

New Wastewater Treatment Plant

This project consists of constructing a new activated sludge wastewater treatment plant at the existing WWTP site to provide a modern, more reliable treatment process. An activated sludge system uses aeration and biological treatment to remove organic matter and other pollutants from wastewater before final clarification and discharge. The new facility is intended to replace aging treatment infrastructure with a process that provides improved treatment performance, greater operational flexibility, and capacity to meet current and future regulatory and system demands.

Design and CEI: \$14 million

Construction: \$53 million
