU) by 1 percent or approximately 2 gpd per year over the next six years. Figure 2 compares the City's actual single-family residential (SFR) demand to the demand-side WUE goal to demonstrate the effectiveness of the City's WUE Program. The goal demand begins at 260 gpd/ERU, which represents the 2013 to 2015 average demand used as the planning ERU in the 2019 Water System Plan. The goal demand was then reduced by 2 gpd each year, consistent with the City's goal. As shown in Figure 2, actual SFR demand has generally remained below or near the goal demand, indicating that the

City has been successful in meeting its demand-side WUE objective. Note that the 2016 data is represented with a dashed bar. This is because 2016 data was not available; therefore, the 2016 demand is estimated as the average of 2015 and 2017 demands.

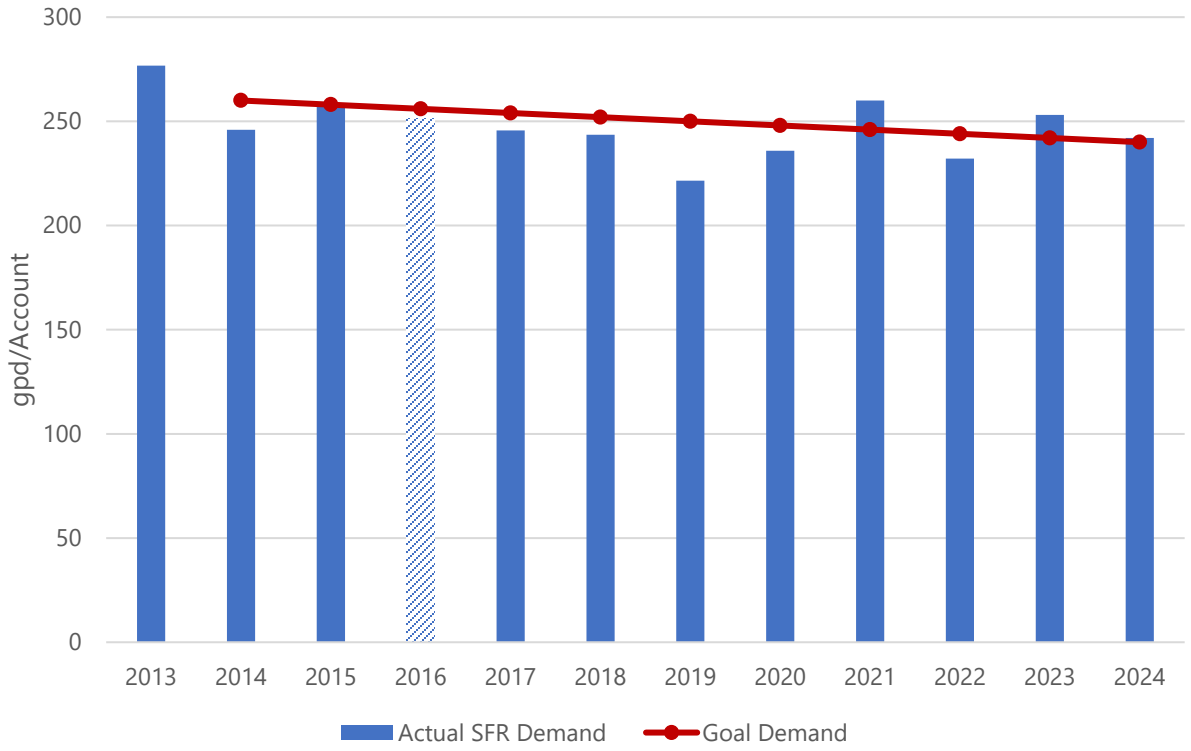

Figure 2 Actual Compared to Goal Single-Family Residential Demand

SECTION 5 DISTRIBUTION SYSTEM LEAKAGE

Distribution system leakage (DSL) is a significant element of supply-side WUE requirements. DSL above 10 percent on a three year rolling average is considered excessive and necessitates the creation of a Water Loss Control Action Plan (WLCAP). DSL is the difference between total water production and metered water use. The estimate of DSL is dependent on the accuracy of meter readings for supply and customer meters. Table 4 presents the City's reported three year rolling average DSL from 2021 through 2025. The City has averaged above their WUE program goal and DOH standard of 10 percent, but the City is making progress in mitigating DSL with it decreasing in successive years. Note that the 2025 three year rolling average is under the 10 percent threshold; however, it is possible that there may be inaccuracies in the data collected for 2025 as the billing system shifted to a new one. Therefore, the City will complete a WLCAP to address their DSL.

Table 4 Distribution System Leakage (3-year Rolling Average)

Year	3-Year Rolling Average DSL (%)
2021	14.2
2022	14.5
2023	13.1
2024	11.2
2025	6.7

The DSL in Table 4 differs from that calculated in Chapter 5 - Water Requirements of the 2026 WSP, where Chapter 5 evaluated historical billing data for consumption. The City is not able to account for the differences; however, it is believed to be related to year end meter reading. In 2025 the City transitioned its billing software. Consumption data for 2025 was compiled from two sources which may account for the low reported water consumption.

SECTION 6 2027 TO 2032 WUE PROGRAM

The City's current WUE Program was established as part of the 2026 WSP. Per the Washington Administrative Code (WAC) 246-290-830(4)(a), all water purveyors with 1,000 or more connections are required to set efficiency goals through a public process. The established goals promote WUE for internal operations and for water customers. The past WUE Program goals were established in the 2010 WSP and subsequently re-established in 2013, 2019, and 2026:

- **Demand-Side Goal:** Reduce customer consumption per ERU by 1 percent over the next six years.
- **Supply-Side Goal:** Continue to reduce distribution loss to 10 percent or less over the next five years.

6.1 Supply-Side Measures

The City implements the following supply-side measures as part of their WUE Program. A number of these measures are mandated by Washington State DOH per the WUE Guidebook. The following summarizes the City's supply-side measures:

1. Record and monitor supply source production (Mandatory).
2. Record and monitor customer demands through customer water meters (Mandatory).
3. Test and calibrate industrial and commercial meters annually (Mandatory).
4. The City will repair and/or replace residential meters per manufacturer recommendations.
5. Perform annual leak detection surveys through a private contractor. Hydrants and valves are checked as part of leak detection surveys (Mandatory).
6. Repair or replace old distribution system piping with defects as budget allows.
7. Reclaimed Water: Treated wastewater is used for washdown and process use and for landscape irrigation at the wastewater treatment plant (WWTP) (Mandatory to evaluate reclaimed water).

6.2 Demand-Side Measures

The City implements a number of demand-side measures. These measures are similar to many of the example WUE measures presented in Appendix B of the *Water Use Efficiency Guidebook*. The City provides an overview of their WUE activities on their Water Services website (http://www.ci.camas.wa.us/index.php/pwwater). The City's various public outreach activities meet the DOH requirement for educating customers about WUE. The following provides a summary of the City's demand-side measures:

1. City staff alert and visit customers where customer leaks are identified.
2. Promote installation of smart controllers for City-wide users.
3. Educate the public on conservation and water-saving devices at community events, such as Camas Days, and on the City website (http://www.ci.camas.wa.us/images/DOCS/WATER_SEWER/REPORTS/waterconservation.pdf).
4. Promote xeriscaping and Low Impact Development to reduce irrigation requirements for new developments.
5. Promote irrigation systems to incorporate drip systems or micro sprayers.
6. Promote odd/even day and late night or early morning irrigation for all customers.
7. Provide monthly billing to all customers.
8. Send water savings tips to customers in the annual water quality report.
9. Onsite irrigation at the WWTP with treated effluent.

The above supply- and demand-side WUE measures are effective in encouraging WUE for the water system.

6.3 Mandatory Measures

The WUE Program includes supply side measures that the City implements to understand and control leakage including new meters and leak detection surveys. The City's WUE Program will continue to meet the following mandatory measures in the future:

- Install production (source) meters.
- Install consumption (service) meters.
- Perform meter calibration.
- Implement a water loss control action plan to control leakage if the three year rolling average exceeds 10 percent.
- Educate customers about WUE practices.
- Evaluate rates that encourage water demand efficiency, as discussed in a subsequent section.
- Evaluate reclamation opportunities, as discussed in a subsequent section.

6.3.1 Rate Structure

The City's current rate structure bills customers on a uniform volumetric charge. In 2010, the City added a consumption-based element to sewer rates based on average winter water consumption, which was thought to encourage water efficiency. In 2023, a rate study was performed that evaluated a tiered rate structure. Ultimately, it was determined that the current rate structure would remain in place. Future rate studies will continue to reevaluate rate structures to encourage conservation.

6.3.2 Reclaimed Water

Per WAC 246-290-100 and WUE requirements, water systems with over 1,000 connections must evaluate reclaimed water opportunities. As mentioned previously, the City currently uses treated wastewater at the WWTP. In addition, the City previously evaluated reclaimed water opportunities in 2006 with costs escalated to 2025 dollars in the concurrent effort of updating the General Sewer Plan, considering a multitude of locations to use the water for irrigation; Figure 1 displays locations with irrigation connections. Overall, it was concluded that using reclaimed water as irrigation water was not economically feasible, and therefore, the reclaimed water system will not be expanded at this time.

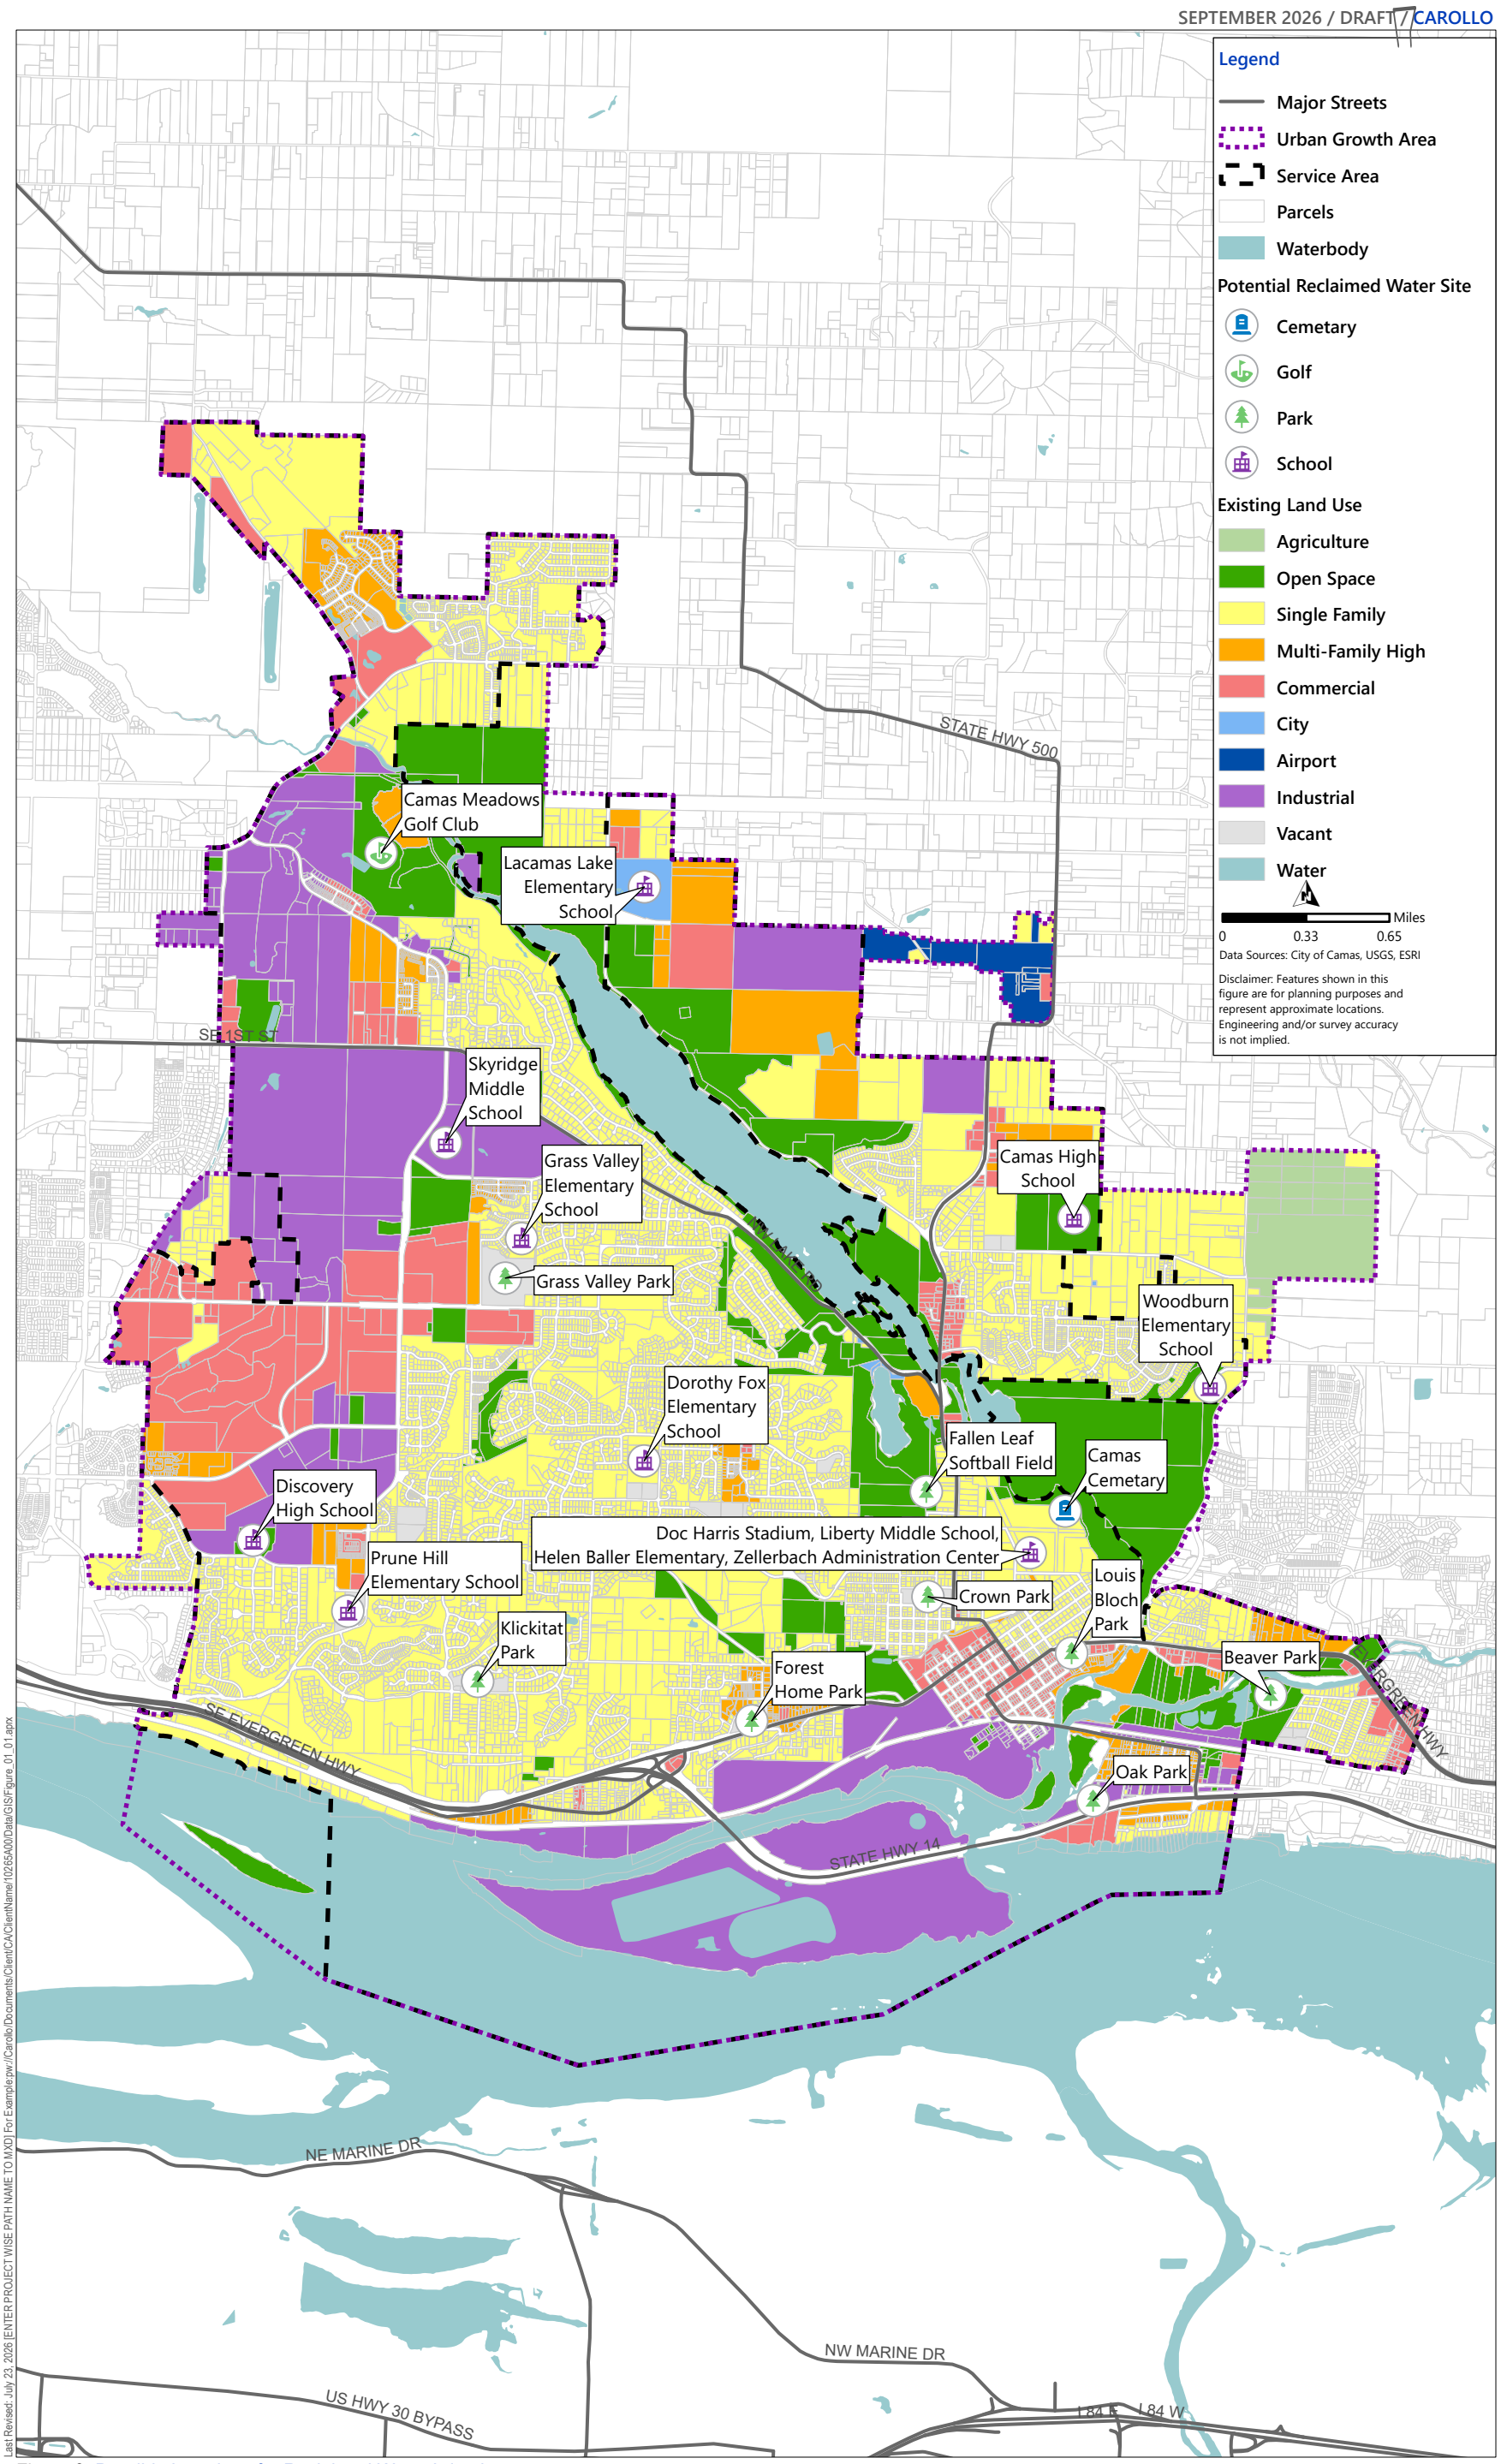

Figure 3 Possible Locations for Reclaimed Water Irrigation

6.3.3 Projected Demands with WUE Goals

The projected water demands considering the water savings from the City's WUE Program were represented with the low demand scenario presented in Chapter 5 of the 2026 WSP. Projected demands with WUE savings were compared to the medium demand projection. The low demand projection assumes a 2025 demand of 242 gpd/ERU while the medium demand projections assume a 2025 demand of 248 gpd/ERU. The low demand projection also assumes the WUE Program will help to reduce the MDD to ADD peaking factor by approximately 0.45 percent. The low and medium demand projections assume the City's DSL is 9.1 and 10 percent, respectively. Table 5 presents the projected ADD and MDD with and without the WUE Program for the 20-year planning period. The projected demands with the WUE Program are also shown in Figure 4. For ADD, WUE measures are projected to provide a reduction of 1.0 mgd), or 11.9 percent, by 2046. For MDD, WUE measures are projected to provide a reduction of 2.4 mgd, or 14.6 percent, by 2046.

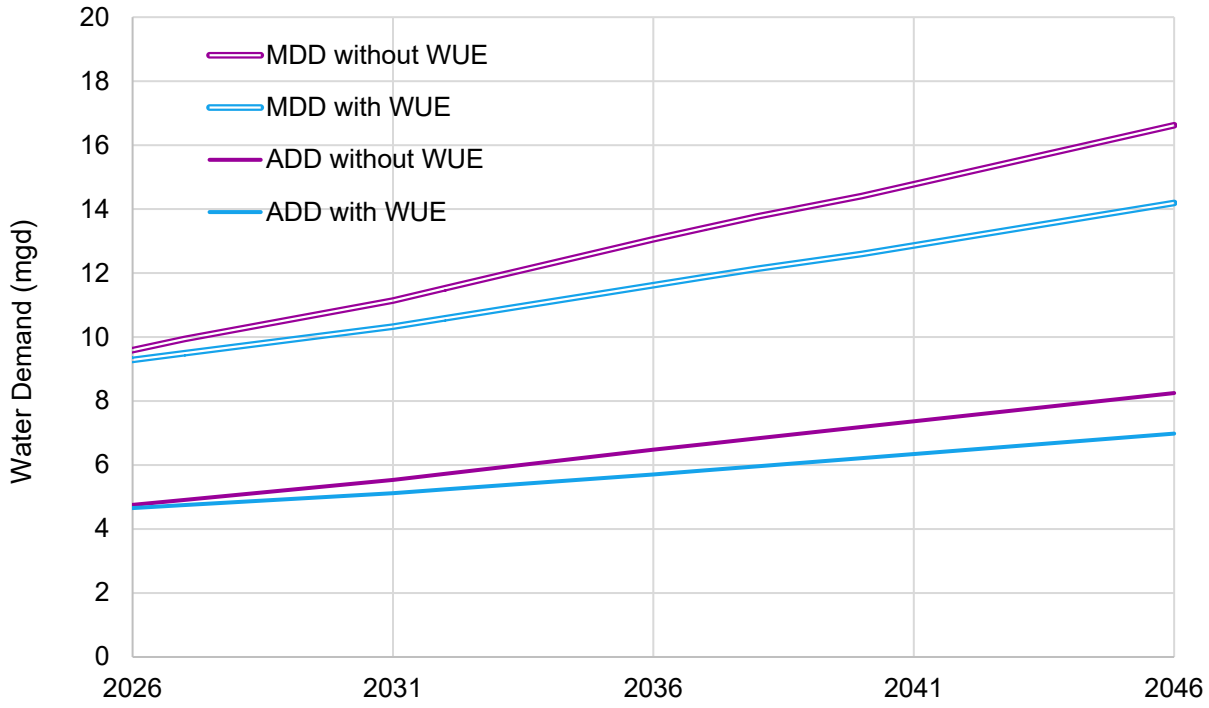

Figure 4 Projected Demands With and Without Water Use Efficiency

Table 5 WUE Demand Projections

Demand Scenario	2046 Projection with WUE (mgd)	2046 Projection without WUE (mgd)	Water Savings (mgd)	Percent Savings
ADD	7.4	8.4	1.0	11.9
MDD	14.2	16.6	2.4	14.6

6.4 WUE Program Effectiveness

The effectiveness of the existing WUE program was evaluated using system-wide water use data. Measuring the effectiveness of the City's future WUE Program against the established goals could be similarly evaluated using system-wide water use data. Estimating the water savings directly resulting from the City's WUE Program in a single year is difficult. Therefore, long-term trends should be use to more clearly show the impact of the City's WUE Program.

