EXHIBIT “A” SCOPE OF SERVICES

Background and Understanding

Haight Reservoir is located near the center of the City of Camas (City). It is bound on the east by NW 12th Circle and NW 12th Avenue. The surface area of the dam is approximately 2 acres and impounds water with an earthen dam.

The dam falls under the jurisdiction of the Washington Department of Ecology (Ecology) Dam Safety Division. Ecology conducted an inspection in August of 2019 and identified several deficiencies as documented in the letter from Ecology to the City dated March 31, 2020. The City has requested that Stantec provide services to address item 3) Main Dam and Saddle Dam Embankment Stability of this Ecology Inspection summary letter.

City agrees that Stantec assumes no responsibility for, and makes no representation or warranty, express or implied, that, such facilities are safe or is without latent defects or deficiencies. Consultant disclaims any liability for any latent defects or deficiencies which are not reasonably discoverable under generally accepted industry standards or that should reasonably have been identified pursuant to other applicable inspection criteria. Any assessments of the facilities are limited in terms of accuracy to the time, scope and purpose for which the assessment was prepared.

Stantec has prepared the following scope of services to accomplish the aforementioned goals and objectives and further has determined the following tasks are necessary to complete the work.

- Task 1 – Geotechnical Field Investigations
- Task 2 - Slope Stability Analysis
- Task 3 – Project Management

1.0 Task 1 – Geotechnical Field Investigations

1.1 Task Specific Objective

Complete field drilling, sampling and analysis of the embankment to determine soil characteristics needed for conducting a slope stability analysis.

1.2 Task Specific Services and Assumptions

Drill two (2) drill holes at the locations shown generally in **Figure 1**, the hole layout is intended to fill in gaps between pre-construction holes on each side of the overflow spillway.

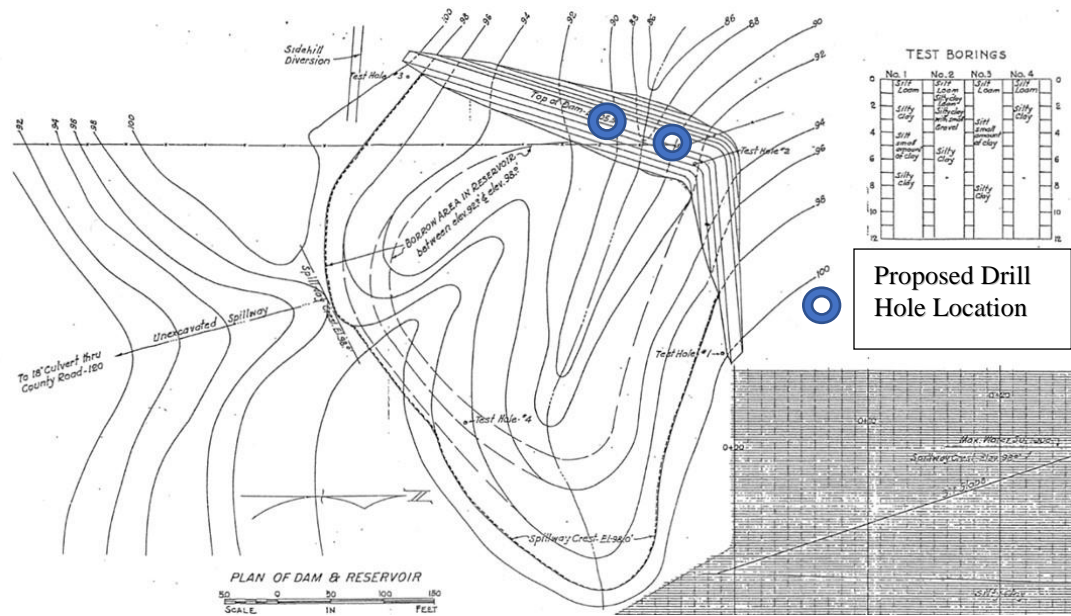

Figure 1: Proposed bore hole locations – Haight Reservoir

The holes will be advanced from the crest of the main dam through its embankment and extend about 20 feet below the embankment/cutoff trench foundation. A track-mounted drill rig will access the hole locations and use continuous flight hollow-stem augers to advance the holes to each Standard Penetration Test (SPT) test interval. Water will be routinely introduced into the hollow stem augers to be equal to or several feet above the static water level encountered in the borings and a center-plug bit will be used in the hollow stem augers while advancing the holes.

