

REPORT OF FINDINGS - HYDROLOGY ANALYSIS

Site Information:

2250 Ogulin Canyon Clearlake, CA 95422 APNs: 010-044-19

Prepared for:

Clearlake Harvest Company

Prepared by:

Chico Environmental Science & Planning 333 Main Street, Suite 260 Chico, CA 95928 (530) 899-2900

Prepared: August 4, 2021

1.0 INTRODUCTION

Chico Environmental prepared this Report of Findings to determine groundwater availability at 2250 Ogulin Canyon in Clearlake, CA ("subject property" or "site"). The approximately 12.95-acre site is situated in Burns Valley Groundwater Basin, a rural portion of southeastern Lake County, California (Figure 1). One 200 feet below ground surface (bgs), 4 ½ inch casing diameter domestic groundwater well is located on APN 010-044-19. The well was installed on December 12, 2005. A well test and system equipment evaluation were conducted on March 31, 2021. The purpose of this investigation is to determine if the aquifer has sufficient quantity to support outdoor cannabis cultivation for 17,500 square-feet of the 12.95-acre property.

2.0 BACKGROUND

Chico Environmental conducted a site visit to the site on July 28, 2021 (Appendix A). Chico Environmental reviewed Well Completion Reports within Lake County from DWR (Appendix B). Chico Environmental also reviewed Lake County groundwater ordinances, the California State Sustainable Groundwater Management Act (SGMA), geology maps (Figure 2), topography maps (Figure 3) and groundwater well locations (Figure 4).

3.0 GEOLOGY

The subject property is located in the Coast Range Geomorphic Province of California. The Coast Range is comprised largely of the Franciscan Complex which represents an accretionary complex formed by long-term subduction of an oceanic plate under the western margin of the North American craton. The Franciscan complex is composed of three distinguishable belts: the eastern belt, the central belt, and the coastal belt. Formation of the accretionary complex began during the late Jurassic in the eastern belt and has continued into the Miocene along the western coastal belt. The complex trends NNW and is bounded by the San Andreas Fault to the east and by the coastal range fault to the west. The coast range fault separates the Franciscan complex with the partly coeval Great Valley sequence.

The subject property is located in the Coast Range Geomorphic Province of California. The Coast Range is comprised largely of the Franciscan Complex which represents an accretionary complex formed by long-term subduction of an oceanic plate under the western margin of the North American craton. The Franciscan complex is composed of three distinguishable belts: the eastern belt, the central belt, and the coastal belt. Formation of the accretionary complex began during the late Jurassic in the eastern belt and has continued into the Miocene along the western coastal belt. The complex trends NNW and is bounded by the San Andreas Fault to the east and by the coastal range fault to the west. The coast range fault separates the Franciscan complex with the partly coeval Great Valley sequence.

Faulting occurred in Mendocino County, lowering an area in the Coast Ranges. This area became filled with gravels and sands from creeks in the mountains and became the Cache Formation. Toward the end of the Cache Formation's deposition, faulting created a depression that combined with lava flows created the basin that contains Clear Lake. Volcanic activity occurred intermittently through the Pleistocene with the extrusion of a number of separate lava flows, beginning the deposition of the Clear Lake Pleistocene Volcanics,

including Mount Konocti and the surrounding area. Other depressions and valleys in the Coast Ranges began to be filled with sands, silts and gravels carried by streams, resulting in the deposition of alluvial basins.

The Burns Valley Basin is in the southeastern portion of Lake County and is the Shoreline Inventory Unit. It is bordered by the Franciscan Formation to the north, Clear Lake to the west and the Cache Formation to the south and east. There are three water-bearing formations in the Burns Valley Basin, including Quaternary Alluvium, Quaternary Terrace Deposits and Lower Lake Formation. Quaternary alluvium occurs in the valley lowlands and consist of silt, sand and gravel. This layer is thickest in the southern portion of the basin at approximately 50 feet. Groundwater from this layer is used for domestic use and is unconfined.

Quaternary Terrace Deposits occur on the sides of the alluvial plain at approximately 15 feet above the valley floor. Further research is necessary to qualify groundwater in this formation. The Lower Lake Formation consists of lake deposits underlying the alluvial and terrace deposits. It mainly consists of fine sands, silts and thick interbeds of marl and limestone. The maximum thickness is 200 feet and has low permeability. Groundwater from this layer can be pumped at a few hundred gallons per minute.