The first step would be to establish a baseline from historical information. The second step is to evaluate the resulting water use after promoting WUE through targeted activities and events to customers. It is recommended that water use be tracked for at least a year to identify trends. Some consideration needs to be given to variations in weather and economic conditions. Another method would be to perform the same before/after water use analysis for WUE Program participants who volunteer and provide their address. The resulting information would be valuable for the City to correlate its WUE Program efforts with direct water savings for its customers.

Advanced Metering Infrastructure (AMI) was implemented in 2025. The City plans to leverage this data in its targeted public education programs to customers in a particular area or user profile, such as heavy irrigators. Using AMI, the City can estimate overall usage, irrigation usage, and peak water use rates.

6.5 Budget

The City recognizes the importance of continuing their WUE measures and considers it a core function of the Utility. The WUE program provides cost savings through demand reduction and reduction in DSL. Continuing the WUE Program can assist the City in meeting peak demands and avoiding curtailment periods.

The City does not officially track staff time or project costs associated with WUE. The supply-side WUE measures, such as metering and leak detection, are core activities of the Utility and are funded through Utility Capital Improvement and operations and maintenance (O&M) funds. The City estimates that it dedicates approximately 0.5 full-time-equivalents of staff time to conduct demand-side measures across its Water Utility, finances department, and development services staff. It is not possible to estimate the cost of each demand-side measure; therefore, a cost-benefit comparison cannot be calculated.

Due to AMI capabilities, it is anticipated that the City will further personalize water use communications with customers without increasing staff effort. Future supply-side WUE measures will be funded, as appropriate, through the Capital Improvement and O&M funds. If AMI detects a large number of existing and new leaks, the City will evaluate the need for additional personnel in its meter maintenance group to address leaks.

Water Quality Results

At the City of Camas we understand how important it is to ensure we provide high quality water. The health of our consumers and their families is paramount and our goal is to provide you with a safe and dependable supply of drinking water. We work diligently to provide top quality water to a residential population of 23,080.

Our drinking water is safe and surpasses all State and Federal health standards.

We ask that all of our customers help us protect our water sources, which are the heart of our community, our way of life, and our children's future. This report provides a summary of the tests and processes performed to ensure the safety of your drinking water. For more information or questions about this report, please contact Public Works call 360-817-1563, or email publicworks@cityofcamas.us

Public Water System ID 108002

Water Conservation

The average daily water consumption in Camas for 2017 was 4.01 million gallons (mg/d) per day. During our peak usage day on July 22nd, 2017 we consumed 8.3 million gallons. Most of this increase in the summer months is due to irrigation demand. We are once again asking for your help to implement a voluntary odd/even lawn watering program for residential customers. Water on odd days if your house number ends in an odd number, and even days if it ends in an even number.

To view more water saving tips for residential use visit the following websites: www.irrigationtutorials.com/faq/save-water.htm and www.home-water-works.org/water-conservation-tips/home

Voluntary Odd/Even Watering Program

Water Use Facts

A leaky faucet can waste 100 gallons a day.

An average bath requires 37 gallons of water.

What's Ahead

The City of Camas Cross Connection Control Program is being updated. Be on the look out for increased information regarding backflow regulations and testing requirements.

Approximately 65% of the City's water meters have been replaced with advanced radio read meters. The City is continuing the replacement project and will be upgrading approximately 600 additional meters in 2017.

Important Health Information

Drinking water, including bottled water, may reasonably be expected to contain small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the EPA's Safe Drinking Water Hotline 800-426-4791.

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and in some cases, radio-active material. It can also pick up substances resulting from the presence of animals or from human activity.

Contaminants that may be present in source water before we treat it include:

- Microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- Inorganic contaminants, such as salts and metals, which can be naturally-occurring or result from urban storm water runoff, industrial or domestic wastewater discharges, oil and gas production, and mining or farming.
- Pesticides and herbicides, which may come from a variety of sources such as agriculture and residential uses.
- Radioactive contaminants, which are naturally occurring.
- Organic chemical contaminants, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff, and septic systems.

In order to ensure that tap water is safe to drink, EPA prescribes regulations which limit the amount of certain contaminants in water provided by public water systems. We treat our water according to the EPA's regulations. Food and Drug Administration regulations establish limits for contaminants in bottled water which must provide the same protection for public health. Some people may be more vulnerable to contaminants in drinking water than the general population.

Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by cryptosporidium and other microbiological contaminants are available from the Safe Drinking Water Hotline at 1-800-426-4791.

EPA Statement for Lead and Copper

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The City of Camas is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to two minutes before using water for drinking or cooking. The EPA requires the City to conduct lead testing every three years.

Copper is a mineral component naturally found in solids. In the correct amounts, it is an essential nutrient for humans and plants. In Washington State, most copper in drinking water comes from corrosion of household plumbing. Plumbing sources can include copper pipe and brass fixtures. Copper from plumbing corrosion can accumulate overnight. Although copper is an essential mineral in the diet, too much copper can cause health problems. Copper is widely distributed within the tissues of the body, but accumulates primarily in the liver and kidneys. A single dose of 15 mg of copper can cause nausea, vomiting, diarrhea, and intestinal cramps.

If you are concerned about lead or copper in your water, you may wish to have your water tested. Information on lead and copper in your drinking water, testing methods, and steps you can take to minimize exposure is available from the Safe Drinking Water Hotline or at http://www.epa.gov/safewater/lead

To Reduce Lead and Copper Exposure

1. When your water has been sitting for several hours, flush the pipe by running the cold water tap until the water is noticeably colder before using the water for drinking or cooking.

2. Use only cold water for drinking, cooking, and making baby formula. Hot water may contain higher levels of copper.

3. Frequently clean the filter screens and aerators in faucets to remove captured particles.

4. If building or remodeling, only use "lead free" or low lead piping and materials. Avoid using copper piping or brass fixtures for locations where water will be consumed or used in food preparation.

Contaminants Inorganic	Maximum Contaminant Level Goal mg/L	Action Level (AL) mg/L	Camas Water Results g/L	Sample Year	# of Samples Exceeding AL	Violation	Typical Sources
Lead (ppb) at Consumers Tap	0	0.015	0.0026	2015	0 of 30	NO	Corrosion of household plumbing systems; erosion of natural deposits
Copper	0	1.30	0.6100	2015	0 of 30	NO	

Unregulated Contaminants Monitoring

Unregulated contaminants are those for which the EPA has not established drinking water standards. The purpose of unregulated contaminant monitoring is to help EPA determine their occurrence in drinking water and potential need for future regulation. For more information, go to:

http://water.epa.gov/lawsregs/rulesregs/sdwa/ucmr/ucmr3/ or contact the Safe Drinking Water Hotline at 1-800-426-4791, or at: http://water.epa.gov/drink/contact.cfm

2017 Water Quality Test Results

The City of Camas has its water analyzed for more than 200 different regulated and unregulated contaminants. Only the samples that have detectable levels of contaminants are required by law to be reported to the public. The contaminants listed below are REGULATED and were in our water during 2017. All samples taken are from treated water that is delivered to the distribution system. All contaminants tested were below levels allowed by Federal and State agencies. We have provided definitions below to help you understand the terms and abbreviations that are used in the Test Results.

In some cases, certain contaminants are granted waivers from monitoring. This is due to past consecutive years of non-detectable results, or results lower that the State Reporting Level (SRL).

Important Terms and Abbreviations

Maximum Contaminant Level (MCL): The "Maximum Allowed" is the highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as feasible using the best available treatment technology.

Maximum Contaminant Level Goal (MCLG) : The "Goal" is the level of a contaminant in drinking water below which there is no known or expected risk to health. MCLGs allow for a margin of safety.

Milligrams Per Liter (MG/L): A unit of measurement used in reporting the concentration of matter in water as determined by water analyses.

Nephelometric Turbidity Unit (NTU): Nephelometric Turbidity Unit is a measure of the clarity of water. Turbidity in excess of 5 NTU is just noticeable to the average person.

Parts Per Million (ppm): A unit of measurement used in reporting the concentration of matter in water as determined by water analyses.

pCi/L: Picocuries per liter is a unit for measuring radioactive concentrations. The curie (Ci) unit is the activity of 1 gram of pure radium.

N/A (Not applicable): Means EPA has not established MCLGs for these substances.

Ug/L: Units of measurement in micrograms/liter. A unit of concentration for dissolved substances based on their weights.

Regulated Contaminants Unit Measurement	Violation	Range of Level Detected	Ideal Goal (MCLG)	MAX Allowed (MCL)	Description & Origin of Substance
Health Related (Primary) Standards: Inorganic					
Fluoride (MG/L)	No	0.31-1.13	1	4	Sodium fluoride added to Camas water to maintain good dental hygiene.
Nitrates (MG/L) (As Nitrogen)	No	1.30-1.60	10	10	Runoff from fertilizer use; leaching from septic tanks, sewage; erosion of natural products.
Health Related Standards: Radiological					
Radium 228	No	.0366 -.313	0.00	5 pCi/L	Erosion of natural deposits leaching into the groundwater.
Other Substances					
Total Hardness (ppm)	No	22	N/A	N/A	Hardness units are in ppm as $CaCO^3$ (calcium carbonate equivalent units).
Turbidity (NTU)	No	0.33	N/A	N/A	Turbidity is a measure of the cloudiness of water.
Disinfection By-Products and Residuals within the Distribution System					
Haloacetic Acids (UG/L)	No	6.9	48	60	By-product of drinking water disinfection.
Total Trihalomethanes (UG/L) *	No	4.50-10.00	60	80	Chlorination by-product caused by the reaction of chlorine with organic matter.

New Water System Supply

As the City of Camas continues to grow, our water system serves a greater population each year. The City is currently seeking new water system supply to meet the needs of our growing population. You may hear about a new groundwater well called "Well 17", which the City is in the active planning stages. This includes finding a suitable location, testing for water availability and quality and seeking new water rights from the Department of Ecology. This process will take at least two years to complete but the City is committed to delivering clean and reliable drinking water to our citizens and meeting growing demands.

Our Water System

The City of Camas has multiple water sources that include surface and ground water. The surface water sources, Boulder and Jones Creeks, are located on the south side of Larch Mountain, northeast of Camas. Surface water was not used in 2017. The ground water sources include nine wells near the Washougal river and one well in Grass Valley. All water sources are treated with chlorine for disinfection, fluoride for good dental health and sodium hydroxide to reduce the corrosion of copper piping to meet State and EPA standards. Water pressure and fire flows are maintained throughout the service area with seven distribution reservoirs, nine pump stations, and over 160 miles of pipeline.

Water Leaks

Locate your master water supply valve and label it. The master supply valve can be turned off in case of a major leak or broken pipe.

The majority of leaks in residential plumbing systems are found at the toilet tank (fill and flapper valves).

Other common areas for leaks include:

- Lawn irrigation valves and lines
- Hose in yard turned on or leaking
- Ornamental fountains, fish ponds
- Relief valve or fittings on water heater
- Leaking pipes or fittings in the house
- Line between the meter and the house
- Dripping faucets in bathrooms or sinks
- Outside faucet open or dripping

The City is actively working to reduce system leaks. If you suspect a leak in your neighborhood please call 360-817-1563.

Check out this helpful website at www.epa.gov/watersense/fixaleak

City of Camas Numbers
Residential population served: 23,080
The Camas water system contains:
Seven reservoirs
Nine pump stations
8,649 water meters
Ten wells
More than 500 fire hydrants

Five Simple Water Conservation Tips

1. Fix leaks inside and outside, including old leaky faucets, toilets, hoses, and sprinkler systems.
2. Choose water saving fixtures and appliances and you will use 30% less water.
3. Sweep porches, driveways and sidewalks rather than hosing, to not only conserve water, but to avoid runoff.
4. Water late at night or early in the morning (10:00 pm to 6:00 am).
5. Take a short shower instead of a bath.

An inch of water per week is enough to keep lawns green.

For more water saving ideas see our newsletters, news releases, and/or printed material available at City Hall and the Operations Center, or visit our website at : www.cityofcamas.us/pwwater

It's Yearly Backflow Testing Time!

Make sure to schedule your yearly backflow inspection. If you are a property owner and have an in-ground sprinkler system you are required by State and local laws to install and maintain a backflow prevention device on your service line, and have it inspected yearly by a certified backflow tester. If you have more questions call our Backflow Cross Connection Hotline at 360-817-1569, or email us at backflow@cityofcamas.us. For more information and a current list of certified backflow testers visit www.cityofcamas.us/index.php/pwwater#backflowirrigation

Water Quality Monitoring

The City of Camas routinely monitors for constituents in your drinking water according to Federal and State laws. Field and laboratory analyses include tests for bacteria, as well as chemical and physical indicators. Reports are submitted monthly to the Department of Health to report that your water meets all drinking water standards. Should there ever be a public health concern, you would be notified immediately.

Please report possible water pollution (illicit discharge) to the City of Camas 360-817-1563, or the Department of Ecology SW Regional Office 360-407-6300

The City of Camas is pleased to present the annual Water Quality Report, which provides the public with water testing results. The health of our consumers and their families is paramount and our goal is to provide the community with a safe and dependable supply of drinking water.

At the City of Camas we understand how important it is to ensure we provide high quality water. We work diligently to provide top quality water to a growing residential population of 23,770.

More information about Camas drinking water and what we're doing to keep your water safe can be found online at www.cityofcamas.us/pwwater

The Camas Water System is comprised of seven reservoirs, nine pump stations, 8,649 water meters, ten wells, and approximately 900 fire hydrants.

IMPORTANT!

This report contains important information about your drinking water. If English is not your first language, please have someone who can translate it for you, or speak with someone who understands it.

Este informe contiene información importante sobre su agua potable. Si el inglés no es su primer idioma, tenga a alguien que pueda traducirlo por usted o hable con alguien que lo entienda.

Ce rapport contient des informations importantes sur votre eau potable. Si l'anglais n'est pas votre langue maternelle, demandez à quelqu'un de le traduire à votre place ou de parler à quelqu'un qui le comprend.

Этот отчет содержит важную информацию о вашей питьевой воде. Если английский не является вашим родным языком, попросите кого-нибудь, кто может перевести его для вас, или поговорить с кем-то, кто понимает его.

Our Water System

The City of Camas has multiple water sources that include surface and ground water. The surface water sources (Boulder and Jones Creeks) are located on the south-side of Larch Mountain, northeast of Camas. Surface water was not used in 2018. The ground water sources include nine wells near the Washougal river and one well in Grass Valley. All water sources are treated with chlorine for disinfection, fluoride for good dental health and sodium hydroxide to reduce the corrosion of copper piping to meet State and EPA standards. Water pressure and fire flows are maintained throughout the service area with seven distribution reservoirs, nine pump stations, and over 160 miles of pipeline.

2018 Water Quality Summary

Our drinking water is safe and surpasses all State and Federal health standards!

The City of Camas routinely monitors for contaminants in your drinking water according to Federal and State laws. Field and laboratory analyses include tests for bacteria, as well as chemical and physical indicators. Reports are submitted monthly to the Department of Health to report that City water meets all drinking water standards. Contaminants that were detected are listed in the following tables.

Should there ever be a public health concern, you would be notified immediately. Please report possible water pollution (illicit discharge) to the City of Camas 360-817-1563, or the Department of Ecology-SW Regional Offices 360-407-6300.

Definitions

MCL (Maximum Contaminant Level): The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as possible using the best available treatment technologies.

MCLG (Maximum Contaminant Level Goal): The maximum level of a contaminant in drinking water below which there is no known or expected health risk. MCLGs allow for a margin of safety.

AL (Action Level): The concentration of a contaminant which, if exceeded, triggers treatments or other requirements that a waster system must follow.

Milligram Per Liter (mg/L): A unit of measurement used in reporting the concentration of matter in water as determined by water analyses.

NTU (Nephelometric Turbidity Unit): Turbidity is a measure of the clarity of water. Turbidity in excess of 5 NTU is just noticeable to the average person.

Definitions

ug/L: Units of measurement in micrograms/liter. A unit of concentration for dissolved substances based on their weights.

ppm: (1 parts per million = 1 mh/L = 1 milligram per liter)

ppb: (1 parts per billion = 0.001 mg/L = 1 microgram per liter)

pCi/L: Picocuries per liter is a unit for measuring radioactive concentrations. The curie (Ci) unit is the activity of 1 gram of pure radium.

NA (Not Applicable): Means that the U.S. EPA has not established MCLGs for these substances.

ND (Not Detected): A compound that was analyzed and not detected at a level greater than or equal to the state reporting level.

2018 Detected Contaminants

		EPA Regulations		City of Camas Water Quality Results	
Regulated Contaminants	**Units**	**Ideal Level/Goal (MCLG)**	**Maximum Level (MCL)**	**Range of Level Detected**	**Violation**
Fluoride	mg/L	.5—2.9	4	.42—.9	No
Fluoride is added to your water in carefully controlled levels for dental health. In May 2016, the Washington State Department of Health changed the fluoridation requirement to a target of 0.7 mg/L from the previous target of 0.7-1.2 mg/L.					
Nitrates ***(as nitrogen)***	mg/L	10	10	Not Detected—1.7	No
Runoff from fertilizer use; leaching from septic tanks, sewage; erosion of natural products.					
Haloacetic Acid (5)	ug/L	48	60	2.9	No
Trihalomethanes	ug/L	60	80	4.5	No
Haloacetic acids (HAA5) and trihalomethanes form as by-products of the chlorination process that is used to kill or inactivate disease-causing microbes.					

Unregulated contaminants are those for which the EPA has not established drinking water standards. The purpose of unregulated contaminant monitoring is to help EPA determine their occurrence in drinking water and potential need for future regulation. For more information, go to: https://www.epa.gov/dwucmr/third-unregulated-contaminant-monitoring-rule or contact the Safe Drinking Water Hotline at 1-800-426-4791 or via website https://www.epa.gov/home/epa-hotlines.

The sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and in some cases, radio-active material. It can also pick up substances resulting from the presence of animals or from human activity. To ensure that tap water is safe to drink, the Washington Department of Health and the United State Environmental Protection Agency (EPA) prescribes regulations that limit the amount of certain contaminants in the water provided by public water systems. Contaminants that may be present in source water before we treat it include:

- **Microbial Contaminants**, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- **Inorganic Contaminants**, such as salts and metals, which can be naturally-occurring or result from urban storm water runoff, industrial or domestic wastewater discharges, oil and gas production, and mining or farming.
- **Pesticides and Herbicides**, which may come from a variety of sources such as agriculture and residential uses.
- **Organic Chemicals**, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban storm water runoff, and septic systems.

Mandatory EPA Statement for All Community Water Systems

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the EPA's Safe Drinking Water Hotline (1-800-426-4791).

Some people may be more vulnerable to contaminants in drinking water than the general population. Immunocompromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. The US EPA-Center for Disease Control guidelines on appropriate means to lessen the risk of infection by cryptosporidium and other microbiological contaminants are from the EPA's Safe Drinking Water website.

Lead & Copper

In 2018, the City tested thirty residences for lead and copper. The highest result was 0.0026 mg/L for Lead, and 0.6100 mg/L in Copper. No households exceeded the action level. The next sampling event is scheduled for 2021.

Parameter	Major Source	Units	(MCLG) mg/L	(AL) mg/L	City Results mg/L	Violation
Lead *(at consumers tap)*	Plumbing, erosion of natural deposits.	ppb	0	0.015	.0010—.0034	No
Copper		ppm	0	1.30	.027—.55	No

To Reduce Lead and Copper Exposure

1. When your water has been sitting for several hours, flush the pipe by running the cold water tap until the water is noticeably colder before using the water for drinking or cooking.
2. Use only cold water for drinking, cooking, and making baby formula. Hot water may contain higher levels of copper.
3. Frequently clean the filter screens and aerators in faucets to remove captured particles.
4. If building or remodeling, only use "lead free" or low lead piping and materials. Avoid using copper piping or brass fixtures for locations where water will be consumed or used in food preparation.

EPA STATEMENT

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The City of Camas is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to two minutes before using water for drinking or cooking. The EPA requires the City to conduct lead testing every three years.

Copper is a mineral component naturally found in solids. In the correct amounts, it is an essential nutrient for humans and plants. In Washington State, most copper in drinking water comes from corrosion of household plumbing. Plumbing sources can include copper pipe and brass fixtures. Copper from plumbing corrosion can accumulate overnight. Although copper is an essential mineral in the diet, too much copper can cause health problems. Copper is widely distributed within the tissues of the body, but accumulates primarily in the liver and kidneys. A single dose of 15 mg of copper can cause nausea, vomiting, diarrhea, and intestinal cramps.

If you are concerned about lead or copper in your water, you may wish to have your water tested. Information on lead and copper in your drinking water, testing methods, and steps you can take to minimize exposure is available from the **Safe Drinking Water Hotline 1-800-426-4791, or at www.epa.gov/safewater/lead.**

Water Conservation

In 2018, the **average daily water consumption in Camas was 4.2 million gallons**. Our **peak usage day was on August 19, 2018, when 8,335,000 gallons were consumed**. Most of this increase in the summer months, is due to irrigation demands. We are once again asking for the publics help to implement a voluntary odd/even lawn watering program for residential customers. Water on odd days for home addresses that end in an odd number, and even days if it ends in an even number.

In 2018, the City replaced approximately 470 advanced radio read water meters. We will be continuing the water meter replacement project and upgrading approximately 529 additional meters in 2019.

City Water Saving Commitments

- To reduce the customer consumption per ERU by one percent or approximately two gallons-per-day per year over the next six years. The City will continue to reduce distribution system loss at-or-below ten percent for the next five years.
- Replacing industrial, commercial, and residential service meters with the new radio read meters, which will allow the City to log usage more effectively to notify customers about continuous leaks or high consumption.
- Encourage the installation of smart controllers on irrigation systems for the school district and industrial users.
- Educate the public on water-saving devices, and distribute water conservation kits and water-saving devices to homeowners. Continue metering all sources.
- Replace water mains and service lines in problematic areas and complete Capital Projects in accordance with the new Water System Plan Update.

Community Involvement to Reduce Water Leaks

Locate your master water supply valve and label it. The master supply valve can be turned off in case of a major leak or broken pipe. The majority of leaks in residential plumbing systems are found at the toilet tank (fill and flapper valves).

CONSERVATION TIPS

Fix leaks on old leaky faucets, toilets, hoses, and sprinkler systems.

Choose water saving fixtures and appliances and you will use 30% less water.

Sweep porches, driveways & sidewalks rather than hosing, to not only conserve water, but to avoid runoff.

Water late at night or early in the morning (10:00 pm or 6:00 am).

Take a short shower instead of a bath.

Other common leaks include:

- Lawn irrigation valves and lines
- Yard hose turned on or leaking
- Ornamental fountains & fish ponds
- Water heater relief valve or fittings
- Leaking house pipes or fittings
- Leaking between the house and meter
- Inside and outside dripping faucets

The City is actively working to reduce system leaks. If you suspect a leak in your neighborhood please call City of Camas at 360-817-1563.

Cross Connection Program

What is backflow?

Backflow is the undesirable reversal of the flow of water from the intended direction of flow. When this occurs, other liquids, mixtures, gases or substances can enter the potable water piping through cross connection. Under the right hydraulic conditions, backflow can result in contamination of the water supply, which is called backsiphonage and backpressure.

