Executive Summary

Purpose of Report and Study Objectives

This report presents the findings of Traffic Impact Analysis conducted for the proposed Schoolhouse Commons development in the Town of Haymarket, Virginia. This study was developed in accordance with Virginia Department of Transportation ("VDOT") and the Town of Haymarket guidelines.

The document is prepared in accordance with best professional practice and standards that assess the impact of a proposed development on the transportation system and recommends improvements to lessen or negate those impacts. Traffic Impact Analysis involves the evaluation of anticipated roadway conditions with and without the proposed development and recommend transportation improvements to offset both the impacts of the increase in future traffic volumes and the changes in traffic operations due to the development. The analysis assists public officials and developers to balance interrelations between efficient traffic movements with necessary lane access.

Site Location and Study Area

The site is located in the Town of Haymarket. The vehicular study area has six (6) existing intersections, five (5) of which are located along Washington St (Rte. 55) and one (1) located along Bleight Dr.

Description of Proposed Development

The planned development program for the site includes mix uses with approximately 26,000 SF of existing commercial/office land uses to remain and about 61 single family attached (townhome) units. Please note, for the purposes of the operational analysis, the development program analyzed 65 units to evaluate the most conservative scenario.

The site is currently occupied by approximately 32,000 SF of existing commercial uses. A portion of the commercial uses, approximately 5,900 SF of office space, are planned to be removed with this application while the remaining 26,000 SF is anticipated remain. The development currently has two access points (one entrance only and one exit only entrance) along Washington St. The current plan for the development proposes one full access entrance (inbound and outbound) along Washington St. The development is also planning a site access by constructing a fourth leg to the intersection of Bleight Dr & Dogwood Park Ln.

Principal Findings, Conclusions, and Proposed Mitigations

Discussions regarding the study assumptions and relevant background information were held with the Town of Haymarket ("The Town") and VDOT staff during a June 13, 2025, scoping meeting. A finalized scope was agreed upon and signed by VDOT and PWCDOT on June 20, 2025.

The analysis presented in this report supports the following assumptions and findings:

Analysis Components

- Existing counts, dated Tuesday June 3, 2025, were collected while schools were in session to reflect typical traffic patterns, and serve as the basis for this study. Existing traffic counts were conducted at the existing intersections on Saturday June, 14, 2025. Please note there was approximately 4,700 SF of vacant commercial and church space at the time of collected counts, had the building been fully leased, the traffic volumes for the existing conditions would be slightly higher than presented in the report.
- As determined based on discussions at the scoping meeting, an inherent growth rate of 2% (compounded annually) for the period 2025-2029 has been applied to all through movements along Washington St at all intersections.
- The site is anticipated to generate approximately 26 total trips during the AM peak hour, 27 total trips during the PM peak hour, 444 total daily trips on a typical weekday and 296 Saturday daily trips.

- One (1) identified background development was included in the study – 6700 Bleight Drive – Which will consist of approximately 11 single family attached units.
- The scenarios to be included in this study are Existing Conditions (2025), Future without Development (2029), Future with Development (2029).
- The existing access to the site is served via two (2) intersections, one entrance and one egress. The development proposes to convert the existing entrance only driveway to a full access (inbound and outbound) driveway. The development also proposes to remove the existing exit only driveway as the primary bidirectional entrance would reduce driver confusion and better meet driver expectation. The proposed development is also planning to construct a fourth leg to the intersection of Bleight Dr & Dogwood Park Ln.

Conclusion

The analysis presented in this report supports the following assumptions and findings:

Infrastructure

- There is one (1) identified infrastructure change with this proposed development. Construction of a fourth leg to the intersection of Bleight Dr & Dogwood Park Ln, will serve as another site access for the proposed development. No additional background infrastructure changes were identified and agreed upon in the scope.

Analysis Results

Analysis Terms:

- Level of Service (LOS) is based upon the traffic volume present in each lane on the roadway, the capacity of each lane at the intersection and the delay (in seconds) associated with each directional movement. This evaluation is consistent in all traffic analysis scenarios. Please refer to definitions of Level of Service in Appendix J.
- The 95th percentile queue length refers to the queue length within which 95% of all observed queues are contained during a specific analysis period. This evaluation is consistent in all traffic analysis scenarios.

Existing Conditions (2025):

- All approaches and the overall intersections operate at an acceptable level of service.
- All the anticipated 95th percentile queues are contained in the available storage lane lengths for all the study intersections.

Total Future without Development (2029):

- All approaches and the overall intersections operate at an acceptable level of service.
- All the anticipated 95th percentile queues are contained in the available storage length for all the study intersections.

Total Future with Development (2029):

The results of the Future with Development Conditions (2029) analysis scenario are as follows:

- All the approaches and the overall intersection operate at acceptable levels of service for all of the study intersections.
- All the anticipated 95th percentile queues are contained in the available storage length for all the study intersections.
- Please note that while all study intersections and approaches operate at acceptable levels of service, the following lane group was observed to experience larger delay:
 - Intersection #2 Washington St (Rte. 55) & Greenhill Crossing Dr/Site Access #1 – Northbound shared left/thru lane operates at LOS E in the PM peak hour. The overall approach operates acceptably.
 - The 95th percentile queue for the northbound shared left/thru lane is approximately 23 ft (less than one car). Therefore, the queues do not extend to the downstream driveways that serve the residential community.

- The reconfigurations and mitigations for this analysis scenario are as follows:
 - The existing primary driveway entrance (Access #1) will be reconfigured to a full-access driveway (inbound & outbound).
 - The existing exit-only driveway (Access #2) is planned to be closed to address the existing safety issues due to the proximity to the driveway to the east.
 - The addition of a westbound right turn lane at Intersection #2 (Washington St (Rte. 55) & Greenhill Crossing Dr/Site Access) is a proposed mitigation. Please note only a right turn taper is warranted using VDOT Road Design Manual (RDM) Turn Lane Assessment.
- In addition to the mitigation implemented for the Future Conditions with Development (2029) scenario, an alternative scenario was provided that reviewed the capacity of the adjacent roundabout to understand the capacity if existing vehicles were to reroute to utilize the intersection. The analysis confirms that the roundabout operates acceptably if additional vehicles were to use it.

Overall Conclusion

Based on the capacity and queueing analysis results, the proposed development will not have a significant impact to the surrounding transportation and roadway network, assuming that all designs planned with the subject proposal, and mitigations discussed in this report are implemented.

Introduction

This report presents the findings of Traffic Impact Analysis conducted for the proposed Schoolhouse Commons development in the Town of Haymarket, Virginia.

The site is currently occupied with approximately 32,000 SF of commercial and office space. The planned development program for the site includes approximately 26,000 SF of commercial/office land uses and about 61 single family attached (townhome) units. Please note for the purposes of the operational analysis, the development program analyzed 65 townhome units to evaluate the most conservative scenario. Also note, a portion of the site is currently occupied by existing commercial uses. A portion of the commercial uses, approximately 5,900 SF of office space, are planned to be removed with this application while the remaining 26,000 SF is anticipated remain. The projected build-out date for the site is assumed to be 2029.