4.0 Hydrology

The average annual precipitation ranges from 25 inches to 35 inches per year and the average annual air temperature ranges between 55 to 59 °F in the project area. Surface water is limited to ephemeral drainages within the project area.

Groundwater Hydrogeology

Groundwater typically fluctuates between 2-10 feet below ground surface (bgs) from spring to fall. The DWR estimates the usable storage capacity to be 4,000 acre-feet (DWR 1960). Agricultural demand is typically around 14 acre-feet per year. As of 2006, there were 86 domestic wells and 13 irrigation wells in the Burn Valley Basin, with half of the domestic wells measuring less than 75 feet bgs and half of the irrigation wells measuring less than 250 feet bgs.

Groundwater Wells

As of March 2006, there are 86 domestic wells and 13 irrigation wells in the Burns Valley Basin. Approximately half of these domestic wells are shallower than 75 feet deep, and approximately half of the irrigation wells are shallower than 250 feet deep.

On December 11, 2005 a domestic well was completed at the subject site. The 200 feet bgs well was drilled with first water encountered at 120 feet bgs and a completed static water level of 125 feet bgs. The estimated yield for the well was 30 gallons per minute.

A well performance report from March 2021 shows the static water level of the well is 113.5 feet bgs. After pumping at a rate of 23 gallons per minute for 1.5 hours, the pumping level decreased from 133.5 feet bgs to 143.2 feet bgs. The well returned to 121 feet bgs after 5 minutes of recovery.

5.0 FINDINGS

2250 Ogulin Canyon has approximately 12.95 acres of surface land that is located over loosely consolidated gravel deposits in the Burns Valley (Figure 3).

The 2019 SGMA report rates Burns Valley as a Very Low Priority groundwater basin. Current groundwater data suggests that the Burns Valley Groundwater Basin fully recharges annually.

Section 28.1 of the lake County, California – Code of Ordinances - Regulation of the Extraction and Exportation of Groundwater from Lake County. Section 1.11 States:

"The County seeks to foster prudent water management practices to avoid significant adverse overdraft-related environmental, social, and economic impacts. It is therefore essential for the protection of the County's important groundwater resources that the County requires a Permit to extract or otherwise capture groundwater for any use outside the County. This chapter requires a Permit for the export and use of groundwater outside the County and is not intended to regulate groundwater in any other way."

Groundwater pumped for irrigation on 2250 Ogulin Canyon will not be used for export out of the County.

The expected annual water use for the cannabis cultivation project would be 511,400 gallons per square foot (gsf) per year with usage including cultivation (455,000 gsf per year), processing (24,000 gsf), and a nursery (32,400 gsf per year). The well yields 30 gallons per minute (15,768,000 gallons per year) and is monitored by a flow through meter (**Appendix C**).

There are no additional impacts on the Burns Valley Basin from the project, nor impacts of water use for this project to the surrounding areas.

6.0 CONCLUSIONS AND RECOMMENDATIONS

It is Chico Environmental's opinion that the completed well is of sufficient yield to irrigate 17,500 square-feet of cannabis at 2250 Ogulin Canyon. Additionally, it appears that the overlying property possesses a sufficient quantity of groundwater for seasonal irrigation that would not adversely overdraft the Burns Valley Groundwater Basin, affect downgradient groundwater users or other well users in the vicinity.

7.0 QUALIFICATIONS AND SIGNATURE

I am a Professional Geologist with the State of California. Chico Environmental has performed this assessment under my supervision in accordance with generally accepted environmental practices and procedures, as of the date of this report. I have employed the degree of care and skill ordinarily exercised under similar circumstances by reputable environmental professionals practicing in this area. The conclusions contained within this assessment are based upon site conditions readily observed or were reasonably ascertainable and present at the time of the site inspection.

The conclusions and recommendations stated in this report are based upon personal observations made by employees of Chico Environmental and upon information provided by others. I have no reason to suspect or believe that information provided is inaccurate.

John Lane, P.G. No. 7717 Chico Environmental Science & Planning jlane@chicoenvironmental.com (530) 899-2900