How to keep our drinking water clean and safe

Locate or install a backflow device

If you have an underground irrigation system, check to see if you have a backflow assembly. The backflow assembly is a brass valve usually found between your water meter and the point where your water service line enters your home, usually in a small green box similar to a meter box. If your irrigation system does not include backflow assembly or if you are installing a new underground irrigation system, City of Camas plumbing code requires you to install a *Double Check Valve Assembly (DCVA)* at a minimum.

Test your backflow assembly device annually

Once you have your backflow assembly installed or located, make sure to have it tested annually by a state-certified backflow assembly tester. If you are a property owner and have an in-ground sprinkler system you are required by state and local laws (WAC 246-290) to install and maintain a backflow prevention device on your service line, and have it inspected yearly by a Washington State Certified Backflow Assembly Tester (BAT). If you have more questions call our Backflow Hotline at 360-817-1569, or email us at backflow@cityofcamas.us

Properly winterizing your irrigation system

During the fall, most irrigation systems will need to be winterized to prevent pipes from freezing and breaking. Many times this involves using compressed air to blow out the excess water left in the irrigation piping. Although this is the best method, backflow of compressed air and contaminants may enter the drinking water distribution system and cause damage and or health risks if not performed properly. Make sure the compressed air is connected to a properly installed blowout connection to avoid inadvertently introducing air into our water system.

An inch of water per week is enough to keep lawns green.

Stop these biggest water consumers first! Look for the Water Sense label on new plumbing fixtures; Repair leaky toilets or install high efficiency low flow toilets; Consider purchasing a water-energy-efficient washer and use water-savings habits such as washing full loads only. Repair leaky faucets, and turn off water when you shave or brush your teeth, Install low flow showerheads and take shorter showers. **For more information Visit City Hall to pick up printed material or visit our website at www.cityofcamas.us/pwwater, or check out this the EPA's website at www.epa.gov/watersense/fixaleak.**

The City of Camas is pleased to present the annual Water Quality Report, which provides the public with water testing results. The health of our consumers and their families is paramount and our goal is to provide the community with a safe and dependable supply of drinking water.

At the City of Camas we understand how important it is to ensure we provide high quality water. We work diligently to provide top quality water to a growing residential population of approximately 25,000.

More information about Camas drinking water and what we're doing to keep your water safe can be found online at www.cityofcamas.us/pwwater.

The Camas Water System is comprised of seven reservoirs, nine pump stations, 8,649 water meters, ten wells, and approximately 900 fire hydrants.

IMPORTANT!

This report contains important information about your drinking water. If English is not your first language, please have someone who can translate it for you, or speak with someone who understands it.

Este informe contiene información importante sobre su agua potable. Si el inglés no es su primer idioma, tenga a alguien que pueda traducirlo por usted o hable con alguien que lo entienda.

Ce rapport contient des informations importantes sur votre eau potable. Si l'anglais n'est pas votre langue maternelle, demandez à quelqu'un de le traduire à votre place ou de parler à quelqu'un qui le comprend.

Этот отчет содержит важную информацию о вашей питьевой воде. Если английский не является вашим родным языком, попросите кого-нибудь, кто может перевести его для вас, или поговорить с кем-то, кто понимает его.

Our Water System

The City of Camas has multiple water sources that include surface and ground water. The surface water sources (Boulder and Jones Creeks) are located on the south-side of Larch Mountain, northeast of Camas. Surface water was not used in 2019. The ground water sources include nine wells near the Washougal river and one well in Grass Valley. All water sources are treated with chlorine for disinfection, fluoride for good dental health and sodium hydroxide to reduce the corrosion of copper piping to meet State and EPA standards. Water pressure and fire flows are maintained throughout the service area with seven distribution reservoirs, nine pump stations, and over 160 miles of pipeline.

We've got news!

2019 Water Quality Summary

Our drinking water is safe and surpasses all State and Federal health standards!

The City of Camas routinely monitors for contaminants in your drinking water according to Federal and State laws. Field and laboratory analyses include tests for bacteria, as well as chemical and physical indicators. Reports are submitted monthly to the Department of Health to report that City water meets all drinking water standards. Contaminants that were detected are listed in the following tables.

Should there ever be a public health concern, you would be notified immediately. Please report possible water pollution (illicit discharge) to the City of Camas 360-817-1563, or the Department of Ecology-SW Regional Offices 360-407-6300.

Definitions

MCL (Maximum Contaminant Level): The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as possible using the best available treatment technologies.

MCLG (Maximum Contaminant Level Goal): The maximum level of a contaminant in drinking water below which there is no known or expected health risk. MCLGs allow for a margin of safety.

AL (Action Level): The concentration of a contaminant which, if exceeded, triggers treatments or other requirements that a waster system must follow.

Milligram Per Liter (mg/L): A unit of measurement used in reporting the concentration of matter in water as determined by water analyses.

NTU (Nephelometric Turbidity Unit): Turbidity is a measure of the clarity of water. Turbidity in excess of 5 NTU is just noticeable to the average person.

Definitions

ug/L: Units of measurement in micrograms/liter. A unit of concentration for dissolved substances based on their weights.

ppm: (1 parts per million = 1 mh/L = 1 milligram per liter)

ppb: (1 parts per billion = 0.001 mg/L = 1 microgram per liter)

pCi/L: Picocuries per liter is a unit for measuring radioactive concentrations. The curie (Ci) unit is the activity of 1 gram of pure radium.

NA (Not Applicable): Means that the U.S. EPA has not established MCLGs for these substances.

ND (Not Detected): A compound that was analyzed and not detected at a level greater than or equal to the state reporting level.

2019 Detected Contaminants

		EPA Regulations		City of Camas Water Quality Results	
Regulated Contaminants	**Units**	**Ideal Level/Goal (MCLG)**	**Maximum Level (MCL)**	**Range of Level Detected**	**Violation**
Fluoride	mg/L	.5—.9	4	.45—.84	No
Fluoride is added to your water in carefully controlled levels for dental health. In May 2016, the Washington State Department of Health changed the fluoridation requirement to a target of 0.7 mg/L from the previous target of 0.7-1.2 mg/L.					
Nitrates ***(as nitrogen)***	mg/L	10	10	Not Detected—1.4	No
Runoff from fertilizer use; leaching from septic tanks, sewage; erosion of natural products.					
Haloacetic Acid (5)	ug/L	48	60	1.0-1.1	No
Trihalomethanes	ug/L	60	80	2.3-4.1	No
Haloacetic acids (HAA5) and trihalomethanes form as by-products of the chlorination process that is used to kill or inactivate disease-causing microbes.					

Unregulated contaminants are those for which the EPA has not established drinking water standards. The purpose of unregulated contaminant monitoring is to help EPA determine their occurrence in drinking water and potential need for future regulation. For more information, go to: https://www.epa.gov/dwucmr/third-unregulated-contaminant-monitoring-rule or contact the Safe Drinking Water Hotline at 1-800-426-4791 or via website https://www.epa.gov/home/epa-hotlines.

In general, the sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and in some cases, radio-active material. It can also pick up substances resulting from the presence of animals or from human activity. To ensure that tap water is safe to drink, the Washington Department of Health and the United State Environmental Protection Agency (EPA) prescribe regulations that limit the amount of certain contaminants in the water provided by public water systems. Contaminants that may be present in source water before we treat it include:

- **Microbial Contaminants**, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- **Inorganic Contaminants**, such as salts and metals, which can be naturally-occurring or result from urban storm water runoff, industrial or domestic wastewater discharges, oil and gas production, and mining or farming.
- **Pesticides and Herbicides**, which may come from a variety of sources such as agriculture and residential uses.
- **Organic Chemicals**, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban storm water runoff, and septic systems.

Mandatory EPA Statement for All Community Water Systems

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the EPA's Safe Drinking Water Hotline (1-800-426-4791).

Some people may be more vulnerable to contaminants in drinking water than the general population. Immunocompromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. The US EPA-Center for Disease Control guidelines on appropriate means to lessen the risk of infection by cryptosporidium and other microbiological contaminants are from the EPA's Safe Drinking Water website.

Lead & Copper

In 2018, the City tested thirty residences for lead and copper. The highest result was 0.0026 mg/L for Lead, and 0.6100 mg/L in Copper. No households exceeded the action level. The City was not required to test for lead or copper in 2019. The next sampling event is scheduled for 2021.

Parameter	Major Source	Units	(MCLG) mg/L	(AL) mg/L	City Results mg/L	Violation
Lead *(at consumers tap)*	Plumbing, erosion of natural deposits.	ppb	0	0.015	.0010—.0034	No
Copper		ppm	0	1.30	.027—.55	No

To Reduce Lead and Copper Exposure

1. When your water has been sitting for several hours, flush the pipe by running the cold water tap until the water is noticeably colder before using the water for drinking or cooking.
2. Use only cold water for drinking, cooking, and making baby formula. Hot water may contain higher levels of copper.
3. Frequently clean the filter screens and aerators in faucets to remove captured particles.
4. If building or remodeling, only use "lead free" or low lead piping and materials. Avoid using copper piping or brass fixtures for locations where water will be consumed or used in food preparation.

EPA STATEMENT

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The City of Camas is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to two minutes before using water for drinking or cooking. The EPA requires the City to conduct lead testing every three years.

Copper is a mineral component naturally found in solids. In the correct amounts, it is an essential nutrient for humans and plants. In Washington State, most copper in drinking water comes from corrosion of household plumbing. Plumbing sources can include copper pipe and brass fixtures. Copper from plumbing corrosion can accumulate overnight. Although copper is an essential mineral in the diet, too much copper can cause health problems. Copper is widely distributed within the tissues of the body, but accumulates primarily in the liver and kidneys. A single dose of 15 mg of copper can cause nausea, vomiting, diarrhea, and intestinal cramps.

If you are concerned about lead or copper in your water, you may wish to have your water tested. Information on lead and copper in your drinking water, testing methods, and steps you can take to minimize exposure is available from:

Safe Drinking Water Hotline 1-800-426-4791, or at www.epa.gov/safewater/lead.

Water Conservation

In 2019, the average daily water consumption in Camas was 3.96 million gallons. Our peak usage day was on June 15, 2019, when 7,693,000 gallons were consumed. Most of this increase in the summer months is due to irrigation demands. We are once again asking for the public's help to implement a voluntary odd/even lawn watering program for residential customers. Water on odd days for home addresses that end in an odd number, and even days if it ends in an even number.

In 2019, the City replaced approximately 596 advanced radio read water meters. We will be continuing the water meter replacement project and upgrading additional meters in 2020.

City Water Saving Commitments

- To reduce the customer consumption per home by one percent or approximately two gallons-per-day per year over the next six years. The City will maintain distribution system loss at-or-below ten percent for the next five years.
- Replacing industrial, commercial, and residential service meters with the new radio read meters, which will allow the City to log usage more effectively to notify customers about continuous leaks or high consumption.
- Encourage the installation of smart controllers on irrigation systems for the school district and industrial users.
- Educate the public on water-saving devices, and distribute water conservation kits and water-saving devices to homeowners. Continue metering all sources.
- Replace water mains and service lines in problematic areas and complete Capital Projects in accordance with the new Water System Plan Update.

Community Involvement to Reduce Water Leaks

Locate your master water supply valve and label it. The master supply valve can be turned off in case of a major leak or broken pipe. The majority of leaks in residential plumbing systems are found at the toilet tank (fill and flapper valves).

Other common leaks include:

- Lawn irrigation valves and lines
- Yard hose turned on or leaking
- Ornamental fountains & fish ponds
- Water heater relief valve or fittings
- Leaking house pipes or fittings
- Leaking between the house and meter
- Inside and outside dripping faucets

The City is actively working to reduce system leaks. If you suspect a leak in your neighborhood please call City of Camas at 360-817-1563.

CONSERVATION TIPS

Fix leaks on old leaky faucets, toilets, hoses, and sprinkler systems.

Choose water saving fixtures and appliances and you will use 30% less water.

Sweep porches, driveways & sidewalks rather than hosing, to not only conserve water, but to avoid runoff.

Water late at night or early in the morning (10:00 pm or 6:00 am).

Take a short shower Instead of a bath.

An inch of water per week is enough to keep lawns green.

Cross Connection Program

What is Backflow?

Backflow is the undesirable reversal of the flow of water from the intended direction of flow. When this occurs, other liquids, mixtures, gases or substances can enter the potable water piping through cross connection. Under the right hydraulic conditions, backflow can result in contamination of the water supply, which is called back siphonage and backpressure.

How to keep our drinking water clean and safe:

Locate or install a backflow device

If you have an underground irrigation system, check to see if you have a backflow assembly. The backflow assembly is a brass valve usually found between your water meter and the point where your water service line enters your home, usually in a small green box similar to a meter box. If your irrigation system does not include backflow assembly or if you are installing a new underground irrigation system, City of Camas plumbing code requires you to install a *Double Check Valve Assembly (DCVA)* at a minimum.

Test your backflow assembly device annually

Once you have your backflow assembly installed or located, make sure to have it tested annually by a state-certified backflow assembly tester. If you are a property owner and have an in-ground sprinkler system you are required by state and local laws (WAC 246-290) to install and maintain a backflow prevention device on your service line, and have it inspected yearly by a Washington State Certified Backflow Assembly Tester (BAT).

If you have more questions call our Backflow Hotline at 360-817-1569, or email us at backflow@cityofcamas.us

Properly winterizing your irrigation system

During the fall, most irrigation systems will need to be winterized to prevent pipes from freezing and breaking. Many times this involves using compressed air to blow out the excess water left in the irrigation piping. Although this is the best method, backflow of compressed air and contaminants may enter the drinking water distribution system and cause damage and or health risks if not performed properly. Make sure the compressed air is connected to a properly installed blowout connection to avoid inadvertently introducing air into our water system.

Stop these biggest water consumers first! Look for the Water Sense label on new plumbing fixtures; Repair leaky toilets or install high efficiency low flow toilets; Consider purchasing a water-energy-efficient washer and use water-savings habits such as washing full loads only. Repair leaky faucets, and turn off water when you shave or brush your teeth, Install low flow showerheads and take shorter showers. **For more information Visit City Hall to pick up printed material or visit our website at www.cityofcamas.us/pwwater, or check out this the EPA's website at www.epa.gov/watersense/fixaleak.**

Total Coliform Bacteria	%	0	<5% Positive/Mo.	0	No

Unregulated contaminants are those for which the EPA has not established drinking water standards. The purpose of unregulated contaminant monitoring is to help EPA determine their occurrence in drinking water and potential need for future regulation. For more information, go to: https://www.epa.gov/dwucmr/third-unregulated-contaminant-monitoring-rule or contact the Safe Drinking Water Hotline at 1-800-426-4791 or via website https://www.epa.gov/home/epa-hotlines.

Sources of Drinking Water

In general, the sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and in some cases, radio-active material. It can also pick up substances resulting from the presence of animals or from human activity. To ensure that tap water is safe to drink, the Washington Department of Health and the United State Environmental Protection Agency (EPA) prescribe regulations that limit the amount of certain contaminants in the water provided by public water systems. Contaminants that may be present in source water before we treat it include:

Mandatory EPA Statement for All Community Water Systems

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the EPA's Safe Drinking Water Hotline (1-800-426-4791).

Some people may be more vulnerable to contaminants in drinking water than the general population. Immunocompromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. The US EPA-Center for Disease Control guidelines on appropriate means to lessen the risk of infection by cryptosporidium and other microbiological contaminants are from the EPA's Safe Drinking Water website.

- **Microbial Contaminants**, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- **Inorganic Contaminants**, such as salts and metals, which can be naturally-occurring or result from urban storm water runoff, industrial or domestic wastewater discharges, oil and gas production, and mining or farming.
- **Pesticides and Herbicides**, which may come from a variety of sources such as agriculture and residential uses.
- **Organic Chemicals**, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban storm water runoff, and septic systems.
- **Radioactive Contaminants**, which are naturally occurring as a result of mining and/or gas production.

Lead & Copper

In 2018, the City tested thirty residences for lead and copper. The highest result was 0.0026 mg/L for Lead, and 0.6100 mg/L in Copper. No households exceeded the action level. The City was not required to test for lead or copper in 2020. The next sampling event is scheduled for 2021.

Parameter	Major Source	Units	(MCLG) mg/L	(AL) mg/L	City Results mg/L	Violation
Lead *(at consumers tap)*	Plumbing, erosion of natural deposits.	ppb	0	0.015	.0010—.0034	No
Copper		ppm	0	1.30	.027—.55	No

To Reduce Lead and Copper Exposure

- When your water has been sitting for several hours, flush the pipe by running the cold water tap until the water is noticeably colder before using the water for drinking or cooking.
- Use only cold water for drinking, cooking, and making baby formula. Hot water may contain higher levels of copper.
- Frequently clean the filter screens and aerators in faucets to remove captured particles.
- If building or remodeling, only use "lead free" or low lead piping and materials. Avoid using copper piping or brass fixtures for locations where water will be consumed or used in food preparation.

EPA STATEMENT

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The City of Camas is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to two minutes before using water for drinking or cooking. The EPA requires the City to conduct lead testing every three years.

Copper is a mineral component naturally found in solids. In the correct amounts, it is an essential nutrient for humans and plants. In Washington State, most copper in drinking water comes from corrosion of household plumbing. Plumbing sources can include copper pipe and brass fixtures. Copper from plumbing corrosion can accumulate overnight. Although copper is an essential mineral in the diet, too much copper can cause health problems. Copper is widely distributed within the tissues of the body, but accumulates primarily in the liver and kidneys. A single dose of 15 mg of copper can cause nausea, vomiting, diarrhea, and intestinal cramps.

If you are concerned about lead or copper in your water, you may wish to have your water tested. Information on lead and copper in your drinking water, testing methods, and steps you can take to minimize exposure is available from:

Safe Drinking Water Hotline 1-800-426-4791, or at www.epa.gov/safewater/lead.

Water Conservation

In 2020 the average daily water consumption in Camas was 4.22 million gallons. Our peak usage day was on August 16, 2020, when 8,686,000 gallons were consumed. Most of this increase in the summer months is due to irrigation demands. We are once again asking for the public's help to implement a voluntary odd/even lawn watering program for residential customers. Water on odd days for home addresses that end in an odd number, and even days if it ends in an even number.

City Water Saving Commitments

- To reduce the customer consumption per home by one percent or approximately two gallons-per-day per year over the next six years. The City will maintain distribution system loss at-or-below ten percent for the next five years.
- Replacing industrial, commercial, and residential service meters with the new radio read meters, which will allow the City to log usage more effectively to notify customers about continuous leaks or high consumption.
- Encourage the installation of smart controllers on irrigation systems for the school district and industrial users.
- Educate the public on water-saving devices, and distribute water conservation kits and water-saving devices to homeowners. Continue metering all sources.
- Replace water mains and service lines in problematic areas and complete Capital Projects in accordance with the new Water System Plan Update.

Community Involvement to Reduce Water Leaks

Locate your master water supply valve and label it. The master supply valve can be turned off in case of a major leak or broken pipe. The majority of leaks in residential plumbing systems are found at the toilet tank (fill and flapper valves).

Other common leaks include:

- Lawn irrigation valves and lines
- Yard hose turned on or leaking
- Ornamental fountains & fish ponds
- Water heater relief valve or fittings
- Leaking house pipes or fittings
- Leaking between the house and meter
- Inside and outside dripping faucets

The City is actively working to reduce system leaks. If you suspect a leak in your neighborhood please call City of Camas at 360-817-1563.

CONSERVATION TIPS

Fix leaks on old leaky faucets, toilets, hoses, and sprinkler systems.

Choose water saving fixtures and appliances and you will use 30% less water.

Sweep porches, driveways & sidewalks rather than hosing, to not only conserve water, but to avoid runoff.

Water late at night or early in the morning (10:00 pm or 6:00 am).

Take a short shower Instead of a bath.

An inch of water per week is enough to keep lawns green.

Cross Connection Program

Annual Backflow Test Required - Cross-Connection Prevention

Backflow is the undesirable reversal of the flow of water from the intended direction of flow. When this occurs, other liquids, mixtures, gases or substances can enter the potable water piping through cross connection. Under the right hydraulic conditions, backflow can result in contamination of the water supply, which is called back siphonage and back pressure.

How to keep our drinking water clean and safe:

Locate or install a backflow device

If you have an underground irrigation system, check to see if you have a backflow assembly. The backflow assembly is a brass valve usually found between your water meter and the point where your water service line enters your home, usually in a small green box similar to a meter box. If your irrigation system does not include backflow assembly or if you are installing a new underground irrigation system, City of Camas plumbing code requires you to install a *Double Check Valve Assembly (DCVA)* at a minimum.

Test your backflow assembly device annually

Once you have your backflow assembly installed or located, make sure to have it tested annually by a state-certified backflow assembly tester. If you are a property owner and have an in-ground sprinkler system you are required by state and local laws (WAC 246-290) to install and maintain a backflow prevention device on your service line, and have it inspected yearly by a Washington State Certified Backflow Assembly Tester BAT). View our Certified Backflow Tester List on the City website: https://www.cityofcamas.us/publicworks/page/backflow-and-cross-connection-prevention.

If you have more questions call our Backflow Hotline at 360-817-1569, or email us at backflow@cityofcamas.us

Properly winterizing your irrigation system

During the fall, most irrigation systems will need to be winterized to prevent pipes from freezing and breaking. Many times this involves using compressed air to blow out the excess water left in the irrigation piping. Although this is the best method, backflow of compressed air and contaminants may enter the drinking water distribution system and cause damage and or health risks if not performed properly. Make sure the compressed air is connected to a properly installed blowout connection to avoid inadvertently introducing air into our water system.

For more water-leak information, check the EPA's website at www.epa.gov/watersense/fixaleak.

City of Camas Annual Water Quality Report

Public Water System ID: 108002

The City of Camas is pleased to present the annual Water Quality Report, which provides the public with water testing results. The health of our consumers and their families is paramount and our goal is to provide the community with a safe and dependable supply of drinking water.

At the City of Camas we understand how important it is to ensure we provide high quality water. We work diligently to provide top quality water to our growing residential population.

More information about Camas drinking water and what we're doing to keep your water safe can be found online at www.cityofcamas.us/publicworks/page/water-services

IMPORTANT!

This report contains important information about your drinking water. If English is not your first language, please have someone who can translate it for you, or speak with someone who understands it.

Este informe contiene información importante sobre su agua potable. Si el inglés no es su primer idioma, tenga a alguien que pueda traducirlo por usted o hable con alguien que lo entienda.

Ce rapport contient des informations importantes sur votre eau potable. Si l'anglais n'est pas votre langue maternelle, demandez à quelqu'un de le traduire à votre place ou de parler à quelqu'un qui le comprend.

Этот отчет содержит важную информацию о вашей питьевой воде. Если английский не является вашим родным языком, попросите кого-нибудь, кто может перевести его для вас, или поговорить с кем-то, кто понимает его.

Our Water System

The City of Camas has multiple water sources that include surface and ground water. The surface water sources (Boulder and Jones Creeks) are located on the south-side of Larch Mountain, northeast of Camas. Surface water was not used in 2021. The ground water sources include nine wells near the Washougal river and one well in Grass Valley. All water sources are treated with chlorine for disinfection, fluoride for good dental health and sodium hydroxide to reduce the corrosion of copper piping to meet State and EPA standards. Water pressure and fire flows are maintained throughout the service area with eight distribution reservoirs, nine pump stations, and over 160 miles of pipeline.

We've got news!

Follow City of Camas on social media and on the city's website for the latest in updates and alerts:

Website: www.cityofcamas.us

2021 Water Quality Summary

Our drinking water is safe and surpasses all State and Federal health standards!

The City of Camas routinely monitors for contaminants in your drinking water according to Federal and State laws. Field and laboratory analyses include tests for bacteria, as well as chemical and physical indicators. Reports are submitted monthly to the Department of Health to report that City water meets all drinking water standards. Contaminants that were detected are listed in the following tables.

Should there ever be a public health concern, you would be notified immediately. Please report possible water pollution (illicit discharge) to the City of Camas 360-817-1563, or the Department of Ecology-SW Regional Offices 360-407-6300.

Definitions

MCL (Maximum Contaminant Level): The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as possible using the best available treatment technologies.

MCLG (Maximum Contaminant Level Goal): The maximum level of a contaminant in drinking water below which there is no known or expected health risk. MCLGs allow for a margin of safety.

AL (Action Level): The concentration of a contaminant which, if exceeded, triggers treatments or other requirements that a waster system must follow.