The following tasks were completed as part of this study effort:

- A scoping meeting was held on Friday, June 13, 2025, with VDOT and the Town of Haymarket "The Town" staff to discuss the parameters of this study as well as any relevant background information. A copy of the signed scoping document is included in Appendix A.
- Existing conditions were observed in the field to verify roadway geometry, pedestrian and bicycle infrastructure, and traffic flow characteristics.
- Existing traffic counts conducted at the existing intersections on Tuesday, June 3, 2025, during the weekday morning and weekday afternoon peak periods were used as baseline counts. Existing traffic counts were conducted at the existing intersections on Saturday June, 14, 2025. Please note there was approximately 4,700 SF of vacant commercial and church space at the time of collected counts, had the building been fully leased, the traffic volumes for the existing conditions would be slightly higher than presented in the report.
- The Future Conditions without Development (2029) scenario was projected based on the existing traffic volumes and an inherent growth rate to account for regional growth on the roadway network. There was one (1) identified background development was included in the study – 6700 Bleight Drive – Which will consist of approximately 11 single family attached units.
- Proposed site traffic volumes were derived based on the methodology outlined in the Institute of Transportation Engineers' (ITE) Trip Generation Manual, 11th Edition, publication and were assigned to the road network based on the agreed upon direction of approach discussed during the aforementioned scoping meeting.
- The Future Conditions with Development (2029) scenario was projected based on the existing traffic volumes, regional growth, background developments, and plans for the proposed development.
- Intersection capacity and queueing analyses were performed for the identified study intersections for the Existing Conditions (2025), Future without Development (2029), and Future with Development (2029) during the weekday morning (AM), weekday afternoon (PM) peak hours, and weekend afternoon (SAT) peak hour.
- Intersection capacity and queueing analyses were performed using Synchro, version 11, with results based on the Federal Highway Administration's (FHWA) Highway Capacity Manual (HCM) 6 and (HCM) 2000 methodology and following VDOT's Traffic Operations and Safety Manual (TOSAM).

Sources of data for this study include information provided by VDOT, PWCDOT, and the office files and field reconnaissance efforts of Gorove Slade.

Description of the Existing Site

Site Location

The site is located in the Town of Haymarket. The site is generally bounded by Alexandra's Keep Ln to the north, Washington St (Rte. 55) to the south, an existing residential community and office space to the east, and Bleight Dr to the west. The development proposes to convert the existing entrance only driveway to a full access (inbound and outbound) driveway. The development also proposes to remove the existing exit-only driveway as the primary bidirectional entrance would reduce driver confusion and better meet driver expectations. The development is also planning to construct a fourth leg to the intersection of Bleight Dr & Dogwood Park Ln. The site entrances for the development are shown on Figure 1 below.

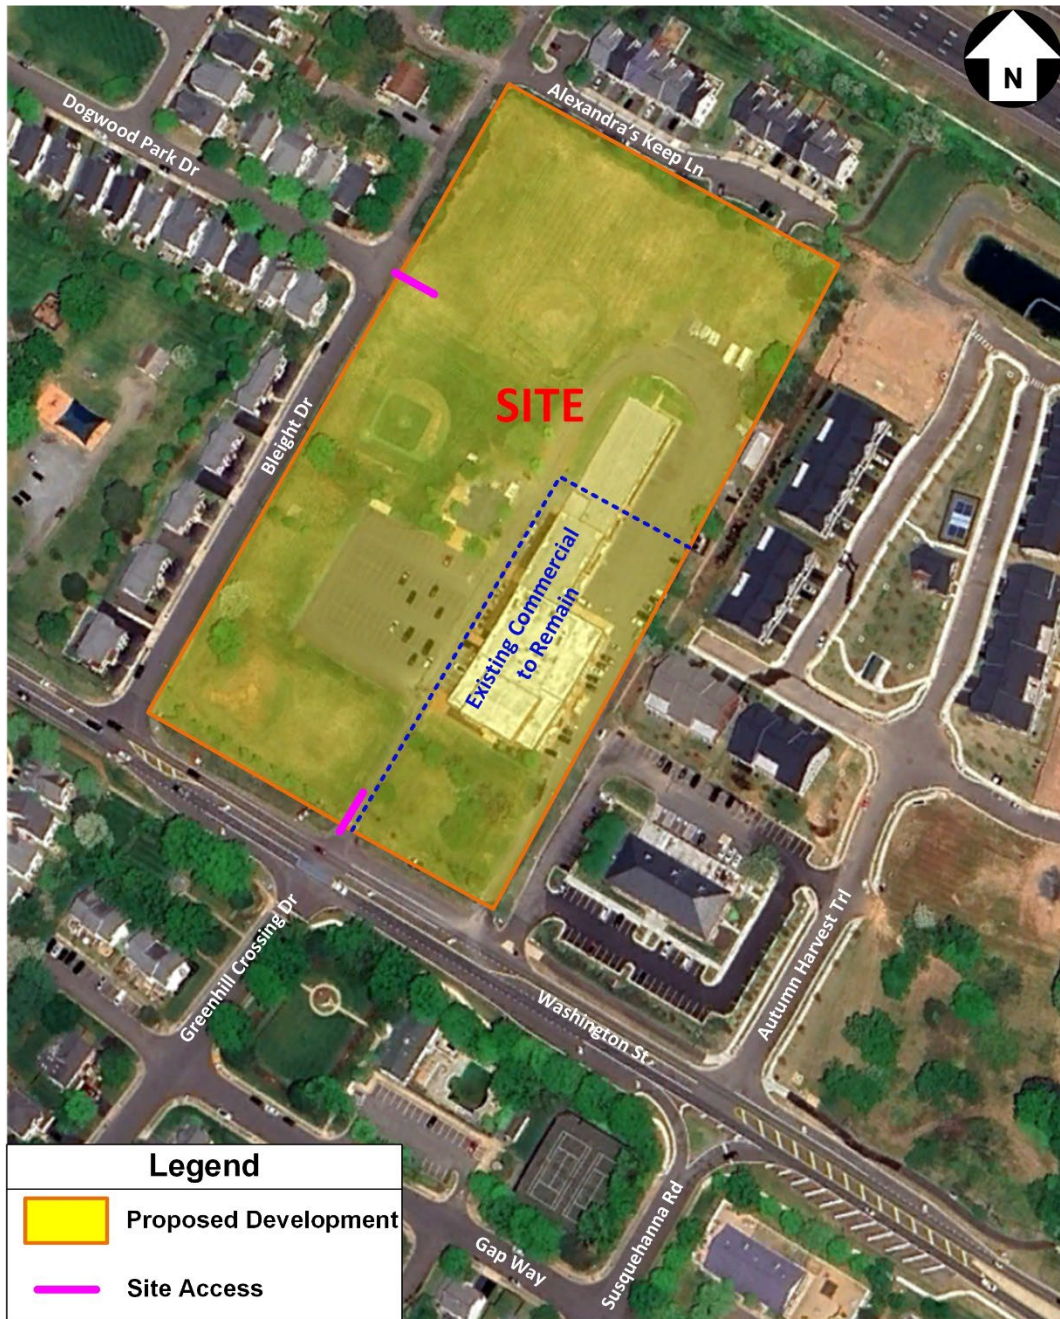

Figure 1: Site Location & Access

Location within Jurisdiction and Region

The site is located in the northeast quadrant of the intersection of Washington St (Rte. 55) & Bleight Dr and is approximately 0.9 miles from the intersection of Washington St (Rte. 55) & James Madison Hwy (US-15). The site is located approximately 1.0 mile southeast of the interchange of James Madison Hwy (US-15) and I-66 shown in Figure 3. The site is also located approximately 1.3 miles northwest of the interchange of John Marshall Hwy (Rte. 55) and Lee Hwy (US-29).