SPTs will be performed every 2.5 feet within the embankment and seepage cutoff trench. SPTs will be performed every 5 feet once the foundation contact is encountered in the boring. In addition to soil samples obtained from the SPTs, 2 thin-walled Shelby Tube samples will be attempted in each hole within the embankment material to obtain relatively undisturbed soil samples for strength testing. Within the foundation material, a thick-walled ring sampler with brass liners will also be advanced through the material to obtain relatively intact samples for laboratory testing.

Holes will be field-logged by a Stantec field representative and soil descriptions will be based in the field on visual and manual procedures. Final logs will be developed upon completion of laboratory testing.

Each hole created will be backfilled with cement-bentonite grout mixture tremie-placed from the bottom of the hole. Cuttings will be containerized and disposed of properly off-site. No instrumentation (such as open standpipe piezometers) will be installed.

In addition to these two drill holes, up to six (6) shallow (less than 5 feet) holes will be advanced from the dam crest using a 6-inch solid stem auger to obtain

disturbed “grab samples” of the main and saddle dam embankments to additionally characterize the soil materials types used to construct each structure. Soil samples obtained from the drilling investigation will be tested in a soils laboratory for soil index testing and soil engineering properties (strength testing only). The following laboratory testing schedule (**Table 1**) is currently planned and will be updated upon completing the field investigation.

2.0 Task 2 – Slope Stability Analysis

2.1 Task Specific Objective

Conduct slope stability and analysis and prepare report.

2.2 Task Specific Services and Assumptions

Stability analyses will be performed on 2-D cross sections of the main dam and the saddle dam. The cross section analyzed for the main dam will be at the maximum height of the dam, currently assumed to be about 12 feet height (crest to downstream toe). The modeled cross section geometry will be based upon field measurements performed by Stantec along the cross section using field tape, survey staff, and hand-level. Information from previous surveys performed by the Department of Ecology for the 2019 Periodic Inspection Report will also be cross-referenced in developing the model geometry.

The stability analyses will be performed using the SLOPE/W suite of the Geostudio computer software package. SLOPE/W will perform limit equilibrium,

method of slices analyses using Spencer’s Method that is capable of satisfying equilibrium of both moment and shear forces between slices. The following loading conditions will be analyzed: long-term steady state seepage, rapid drawdown, flood condition, and seismic. A phreatic surface through embankment will be estimated and used in the analysis based on engineering judgement to reflect the water level during steady-state and flood seepage conditions. Flooding loading condition will be based upon reported values of maximum reservoir elevations estimated by Ecology in their preliminary hydraulic analysis of the overflow spillway.

A simplified seismic deformation analysis will be performed for the seismic loading condition. Procedures outlined by Makdisi and Seed in 1977 (“A Simplified Procedure for Estimating Earthquake-Induced Deformations in Dams and Embankment”) will be used calculate estimates of crest deformation during the selected earthquake ground motions. The ground motions (earthquake magnitude and peak ground acceleration) to be used in the analysis will be based on published USGS open reports presenting ground motions associated with annual exceedance probabilities in line with the appropriate Design Step for the dam’s high downstream hazard class (Class 1C). A site-specific seismic hazard analysis is not planned to be performed for the site to obtain these ground motions. However, Stantec will notify the City and advise on them on whether a site-specific probabilistic seismic hazard analysis is warranted prior to finalizing the results.

The results of the field investigation and stability analyses will be reported and evaluated with respect to required criteria presented in the Washington State Department of Ecology Dam Safety Guidelines- Part IV: Dam Design and Construction.