Milligram Per Liter (mg/L): A unit of measurement used in reporting the concentration of matter in water as determined by water analyses.

NTU (Nephelometric Turbidity Unit): Turbidity is a measure of the clarity of water. Turbidity in excess of 5 NTU is just noticeable to the average person.

ug/L: Units of measurement in micrograms/liter. A unit of concentration for dissolved substances based on their weights.

ppm: (1 parts per million = 1 mh/L = 1 milligram per liter)

ppb: (1 parts per billion = 0.001 mg/L = 1 microgram per liter)

pCi/L: Picocuries per liter is a unit for measuring radioactive concentrations. The curie (Ci) unit is the activity of 1 gram of pure radium.

NA (Not Applicable): Means that the U.S. EPA has not established MCLGs for these substances.

ND (Not Detected): A compound that was analyzed and not detected at a level greater than or equal to the state reporting level.

2021 Detected Contaminants

		EPA Regulations		City of Camas Water Quality Results	
Regulated Contaminants	**Units**	**Ideal Level/Goal (MCLG)**	**Maximum Level (MCL)**	**Range of Level Detected**	**Violation**
Fluoride	mg/L	.50 -.90	4	.34—1.03	No
Fluoride is added to your water in carefully controlled levels for dental health. In May 2016, the Washington State Department of Health changed the fluoridation requirement to a target of 0.7 mg/L from the previous target of 0.7-1.2 mg/L.					
Nitrates ***(as nitrogen)***	mg/L	10	10	Not Detected—2.9	No
Runoff from fertilizer use; leaching from septic tanks, sewage; erosion of natural products.					
Haloacetic Acid (5)	ug/L	48	60	Not Detected—1.4	No
Trihalomethanes	ug/L	60	80	2.5-6.5	No
Haloacetic acids (HAA5) and trihalomethanes form as by-products of the chlorination process that is used to kill or inactivate disease-causing microbes.					
Radionuclides - Naturally Occurring Substances In Drinking Water					
Gross Alpha	pCil	0	15	2.67	No
Radium 228	pCil	0	5	.670	No
Total Coliform Bacteria	%	0	<5% Positive/Mo.	0	No

Unregulated contaminants are those for which the EPA has not established drinking water standards. The purpose of unregulated contaminant monitoring is to help EPA determine their occurrence in drinking water and potential need for future regulation. For more information, go to: https://www.epa.gov/dwucmr/third-unregulated-contaminant-monitoring-rule or contact the Safe Drinking Water Hotline at 1-800-426-4791 or via website https://www.epa.gov/home/epa-hotlines.

Sources of Drinking Water

In general, the sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and in some cases, radio-active material. It can also pick up substances resulting from the presence of animals or from human activity. To ensure that tap water is safe to drink, the Washington Department of Health and the United State Environmental Protection Agency (EPA) prescribe regulations that limit the amount of certain contaminants in the water provided by public water systems. Contaminants that may be present in source water before we treat it include:

Mandatory EPA Statement for All Community Water Systems

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the EPA's Safe Drinking Water Hotline (1-800-426-4791).

Some people may be more vulnerable to contaminants in drinking water than the general population. Immunocompromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. The US EPA-Center for Disease Control guidelines on appropriate means to lessen the risk of infection by cryptosporidium and other microbiological contaminants are from the EPA's Safe Drinking Water website.

- **Microbial Contaminants**, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- **Inorganic Contaminants**, such as salts and metals, which can be naturally-occurring or result from urban storm water runoff, industrial or domestic wastewater discharges, oil and gas production, and mining or farming.
- **Pesticides and Herbicides**, which may come from a variety of sources such as agriculture and residential uses.
- **Organic Chemicals**, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban storm water runoff, and septic systems.
- **Radioactive Contaminants**, which are naturally occurring as a result of mining and/or gas production.

Lead & Copper

In 2021, the City tested thirty two residences for lead and copper. The highest level for copper was 0.93 mg/L. The highest level for lead was .019mg/L. To be in compliance with the Lead and Copper Rules, our system must fall within the 90th percentile of samples collected, where sample results are less than or equal to the action level for lead and copper. The action level for Lead is .015 mg/L and the action level for Copper is 1.3mg/L.

Parameter	Major Source	Units	(MCLG) mg/L	(AL)	City Results mg/L	Violation
Lead *(at consumers tap)*	Plumbing, erosion of natural deposits.	ppb	0	0.015	Not Detected —.019	No
Copper		ppm	0	1.30	.021—.93	No

To Reduce Lead and Copper Exposure

- When your water has been sitting for several hours, flush the pipe by running the cold water tap until the water is noticeably colder before using the water for drinking or cooking.
- Use only cold water for drinking, cooking, and making baby formula. Hot water may contain higher levels of copper.
- Frequently clean the filter screens and aerators in faucets to remove captured particles.
- If building or remodeling, only use "lead free" or low lead piping and materials. Avoid using copper piping or brass fixtures for locations where water will be consumed or used in food preparation.

EPA STATEMENT

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The City of Camas is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to two minutes before using water for drinking or cooking. The EPA requires the City to conduct lead testing every three years.

Copper is a mineral component naturally found in solids. In the correct amounts, it is an essential nutrient for humans and plants. In Washington State, most copper in drinking water comes from corrosion of household plumbing. Plumbing sources can include copper pipe and brass fixtures. Copper from plumbing corrosion can accumulate overnight. Although copper is an essential mineral in the diet, too much copper can cause health problems. Copper is widely distributed within the tissues of the body, but accumulates primarily in the liver and kidneys. A single dose of 15 mg of copper can cause nausea, vomiting, diarrhea, and intestinal cramps.

If you are concerned about lead or copper in your water, you may wish to have your water tested. Information on lead and copper in your drinking water, testing methods, and steps you can take to minimize exposure is available from:

Safe Drinking Water Hotline 1-800-426-4791, or at www.epa.gov/safewater/lead.

Water Conservation

In 2021 the average daily water consumption in Camas was 4.75 million gallons. Our peak usage day was on July 22, 2021, when 11,670,000 gallons were consumed. Most of this increase in the summer months is due to irrigation demands. We are once again asking for the public's help to implement a voluntary odd/even lawn watering program for residential customers. Water on odd days for home addresses that end in an odd number, and even days if it ends in an even number.

City Water Saving Commitments

- To reduce the customer consumption per home by one percent or approximately two gallons-per-day per year over the next six years. The City will maintain distribution system loss at-or-below ten percent for the next five years.
- Replacing industrial, commercial, and residential service meters with the new radio read meters, which will allow the City to log usage more effectively to notify customers about continuous leaks or high consumption.
- Encourage the installation of smart controllers on irrigation systems for the school district and industrial users.
- Educate the public on water-saving devices, and distribute water conservation kits and water-saving devices to homeowners. Continue metering all sources.
- Replace water mains and service lines in problematic areas and complete Capital Projects in accordance with the new Water System Plan Update.

Community Involvement to Reduce Water Leaks

Locate your master water supply valve and label it. The master supply valve can be turned off in case of a major leak or broken pipe. The majority of leaks in residential plumbing systems are found at the toilet tank (fill and flapper valves).

Other common leaks include:

- Lawn irrigation valves and lines
- Yard hose turned on or leaking
- Ornamental fountains & fish ponds
- Water heater relief valve or fittings
- Leaking house pipes or fittings
- Leaking between the house and meter
- Inside and outside dripping faucets

The City is actively working to reduce system leaks. If you suspect a leak in your neighborhood please call City of Camas at 360-817-1563.

CONSERVATION TIPS

Fix leaks on old leaky faucets, toilets, hoses, and sprinkler systems.

Choose water saving fixtures and appliances and you will use 30% less water.

Sweep porches, driveways & sidewalks rather than hosing, to not only conserve water, but to avoid runoff.

Water late at night or early in the morning (10:00 pm or 6:00 am).

Take a short shower Instead of a bath.

An inch of water per week is enough to keep lawns green.

Cross Connection Program

Annual Backflow Test Required - Cross-Connection Prevention

Backflow is the undesirable reversal of the flow of water from the intended direction of flow. When this occurs, other liquids, mixtures, gases or substances can enter the potable water piping through cross connection. Under the right hydraulic conditions, backflow can result in contamination of the water supply, which is called back siphonage and back pressure.

How to keep our drinking water clean and safe:

Locate or install a backflow device

If you have an underground irrigation system, check to see if you have a backflow assembly. The backflow assembly is a brass valve usually found between your water meter and the point where your water service line enters your home, usually in a small green box similar to a meter box. If your irrigation system does not include backflow assembly or if you are installing a new underground irrigation system, City of Camas plumbing code requires you to install a *Double Check Valve Assembly (DCVA)* at a minimum.

Test your backflow assembly device annually

Once you have your backflow assembly installed or located, make sure to have it tested annually by a state-certified backflow assembly tester. If you are a property owner and have an in-ground sprinkler system you are required by state and local laws (WAC 246-290) to install and maintain a backflow prevention device on your service line, and have it inspected yearly by a Washington State Certified Backflow Assembly Tester BAT). View our Certified Backflow Tester List on the City website: https://www.cityofcamas.us/publicworks/page/backflow-and-cross-connection-prevention.

If you have more questions call our Backflow Hotline at 360-817-1569, or email us at backflow@cityofcamas.us

Properly winterizing your irrigation system

During the fall, most irrigation systems will need to be winterized to prevent pipes from freezing and breaking. Many times this involves using compressed air to blow out the excess water left in the irrigation piping. Although this is the best method, backflow of compressed air and contaminants may enter the drinking water distribution system and cause damage and or health risks if not performed properly. Make sure the compressed air is connected to a properly installed blowout connection to avoid inadvertently introducing air into our water system.

For more water-leak information, check the EPA's website at www.epa.gov/watersense/fixaleak.

City of Camas Annual Water Quality Report

Public Water System ID: 108002

The City of Camas is pleased to present the annual Water Quality Report, which provides the public with water testing results. The health of our consumers and their families is paramount and our goal is to provide the community with a safe and dependable supply of drinking water.

At the City of Camas we understand how important it is to ensure we provide high quality water. We work diligently to provide top quality water to our growing residential population.

More information about Camas drinking water and what we're doing to keep your water safe can be found online at www.cityofcamas.us/publicworks/page/water-services

IMPORTANT!

This report contains important information about your drinking water. If English is not your first language, please have someone translate it for you, or speak with someone who understands it.

Este informe contiene información importante sobre su agua potable. Si el inglés no es su primer idioma, tenga a alguien que pueda traducirlo por usted o hable con alguien que lo entienda.

Ce rapport contient des informations importantes sur votre eau potable. Si l'anglais n'est pas votre langue maternelle, demandez à quelqu'un de le traduire à votre place ou de parler à quelqu'un qui le comprend.

Этот отчет содержит важную информацию о вашей питьевой воде. Если английский не является вашим родным языком, попросите кого-нибудь, кто может перевести его для вас, или поговорить с кем-то, кто понимает его.

Our Water System

The City of Camas has multiple water sources that include surface and ground water. The surface water sources (Boulder and Jones Creeks) are located on the south-side of Larch Mountain, northeast of Camas. Surface water was not used in 2022. The ground water sources include nine wells near the Washougal river and one well in Grass Valley. All water sources are treated with chlorine for disinfection, fluoride for good dental health and sodium hydroxide to reduce the corrosion of piping to meet State and Environmental Protection Agency (EPA) standards. Water pressure and fire flows are maintained throughout the service area with eight distribution reservoirs, nine pump stations, and over 160 miles of pipeline.

2022 Water Quality Summary

Our drinking water is safe and surpasses all State and Federal health standards!

The City of Camas routinely monitors for contaminants in your drinking water according to Federal and State laws. Field and laboratory analyses include tests for bacteria, as well as chemical and physical indicators. Reports are submitted monthly to the Department of Health to report that City water meets all drinking water standards. Contaminants that were detected are listed in the following tables.

Should there ever be a public health concern, you would be notified immediately. Please report possible water pollution (through illicit discharge or contamination) to the City of Camas 360-817-1563, or the Department of Ecology-SW Regional Offices 360-407-6300.

Definitions

MCL (Maximum Contaminant Level): The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as possible using the best available treatment technologies.

MCLG (Maximum Contaminant Level Goal): The maximum level of a contaminant in drinking water below which there is no known or expected health risk. MCLGs allow for a margin of safety.

AL (Action Level): The concentration of a contaminant which, if exceeded, triggers treatments or other requirements that a waster system must follow.

Milligram Per Liter (mg/L): A unit of measurement used in reporting the concentration of matter in water as determined by water analyses.

NTU (Nephelometric Turbidity Unit): Turbidity is a measure of the clarity of water. Turbidity in excess of 5 NTU is just noticeable to the average person.

µg/L: Units of measurement in micrograms/liter.

ppm: (1 parts per million = 1 mg/L = 1 milligram per liter)

ppb: (1 parts per billion = 0.001 µg/L = 1 microgram per liter)

ppt: (1 parts per trillion = 1 ng/L = 1 nanogram per liter)

pCi/L: Picocuries per liter is a unit for measuring radioactive concentrations. The curie (Ci) unit is the activity of 1 gram of pure radium.

NA (Not Applicable): Means that the U.S. EPA has not established MCLGs for these substances.

ND (Not Detected): A compound that was analyzed and not detected at a level greater than or equal to the state reporting level.

Ng/L: Nanograms per liter

2022 Detected Contaminants

		EPA Regulations		City of Camas Water Quality Results	
Regulated Contaminants	**Units**	**Ideal Level/Goal (MCLG)**	**Maximum Level (MCL)**	**Range of Level Detected**	**Violation**
Fluoride	mg/L	.50 -.90	4	.16-1.10	No
Fluoride is added to your water in carefully controlled levels for dental health. In May 2016, the Washington State Department of Health changed the fluoridation requirement to a target of 0.7 mg/L from the previous target of 0.7-1.2 mg/L.					
Nitrates ***(as nitrogen)***	mg/L	10	10	Not Detected—2.1	No
Runoff from fertilizer use; leaching from septic tanks, sewage; erosion of natural products.					
Haloacetic Acid (5)	ug/L	48	60	Not Detected	No
Trihalomethanes	ug/L	60	80	5.7-7.6	No
Haloacetic acids (HAA5) and trihalomethanes form as by-products of the chlorination process that is used to kill or inactivate disease-causing microbes.					
Radionuclides - Naturally Occurring Substances In Drinking Water					
Gross Alpha	pCil	0	15	2.68	No
Radium 228	pCil	0	5	.739	No
Total Coliform Bacteria	%	0	<1% Positive/Mo.	0	No

2022 Detected Contaminants continued...

A Volatile Organic Chemical (VOC) sample was inadvertently missed at the Washougal Wellfield (source 5-18) in 2022. Through coordination with The Department of Health, the sample was taken in March 2023 resulting in a non-detect.

Sources of Drinking Water

In general, the sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and in some cases, radio-active material. It can also pick up substances resulting from the presence of animals or from human activity. To ensure that tap water is safe to drink, the Washington Department of Health and EPA prescribe regulations that limit the amount of certain contaminants in the water provided by public water systems. Contaminants that may be present in source water before we treat it include:

- **Microbial Contaminants**, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- **Inorganic Contaminants**, such as salts and metals, which can be naturally-occurring or result from urban storm water runoff, industrial or domestic wastewater discharges, oil and gas production, and mining or farming.
- **Pesticides and Herbicides**, which may come from a variety of sources such as agriculture and residential uses.
- **Organic Chemicals**, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban storm water runoff, and septic systems.
- **Radioactive Contaminants**, which are naturally occurring as a result of mining and/or gas production.

Mandatory EPA Statement for All Community Water Systems

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the EPA's Safe Drinking Water Hotline (1-800-426-4791).

Some people may be more vulnerable to contaminants in drinking water than the general population. Immunocompromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. The US EPA-Center for Disease Control guidelines on appropriate means to lessen the risk of infection by cryptosporidium and other microbiological contaminants are from the EPA's Safe Drinking Water website.

Lead & Copper

In 2022, the City tested thirty two residences for lead and copper. The highest level for copper was 0.93 mg/L. The highest level for lead was .019mg/L. To be in compliance with the Lead and Copper Rules, sample results must be less than or equal to the action level for lead and copper. The action level for Lead is .015 mg/L and the action level for Copper is 1.3mg/L.

Parameter	Major Source	Units	(MCLG) mg/L	(AL) mg/L	City Results mg/L	Violation
Lead *(at consumers tap)*	Plumbing, erosion of natural deposits.	ppb	0	0.015	Not Detected —	No
Copper		ppm	0	1.30	.021—.93	No

To Reduce Lead and Copper Exposure

- When your water has been sitting for several hours, flush the pipe by running the cold water tap until the water is noticeably colder before using the water for drinking or cooking.
- Use only cold water for drinking, cooking, and making baby formula. Hot water may contain higher levels of copper.
- Frequently clean the filter screens and aerators in faucets to remove captured particles.
- If building or remodeling, only use "lead free" or low lead piping and materials. Avoid using copper piping or brass fixtures for locations where water will be consumed or used in food preparation.

EPA Statement

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The City of Camas is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to two minutes before using water for drinking or cooking. The EPA requires the City to conduct lead testing every three years.

Copper is a mineral component naturally found in solids. In the correct amounts, it is an essential nutrient for humans and plants. In Washington State, most copper in drinking water comes from corrosion of household plumbing. Plumbing sources can include copper pipe and brass fixtures. Copper from plumbing corrosion can accumulate overnight. Although copper is an essential mineral in the diet, too much copper can cause health problems. Copper is widely distributed within the tissues of the body, but accumulates primarily in the liver and kidneys. A single dose of 15 mg of copper can cause nausea, vomiting, diarrhea, and intestinal cramps.

If you are concerned about lead or copper in your water, you may wish to have your water tested. Information on lead and copper in your drinking water, testing methods, and steps you can take to minimize exposure is available from:

Safe Drinking Water Hotline 1-800-426-4791, or at www.epa.gov/safewater/lead.

PFAS

In 2021, the Washington State Board of Health (SBOH) adopted a rule that requires water system utilities, including the City of Camas, to test for Per and Polyfluoroalkyl substances (PFAS). PFAS are a new class of contaminants not currently regulated by the EPA which include Perfluorooctanoic acid (PFOA) and Perfluorooctanioc Sulfonic Acid (PFOS). The rule requires the City to notify you if any test results exceed a State Action Level. EPA has not yet set an action level but one is expected sometime in 2024 that is anticipated to be lower than the state action level (SAL).

The City recently completed another sampling for PFAS at all of its wells in March of 2023. The testing resulted in no detection for PFOA or PFOS at any of the City wells. PFAS detection below 4 parts per trillion is considered a non-detect. The City will continue to sample for PFAS as required by the Washington Department of Health on a quarterly basis at all of its wells. Complete information for 2023 will be provided in next years Annual Water Quality Report.

Source	PFOA Result (ppt)	PFOA SAL 10ppt	PFOS Result (ppt)	PFOS SAL 15ppt
Well 5 (S-06)	3.6	Below	6.9	Below
WFW (S-19)	ND	NA	3.1	Below
WFE (S-18)	ND	NA	3.3	Below
Well 13 (S-16)	3.6	Below	21	Above

ND: None Detected **NA:** Not Applicable

The City continues to monitor the water system, coordinate with the Department of Health, and investigate options for treatment of PFAS in the City's water system. For more information, please visit the City's website.

Water Conservation

In 2022 the average daily water consumption in Camas was 4.49 million gallons. Our peak usage day was on July 29, 2022, when 8,781,000 gallons were consumed. Most of this increase in the summer months is due to irrigation demands. We are once again asking for the public's help to implement a voluntary odd/even lawn watering program for residential customers. Water on odd days for home addresses that end in an odd number, and even days if it ends in an even number.

City Water Saving Commitments

- To reduce the customer consumption per home by one percent, or approximately two gallons-per-day per year over the next six years. The City will maintain distribution system loss at-or-below ten percent for the next five years.
- Replacing industrial, commercial, and residential service meters with new radio read meters, which will allow the City to log usage more effectively to notify customers about continuous leaks or high consumption.
- Encourage the installation of smart controllers on irrigation systems for the school district and industrial users.
- Educate the public on water-saving devices. Continue metering all sources.
- Replace water mains and service lines in problematic areas and complete Capital Projects in accordance with the new Water System Plan Update.

Community Involvement to Reduce Water Leaks

Locate your master water supply valve and label it. The master supply valve can be turned off in case of a major leak or broken pipe. The majority of leaks in residential plumbing systems are found at the toilet tank (fill and flapper valves).

Other common leaks include:

- Lawn irrigation valves and lines
- Yard hose turned on or leaking
- Ornamental fountains & fish ponds
- Water heater relief valve or fittings
- Leaking house pipes or fittings

CONSERVATION TIPS

Fix leaks on old leaky faucets, toilets, hoses, and sprinkler systems.

Choose water saving fixtures and appliances and you will use 30% less water.

Sweep porches, driveways & sidewalks rather than hosing, to not only conserve water, but to avoid runoff.

Water late at night or early in the morning (10:00 pm or 6:00 am).

An inch of water per week is enough to keep lawns green.

Take a short shower instead of a bath

Cross Connection Program

Annual Backflow Test Required

Cross-Connection Prevention

Backflow is the undesirable reversal of the flow of water from the intended direction of flow. When this occurs, other liquids, mixtures, gases or substances can enter the potable water piping through cross connection. Under the right conditions, backflow can result in contamination of the water supply, which is called back siphonage and back pressure.

How to keep our drinking water clean and safe:

Locate or install a backflow device

If you have an underground irrigation system, check to see if you have a backflow assembly. The backflow assembly is a brass valve usually found between your water meter and the point where your water service line enters your home, usually in a small green box similar to a meter box. If your irrigation system does not include a backflow assembly or if you are installing a new underground irrigation system, City of Camas plumbing code requires you to install a *Double Check Valve Assembly (DCVA)* at a minimum.

Test your backflow assembly device annually

Once you have your backflow assembly installed or located, make sure to have it tested annually by a state-certified backflow assembly tester. If you are a property owner and have an in-ground sprinkler system you are required by state and local laws (WAC 246-290) to install and maintain a backflow prevention device on your service line, and have it inspected yearly by a Washington State Certified Backflow Assembly Tester (BAT). View our Certified Backflow Tester List on the City website: Backflow and Cross-Connection Prevention | Camas WA (cityofcamas.us).

If you have more questions call our Backflow Hotline at 360-817-1569, or email us at backflow@cityofcamas.us

Properly winterizing your irrigation system

During the fall, most irrigation systems will need to be winterized to prevent pipes from freezing and breaking. Many times this involves using compressed air to blow out the excess water left in the irrigation piping. Although this is the best method, backflow of compressed air and contaminants may enter the drinking water distribution system and cause damage and or health risks if not performed properly. Make sure the compressed air is connected to a properly installed blowout connection to avoid inadvertently introducing air into the City's water system.

For more water-leak information, check the EPA's website at www.epa.gov/watersense/fixaleak.

City of Camas Annual Water Quality Report

Public Water System ID: 108002

The City of Camas is pleased to present the annual Water Quality Report, which provides the public with water testing results. The health of our consumers and their families is paramount and our goal is to provide the community with a safe and dependable supply of drinking water.

At the City of Camas we understand how important it is to ensure we provide high quality water. We work diligently to provide top quality water to our growing residential population.

More information about Camas drinking water and what we're doing to keep your water safe can be found online at www.cityofcamas.us/publicworks/page/water-services

IMPORTANT!

This report contains important information about your drinking water. If English is not your first language, please have someone who can translate it for you, or speak with someone who understands it.

Este informe contiene información importante sobre su agua potable. Si el inglés no es su primer idioma, tenga a alguien que pueda traducirlo por usted o hable con alguien que lo entienda.

Ce rapport contient des informations importantes sur votre eau potable. Si l'anglais n'est pas votre langue maternelle, demandez à quelqu'un de le traduire à votre place ou de parler à quelqu'un qui le comprend.

Этот отчет содержит важную информацию о вашей питьевой воде. Если английский не является вашим родным языком, попросите кого-нибудь, кто может перевести его для вас, или поговорить с кем-то, кто понимает его.