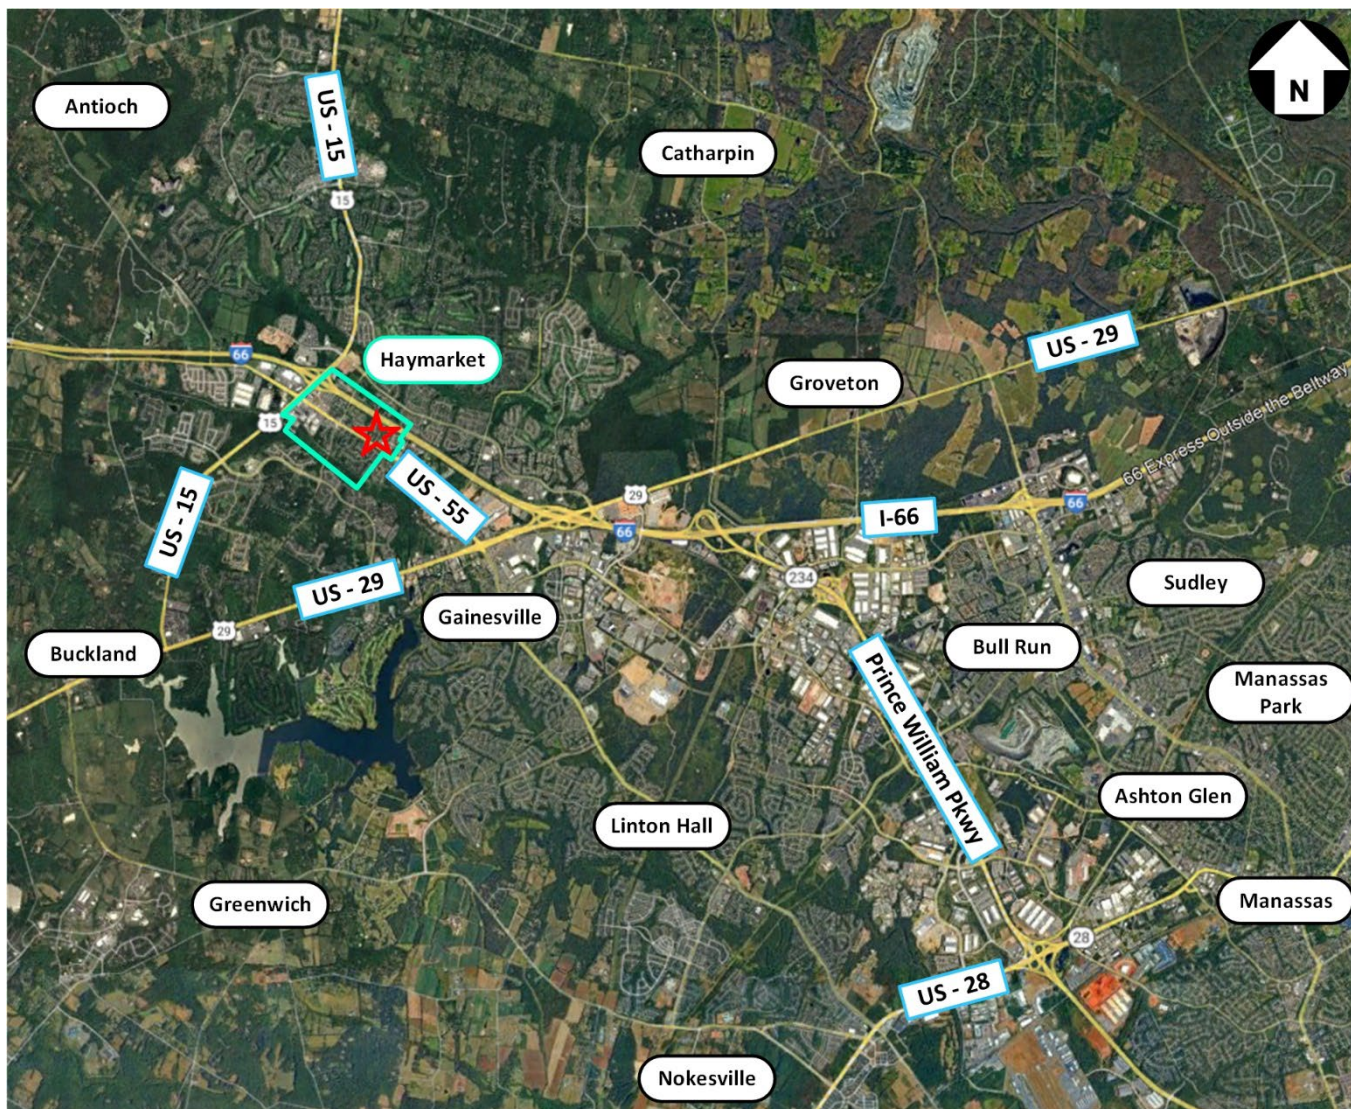

Figure 2: Regional Location

Existing Zoning and Long-Range Land-Use

The existing zoning for the site is Town Center (B-1) as shown on Figure 3 and the Town of Haymarket's Planned Use designation for the site is Public as shown on Figure 4.

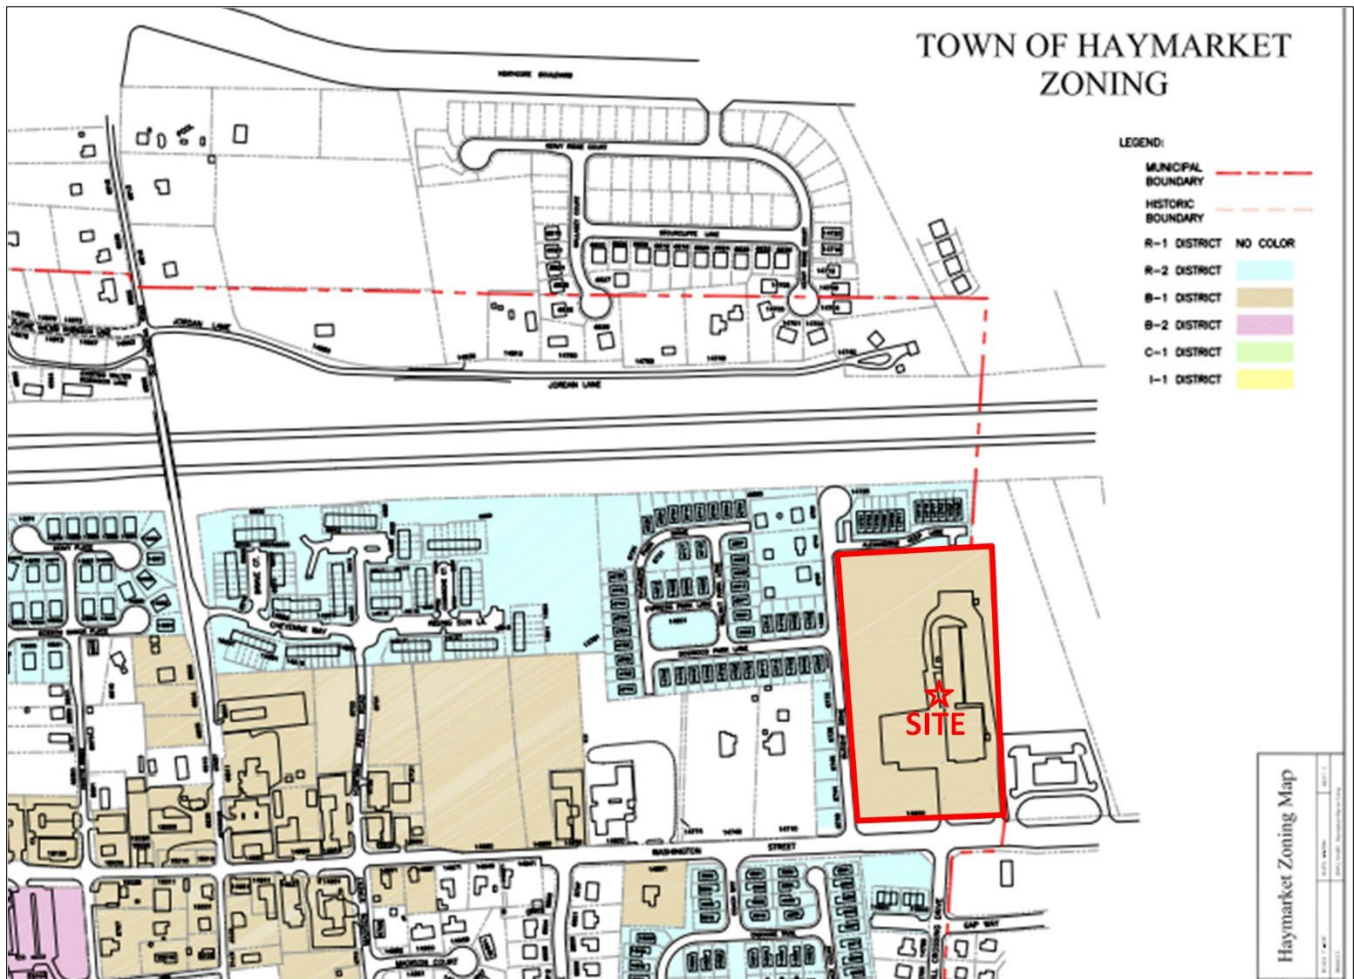

Figure 3: Zoning Map
(Source: Town of Haymarket Zoning)

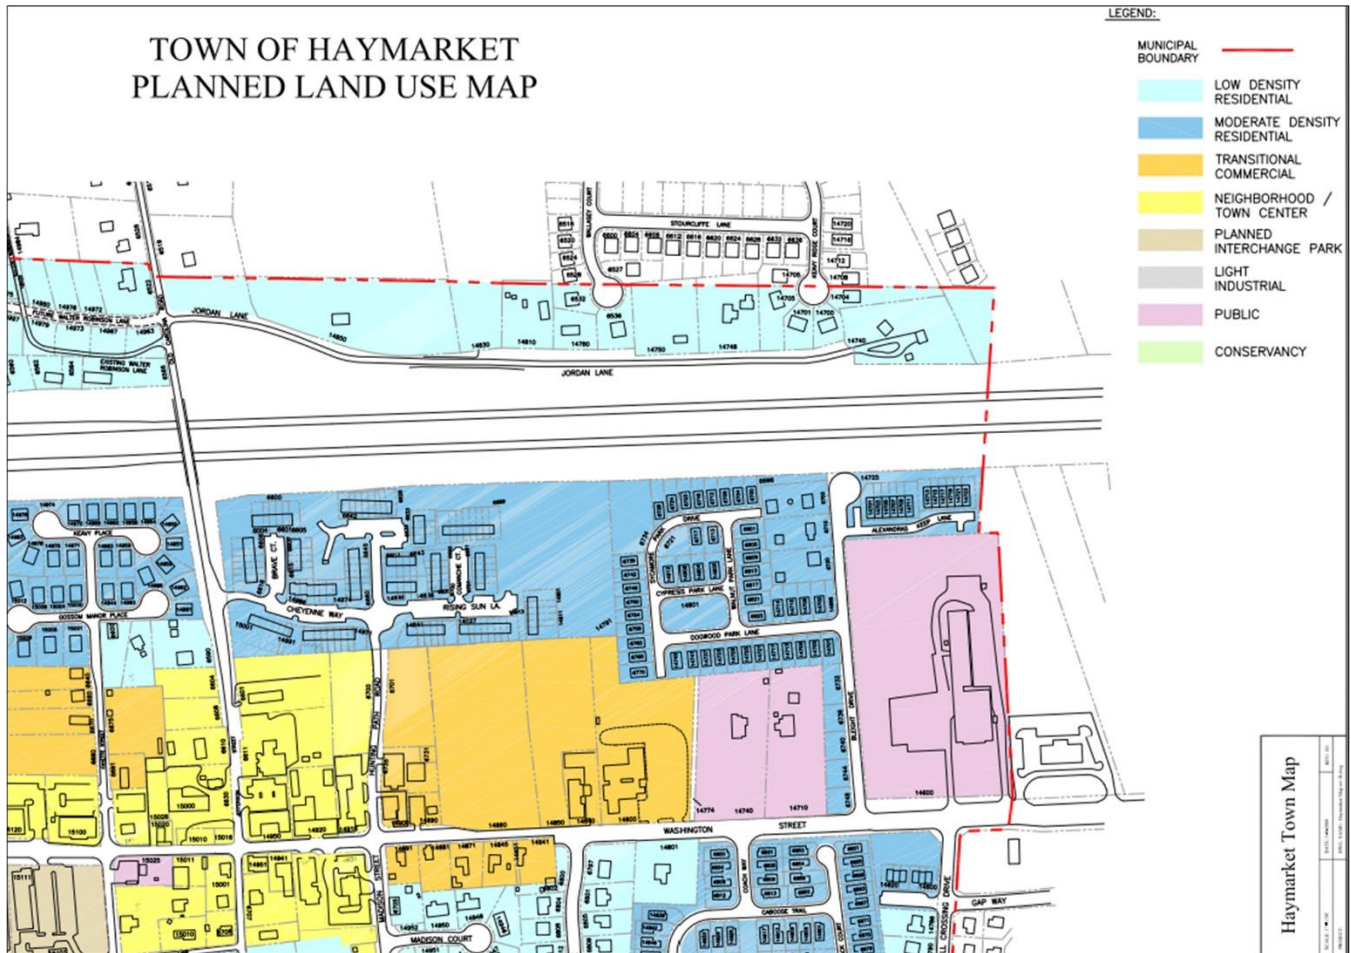

Figure 4: Planned Use Map
(Source: Town of Haymarket Planning Commission)