Our Water System

The City of Camas has multiple water sources that include surface and ground water. The surface water sources (Boulder and Jones Creeks) are located on the south-side of Larch Mountain, northeast of Camas. Surface water was not used in 2022. The ground water sources include nine wells near the Washougal river and one well in Grass Valley. All water sources are treated with chlorine for disinfection, fluoride for good dental health and sodium hydroxide to reduce the corrosion of copper piping to meet State and EPA standards. Water pressure and fire flows are maintained throughout the service area with eight distribution reservoirs, nine pump stations, and over 160 miles of pipeline.

2023 Water Quality Summary

Our drinking water is safe and surpasses all State and Federal health standards!

The City of Camas routinely monitors for contaminants in your drinking water according to Federal and State laws. Field and laboratory analyses include tests for bacteria, as well as chemical and physical indicators. Reports are submitted monthly to the Department of Health to report that City water meets all drinking water standards. Contaminants that were detected are listed in the following tables.

Should there ever be a public health concern, you would be notified immediately. Please report possible water pollution (illicit discharge) to the City of Camas 360-817-1563, or the Department of Ecology-SW Regional Offices 360-407-6300.

Definitions

MCL (Maximum Contaminant Level): The highest level of a contaminant that is allowed in drinking water. MCLs are set as close to the MCLGs as possible using the best available treatment technologies.

MCLG (Maximum Contaminant Level Goal): The maximum level of a contaminant in drinking water below which there is no known or expected health risk. MCLGs allow for a margin of safety.

AL (Action Level): The concentration of a contaminant which, if exceeded, triggers treatments or other requirements that a waster system must follow.

Milligram Per Liter (mg/L): A unit of measurement used in reporting the concentration of matter in water as determined by water analyses.

NTU (Nephelometric Turbidity Unit): Turbidity is a measure of the clarity of water. Turbidity in excess of 5 NTU is just noticeable to the average person.

µg/L: Units of measurement in micrograms/liter.

ppm: (1 parts per million = 1 mg/L = 1 milligram per liter)

ppb: (1 parts per billion = 0.001 µg/L = 1 microgram per liter)

ppt: (1 parts per trillion = 1 ng/L = 1 nanogram per liter)

pCi/L: Picocuries per liter is a unit for measuring radioactive concentrations. The curie (Ci) unit is the activity of 1 gram of pure radium.

NA (Not Applicable): Means that the U.S. EPA has not established MCLGs for these substances.

ND (Not Detected): A compound that was analyzed and not detected at a level greater than or equal to the state reporting level.

Ng/L: Nanograms per liter

2023 Detected Contaminants

		EPA Regulations		City of Camas Water Quality Results	
Regulated Contaminants	**Units**	**Ideal Level/Goal (MCLG)**	**Maximum Level (MCL)**	**Range of Level Detected**	**Violation**
Fluoride	mg/L	.50 -.90	4	.13 - 1.11	No
Fluoride is added to your water in carefully controlled levels for dental health. In May 2016, the Washington State Department of Health changed the fluoridation requirement to a target of 0.7 mg/L from the previous target of 0.7-1.2 mg/L.					
Nitrates ***(as nitrogen)***	mg/L	10	10	Not Detected—1.7	No
Runoff from fertilizer use; leaching from septic tanks, sewage; erosion of natural products.					
Haloacetic Acid (5)	ug/L	48	60	.87—1.0	No
Trihalomethanes	ug/L	60	80	.50—4.1	No
Haloacetic acids (HAA5) and trihalomethanes form as by-products of the chlorination process that is used to kill or inactivate disease-causing microbes.					
Radionuclides - Naturally Occurring Substances In Drinking Water					
Gross Alpha	pCil	0	15	2.16	No
Radium 228	pCil	0	5	.760	No
Total Coliform Bacteria	%	0	<1% Positive/Mo.	0	No

Unregulated contaminants are those for which the EPA has not established drinking water standards. The purpose of unregulated contaminant monitoring is to help EPA determine their occurrence in drinking water and potential need for future regulation. For more information, go to: https://www.epa.gov/dwucmr/third-unregulated-contaminant-monitoring-rule or contact the Safe Drinking Water Hotline at 1-800-426-4791 or via website https://www.epa.gov/home/epa-hotlines.

2023 Detected Contaminants continued...

A VOC was missed at WFE (5-18) which caused a non-compliance letter for 2022. The sample was taken in March 2023 resulting in a non-detect. This brought the source back into compliance.

Sources of Drinking Water

In general, the sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and in some cases, radio-active material. It can also pick up substances resulting from the presence of animals or from human activity. To ensure that tap water is safe to drink, the Washington Department of Health and the United State Environmental Protection Agency (EPA) prescribe regulations that limit the amount of certain contaminants in the water provided by public water systems. Contaminants that may be present in source water before we treat it include:

Mandatory EPA Statement for All Community Water Systems

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the EPA's Safe Drinking Water Hotline (1-800-426-4791).

Some people may be more vulnerable to contaminants in drinking water than the general population. Immunocompromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. The US EPA-Center for Disease Control guidelines on appropriate means to lessen the risk of infection by cryptosporidium and other microbiological contaminants are from the EPA's Safe Drinking Water website.

- **Microbial Contaminants**, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- **Inorganic Contaminants**, such as salts and metals, which can be naturally-occurring or result from urban storm water runoff, industrial or domestic wastewater discharges, oil and gas production, and mining or farming.
- **Pesticides and Herbicides**, which may come from a variety of sources such as agriculture and residential uses.
- **Organic Chemicals**, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban storm water runoff, and septic systems.
- **Radioactive Contaminants**, which are naturally occurring as a result of mining and/or gas production.

Lead & Copper

In 2022, the City tested thirty two residences for lead and copper. The highest level for copper was 0.93 mg/L. The highest level for lead was .019mg/L. To be in compliance with the Lead and Copper Rules, our system must fall within the 90th percentile of samples collected, where sample results are less than or equal to the action level for lead and copper. The action level for Lead is .015 mg/L and the action level for Copper is 1.3mg/L. Lead & Copper sampling for 2024 will begin in the fall.

Parameter	Major Source	Units	(MCLG) mg/L	(AL) mg/L	City Results mg/L	Violation
Lead *(at consumers tap)*	Plumbing, erosion of natural deposits.	ppb	0	0.015	Not Detected —	No
Copper		ppm	0	1.30	.021—.93	No

To Reduce Lead and Copper Exposure

- When your water has been sitting for several hours, flush the pipe by running the cold water tap until the water is noticeably colder before using the water for drinking or cooking.
- Use only cold water for drinking, cooking, and making baby formula. Hot water may contain higher levels of copper.
- Frequently clean the filter screens and aerators in faucets to remove captured particles.
- If building or remodeling, only use "lead free" or low lead piping and materials. Avoid using copper piping or brass fixtures for locations where water will be consumed or used in food preparation.

EPA Statement

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The City of Camas is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to two minutes before using water for drinking or cooking. The EPA requires the City to conduct lead testing every three years.

Copper is a mineral component naturally found in solids. In the correct amounts, it is an essential nutrient for humans and plants. In Washington State, most copper in drinking water comes from corrosion of household plumbing. Plumbing sources can include copper pipe and brass fixtures. Copper from plumbing corrosion can accumulate overnight. Although copper is an essential mineral in the diet, too much copper can cause health problems. Copper is widely distributed within the tissues of the body, but accumulates primarily in the liver and kidneys. A single dose of 15 mg of copper can cause nausea, vomiting, diarrhea, and intestinal cramps.

If you are concerned about lead or copper in your water, you may wish to have your water tested. Information on lead and copper in your drinking water, testing methods, and steps you can take to minimize exposure is available from:

Safe Drinking Water Hotline 1-800-426-4791, or at www.epa.gov/safewater/lead.

PFOS

In 2021, the Washington State Board of Health (SBOH) adopted a rule that requires water system utilities, including the City of Camas, to test for PFAS. PFAS are a new class of contaminants not currently regulated by the Environmental Protection Agency (EPA). The rule also requires the City to notify you if any test results exceed a State Action Level. EPA has not yet set an action level but one is expected sometime in 2024.

The City recently completed another sampling for PFOS at all its wells in March of 2023. The testing resulted in no detection for PFOA or PFOS at any of the sites sampled in 2022. Detection below 4 parts per trillion is considered a non-detect. The City will continue to sample for PFAS as requested by the Washington Department of Health on a quarterly basis at all of its wells.

Source	PFOA Result	PFOA SAL 10ppt	PFOS Result	PFOS SAL 15ppt
Well 5 (S-06)	3.6	Below	6.9	Below
WFW (S-19)	ND	NA	3.1	Below
WFE (S-18)	ND	NA	3.3	Below
Well 13 (S-16)	3.6	Below	21	Above

ND: None Detected **NA:** Not Applicable

Water Conservation

In 2023 the average daily water consumption in Camas was 4.66 million gallons. Our peak usage day was on August 23, 2023, when 8,796,000 gallons were consumed. Most of this increase in the summer months is due to irrigation demands. We are once again asking for the public's help to implement a voluntary odd/even lawn watering program for residential customers. Water on odd days for home addresses that end in an odd number, and even days if it ends in an even number.

City Water Saving Commitments

- To reduce the customer consumption per home by one percent or approximately two gallons-per-day per year over the next six years. The City will maintain distribution system loss at-or-below ten percent for the next five years.
- Replacing industrial, commercial, and residential service meters with the new radio read meters, which will allow the City to log usage more effectively to notify customers about continuous leaks or high consumption.
- Encourage the installation of smart controllers on irrigation systems for the school district and industrial users.
- Educate the public on water-saving devices, and distribute water conservation kits and water-saving devices to homeowners. Continue metering all sources.
- Replace water mains and service lines in problematic areas and complete Capital Projects in accordance with the new Water System Plan Update.

Community Involvement to Reduce Water Leaks

Locate your master water supply valve and label it. The master supply valve can be turned off in case of a major leak or broken pipe. The majority of leaks in residential plumbing systems are found at the toilet tank (fill and flapper valves).

Other common leaks include:

- Lawn irrigation valves and lines
- Yard hose turned on or leaking
- Ornamental fountains & fish ponds
- Water heater relief valve or fittings
- Leaking house pipes or

CONSERVATION TIPS

Fix leaks on old leaky faucets, toilets, hoses, and sprinkler systems.

Choose water saving fixtures and appliances and you will use 30% less water.

Sweep porches, driveways & sidewalks rather than hosing, to not only conserve water, but to avoid runoff.

Water late at night or early in the morning (10:00 pm or 6:00 am).

An inch of water per week is enough to keep lawns green.

Take a short shower instead of a bath

Cross Connection Program

Annual Backflow Test Required

Cross-Connection Prevention

Backflow is the undesirable reversal of the flow of water from the intended direction of flow. When this occurs, other liquids, mixtures, gases or substances can enter the potable water piping through cross connection. Under the right hydraulic conditions, backflow can result in contamination of the water supply, which is called back siphonage and back pressure.

How to keep our drinking water clean and safe:

Locate or install a backflow device

If you have an underground irrigation system, check to see if you have a backflow assembly. The backflow assembly is a brass valve usually found between your water meter and the point where your water service line enters your home, usually in a small green box similar to a meter box. If your irrigation system does not include backflow assembly or if you are installing a new underground irrigation system, City of Camas plumbing code requires you to install a *Double Check Valve Assembly (DCVA)* at a minimum.

Test your backflow assembly device annually

Once you have your backflow assembly installed or located, make sure to have it tested annually by a state-certified backflow assembly tester. If you are a property owner and have an in-ground sprinkler system you are required by state and local laws (WAC 246-290) to install and maintain a backflow prevention device on your service line, and have it inspected yearly by a Washington State Certified Backflow Assembly Tester (BAT). View our Certified Backflow Tester List on the City website: Backflow and Cross-Connection Prevention | Camas WA (cityofcamas.us).

If you have more questions call our Backflow Hotline at 360-817-1569, or email us at backflow@cityofcamas.us

Properly winterizing your irrigation system

During the fall, most irrigation systems will need to be winterized to prevent pipes from freezing and breaking. Many times this involves using compressed air to blow out the excess water left in the irrigation piping. Although this is the best method, backflow of compressed air and contaminants may enter the drinking water distribution system and cause damage and or health risks if not performed properly. Make sure the compressed air is connected to a properly installed blowout connection to avoid inadvertently introducing air into our water system.

For more water-leak information, check the EPA's website at www.epa.gov/watersense/fixaleak.

Unregulated contaminants are those for which the EPA has not established drinking water standards. The purpose of unregulated contaminant monitoring is to help EPA determine their occurrence in drinking water and potential need for future regulation. For more information, go to: https://www.epa.gov/dwucmr/third-unregulated-contaminant-monitoring-rule or contact the Safe Drinking Water Hotline at 1-800-426-4791 or via website https://www.epa.gov/home/epa-hotlines.

2024 Detected Contaminants continued...

Sources of Drinking Water

In general, the sources of drinking water (both tap water and bottled water) include rivers, lakes, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and in some cases, radio-active material. It can also pick up substances resulting from the presence of animals or from human activity. To ensure that tap water is safe to drink, the Washington Department of Health and the United State Environmental Protection Agency (EPA) prescribe regulations that limit the amount of certain contaminants in the water provided by public water systems. Contaminants that may be present in source water before we treat it include:

- **Microbial Contaminants**, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
- **Inorganic Contaminants**, such as salts and metals, which can be naturally-occurring or result from urban storm water runoff, industrial or domestic wastewater discharges, oil and gas production, and mining or farming.
- **Pesticides and Herbicides**, which may come from a variety of sources such as agriculture and residential uses.
- **Organic Chemicals**, including synthetic and volatile organic chemicals, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban storm water runoff, and septic systems.
- **Radioactive Contaminants**, which are naturally occurring as a result of mining and/or gas production.

Mandatory EPA Statement for All Community Water Systems

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the EPA's Safe Drinking Water Hotline (1-800-426-4791).

Some people may be more vulnerable to contaminants in drinking water than the general population. Immunocompromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. The US EPA-Center for Disease Control guidelines on appropriate means to lessen the risk of infection by cryptosporidium and other microbiological contaminants are from the EPA's Safe Drinking Water website.

Lead & Copper

In 2024, the City tested thirty two residences for lead and copper. The highest level for copper was 0.73 mg/L. The highest level for lead was .014mg/L. To be in compliance with the Lead and Copper Rules, our system must fall within the 90th percentile of samples collected, where sample results are less than or equal to the action level for lead and copper. The action level for Lead is .015 mg/L and the action level for Copper is 1.3mg/L. The next round of lead sampling will occur in fall of 2027.

Parameter	Major Source	Units	(MCLG) mg/L	(AL) mg/L	City Results mg/L	Violation
Lead *(at consumers tap)*	Plumbing, erosion of natural deposits.	ppb	0	0.015	ND –.014	No
Copper		ppm	0	1.30	ND-.73	No

To Reduce Lead and Copper Exposure

- When your water has been sitting for several hours, flush the pipe by running the cold water tap until the water is noticeably colder before using the water for drinking or cooking.
- Use only cold water for drinking, cooking, and making baby formula. Hot water may contain higher levels of copper.
- Frequently clean the filter screens and aerators in faucets to remove captured particles.
- If building or remodeling, only use "lead free" or low lead piping and materials. Avoid using copper piping or brass fixtures for locations where water will be consumed or used in food preparation.

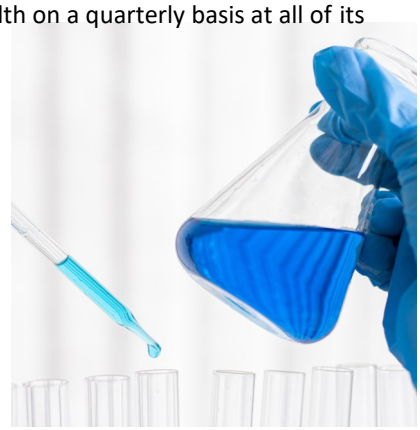
EPA Statement

If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. The City of Camas is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to two minutes before using water for drinking or cooking. The EPA requires the City to conduct lead testing every three years.

Copper is a mineral component naturally found in solids. In the correct amounts, it is an essential nutrient for humans and plants. In Washington State, most copper in drinking water comes from corrosion of household plumbing. Plumbing sources can include copper pipe and brass fixtures. Copper from plumbing corrosion can accumulate overnight. Although copper is an essential mineral in the diet, too much copper can cause health problems. Copper is widely distributed within the tissues of the body, but accumulates primarily in the liver and kidneys. A single dose of 15 mg of copper can cause nausea, vomiting, diarrhea, and intestinal cramps.

If you are concerned about lead or copper in your water, you may wish to have your water tested. Information on lead and copper in your drinking water, testing methods, and steps you can take to minimize exposure is available from:

Safe Drinking Water Hotline 1-800-426-4791, or at www.epa.gov/safewater/lead.



PFOS

In 2021, the Washington State Board of Health (SBOH) adopted a rule that requires water system utilities, including the City of Camas, to test for PFAS. PFAS are a new class of contaminants not currently regulated by the Environmental Protection Agency (EPA). The rule also requires the City to notify you if any test results exceed a State Action Level (SAL). EPA adopted limits of 4 ppt for PFOA and PFOS in April of 2024.

The City recently completed another sampling for PFOS at all its wells in June and July 2024 of 4 ppt. The testing resulted in no detection for PFOA or PFOS at any of the sites sampled in 2022. Detection below 4 parts per trillion is considered a non-detect. The City will continue to sample for PFAS as requested by the Washington Department of Health on a quarterly basis at all of its

Water Conservation

In 2024 the average daily water consumption in Camas was 4.66 million gallons. Our peak usage day was on July 8, 2024, when 10,243,000 gallons were consumed. Most of this increase in the summer months is due to irrigation demands. We are once again asking for the public's help to implement a voluntary odd/even lawn watering program for residential customers. Water on odd days for home addresses that end in an odd number, and even days if it ends in an even number.

City Water Saving Commitments

- To reduce the customer consumption per home by one percent or approximately two gallons-per-day per year over the next six years. The City will maintain distribution system loss at-or-below ten percent for the next five years.
- Replacing industrial, commercial, and residential service meters with the new radio read meters, which will allow the City to log usage more effectively to notify customers about continuous leaks or high consumption.
- Encourage the installation of smart controllers on irrigation systems for the school district and industrial users.
- Educate the public on water-saving devices, and distribute water conservation kits and water-saving devices to homeowners. Continue metering all sources.
- Replace water mains and service lines in problematic areas and complete Capital Projects in accordance with the new Water System Plan Update.

Community Involvement to Reduce Water Leaks

Locate your master water supply valve and label it. The master supply valve can be turned off in case of a major leak or broken pipe. The majority of leaks in residential plumbing systems are found at the toilet tank (fill and flapper valves).

Other common leaks include:

- Lawn irrigation valves and lines
- Yard hose turned on or leaking
- Ornamental fountains & fish ponds
- Water heater relief valve or fittings
- Leaking house pipes or

CONSERVATION TIPS

Fix leaks on old leaky faucets, toilets, hoses, and sprinkler systems.

Choose water saving fixtures and appliances and you will use 30% less water.

Sweep porches, driveways & sidewalks rather than hosing, to not only conserve water, but to avoid runoff.

Water late at night or early in the morning (10:00 pm or 6:00 am).

An inch of water per week is enough to keep lawns green.

Take a short shower instead of a bath

Cross Connection Program

Annual Backflow Test Required

Cross-Connection Prevention

Backflow is the undesirable reversal of the flow of water from the intended direction of flow. When this occurs, other liquids, mixtures, gases or substances can enter the potable water piping through cross connection. Under the right hydraulic conditions, backflow can result in contamination of the water supply, which is called back siphonage and back pressure.

How to keep our drinking water clean and safe:

Locate or install a backflow device

If you have an underground irrigation system, check to see if you have a backflow assembly. The backflow assembly is a brass valve usually found between your water meter and the point where your water service line enters your home, usually in a small green box similar to a meter box. If your irrigation system does not include backflow assembly or if you are installing a new underground irrigation system, City of Camas plumbing code requires you to install a *Double Check Valve Assembly (DCVA)* at a minimum.

Test your backflow assembly device annually

Once you have your backflow assembly installed or located, make sure to have it tested annually by a state-certified backflow assembly tester. If you are a property owner and have an in-ground sprinkler system you are required by state and local laws (WAC 246-290) to install and maintain a backflow prevention device on your service line, and have it inspected yearly by a Washington State Certified Backflow Assembly Tester (BAT). View our Certified Backflow Tester List on the City website: Backflow and Cross-Connection Prevention | Camas WA (cityofcamas.us).

If you have more questions call our Backflow Hotline at 360-817-1569, or email us at backflow@cityofcamas.us

Properly winterizing your irrigation system

During the fall, most irrigation systems will need to be winterized to prevent pipes from freezing and breaking. Many times this involves using compressed air to blow out the excess water left in the irrigation piping. Although this is the best method, backflow of compressed air and contaminants may enter the drinking water distribution system and cause damage and or health risks if not performed properly. Make sure the compressed air is connected to a properly installed blowout connection to avoid inadvertently introducing air into our water system.

For more water-leak information, check the EPA's website at www.epa.gov/watersense/fixaleak.

CERTIFICATE RECORD NO. 2, PAGE NO. 711

STATE OF WASHINGTON, COUNTY OF Clark

CERTIFICATE OF WATER RIGHT

(For rights perfected under original, enlargement or secondary permits.)

(In accordance with the provisions of Chapter 117, Laws of Washington for 1917, and the regulations of the State Hydraulic Engineer thereunder.)

This is to certify, that City of Camas, *of* Camas, *State of* Washington, *has made proof to the satisfaction of the State Supervisor of Hydraulics of Washington, of a right to the use of the waters of* Jones Creek, *a tributary of* Little Washougal River *for the purposes of* domestic supplies, *under* Appropriation *Permit No.* 1575, *of the State Supervisor of Hydraulics, and that said right to the use of said waters has been perfected in accordance with the laws of Washington, and is hereby confirmed by the State Supervisor of Hydraulics of Washington and entered of record in Volume* 2, *at Page* 711, *on the* 28th *day of* July, *19*33; *that the right hereby confirmed dates from* September 5th, *19*30; *that the amount of water to which such right is entitled and hereby confirmed, for the purposes aforesaid, is limited to an amount actually beneficially used for said purposes, and shall not exceed* 1.0 *cubic feet per second.*

A description of the lands under such right, and to which the water hereby confirmed is appurtenant, or if for other purposes, the place where such water is put to beneficial use, is as follows:

PLACE OF USE			LEGAL SUBDIVISION	[illegible]	[illegible]
Section	Township	Range			
			City of Camas		

The right to the use of the water aforesaid hereby confirmed is restricted to the lands or place of herein described, except as provided in Section 39, Chapter 117, Session Laws 1917.

WITNESS the seal and signature of the State Supervisor of Hydraulics affixed this 28th *day of* July, *19*33.

Chas. H. Lee

State Supervisor of Hydraulics.

ENGINEERING DATA

O.K. [illegible]

NOTICE OF PETITION FOR CHANGE OF
POINT OF DIVERSION OF WATER.

TO WHOM IT MAY CONCERN:

Notice is hereby given that the City of Camas, Clark County, Washington, has filed a petition with the State Supervisor of Hydraulics, Olympia, Washington, for a permit to change the point of diversion of one cubic foot per second of the waters of Jones Creek from a point set out in water right permit 1575 as NW¼ of NW¼ of Sec. 10, Twp. 2 N., Rge. 4 E.W.M., to a point within the SW¼ of SW¼ of Sec. 3, Twp. 2 N., Rge. 4 E.W.M., such point being approximately one-half mile above the point of diversion described in permit, all in Clark County, Wash.

Any person, firm or corporation whose right will be injuriously affected by the granting of said petition may file with the Supervisor of Hydraulics, at Olympia, Washington, such objections or representations, in writing, as he may desire to make within thirty (30) days after the date of last publication, which date is _____.

Witness my hand and official seal this 24th day of April, 1933.

CHAS. J. BARTHOLET
State Supervisor of Hydraulics

PERMIT

This is to certify that I have examined the foregoing application and do hereby grant the same, subject to the following limitations and conditions. ~~If for irrigation, this appropriation shall be subject to such reasonable rotation system as may be ordered by the State Supervisor of Hydraulics.~~ And is further subject to rights of C. W. Cottrell under certificate #121, for the appropriation and use of waters of Little Washougal River of which Jones Creek is a tributary.

The amount of water appropriated shall be limited to the amount which can be applied to beneficial use and not to exceed 1.0 *cubic feet per second, or its equivalent in case of rotation.*

The priority date of this permit is September 5th, 1950.

Actual construction work shall begin on or before December 1st, 1951 *and shall thereafter be prosecuted with reasonable diligence and be completed on or before* December 1st, 1952

Complete application of the water to the proposed use shall be made on or before December 1st, 1953.

Given under my hand and the seal of this office at Olympia, Washington, this 2nd *day of* December, 1950

Chas. J. Bartholomew
State Supervisor of Hydraulics.

Application No. 3[illegible]6
Permit No. 1575

PERMIT
To Appropriate Public Waters of the State of Washington

Filed by City of Camas
County of Clark

This instrument was first received in the office of the State Supervisor of Hydraulics, Olympia, Washington, on the 5th *day of* September, 19 50, *at* 8:30 *o'clock* A. M.

Approved December 2nd, 1950
Recorded in Book No. 7 *of Permits, on Page* 1575

CHAS. J. BARTHOLOMEW
State Supervisor of Hydraulics.

JAY P. GROTE, PUBLIC PRINTER

Before your certificate of water right is issued it will be necessary for you to file with the State Supervisor of Hydraulics a copy of each of the following reports:

1st. Progress reports (in case temporary permit is issued).
2nd. Affidavit of publication of notice of water right application.
3rd. Notice of beginning of construction.
4th. Notice of prosecution of work with diligence.
5th. Notice of completion of construction.
6th. Notice of application of water to a beneficial use.
7th. Proof of appropriation of water.

Upon a satisfactory showing that the appropriation has been perfected as provided by statute the State Supervisor of Hydraulics will issue a water right certificate.

[illegible]-ks will be furnished by the office of State Supervisor of Hydraulics.

APPLICATION NO. 5126

CITY OF CAMAS

Examination made November 3rd & 4th, 1930

This application is for 1.0 c.f.s. for domestic use from Jones Creek a tributary of Washougal River.

November 3rd I talked to Mr. R. C. Sugg, Attorney for Mr. C. W. Cottrell who is making protest against the issuance of permit on this application. He stated he questioned the City of Camas right to Jones Creek but suggested I go over the ground with Mr. Cottrell.

November 4th I went over the ground with Mr. W. H. Barber, City Clerk and Superintendent of Water for City of Camas, also, in reference to application No. 924. Mr. Barber stated that a survey was made in 1925 and this system installed same year from the Little Washougal consisting of two reservoirs on hill above Camas and approximately 11 miles of pipe line. The main from reservoirs to "Y" is of 10 inch steel pipe the portion from "Y" to diversion of Little Washougal is of 8 inch steel pipe. The "Y" was installed for the purpose of diverting a portion of Jones Creek when the city needed the additional water.

There is approximately 6.0 c.f.s. in Jones Creek today.

I then went with Mr. Cottrell over the ground on Washougal River. There is approximately 15.0 c.f.s. in the Little Washougal at the mouth. Mr. Cottrell has a 75 K.W. plant on Washougal River about one-half mile below mouth of Little Washougal which is a part of supply. There is approximately 12.0 c.f.s. going over dam not utilized today.

Mr. Cottrell has another 2 unit hydro plant on Washougal River above mouth of Little Washougal which this application does not affect, it develops 362 K.W. He also has a 340 K.W. Diesel plant at Washougal.

Mr. Barber stated that the water supply from Little Washougal was so inadequate this summer that rigid restrictions were necessary and if they would of had fires the storage supply would have been exhausted.

Mr. Cottrell stated that shortage was experienced only at extreme low water.

The City of Camas has no other means of water supply. A permit should be issued the applicant for 1.0 c.f.s. subject to existing rights.

A. E. Hanson

Signed this 15 day of Nov. 1930.

CHAS. J. BARNHART
State Hydraulic Engineer,

FRANK M. LAMBORN, PUBLIC PRINTER, OLYMPIA

Before your certificate of water right is issued it will be necessary for you to fill out and file with the State Hydraulic Engineer a copy of each of the following reports:

1st. Progress report.
2nd. Notice of water right application.
3rd. Notice to begin construction.
4th. Notice of prosecution of work with diligence.
5th. Notice of completion of construction.
6th. Notice of application of water to a beneficial use.
7th. Proof of appropriation of water.

Upon a satisfactory showing that the appropriation has been perfected as provided by statute the State Hydraulic Engineer will issue a water right certificate.

(Blanks will be furnished by the office of State Hydraulic Engineer.)

APPLICATION NO. 924

CITY OF CAMAS

Examination made November 4, 1950

This application is for 2.5 c.f.s. from Little Washougal a tributary to Washougal River for domestic and municipal supply.

Mr. Sugg stated he did not question in his mind the legal right of this application.

I went over the ground with Mr. W. H. Barber, City Clerk and Superintendent of City Water and found the following:

This system was installed in 1923 after a survey had been made, a part of which included a survey for pipe line extended to Jones Creek. The main is of 10" steel pipe from the two reservoirs on a hill about a mile above town of Camas a distance of about 9 miles to a "Y" then approximately 2 miles of 8" pipe to point of diversion. There is approximately 2.5 c.f.s. now running in pipe line and approximately 1.5 c.f.s. going past intake.

Mr. Barber stated that they were taking all of the water up to the recent rains about a week ago and was not filling the pipe and the City of Camas was under a dangerous water shortage.

This application is in reference to application No. 5126.

A. G. Stevens

Signed this 15 day of Nov. 1950.

GROUND WATER

APPLICATION NO. 4

... City of Camas.

The application of the City of Camas for the appropriation of 1200 gallons per minute from ground water through a well, which will be designated Well No. 3, was approved for a permit on September 6.

On September 21 the undersigned visited the locality, accompanied by Mr. Arthur K. Piper, Ground Water Geologist.

The City has a gravity water supply and an additional water supply from two wells. The supply from both of which sources does not furnish sufficient water for the town during the dry months. It was therefore found by the City officials that additional water had to be obtained in order to meet its requirements. For that reason they planned a third well to augment the water supply during critical periods.

Judging from the wells now in use, the amount of water applied for will be available and will be put to an important beneficial use.

Permit has been approved.

Signed this 25th day of September, 1945.

Report of Examination on Ground Water

Received date March 22, 1968 Date of exam May 28, 1968 Appl. No. 9326

Name City of Camas Address 616 N.E. 4th Ave., Camas, Wash. 98607

Type of works a well Dimensions 8" x 70'

Progress of works Started

Quantity applied for 700 g.p.m. acre-feet per year

Legal sub / Sec 12 Twp 1 N. Rge 3 E. County Clark

Lot 9, Plat of Orchard Home within City of Camas & road right of way abutting thereto to the east

Use Municipal supply

Irrigation-acreage: Present Planned Feasible

Municipal: Population 8500 as of 1970

Industrial

Time pump will be operated May 1st through September 30th

Other water rights appurtenant to this land SW Cert. 711 for 1.0 cfs from Jones Cr. for dom. supply; SW Cert. 712 for 2.5 cfs from Little Washougal R. for Munic. supply; GW Cert. 85-A for 1200 gpm, 118 ac-ft/yr for munic. supply; GW Cert. 4072-A for 1325 gpm; 1208 ac-ft/yr for mun. sup.; and concurrent GW App. 9325 for 1500 gpm for mun. supply.

Proximity to existing works, springs, wells, or streams / City of Washougal, northeasterly 1200 feet

Area Sub-area Zone

RECOMMENDATIONS

Approved for 700 g.p.m. 1120 acre-feet per year, subject to existing water rights. (1 acre-foot 325,850 gallons.)

It is noted that the well site and water transmission facilities therefrom are not located upon the land owned by the applicant. Applicant is, accordingly, advised that the issuance of permit by this department for appropriation of the waters in question does not convey a right of access to, or other right to use, land which the applicant does not legally possess. Obtainment of such right is a private matter between applicant and owner of that land.

Use of the waters to be appropriated under this application will be for a public water supply. State Board of Health rules require every owner of a public water supply to obtain written approval from the State Director of Health prior to any new construction or alterations of a public water supply. The applicant is advised to contact the Washington State Department of Health, 304 Public Health Building, Olympia, with regard to the need for compliance.

The following water rights are appurtenant to this land:

Certificate Number	c.f.s./g.p.m.
Surface Water Cert. 711	1.0 c.f.s.
Surface Water Cert. 712	2.5 c.f.s.
Ground Water Cert. 85-A	1200 g.p.m.
Ground Water Cert. 4072-A	1325 g.p.m.
Concurrent Ground Water Appli. 9325	1500 g.p.m.

(over)

The total requirement based on an engineering study is 345 gallons per capita per day for all purposes for an estimated population of 8500 by 1970, or approximately 3300 acre-feet per year.

The quantity recommended under this application is 700 gallons per minute pumping continuously, or 1120 acre-feet per year.

The permit when issued will carry the following provision: "Issued as a supplementary supply to Surface Water Certificates 711 and 712, Ground Water Certificates 85-A and 4072-A and concurrent Ground Water Application 9225, for 700 gallons per minute and 1120 acre-feet per year, the total quantity withdrawn or diverted from all sources is not to exceed 3300 acre-feet per year."

Signed at Olympia, Washington

DIVISION OF WATER MANAGEMENT

Permit to Appropriate Public Ground Waters of the State of Washington

Book No. 18 of Ground Water Permits, on page 8544 under Application No. [illegible]

CITY OF CAMAS

of Camas, Washington

is hereby granted a permit to appropriate the following described public ground waters of the State of Washington, subject to existing rights, and to the limitations and provisions set out herein.

Priority date of this permit is March 22, 1968

Source of the proposed ground water appropriation is a well

within _____ area, _____ sub-area

_____ zone. Name or number of works is _____

Quantity of water appropriated shall be limited to the amount which can be beneficially applied and not to exceed 1500 gallons per minute; 2400 acre-feet per year, to be used for the following purposes: municipal supply

as more definitely set out below.

Location of the well, tunnel, or infiltration trench is 2300 feet east and 1800 feet north of southwest corner of Sec. 12

being within David C. Parker D.L.C. No. 48 of Sec. 12, T. 1 N., R. 3 E.W.M.

county of Clark

Use, or uses to which water is to be applied:

For municipal supply: 1500 gallons per minute; 2400 acre-feet per year, to supply a population of 8500 by 1970 continuously during entire year.

For irrigation: _____ gallons per minute; _____ acre-feet per year, for the irrigation of _____ acres.

For miscellaneous uses: _____ gallons per minute: _____ acre-feet per year, for _____

LEGAL DESCRIPTION OF PROPERTY ON WHICH WATER IS TO BE USED

City of Camas

DESCRIPTION OF WORKS FROM WHICH WATER IS TO BE WITHDRAWN

The well will be drilled (Dug or drilled) and have a diameter of 16 inches, and depth of 85 feet.

Description of tunnel or infiltration trench:

Please read carefully provisions below)

Particular specifications required by the Department of Water Resources for the purpose of preventing waste of public waters: 1) The installation of an access port as described in attached Ground Water Bulletin No. 1 shall be required prior to issuance of final Certificate of Water Right. 2) Issued as a supplementary supply to Surface Water Certificates 711 and 712, Ground Water Certificates 85-A and 4072-A and concurrent Ground Water Application 9126, for 1500 gallons per minute and 2400 acre-feet per year; the total quantity withdrawn or diverted from all sources is not to exceed 3300 acre-feet per year.

(Gallons per min.) 2400

Construction work shall begin on or before July 1, 1969

and shall thereafter be prosecuted with reasonable diligence and completed on or before July 1, 1970

and complete application of water to proposed use shall be made on or before July 1, 1971

Permit to Appropriate Public Waters of the State of Washington

Book No. 22 of Ground Water Permits, on page 10515 under Application No. 11718

CITY OF CAMAS

of CAMAS, WASHINGTON

is, pursuant to the Report of Examination which has been accepted by the applicant, hereby granted a permit to appropriate the following described public ground waters of the State of Washington, subject to existing rights and to the limitations and provisions set out herein.

Priority date of this permit is March 22, 1971

Source(s) of the proposed ground water appropriation is/~~are~~ a well

The quantity of water appropriated shall be limited to the amount which can be beneficially applied and not to exceed 1000 gallons per minute; 530 acre-feet per year, to be used for the following purposes: municipal supply

as more definitely set out below.

Approximate location(s) of the point(s) of withdrawal is/~~are~~ 1245 feet east and 2145 feet north of southeast corner of Sec. 12

being within A portion of David C. Parker D.L.C. # 48 lying within the SW¼ within the city limits of Camas

of Sec. 12, Twp. 1 N., Rge. 3 E. W.M., Clark County.

The use, or uses, to which water is to be applied:

~~Domestic~~/municipal supply: 1000 gallons per minute; 530 acre-feet per year, during entire year.

Irrigation: gallons per minute; acre-feet per year from to each year, for the irrigation of acres.

Other use(s): gallons per minute: acre-feet per year, from to each year, for

LEGAL DESCRIPTION OF PROPERTY ON WHICH WATER IS TO BE USED

Area served by the City of Camas

ADDITIONAL LIMITATIONS AND PROVISIONS: The installation and maintenance of an access port as described in Ground Water Bulletin No. ' shall be required prior to issuance of final Certificate of Water Right.

The total amount of water to be withdrawn or diverted, which includes the amounts as approved in Surface Water Certificates No. 711 and 712 and Ground Water Certificates Nos. 85, 4072, 6635 and 6636 shall not exceed 5750 acre-feet per year.

Nothing in this permit shall **be construed as excusing the permittee from compliance with any applicable federal, state, or local statutes, ordinances, or regulations including those administered by local agencies under the Shoreline Management Act of 1971.**

DESCRIPTION OF PROPOSED WORKS:

The well will be drilled (Dug or drilled) and have a diameter of 14 inches, and depth of 85 feet.

Description of tunnel or infiltration trench: _____

DEVELOPMENT SCHEDULE:

Construction work shall begin on or before Started

and shall thereafter be prosecuted with reasonable diligence and completed on or before November 1, 1972

and complete application of water to proposed use shall be made on or before November 1, 1973

This permit shall be subject to cancellation should the permittee fail to comply with the above development schedule and/or fail to give notice to the Department of Ecology on forms provided by that Department documenting such compliance.

Given under my hand and the seal of this office at Olympia, Washington, this 10th

day of November 19 71

well #7

Report of Examination on Ground Water

Received date March 22, 1971 Date of exam. August 31, 1971 Appli. No. 11718

Name City of Camas Address 616 N.E. 4th Ave., Camas WA 98607

Type of works A well Dimensions 14" x 85'

Progress of works Well drilled and capped

Quantity applied for 1000 g.p.m. 530 acre-feet per year of David C. Parker P.L.C. #48 within the City of Camas (lying within the SW¼)

Legal sub A portion/Sec. 12 Twp. 1 Rge. 3 E. County Clark

Use Municipal supply

Irrigation-acreage: Present Planned Feasible

Municipal: ~~Population~~ Area served 15,000 as of 1990

Industrial

Time pump will be operated Continuously

Other water rights appurtenant to this land See Surface Water Certificates Nos. 712 & 711; Ground Water Certificates Nos. 85, 4072, 6635 and 6636

Proximity to existing works, springs, wells, or streams City of Camas, west 400'; City of Camas, southeasterly 1000'; City of Camas, north; Washougal River, north 200'

Area Sub-area Zone

RECOMMENDATIONS

Approved for 1000 g.p.m. 530 acre-feet per year, subject to existing water rights. (1 acre-foot 325,850 gallons.)

The installation of an access port as described in attached Ground Water Bulletin No. 1 shall be required prior to issuance of final certificate of water right. The applicant may, for his own convenience, wish to install an airline and gage in addition to the access port.

Use of the waters to be appropriated under this application will be for a public water supply. State Board of Health rules require every owner of a public water supply to obtain written approval from the Assistant Secretary, Division of Health prior to any new construction or alterations of a public water supply. The applicant is advised to contact the Washington State Division of Health, Public Health Bldg. No. 7, Thurston Airdustrial Center, Olympia, with regard to the need for compliance.

The following water rights are appurtenant to this land:

Certificate No.	c.f.s./g.p.m.	ac-ft per yr.
SWC 711	1.0 c.f.s.	730
SWC 712	2.5 c.f.s.	1820
GWC 85-A	1200 g.p.m.	118
GWC 4072-A	1325 g.p.m.	1208
GWC 6635	1500 g.p.m.	2400
GWC 6636	600 g.p.m.	920

The total requirement based on an engineering study is 345 gallons per capita per day for all purposes for an estimated population of 15,000 by 1990 or approximately 5,750 acre-feet per year.

The quantity recommended under this application is 1000 gallons per minute not to exceed 530 acrefeet per year as requested in the application.

The permit when issued will carry the following provision: 'The total amount of water to be withdrawn or diverted, which includes the amounts as approved in Surface Water Certificates Nos. 711 and 712 and Ground Water Certificates Nos. 85, 4072, 6635 and 6636 shall not exceed 5,750 acre-feet per year."

Additionally, the permit when issued shall carry the following provision: "Nothing in this permit shall be construed as excusing the permittee from compliance with any applicable federal, state, or local statutes, ordinances, or regulations including those administered by local agencies under the Shoreline Management Act of 1971."

Signed at Olympia, Washington
this 28th day of September, 1971.

DEVELOPMENT SCHEDULE

BEGIN PROJECT BY THIS DATE:	COMPLETE PROJECT BY THIS DATE:	WATER PUT TO FULL USE BY THIS DATE:
Started	July 1, 1979	July 1, 1980

PROVISIONS

Recommend this application be approved for 900 gallon per minute and 530 acre-feet per year for a municipal supply for the City of Camas.

The following water rights are appurtenant to this land.

Certificate No.	CFS/GPM	Acre-feet per year
SWC 711	1.0 CFS	730
SWC 712	2.5 CFS	1820
GWC 85-A	1200 GPM	118
GWC 4072 A	1325 GPM	1208
GWC 6635	1500 GPM	2400
GWC 6636	600 GPM	920
G2 - 00501 C	1000 GPM	530

total requirement based on an engineering study is 345 gallons per capita per day for all poses for an estimated population of 15,000 by 1990 or approximately 5,750 acre-feet per year. The permit when issued will carry the following provision: "The total amount of water to be withdrawn or diverted, which includes the amounts as approved in surface water certificate Nos. 711 and 712 and Ground Water Certificate Nos. 85A, 4072A, 6635 A 6636 A and G2-00501 and this application shall not exceed 5750 acre-feet per year.

The installation of an access port as described in attached Ground Water Bulletin No. 1 shall be required prior to issuance of final certificate of water right. The applicant may for his own convenience, wish to install an airline and gage in addition to the access port.

Use of the waters to be appropriated under this application will be for a public water supply. State Board of Health rules require every owner of a public water supply to obtain written approval from the Water Supply and Waste Section, Department of Social and Health Services, Mail Stop 4-1, Building 4, Olympia, Washington, 98504, prior to any new construction or alterations of a public water supply.

"All water wells constructed within the state shall meet the minimum standards for construction and maintenance as provided under Chapter 18.104 RCW (Washington Water Well Construction Act of 1971) and Chapter 173-160 WAC (Minimum Standards for Construction and Maintenance of Water Wells)."

Nothing in this application shall be construed as excusing the applicant from compliance with any applicable federal, state, or local statutes, ordinances, or regulations including those administered by local agencies under the Shoreline Management Act of 1971.

LEGAL DESCRIPTION OF PROPERTY ON WHICH WATER IS TO BE USED

Area served by the City of Camas.

This permit is subject to the implementation of the minimum requirements established in the Interim Guidel for Public Water Systems Regarding Water Use Reporting, Demand Forecasting Methodology and Conserva Programs, July 1990.

Under RCW 90.03.005 and 90.54.020(6), conservation and improved water use efficiency must be emphas in the management of the states water resources, and must be considered as a potential new source of w Accordingly, as part of the terms of this permit, the applicant shall prepare and implement a water conserva plan approved by Department of Health. The standards for such a plan may be obtained from either Department of Health or the Department of Ecology.

The Water Resources Act of 1971 specifies certain criteria regarding utilization and management of the wa of the state in the best public interest. Use of water may be subject to regulation at certain times, based on necessity to maintain water quantities sufficient for preservation of the natural environment.

RECORDED PLATTED PROPERTY

LOT	BLOCK	OF (GIVE NAME OF PLAT OR ADDITION)

LEGAL DESCRIPTION OF PROPERTY ON WHICH WATER IS TO BE USED

Area served by the City of Camas.

Existing City of Camas rights. The City of Camas has several surface and ground water rights and clair shown below:

Little Washougal River (reach now known as Boulder Creek), Certificate No. S 711 C, is for 1.0 cfs an acre-feet per year (AF/Y). This source is subject to low flow conditions in the summer.

Jones Creek, Certificate No. S 712 C, is for 2.5 cfs and 1820 AF/Y. This source goes low in the summer

Well No. 1, Claim No. 121022 for vested rights, is for 900 gpm and 320 AF/Y. The well is no longer use a regular basis.

Well No. 2, Claim No. 121023 for vested rights, is for 900 gpm and 230 AF/Y. The well is no longer use a regular basis.

Well No. 3, Certificate No. G 85-A C, is for 1200 gpm and 118 AF/Y.

Well No. 4, Certificate No. G 4072 C, is for 1325 gpm and 1208 AF/Y.

Well No. 5, Certificate No. G 6636 C, is for 600 gpm and 920 AF/Y.

Well No. 6, Certificate No. G 6635 C, is for 1500 gpm and 2400 AF/Y.

Well No. 7, Certificate No. G2-00501, is for 1000 gpm and 530 AF/Y.

Well No. 8, Certificate No. G2-24400, is for 900 gpm and 530 AF/Y.

Under the provisions of Certificates No. G2-00501C and G2-24400, the total annual quantity allowed u existing rights is 5,750 AF/Y.

Clark County Reservation. Under the provisions of Chapter 173-592 WAC, Reservation of Future Public W Supply for Clark County, ground water was reserved for future beneficial use for public water supply in C County. Since the enactment of this reservation, water rights issued pursuant to WAC 173-592 have rece a priority date of August 13, 1986, the effective date of said regulation. The total reservation quantity is 97 gpm and 65,300 AF/Y prorated by aquifer as follows:

1) Columbia River Alluvium (1A) and Sandy River Mudstone (1C) 77,000 gpm, 51,800 AF/Y;

2) Upper Troutdale (1B-2B) 20,000 gpm, 13,500 AF/Y.

The subject well is completed within the Upper Troutdale sediments. This appropriation, therefore, falls ur WAC 173-592 and will, when permitted, be debited against the reserved quantity for the Upper Trout aquifers. In addition, the permit will carry the August 13, 1986, priority date of the reservation.

Annual quantity supplemental to existing rights. The total annual allocation under the City's existing rig 5,750 AF/Y, was based on a projected population of 15,000. The City of Camas' actual water use for the 1989 amounted to 1,930 acre-feet for a population of 6,600 (Clark County Coordinated Water system P Update, April 1991; Intergovernmental Resource Center population summary, March 1990).

The City's annual water use should remain within existing rights (5,750 AF/Y) for the foreseeable fut Therefore the annual quantity recommended for this permit will be supplemental to existing rights, augmen system supply within the 5,750 AF/Y already authorized.

Quantities from this well. Due to the apparent limitations of the aquifer, this well is probably not suitable use as a major production well, but it could serve to boost system capacity during peak periods. Mr. Levi requested that the permit authorize a maximum withdrawal of 650 gpm up to 20% of the time on average allow the City to determine the optimum rate and pumping schedule. Accordingly, the permit will autho 650 gpm and 210 AF/Y from Well 9, subject to the provisions below.

Water right certificate. Pursuant to RCW 90.03.330 and 90.44.080, a final certificate will be issued upo showing satisfactory to the Department that the appropriation has been perfected in compliance with the ter of the subject permit. The certificated withdrawal rate and annual quantity will reflect a sustainable yield a protection of senior rights, within the amounts specified on the permit. Monitoring and data submittal will required under the certificate as well as the permit.

The Water Resources Act of 1971 specifies certain criteria regarding utilization and management of the
of the state in the best public interest. Favorable consideration of this application has been based on suf
waters available, at least during portions of the year. However, it is pointed out to the applicant that th
of water may be subject to regulation at certain times, based on the necessity to maintain water qua
sufficient for preservation of the natural environment.