Descriptions of Geographic Scope of Study and Limits of the Study Area

The geographic scope of the study area was developed in accordance with VDOT and the Town guidance. The vehicular study area includes the following six (6) existing intersections:

- Intersection #1:** Washington St (Rte. 55) & Bleight Dr (existing full movement, two-way stop controlled);
- Intersection #2:** Washington St (Rte. 55) & Greenhill Crossing Dr/Site Access #1 (existing full movement on south side, one way entrance on north side, two-way stop controlled);
- Intersection #3:** Washington St (Rte. 55) & Site Access #2 (existing two-way stop controlled, one way exit);
- Intersection #4:** Washington St (Rte. 55) & Commercial Access (existing Right-In/Right-Out (RIRO));
- Intersection #5:** Washington St (Rte. 55) & Autumn Harvest Trl/Susquehanna Rd (existing partial movement, two-way stop controlled);
- Intersection #6:** Bleight Dr & Dogwood Park Dr/Future Site Access #3 (future site access proposed as fourth leg to existing intersection).

An aerial of the study intersections is provided in Figure 5.

Figure 5: Aerial of Study Boundaries (Study Intersections)

Existing Roadway Network

Washington St (Rte. 55) is the major road for this transportation study and the roadway information is displayed in Table 1 below.

Table 1: Washington St (Rte. 55) Roadway Information

| Roadway | RTE # | VDOT Classification | Posted Speed Limit (mph) | AADT (vpd) | k-factor |
|---------------|-------|---------------------|--------------------------|------------|----------|
| Washington St | VA 55 | Major Collector | 25 | 13,000 | 8.9% |

Source: 2023 VDOT Published AADT Traffic Data

Planned Future Transportation Improvements

Roadway Improvements

There were no roadway improvements identified near the intersections for this transportation study. The roadway configuration for Washington St is expected to remain the same in all analyzed scenarios.

Analysis of Existing Conditions (2025)

In order to project the future traffic conditions, it was necessary to create a baseline “existing” scenario. For the purposes of this report and as agreed to by VDOT and Town staff, 2025 roadway conditions were considered to be as “existing.”

Existing Roadway Safety Assessment

Historical crash data was obtained from VDOT's Crash Analysis Tool for the existing study intersections for a five-year period between January 2020 through December 2024. The summary of the reported crashes at the specified intersections are shown in Table 2.

The crash data by intersections is provided in Appendix I of this document.

Table 2: Historical Crash Data Summary (January 2020- December 2024)

| Intersection | Approximate ADT | PDO | IC | Fatality | Total | Crash Rate (Per MEV) |
|---|-----------------|-----|----|----------|-------|----------------------|
| #2 Washington St (Rte. 55) at Greenhill Crossing Dr/Site Entrance | 13,000 | 3 | 0 | 0 | 3 | 0.13 |

*Note the same ADT for each intersection was assumed for all years.

The intersection crash rate was computed for the existing study intersections using the following formula and was calculated as crashes per one million entering vehicles (“MEV”). The approach average daily traffic volumes ($ADT_{approach}$) were derived from calculations based on the existing link ADTs.

$$Rate_{intersection} = \frac{1,000,000 * \# \text{ of Crashes}}{\# \text{ of Years} * 365 \left(\frac{\text{days}}{\text{year}} \right) * ADT_{approach}}$$

Typically, a crash rate of 1.0 MEV or higher is an indication that further study may be required. A rate over 1.0 MEV does not necessarily mean there is a significant problem at an intersection, but rather it is a threshold used to identify which intersections may have an elevated crash rate due to operational, geometric, or other deficiencies.

Table 3: VDOT Crash Data at Washington St (Rte. 55) & Greenhill Crossing Dr/Site Entrance (Intersection #2)

| Crash Data for the Intersection of Washington St (Rte. 55) and Greenhill Crossing Dr/Site Entrance (January 2020 - December 2024) | | | | | | | |
|---|------|------|------|------|------|-------|--------------------|
| Intersection Crash Analysis | 2020 | 2021 | 2022 | 2023 | 2024 | Total | Relative Frequency |

| Distracted Driver | | | | | | | 0.00% |
| Alcohol** | | | | | | | 0.00% |
| Work-Zone | | | | | | | 0.00% |
| Inclement Weather (Non-Dry) | | | | 1 | | 1 | 33.33% |
| Speeding | | | | | | | 0.00% |
| Pedestrian Injury*** | | | | | | | N/A |
| Time of Day | | | | | | | |
| AM Peak Period (6 - 10 AM) | | | | | | | 0.00% |
| Off Peak - Daytime (10 AM - 3 PM) | | | | 2 | | 2 | 66.67% |
| PM Peak Period (3 - 7 PM) | | 1 | | | | 1 | 33.33% |
| Off Peak - Nighttime (7 PM - 6 AM) | | | | | | | 0.00% |
| CALCULATED CRASH RATE**** | | | | | | 0.13 | Crashes per MEV |

* It should be noted that an intersection radius of 150 feet was used in this analysis. Crashes also thought to be caused by the intersection may have been added based on the description of the crash and engineering judgement.

** Instances where the event was classified as "Unknown", "Not Known Whether Impaired", "Ability Not Impaired" were classified as alcohol related to provide a more conservative analysis.

*** Pedestrian injuries are based on the number of pedestrians injured and may not be directly be related to the number of crash incidences (i.e., if one crash occurred injuring two pedestrians, the table would show a "2" instead of a "1").

****Crash rate based on an approximated 12400 ADT.

As shown in Table 3 above, Intersection #2 had 3 reported crashes over the five-year period. The crash report for this intersection shows 100% of the crashes were classified as PDO (Property Damage Only). Average Daily Traffic (ADT) was reported at this intersection based on existing collected counts (2025). The intersection has a calculated crash rate of 0.13 crashes per MEV. Therefore, this intersection is not considered a high crash location.

There were no reported crashes within a 150-foot radius of the other study intersections of this report.

Additionally, study intersection #3 is planned to be removed in the future condition with the proposed development as the existing spacing between the access and the commercial driveway does not meet the VDOT access management standards.