REPORTED BY: Vennie Wright DATE: October 12, 1992

The statutory permit fee for this application is $20.00.

Area served by the City of Camas. The place of use of this water right is the service area described in the currently approved Water System Plan as approved by the Washington State Department of Health. RCW 90.03.386 may have the effect of revising the place of use of this water right if the criteria in section RCW 90.03.386(2) are met.

DESCRIPTION OF PROPOSED WORKS

8 Existing Wells in the Lower Washougal Wellfield

DEVELOPMENT SCHEDULE

BEGIN PROJECT BY THIS DATE:	COMPLETE PROJECT BY THIS DATE:	WATER PUT TO FULL USE BY THIS DATE:
August 1, 2008	August 1, 2015	August 1, 2025

PROVISIONS

Monitoring

The City of Camas shall develop a monitoring plan that includes the following:

a.) Monitor water levels in existing wells (TW-C and Well 4) and three new monitoring wells. The new monitoring wells must be installed as a cluster in the lower Washougal River in general proximity to the Georgia Pacific wellfield (where the largest drawdown occurs in the area). Two wells must be completed in the lower permeability streambed unit that lies beneath the river, and the third well must be completed in the more permeable PAA aquifer. All water levels must be measured to the nearest tenth of a foot, on an hourly basis during baseflow periods. New monitoring wells must be accurately located within 10 feet horizontally and 0.1 foot vertically. All monitoring wells must be constructed according to WAC 173-160-400.

b.) The City shall install a continuous river stage monitoring station in vicinity of the new monitoring wells. The monitoring station must include a staff gage which is accurately located within 10 feet horizontally and 0.1 foot vertically. Stage readings shall also be recorded on an hourly basis.

c.) Aquifer tests on the new Camas production wells must coincide with summer/fall low-flow periods and include seepage surveys during testing events. New supply wells must be accurately located within 10 feet horizontally and 0.1 foot vertically.

d.) The City shall submit water level data from their monitoring network for the previous year by January 31 to the Department of Ecology. Data shall be provided in a digital format along with a two page summary attached. A more thorough monitoring report must be provided after 5 years from the date of issuance of this water right or when this permit is perfected (whichever comes first), to further evaluate the effects of pumping on the Washougal River.

Operations of Surface Water System

1. Prior to groundwater being withdrawn under this water right, the City of Camas must cease their surface water diversions from Jones and Boulder Creeks between May 15 and October 31 of each year. At the State's discretion, the water rights associated with these diversions will be placed into the State's Trust Water Program as permanent, seasonal donations.

Metering and Reporting Diversions

1. An approved measuring device shall be installed and maintained for each of the wells authorized by this water right, in accordance with the rule "Requirements for Measuring and Reporting Water Use", WAC 173-173.

2. Reported water use data shall be submitted via the Internet. To set up an Internet reporting account, access https://fortress.wa.gov/ecy/wrx/wrx/Meteringx/. If you do not have Internet access, contact the Southwest Regional Office for forms to submit your data.

3. Chapter 173-173 WAC describes the requirements for data accuracy, device installation and operation, and information reporting. It also allows a water user to petition Ecology for modifications to some of the requirements. Installation, operation, and maintenance requirements are enclosed as a document entitled "Water Measurement Device Installation and Operation Requirements."

4. Department of Ecology personnel, upon presentation of proper credentials, shall have access at reasonable times, to the records of water use that are kept to meet the above conditions and may inspect, at reasonable times, any measuring device used to meet the above conditions.

Relationship to applicant Engineering Manager - City of Camas

Section 3. STATEMENT OF INTENT

Municipal

The applicant requests a permit to use not more than 1,000 (☒ gallons per minute or ☐ cubic feet per second) from a ☐ surface water source or ☒ ground water source (check only one) for the purpose(s) of Domestic/Public Supply. **ATTACH A "LEGAL" DESCRIPTION OF THE PLACE OF USE.** (See instructions.) *NOTE: A tax parcel number or a plat number is not sufficient.* Area served by City of Camas.

Estimate a maximum annual quantity to be used in acre-feet per year: 1200 AF/YR

☐ Check if the water use is proposed for a short-term project. Indicate the period of time that the water will be needed:

From ___/___/___ to ___/___/___

Section 4. WATER SOURCE

If SURFACE WATER	If GROUNDWATER
Name the water source and indicate if stream, spring, lake, etc. If unnamed, write "unnamed spring," "unnamed stream," etc.: Number of diversions:	A permit is desired for 2 well(s).
Source flows into (name of body of water):	Size & depth of well(s): 12-inch deep 150 feet deep

LOCATION

Enter the north-south and east-west distances in feet from the point of diversion or withdrawal to the nearest section corner: 1600 feet east and 1000 feet south of the NW 1/4 of Section 28, Township 2 North, Range 3 East

ECY 040-1-14 Rev. 9/95 F

APPLICATION

Appl. No.: G2-30019

Q 9-3201d

98

Section 5. GENERAL WATER SYSTEM INFORMATION

A. Name of system, if named: Camas Municipal Water-Sewer System

B. Briefly describe your proposed water system. (See instructions.)

Two 12-inch supply wells will be constructed to depths of 150 feet. The wells will be used to provide water supply to municipal and industrial water users that are served by the City of Camas in the Lacamas Basin area. See 1996 Water System Plan documents for other related water system information.

C. Do you already have any water rights or claims associated with this property or system? ☒ YES ☐ NO
PROVIDE DOCUMENTATION. See list of City Water Rights and claims that are attached.

Section 6. DOMESTIC / PUBLIC WATER SUPPLY SYSTEM INFORMATION
(Completed for all domestic/public supply uses.)

A. Number of "connections" requested: 4896 (current number of connections) Type of connection Municipal Industrial Hookup (Homes, Apartment, Recreational, etc.)

B. Are you within the area of an approved water system? ☒ YES ☐ NO
If yes, explain why you are unable to connect to the system. *Note: Regional water systems are identified by your County Health Department.* The applicant (City of Camas) is the regional water provider.

Complete C. and D. only if the proposed water system will have fifteen or more connections.

C. Do you have a current water system plan approved by the Washington State Department of Health? ☒ YES ☐ NO
If yes, when was it approved? 1996 Please attach the current approved version of your plan.
Note: City is currently updating water system plan. New plan should be approved in early 2002.

D. Do you have an approved conservation plan? ☒ YES ☐ NO
If yes, when was it approved? 1996 Please attach the current approved version of your plan.
Note: Water Conservation Plan incorporated into 1996 Water System Plan, which is currently being updated.

Section 7. IRRIGATION/AGRICULTURAL/FARM INFORMATION
(Complete for all irrigation and agriculture uses.) N/A

A. Total number of acres to be irrigated: _____

B. List total number of acres for other specified agricultural uses:

Use _____ Acres _____
Use _____ Acres _____
Use _____ Acres _____

C. Total number of acres to be covered by this application: _____

D. Family Farm Act (Initiative Measure Number 59, November 3, 1977)
Add up the acreage in which you have a controlling interest, including only:
‡ Acreage irrigated under water rights acquired after December 8, 1977;
‡ Acreage proposed to be irrigated under this application;
‡ Acreage proposed to be irrigated under other pending application(s).

1. Is the combined acreage greater than 2000 acres? ☐ YES ☐ NO
2. Do you have a controlling interest in a Family Farm Development Permit? ☐ YES ☐ NO
If yes, enter permit no: _____

E. Farm uses:
Stockwater - Total # of animals _____ Animal type _____ (If dairy cattle, see below)
Dairy - # Milking _____ # Non-milking _____

Section 8. WATER STORAGE

Will you be using a dam, dike, or other structure to retain or store water? ☐ YES ☒ NO

NOTE: If you will be storing 10 acre-feet or more of water and/or if the water depth will be 10 feet or more at the deepest point, and some portion of the storage will be above grade, you must also apply for a reservoir permit. You can get a reservoir permit application from the Department of Ecology.

Section 9. DRIVING DIRECTIONS

Provide detailed driving instructions to the project site. From Lacey, WA, go southbound on I-5. Take I-205 exit at Hazel Dell. Proceed southbound on I-205 to SR-14. Take SR-14 eastbound to Brady Road. Proceed north on Brady Road which turns into NW Parker Avenue. Continue northbound on NW Parker to SE 1st Street. Go westbound on NW 1st to 216th Ave. Take 216th Ave. northbound to Camas Meadows Golf Course. Take service road through golf course to well site.

Section 10. REQUIRED MAP

A. Attach a map of the project. (See instructions.)

Section 11. PROPERTY OWNERSHIP

A. Does the applicant own the land on which the water will be used? ☐ YES ☒ NO
If no, explain the applicant's interest in the place of use and provide the name(s) and address(es) of the owner(s):

The City will use the water for supply within their service area.

B. Does the applicant own the land on which the water source is located? ☐ YES ☒ NO
If no, submit a copy of agreement:
The City will purchase property as part of the supply well development.

I certify that the information above is true and accurate to the best of my knowledge. I understand that in order to process my application, I grant staff from the Department of Ecology access to the site for inspection and monitoring purposes. Even though I may have been assisted in the preparation of the above application by the employees of the Department of Ecology, all responsibility for the accuracy of the information rests with me.

Re: Water Right Application No. G2-30018

This letter is to acknowledge that the Washington State Department of Ecology received your water right application. We have assigned your application the number indicated above. Please include this number in future correspondence regarding your application with the Department of Ecology.

When we begin actively evaluating applications in your area, we will prepare a public notice and send it to you with publication instructions. It will be sometime before we are able to begin working in your area. In the meantime, please notify Ecology of changes such as address, property ownership, or variations in your proposed water use plans.

The availability of water in Washington state is a serious problem. Much of the water in our state has already been appropriated. The competition for water has escalated with our state's increasing population, conflicting water policy issues, and grave declines in salmon and other fish populations. A new watershed management law brings us a step closer to addressing some of these issues. It sets into motion a locally based process to address water quantity, quality, and habitat issues. Watershed management will help meet challenges for getting water to people, industries, farms, and fish.

In some areas of the state, we are continuing to evaluate applications within watersheds where we have previously gathered information and completed watershed assessments. We are also continuing to process water right permit or change applications that are intended to address public health and safety emergencies, the natural environment, or are for nonconsumptive withdrawals. All other applications are grouped by watershed and processed according to the date of submittal, and when we have enough information and staff resources to make decisions.

If you would like further information on your application, please contact the Southwest Regional Office at (360) 407-0240.

Sincerely,

J. Mike Harris

Subject: ***Water Right Application Submittals***
City of Camas

Dear Mr. Harris:

Enclosed you will find two water right applications along with the statutory examination fee of $10.00 for each water right application (total of $20.00). The enclosed applications are for new water supply sources in the Lacamas Basin.

The City of Camas would like to develop three new supply wells under these applications to meet the rapid growth, which is occurring in the western portion of our service area. We recently completed an extensive test well drilling program in this area. The results of the exploratory drilling and aquifer testing are summarized in the attached report titled *City of Camas, Westside Test Well Drilling Program (PGG, 2001).*

At your convenience, we would like to schedule a meeting with you and your staff to discuss the results of our test well program and strategies for obtaining water right permits for new production wells.

We appreciate your assistance on this matter.

Sincerely,

Eric Levison
Engineering Manager

ROTORK CONTROLS, INC.
SCOPE OF WORK
START UP/COMMISSIONING OF ROTORK ACTUATORS

JOB SITE LOCATION: WARDEN, WASHINGTON

Rotork Field Engineer will:

1. Inspect all installed Rotork actuators for proper orientation.
2. Inspect all installed Rotork actuators for proper wiring terminations.
3. Electrically power up Rotork actuators and perform initial programming.
4. Set both the Open and Closed limits on the Rotork actuators.
5. Electrically stroke all valves with Rotork actuators to ensure proper operation.
6. Provide customer with the Field Service Report for their records.
7. Correct any discrepancies found during this course of work.

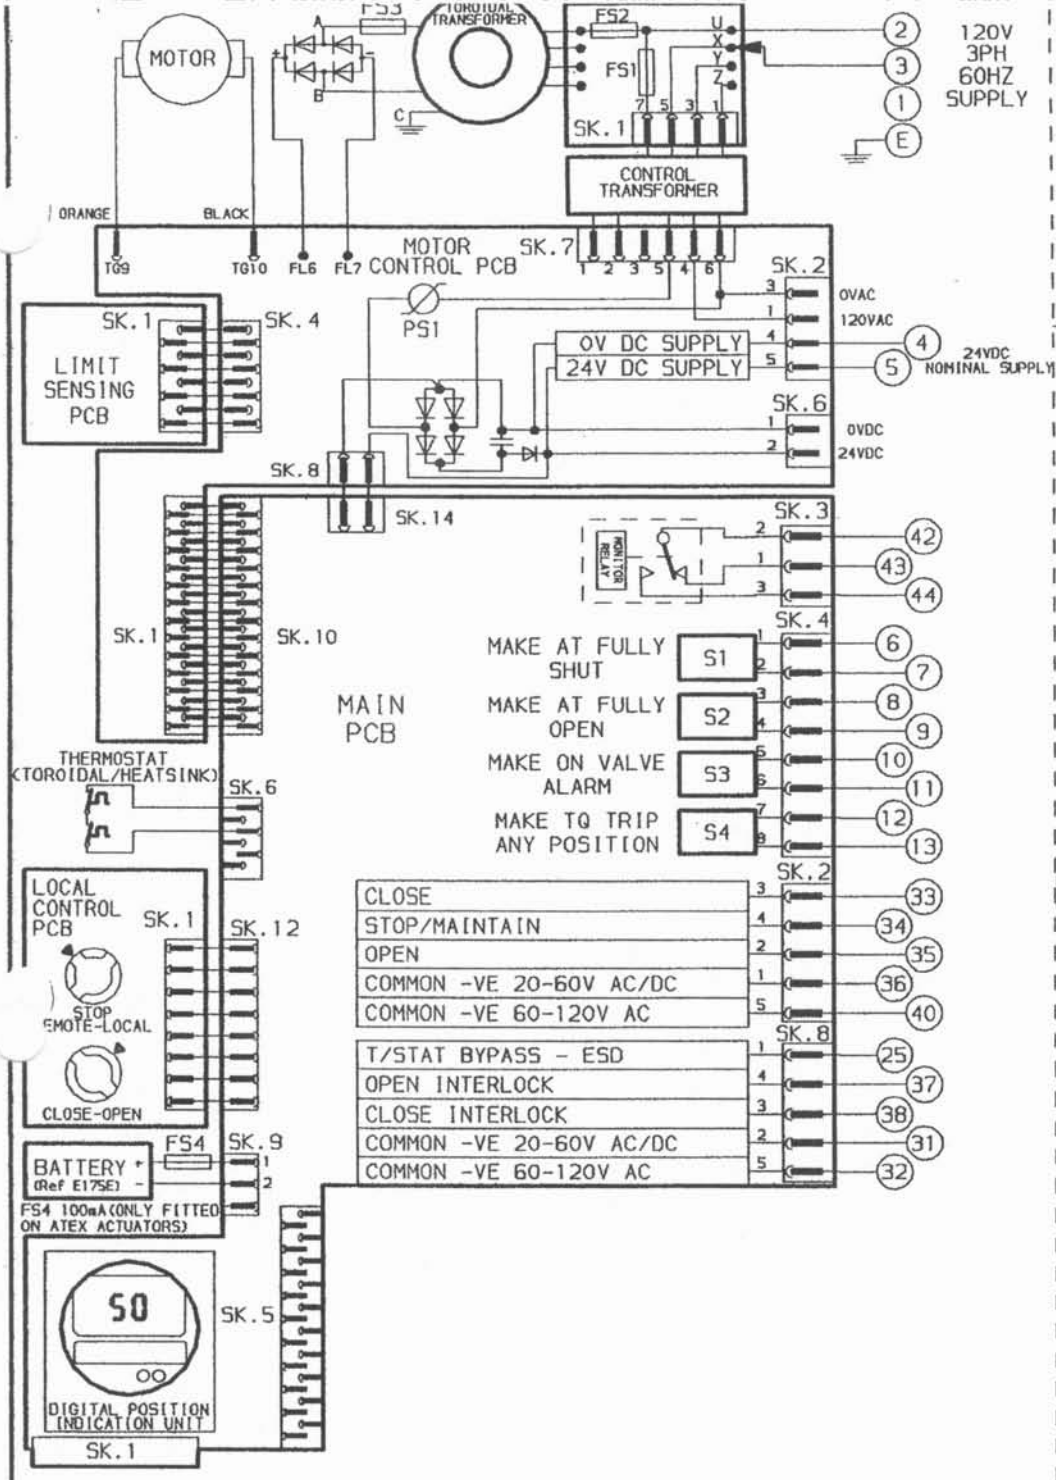
Rotork Site Training Syllabus (for IQT)

I. Introduction to Rotork

A. Tech introduction
B. Rotork Controls, Inc.
C. Types and models of actuators. Sizing, classifications. Nameplates.
D. Documentation, Rotork.com
   1) IQT- E110, E120, E175, E185, Wiring diagrams

II. IQT

A. Nomenclature and parts ID.
   1) Gearcase, center column, drive bushings, battery, seals and o-rings.
   2) Motor & wormwheel, resolver.
   3) Handwheel, hand/auto lever, H/A cover.
   4) Electronics- Cover (UV Window/ local controls), main pcb, power module, motor control pcb
   5) Options, if applicable



III. Operation, set-up and calibration (using live demo actuator)

A. Manual operation B. Setting tool and display
C. Menu structure and functions
   1) Torque display, password screen
   2) Primary functions- open/close action, torque setting, limit setting.
   3) Secondary functions-Indication, ESD(emerg shut down), options, IQT type and speed.
D. Local operation
E. Remote operation
   1) Remote voltage supplies 2) Remote control configurations 3) Network options
F. Installation and adaption
G.Troubleshooting
   1) Alarms 2) Help screens 3) Common faults and checks
H. Maintenance - 1) Lubrication 2) inspection 3) spares

IV. Advanced Functions and Utilities (using laptop and PDA)

A. Insight
B. Configuration Files
C. Datalogger files
   1) Torque profiles (for baseline files/trending, torque issues)
   2) Event logging and review

V. Conclusion- Review and Follow-up

WATER RIGHT APPLICATION REVIEW

Application Number: G230018

Applicant: City of Camas
616 NE 4th Avenue
Camas, Washington 98607

WRIA: 28
Water: Well near Lacamas Lake and the Columbia River.
This water and/or affected reaches downstream are inhabited by:

Based on: ☐ Site-specific observations ☐ WDFW database or GIS
☐ Literature ☐ Knowledge of this type of stream

Amount: cfs 359.00 gpm 300.00 acre-ft
Point of diversion: NW1/4 SW1/4 of S33 T2N R3E.
Point of use:

WDFW recommended conditions:

☐ Instream flows in WAC 173-5

☐ This water right should be subject to any established lake levels, if any.

Instream flows based on: ☐ IFIM study ☐ USGS toe-width ☐ Tennant
☐ Other:

WDFW requests that water right be subject to the following instream flows or natural flow, whichever is less:

Jan
Feb
Mar
Apr
May
Jun

Jul
Aug
Sep
Oct
Nov
Dec

Instream flows to be measured at:

Other conditions requested by WDFW indicated by ☐:

☐ HPA

☐ Screen intake if accessible to fish (to be determined during application for HPA) according to WDFW standards.

☐ Based upon review of fish resources present, type and amount of water use, condition of habitat, and amount of water available, WDFW REQUESTS DENIAL of this application, in accordance with RCW 75.20.050, IF THIS SPACE IS CHECKED.

☐ WDFW recommends modification of this proposal to minimize impacts to fish.

☐ WDFW is a landowner and water user that will be affected by this proposed use.

☐ Please HOLD this application pending field review. WDFW staff will provide detailed response by

☐ Granting this water right application would adversely affect WDFW's existing water rights for a facility. We request the following conditions for this water right if it is granted.

Rationale for WDFW recommendations if not based on existing rules or statutes: WDFW has no objections to this application.

Application for a Water Right

Please follow the attached instructions to avoid unnecessary delays.

For Ecology Use
Fee Paid _____
Date _____

Section 1. APPLICANT - PERSON, ORGANIZATION, OR WATER SYSTEM

Name City of Camas Home Tel:( ) -
Mailing Address 616 NE 4th Ave. Work Tel:(360) 834 - 3451
City Camas State WA Zip+4 98607 + FAX:(360) 834 - 1535

Section 2. CONTACT - PERSON TO CALL ABOUT THE APPLICATION

☐ Same as above

Name Eric Levison Home Tel:( ) -
Mailing Address 616 NE 4th Ave. Work Tel:(360) 834 - 3451
City Camas State WA Zip+4 98607 + FAX:(360) 834 - 1535
Relationship to applicant Engineering Manager - City of Camas

Section 3. STATEMENT OF INTENT

Municipal

The applicant requests a permit to use not more than 350 (☒ gallons per minute or ☐ cubic feet per second) from a ☐ surface water source or ☒ ground water source (check only one) for the purpose(s) of Domestic/Public Supply. **ATTACH A "LEGAL" DESCRIPTION OF THE PLACE OF USE.** (See instructions.) *NOTE: A tax parcel number or a plat number is not sufficient.* Area served by City of Camas
Estimate a maximum annual quantity to be used in acre-feet per year: 300 AF/YR

☐ Check if the water use is proposed for a short-term project. Indicate the period of time that the water will be needed:
From ___/___/___ to ___/___/___

Section 4. WATER SOURCE

If SURFACE WATER	If GROUNDWATER
Name the water source and indicate if stream, spring, lake, etc. If unnamed, write "unnamed spring," "unnamed stream," etc.: Number of diversions:	A permit is desired for 1 well(s).
Source flows into (name of body of water):	Size & depth of well(s): 12-inch well 400 feet deep

LOCATION

Enter the north-south and east-west distances in feet from the point of diversion or withdrawal to the nearest section corner: 1600 feet north and 800 feet east of the SW 1/4 of Section 33, Township 2 North, Range 3 East

¼ of	¼ of	Section	Township	Range(E/W)	County	If location of source is platted, complete below: Lot	Block	Subdivision
NW	SW	33	2N	3E	Clark

APPLICATION

Appl. No.: G2-30018

G9-30018

Section 5. GENERAL WATER SYSTEM INFORMATION

A. Name of system, if named: Camas Municipal Water-Sewer System

B. Briefly describe your proposed water system. (See instructions.)

One 12-inch supply well will be constructed to a depth of 400 feet. The well will be used to provide water supply to municipal and industrial water users that are served by the City of Camas in the Lacamas Basin Area. See City's 1996 Water System Plan documents for other related water system information.

C. Do you already have any water rights or claims associated with this property or system? ☒ YES ☐ NO
PROVIDE DOCUMENTATION. See list of city water right permits and claims that are attached.

Section 6. DOMESTIC / PUBLIC WATER SUPPLY SYSTEM INFORMATION
(Completed for all domestic/public supply uses.)

A. Number of "connections" requested: 4896 Type of connection Municipal Industrial Hookup
(Homes, Apartment, Recreational, etc.)

B. Are you within the area of an approved water system? ☒ YES ☐ NO
If yes, explain why you are unable to connect to the system. *Note: Regional water systems are identified by your County Health Department.* The applicant (City of Camas) is the regional water provider.

Complete C. and D. only if the proposed water system will have fifteen or more connections.

C. Do you have a current water system plan approved by the Washington State Department of Health? ☒ YES ☐ NO
If yes, when was it approved? 1996 Please attach the current approved version of your plan.
Note: City is currently updating their Waster System Plan. The new plan should be approved in early 2002.

D. Do you have an approved conservation plan? ☒ YES ☐ NO
If yes, when was it approved? 1996 Please attach the current approved version of your plan.
Note: Water Conservation Plan incorporated into 1996 Water System Plan which is currently being updated.