Existing Traffic Volumes

In order to determine the weekday morning (AM) and weekday afternoon (PM) peak hour turning movement traffic volumes, traffic counts were conducted at the following study intersections on Tuesday, June 3, 2025, during the weekday morning, weekday afternoon peak periods, and weekend afternoon (SAT) peak period. Please note there was approximately 4,700 SF of vacant commercial and church space at the time of collected counts, had the building been fully leased, the traffic volumes for the existing conditions would be slightly higher than presented in the report.

The system peak hours for the six (6) study intersections were determined to be:

- Weekday Morning (AM) Peak Hour: 8:00 AM to 9:00 AM
- Weekday Afternoon (PM) Peak Hour: 4:30 PM to 5:30 PM
- Saturday (SAT) Peak Hour: 5:45 PM to 6:45 PM

The 2025 existing road network lane configuration is presented in Figure 6. The 2025 existing conditions peak hour traffic volumes for the six (6) existing intersections within the study area are illustrated in Figure 7. The average daily traffic (“ADT”) volumes, depicted in this figure and in subsequent volume graphics, were calculated based on the PM peak hour turning movement volumes and multiplied by the VDOT historical k-factors from 2023. If the historic k-factor data was not available for a given roadway or roadway segment, then a k-factor of 0.10 was assumed.

Please note all vehicle maneuvers and volumes were balanced throughout the six (6) study intersections. The raw data for the existing turning count movements are provided in Appendix B.

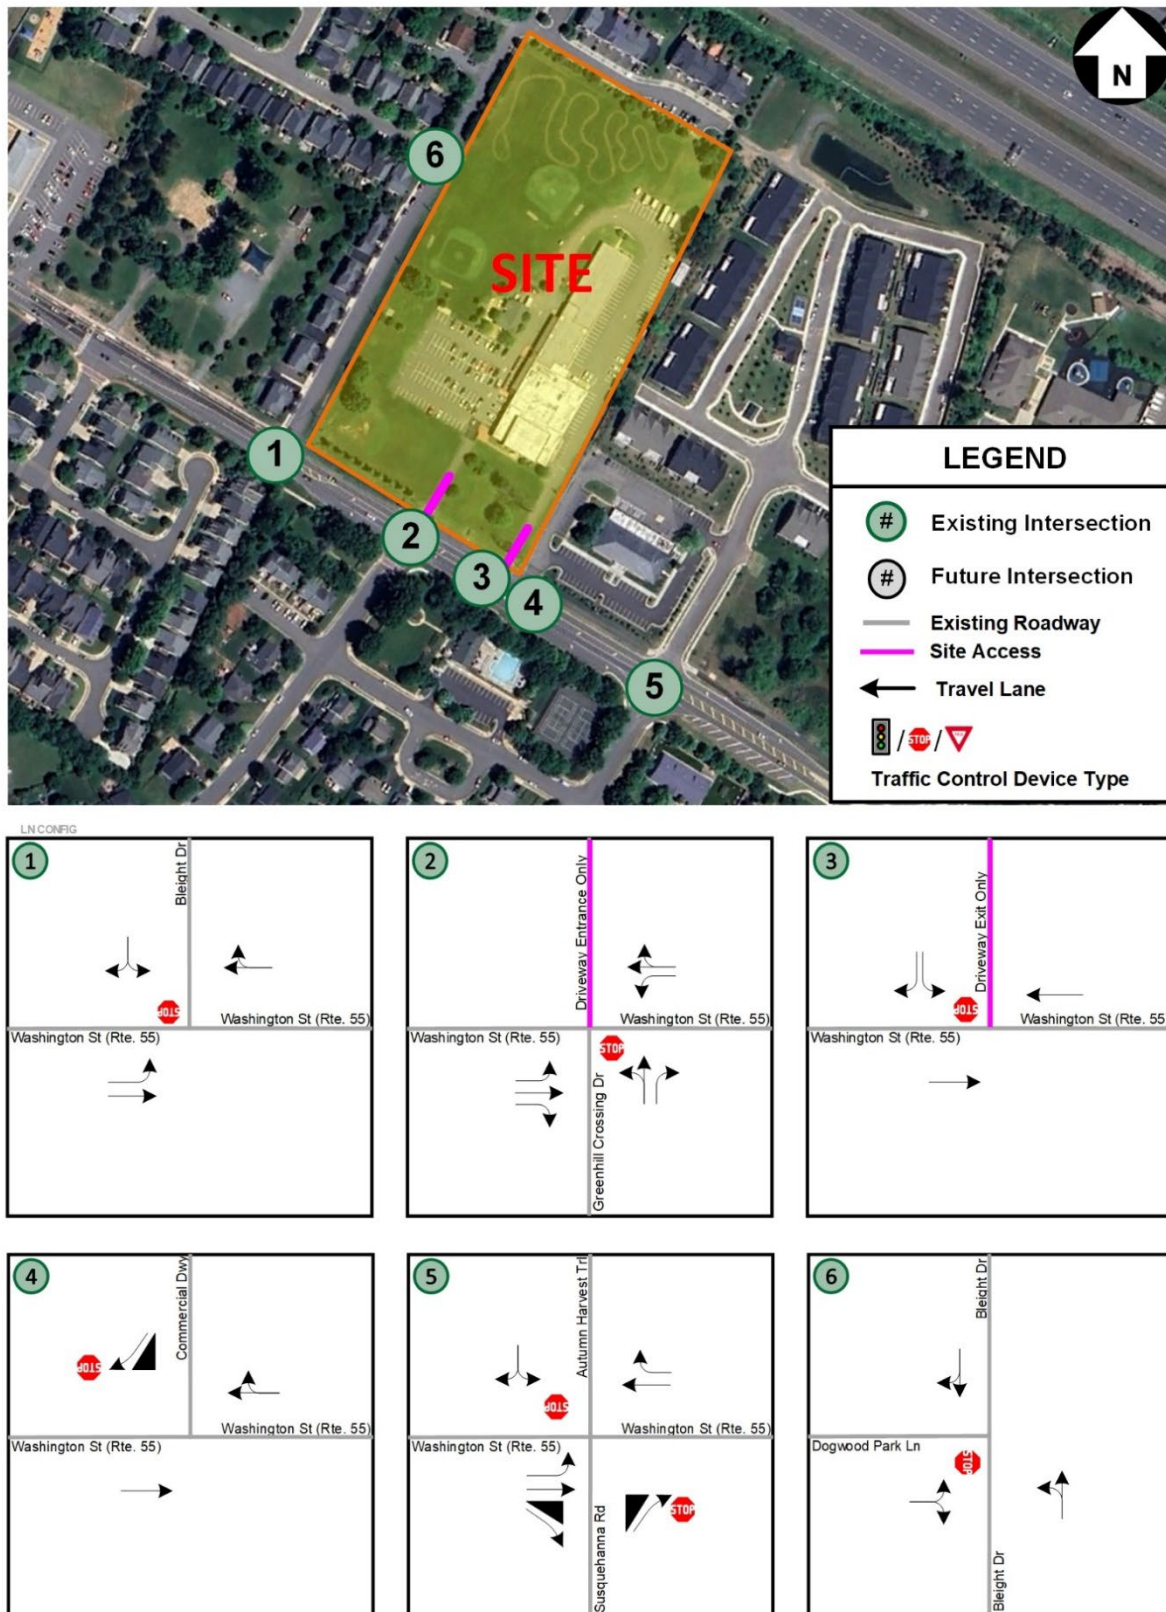

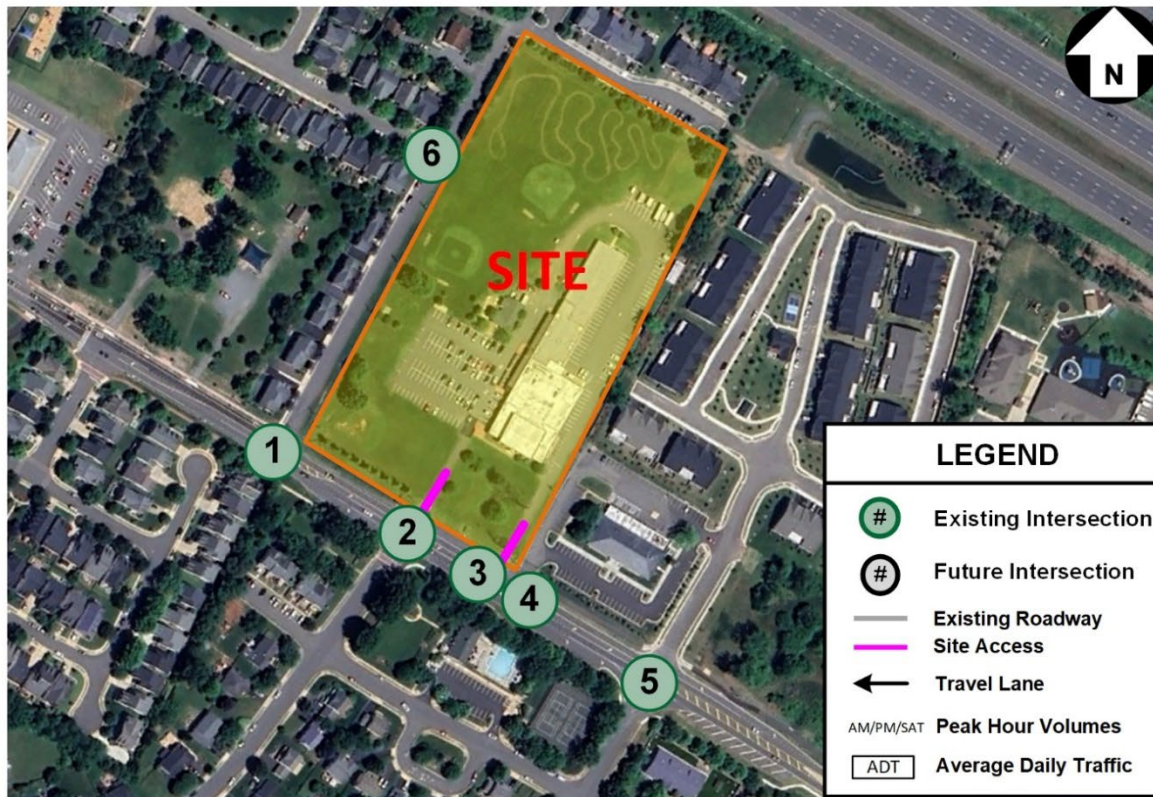

Figure 6: 2025 Existing Conditions – Roadway Network Geometric Configuration and Traffic Control Devices

*Please note, prohibited eastbound & southbound left turns observed at INT #3. Prohibited southbound left turn at Int #4

Figure 7: 2025 Existing Conditions – Vehicular Traffic Volumes

It should be noted that Figure 7 above illustrates the peak hour volumes by movement. The existing lane configuration for the study intersections should be referred from Figure 6. Please note that prohibited movements at Intersection #2 and #3 were observed as shown.

Existing Intersection Capacity and Queueing Analysis

Intersection capacity and queueing analyses were performed for the Existing Conditions (2025) scenario at the study area intersections during AM, PM, and SAT peak hours. *Synchro*, version 11, was used to analyze the study intersections with results based on the Federal Highway Administration's (FHWA) Highway Capacity Manual¹ ("HCM") and analysis guidelines provided in VDOT's Traffic Operations and Safety Analysis Manual ("TOSAM"). The analysis herein includes level of service ("LOS"), delay, and queue length comparisons for the turning movements analyzed.

Signal timings and *Synchro* files were obtained from VDOT and were utilized as base for the analysis models. Traffic operation conditions as well as lane configurations were field verified. The existing traffic volumes discussed in the aforementioned section as well as other relevant data were entered into the analysis models. For the purposes of this analysis, the existing peak hour factors ("PHF") were based on the traffic count and utilized on a by-intersection basis; PHF in the range of 0.85 to 1.00 were used for the existing scenario, consistent with VDOT analysis guidelines. Heavy vehicle percentages ("HV%") were based on existing traffic count data for each individual lane group.