Section 7. IRRIGATION/AGRICULTURAL/FARM INFORMATION
(Complete for all irrigation and agriculture uses.) N/A

A. Total number of acres to be irrigated: _____

B. List total number of acres for other specified agricultural uses:

Use _____ Acres _____
Use _____ Acres _____
Use _____ Acres _____

C. Total number of acres to be covered by this application: _____

D. Family Farm Act (Initiative Measure Number 59, November 3, 1977)
Add up the acreage in which you have a controlling interest, including only:
‡ Acreage irrigated under water rights acquired after December 8, 1977;
‡ Acreage proposed to be irrigated under this application;
‡ Acreage proposed to be irrigated under other pending application(s).

1. Is the combined acreage greater than 2000 acres? ☐ YES ☐ NO
2. Do you have a controlling interest in a Family Farm Development Permit? ☐ YES ☐ NO
If yes, enter permit no: _____

E. Farm uses:
Stockwater - Total # of animals _____ Animal type _____ (If dairy cattle, see below)
Dairy - # Milking _____ # Non-milking _____

Section 8. WATER STORAGE

Will you be using a dam, dike, or other structure to retain or store water? ☐ YES ☒ NO

NOTE: If you will be storing 10 acre-feet or more of water and/or if the water depth will be 10 feet or more at the deepest point, and some portion of the storage will be above grade, you must also apply for a reservoir permit. You can get a reservoir permit application from the Department of Ecology.

Section 9. DRIVING DIRECTIONS

Provide detailed driving instructions to the project site. From Lacey, WA, go southbound on I-5. Take I-205 exit at Hazel Dell. Proceed southbound on I-205 to SR-14. Take SR-14 eastbound to Brady Road. Proceed northbound on Brady Road, which turns into NW Parker Avenue, continue northbound on NW Parker Avenue past 20th Street NW. Turn into Fire Station Property, which is located on west side of NW Parker Avenue.

Section 10. REQUIRED MAP

A. Attach a map of the project. (See instructions.)

Section 11. PROPERTY OWNERSHIP

A. Does the applicant own the land on which the water will be used? ☐ YES ☒ NO
If no, explain the applicant's interest in the place of use and provide the name(s) and address(es) of the owner(s):

The City will use the water for supply within their service area.

B. Does the applicant own the land on which the water source is located? ☐ YES ☐ NO
If no, submit a copy of agreement:

The City will purchase the property as part of the supply well development.

I certify that the information above is true and accurate to the best of my knowledge. I understand that in order to process my application, I grant staff from the Department of Ecology access to the site for inspection and monitoring purposes. Even though I may have been assisted in the preparation of the above application by the employees of the Department of Ecology, all responsibility for the accuracy of the information rests with me.

PROVISIONS

All conditions and requirements contained in reports of examination or permits previously issued apply to this certificate unless specifically noted below.

The water appropriated under this application will be used for public water supply. The State Board of Health rules require public water supply owners to obtain written approval from the Office of Water Supply, Department of Health, 1112 SE Quince Street, PO Box 47890, Olympia, Washington 98504-7890, prior to any new construction or alterations of a public water supply system.

An approved measuring device shall be installed and maintained for each of the sources identified by this water right in accordance with the rule "Requirements for Measuring and Reporting Water Use", Chapter 173-173 WAC.

Water use data shall be recorded monthly. The maximum rate of diversion/withdrawal and the annual total volume shall be submitted to Ecology by January 31st of each calendar year.

The following information shall be included with each submittal of water use data: owner, contact name if different, mailing address, daytime phone number, WRIA, Permit/Certificate/Claim No., source name, annual quantity used including units, maximum rate of diversion including units, monthly meter readings including units, peak monthly flow including units, Department of Health WFI water system number and source number(s), well tag number, and period of use. In the future, Ecology may require additional parameters to be reported or more frequent reporting. Ecology prefers web based data entry, but does accept hard copies. Ecology will provide forms and electronic data entry information. Submit data to: Department of Ecology, SWRO/WR PO Box 47775, Olympia, WA 98504-7775.

Chapter 173-173 WAC describes the requirements for data accuracy, device installation and operation, and information reporting. It also allows a water user to petition Ecology for modifications to some of the requirements. Installation, operation and maintenance requirements are enclosed as a document entitled "Water Measurement Device Installation and Operation Requirements".

Department of Ecology personnel, upon presentation of proper credentials, shall have access at reasonable

(continued on page 3)

The right to use of the water aforesaid hereby confirmed is restricted to the lands or place of use herein described, except as provided in RCW 90.03.380, 90.03.390, and 90.44.100.

This certificate of water right is specifically subject to relinquishment for non-use of water as provided in Chapter 90.14 RCW.

Given under my hand and the seal of this office at Olympia, Washington, this 5th *day of* February, *2008.*

times, to the records of water use that are kept to meet the above conditions, and to inspect at reasonable times any measuring device used to meet the above conditions.

All wells constructed in the State shall meet the construction requirements of Chapter 173-160 WAC entitled "Minimum Standards for the Construction and Maintenance of Wells" and Chapter 18-104 RCW entitled "Water Well Construction, Act (1971)."

In accordance with Chapter 173-160 WAC, wells shall not be located within certain minimum distances of potential sources of contamination. These minimum distances shall comply with local health regulations, as appropriate. In general, wells shall be located at least 100 feet from sources of contamination. Wells shall not be located within 1,000 feet of a solid waste landfill.

Nothing in this approval shall be construed as lessening or enlarging any water rights represented by Water Right Claim No's 121022 & 121023. The water use authorized under this filing (fill in with water right no.) shall be considered supplemental to any water rights confirmed for said claim as a result of a general adjudication through Superior Court, should adjudication be undertaken.

RE: Streamlined CRA Request for City of Camas Well 17 (G2-30019)

Dear Ms. Hall:

The City of Camas would like to move forward with the processing of our *Application for Water Right G2-30019.* This request is associated with our Well 17 which is currently being drilled under the Preliminary Permit you issued. As you are already aware the issuance of new water rights in the Lacamas Creek watershed is regulated protect flows. Our current water right permitting approach is to provide Ecology with an appropriate mitigation offset for the water we will be withdrawing from Well 17.

We wish to use the Streamlined Cost Reimbursement Process, and enter into a contract with Ecology to oversee the processing of our new application.

Our consultant Pacific Groundwater Group's (PGG) preliminary evaluation of Well 17 indicates that a relatively small portion (less than 10%) of our projected surface water capture from the well will affect stream flows in the Lacamas Creek drainage above the confluence with the Lacamas Lake impoundment and the balance of the capture is to the impoundment itself. We understand that mitigation for this site, as for all new applications in WRIA 28, needs to be provided in a manner consistent with the recommendation of the WRIA 27/28 Planning Group, and embodied in the provisions of WAC 173-528.

Under the Streamlined CRA approach PGG will prepare a Report of Examination (ROE) for your review. The ROE will address impairment, mitigations and consistency with WAC 173-528.

For contracting purposes please use the following information:

Re: Preliminary Permit to Drill and Test a Well for Water Right Application G2-30019

Dear Mr. Levison:

Water Right Application G2-30019 requests 1,000 gallons per minute (gpm) and 1,200 acre-feet (ac-ft) per year for municipal supply. The proposed point of withdrawal is a well to be drilled in the SW ¼ NW ¼ of Section 34, T. 2 N., R. 3 E.W.M. of Clark County.

Under the authority of RCW 90.03.290, Ecology can issue a Preliminary Permit for a water right applicant to conduct studies, surveys, and investigations to gather information to assess a water right application. This Preliminary Permit allows temporary groundwater withdrawals for testing purposes only.

Ecology needs information that evaluates your proposed withdrawal before your application can be processed. Impacts to area users and surface water impacts need to be evaluated. Ecology reserves the right to ask for more information before making a final decision on the application, if necessary.

The requirements of this Preliminary Permit must be met within the deadline or Water Right Application G2-30019 will automatically be cancelled. This Preliminary Permit does not commit Ecology to approve the water right for your project. Other uses needing a water right permit are not allowed unless approved.

Ecology has determined the activities authorized under this Preliminary Permit are categorically exempt from SEPA review under WAC 197-11-800(17).

Please make sure that your consultant receives a copy of this Preliminary Permit to ensure compliance with all requirements. If adverse impacts to senior water right holders occur during any portion of the test, the test must be stopped immediately. Once testing is complete, the well must be capped so it does not pose a safety hazard.

This Preliminary Permit will remain in effect until April 1, 2020, unless revoked sooner by Ecology. The City of Camas will assume all expenses, risks, and liabilities incurred in response to this Preliminary Permit.

This Preliminary Permit is subject to existing rights and the following requirements:

Requirements for drilling new wells:

- ✓ All water wells constructed must meet the minimum standards for construction and maintenance. Chapter 18.104 RCW (Washington Water Well Construction Act of 1971) and Chapter 173-160 WAC (Minimum Standards for Construction and Maintenance of Water Wells) discuss well construction requirements.

> *Check with the County Health Department to see if well site approval is required before well construction.*

- ✓ Wells must be at least 100 feet away from potential sources of contamination, such as a sewer, septic tank, privy as specified in WAC 173-160-171. Wells must also be at least 1,000 feet away from solid waste landfills. These minimum distances must also comply with state and local health laws.

- ✓ The well must have a well-maintained access port. A backflow check-valve must also be installed. This valve will prevent water from flowing back into the well when pumping stops so data collected during recovery is accurate.

- ✓ The well driller must submit a well report for the new wells to Ecology within 30 days after drilling.

Requirements for test observation wells:

- ✓ At least one observation well must be monitored for drawdown, recovery and water quality during the aquifer test.

- ✓ Observation wells must be completed in the same aquifer as the pumping well and not be actively pumping during the test.

- ✓ Wells should be selected where they will best determine potential for impacts to surface water in the area, effects on nearby wells, and potential to cause seawater intrusion.

Requirements for pumping test:

The Washington State Department of Health (DOH) Water System Design Manual (DOH #331-123, June 99), Appendix E provides guidelines for designing and conducting aquifer tests (available at www.doh.wa.gov/ehp/dw). DOH guidelines are minimum requirements. Failure to follow correct methods may require the tests to be repeated.

- ✓ A Washington Licensed Hydrogeologist or Registered Engineer, specializing in groundwater evaluation, must supervise the test and perform data analysis.
- ✓ The well must be tested at a constant rate not less than the maximum design rate of the well.
- ✓ The test **must be designed to provide the following information:**
  - Distance and time drawdown response in the producing aquifer.
  - Aquifer transmissivity.
  - Aquifer storage coefficient and specific yield.
  - Effects on regulated surface water.
  - Effects to area users

Select accurate water level devices, such as transducers, or electric tape, to measure water levels. All watches and clocks used for timing should be synchronized so that each measurement can be referenced to the exact time since pumping began.

- ✓ The pumping portion of the test must be at least 24 hours long OR until the water level in the pumping well has been stable for at least four (4) hours, whichever occurs last.

Water levels are stable if they drop less than 0.1 foot in an hour while the well is pumping. Measuring points for water levels must be accurately located within 10 feet horizontally and 1 foot vertically.

- ✓ Water pumped during the test should be discharged so it will not recharge the drawdown cone or influence monitoring during the test.

- ✓ Recovery data must be collected from all wells until the water level in the pumped well nears pre-pumping conditions and the water-level recovery rate is less than 0.1 foot per hour.

- ✓ Data collected must be corrected for influences of barometric pressure, if applicable.

> *Ecology recommends measuring water levels in the test and observation well every hour at least 48 hours before the start of the aquifer test. This will help evaluate aquifer response to external stresses such as precipitation and well interference. Barometric pressure should also be monitored on similar schedule, particularly for confined aquifers, so corrections for barometric influences can be made.*

For water quality sampling, water samples must be collected from the pumping well and observation wells and tested for chlorides and conductivity at a laboratory accredited by the Department of Ecology. Water samples must be collected as follows:

- ✓ From the pumping well:
  - During the first 30 minutes of pumping.
  - About mid-way through pumping.
  - During the last 15 minutes of pumping.

- ✓ From the observation wells:
  - Before the pump test starts.
  - Immediately after all recovery data is collected and the well has recovered to its static water level.

Please be aware that the state or county health department may require additional testing prior to the approval of your project. If your project involves a public water system, please check with the appropriate health agency to determine what additional testing is required before you conduct the test.

Requirements for reporting:

City of Camas must file a report with Ecology when aquifer testing is complete. This information must provide Ecology with the information needed to evaluate results of the study. Ecology may request any of this information in an electronic format.

The report should contain the following information:

- ✓ Maps showing locations of wells used in pump test (pumping and observation wells) and surface water bodies.

- ✓ Pumping well information.
  - o Construction diagrams.
  - o Well report
  - o Lithology description of units.
  - o Pump intake depth.
  - o Wellhead elevation and way measured.
  - o Identification of measuring point.

- ✓ Monitoring well information.
  - o Well reports (if available).
  - o Well information and way it was determined (if no well report).
  - o Wellhead elevations and way measured.
  - o Total well depth and way determined.
  - o Screened interval and way determined.
  - o Identification of measuring point.

> *All water level and water quality data must be presented in both tabular form and on data plots.*

- ✓ Distances between pumping well and observation well(s).

- ✓ Testing information.
  - o Pumping rates.
  - o Duration of pumping and recovery.
  - o Water level information.
  - o Raw data and corrected measurements.
  - o Corrections made for tidal influences (if any).
  - o Discussion of the methods and calculations used to determine aquifer characteristics.
  - o Copies of the all field data sheets related to the testing.

- ✓ Hydrogeology information.
  - o Hydrogeologic cross-sections.
  - o Description of the hydrogeologic system.
  - o Copies of all laboratory data sheets.

YOUR RIGHT TO APPEAL

You have a right to appeal this Preliminary Permit to the Pollution Control Hearing Board (PCHB) within 30 days of the date of receipt of this Preliminary Permit. The appeal process is governed by Chapter 43.21B RCW and Chapter 371-08 WAC. "Date of receipt" is defined in RCW 43.21B.001(2).

To appeal you must do all of the following within 30 days of the date of receipt of this Preliminary Permit:

- File your appeal and a copy of this with the PCHB (see addresses below). Filing means actual receipt by the PCHB during regular business hours.
- Serve a copy of your appeal and this Preliminary Permit on Ecology in paper form - by mail or in person. (See addresses below.) E-mail is not accepted.

You must also comply with other applicable requirements in Chapter 43.21B RCW and Chapter 371-08 WAC.

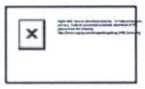
Subject: City of Camas - Request for Preliminary Permit and to Amend Application G2-30019
Attachments: Amend Camas Application.pdf; G2-30019_Camas application.pdf; Fig1_Site_Plan_V2.pdf

Hi Tammy, it's been a couple of months since we met with your regarding the City of Camas' plans to construct a new well (Well 17) near Lacamas Lake. As we discussed the City has a new well site in mind - just over a mile south and east from the originally designated site. We would like to modify the application that was filed in 2001 (G2-30019) with the new site AND request a **Preliminary Permit to Drill and Test** as soon as possible.



It does not appear that the original application was ever published so I will let the City know to be expecting that – and if you guys could loop me on that notice, I'd appreciate it.

A hard copy of this will be in the mail as well.

Thanks, and let me know if you need anything!

Jill

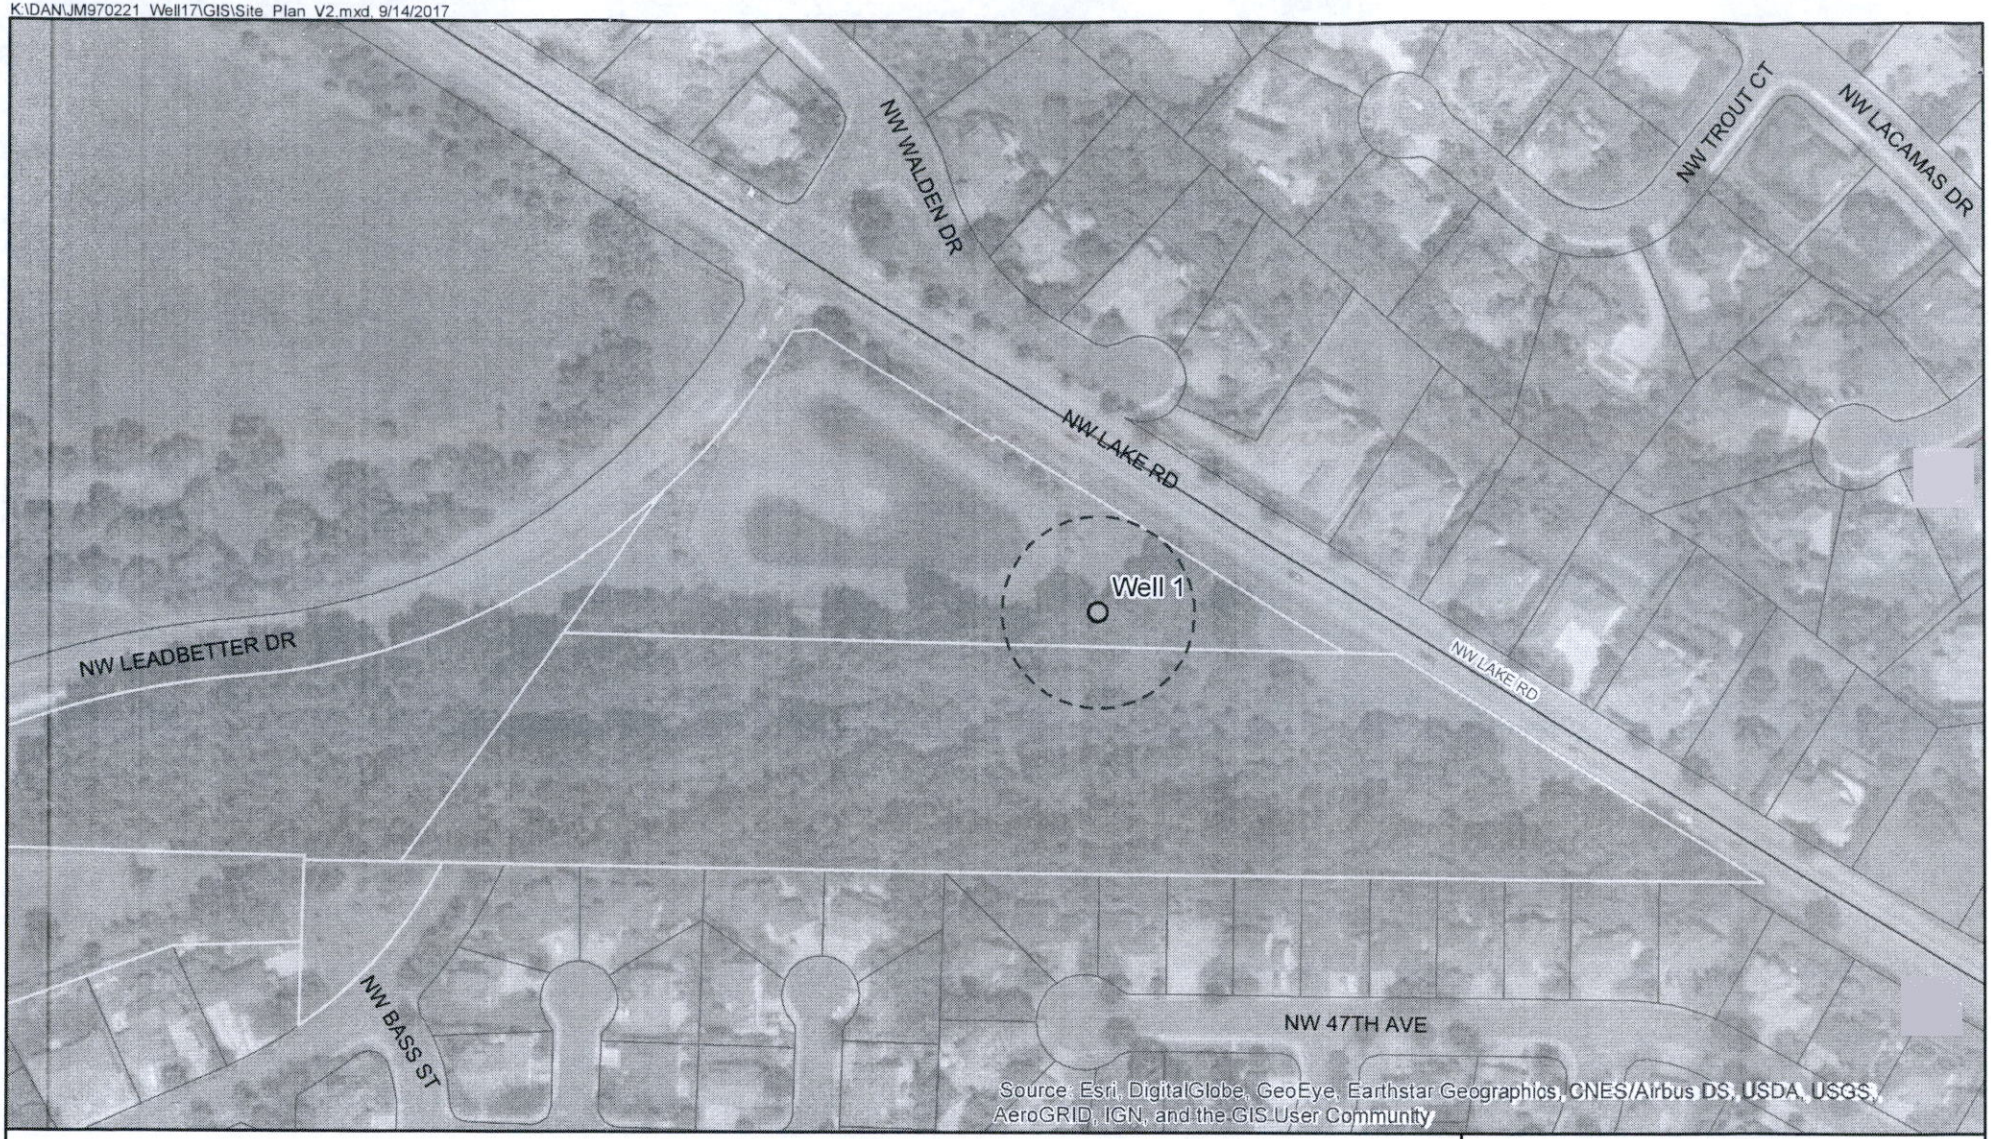
Re: Amendment of Application G2-30019

Dear Tammy

The intent of this letter is to request a modification in the *Point of Withdrawal* for pending application G2-30019 AND to request the issuance of a **Preliminary Permit** to drill and test at the new site.

Application G2-30019 was filed on September 4, 2001 in the amount of 1,000 gpm and projected annual quantity of 1,200 acre-feet per year. The intent was to construct up to two 12-inch production wells at a site immediately north of Lacamas Lake in the NE ¼ NW ¼ of Section 28, T. 2N. R. 3 E.W.M.



Since the time the application was filed we have reassessed our infrastructure needs and selected a new site for this well (Well 17) approximately a mile to the southeast of the original site within the SW ¼ NW ¼ of Section 34, T. 2 N., R. 3 E.W.M.

We would like to publish and secure the Preliminary Permit as soon as possible.

Sincerely,
Pacific Groundwater Group

Jill Van Hulle
Water Resources Specialist

Re: Water Right Application No. G2-30019

This letter is to acknowledge that the Washington State Department of Ecology received your water right application. We have assigned your application the number indicated above. Please include this number in future correspondence regarding your application with the Department of Ecology.

When we begin actively evaluating applications in your area, we will prepare a public notice and send it to you with publication instructions. It will be sometime before we are able to begin working in your area. In the meantime, please notify Ecology of changes such as address, property ownership, or variations in your proposed water use plans.

The availability of water in Washington state is a serious problem. Much of the water in our state has already been appropriated. The competition for water has escalated with our state's increasing population, conflicting water policy issues, and grave declines in salmon and other fish populations. A new watershed management law brings us a step closer to addressing some of these issues. It sets into motion a locally based process to address water quantity, quality, and habitat issues. Watershed management will help meet challenges for getting water to people, industries, farms, and fish.

In some areas of the state, we are continuing to evaluate applications within watersheds where we have previously gathered information and completed watershed assessments. We are also continuing to process water right permit or change applications that are intended to address public health and safety emergencies, the natural environment, or are for nonconsumptive withdrawals. All other applications are grouped by watershed and processed according to the date of submittal, and when we have enough information and staff resources to make decisions.

If you would like further information on your application, please contact the Southwest Regional Office at (360) 407-0240.

Sincerely,

J. Mike Harris