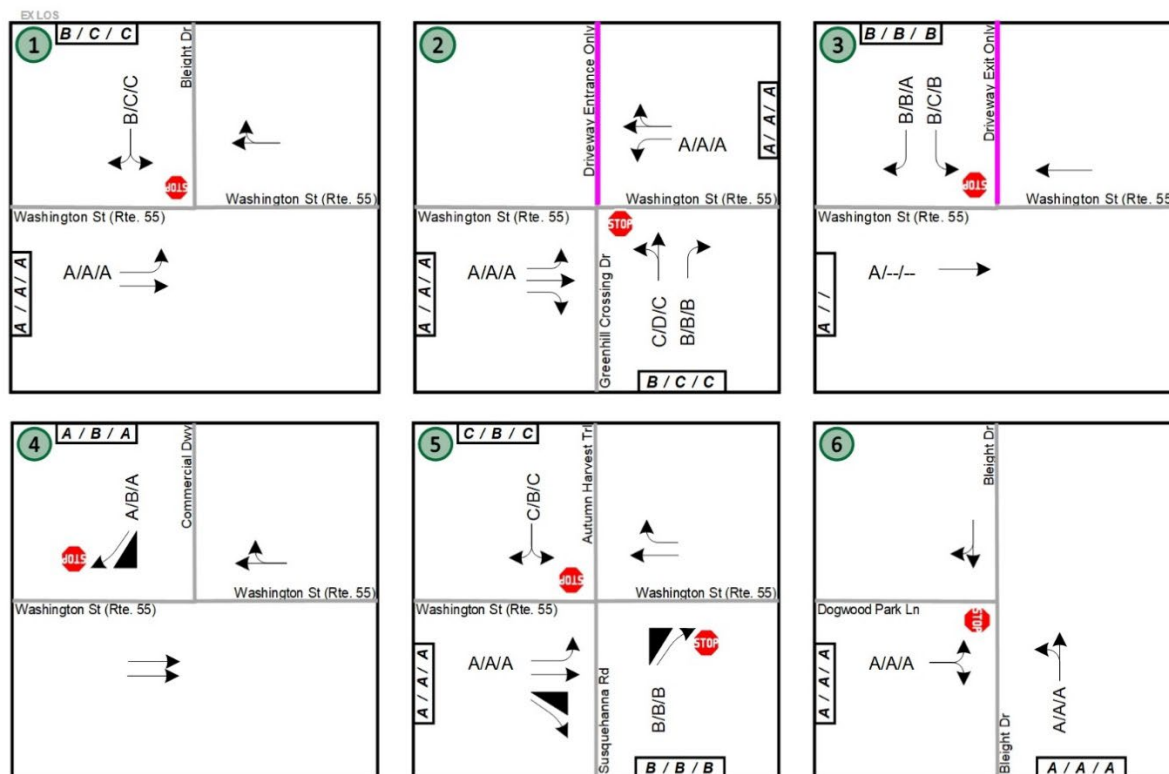

Per the scoping meeting with VDOT and the Town staff, it would be considered acceptable and/or desirable to achieve an approach LOS D or better for traffic operations using HCM 6th edition methodology and HCM 2000 where applicable. The results of the intersection capacity analyses from *Synchro* are presented in Table 4 and graphically in Figure 8. The results are expressed in LOS and delay (seconds per vehicle) for overall signalized intersections and per approach and lane group for all study intersections. The overall signalized intersections and any approaches that operate at LOS F and E are displayed in red.

The 95th percentile queues were also determined from *Synchro* and are expressed in feet. The lane groups where the queue lengths exceeded the available effective storage capacity of existing turn lanes are displayed in red.

The description of different LOS and delay are included in Appendix J. The detailed analysis worksheets of 2025 Existing Conditions are contained in Appendix C.

Table 4: Existing Conditions (2025) – Intersection Capacity and Queuing Analysis Results

| No. | Intersection (Movement) | Effective Storage | AM Peak Hour | | | PM Peak Hour | | | SAT Peak Hour | | |

Figure 8: 2025 Existing Conditions – Level of Service Results

As mentioned previously, it would be considered acceptable and/or desirable to achieve an approach LOS D or better for traffic operations using HCM 6th edition methodology and HCM 2000 where applicable.

Analysis Terms:

- Level of Service (LOS) is based upon the traffic volume present in each lane on the roadway, the capacity of each lane at the intersection and the delay (in seconds) associated with each directional movement. This evaluation is consistent in all traffic analysis scenarios. Please refer to definitions of Level of Service in Appendix J.
- The 95th percentile queue length refers to the queue length within which 95% of all observed queues are contained during a specific analysis period. This evaluation is consistent in all traffic analysis scenarios.

The results of the Existing Conditions (2025) analysis scenario are as follows:

- All the approaches and the overall intersection operate at acceptable levels of service for all of the study intersections.
- All the anticipated 95th percentile queues are contained in the available storage length for all the study intersections.

Analysis of Future Conditions without Development 2029

For the purposes of this study, the development is anticipated to be constructed by 2029; this scenario analyzes the future without development conditions for the year 2029.

The derivation of future without development traffic volumes was based on assumptions and parameters discussed with VDOT and the Town during the scoping process for this report. The future conditions include anticipated inherent regional growth, the inclusion of any potential background developments in the pipeline around the vicinity of the site, and anticipated roadway improvements.

Inherent Regional Growth

The development is anticipated to be completed in 2029. In order to account for increased demand on the traffic network, an inherent growth rate was applied to the future scenarios. This “inherent” growth was anticipated to account for regional development within the at-large area, which would ultimately result in increased roadway demand. Furthermore, the inherent growth was anticipated to account for any potential background developments unaccounted for within the vicinity of the study area. Historical VDOT AADT data for roadways bounding the site are shown in Table 5.

Table 5: Historical Regional Growth within Vicinity of the Road Network

| Road Segment: | From: | To: | Published VDOT AADT | | | | |
|---------------|-----------------|------------------------|---------------------|-------|-------|-------|--------|
| | | | 2019 | 2020 | 2021 | 2022 | 2023 |
| Washington St | Old Carolina Rd | Town of Haymarket Bdry | 11,000 | 7,900 | 9,000 | 9,950 | 13,000 |

Source: VDOT Published AADT Traffic Data

As agreed upon in the scope for this study, to account for 2029 future conditions, an inherent growth rate of 2.0%, compounded annually over a four-year period, between 2025 to 2029 (and totaling 8.24% growth of the existing volumes) was applied to the mainline through movements on Washington St (Rte. 55) traveling eastbound and westbound.

The inherent regional growth volumes (for the period between 2025 and 2029) are illustrated in Figure 9.

Potential Background Development(s)

One (1) background development was identified in the scoping meeting for inclusion in this study. The 6700 Bleight Drive background development is anticipated to consist of 11 single-family attached dwelling units. Volumes associated with this development are included in the Total Future without Development (future background) scenario of the analysis. The Institute of Transportation Engineers' (ITE) Trip Generation Manual, 11th Edition, publication was used to determine the total trips going into and out of the subject study site during the weekday morning (AM), weekday afternoon (PM) peak hours, typical weekday daily trips, and weekend (SAT) peak hour and daily trips. The projected trip generation for the 6700 Bleight Drive development using ITE rates is depicted in below.

Table 6: 6700 Bleight Drive Site Trips

| Land Use | ITE Code | Size | Weekday | | | | | | Weekend | | | |
|---|----------|-------|--------------|----------|----------|--------------|----------|----------|-------------|--------------------|----------|----------|
| | | | AM Peak Hour | | | PM Peak Hour | | | Daily Total | Saturday Peak Hour | | |
| | | | In | Out | Total | In | Out | Total | | In | Out | Total |
| Proposed Use | | | | | | | | | | | | |
| *Single-Family Attached Housing (RATES) | 215 | 11 DU | 1 | 4 | 5 | 4 | 2 | 6 | 79 | 3 | 3 | 6 |
| Total Trips | | | 1 | 4 | 5 | 4 | 2 | 6 | 79 | 3 | 3 | 6 |

*ITE equations not applicable for proposed density - ITE rates used in lieu.

The 6700 Bleight Drive development is anticipated to generate approximately 5 trips in the AM peak hour, 6 trips in the PM peak hour, 79 typical weekday daily trips, 6 Saturday peak hour trips, and about 96 Saturday daily trips.

Potential Roadway Improvement(s)

There were no identified background transportation improvements near the proposed development.

Future without Development Lane Configuration

There were no adjustments to the roadway configuration identified for the future without development (future background) scenario. Therefore, the lane configuration is assumed to be the same as the existing lane configuration illustrated previously in Figure 6.

Future without Development (2029) Traffic Volumes

In order to forecast the future (without development) traffic volumes for the year 2029, the 2025 existing traffic volumes were combined with the inherent growth traffic volumes presented in Figure 9 and the background trips associated with the one (1) background development shown in Figure 10. The trip generation summary tables for background development will be included in Appendix D.

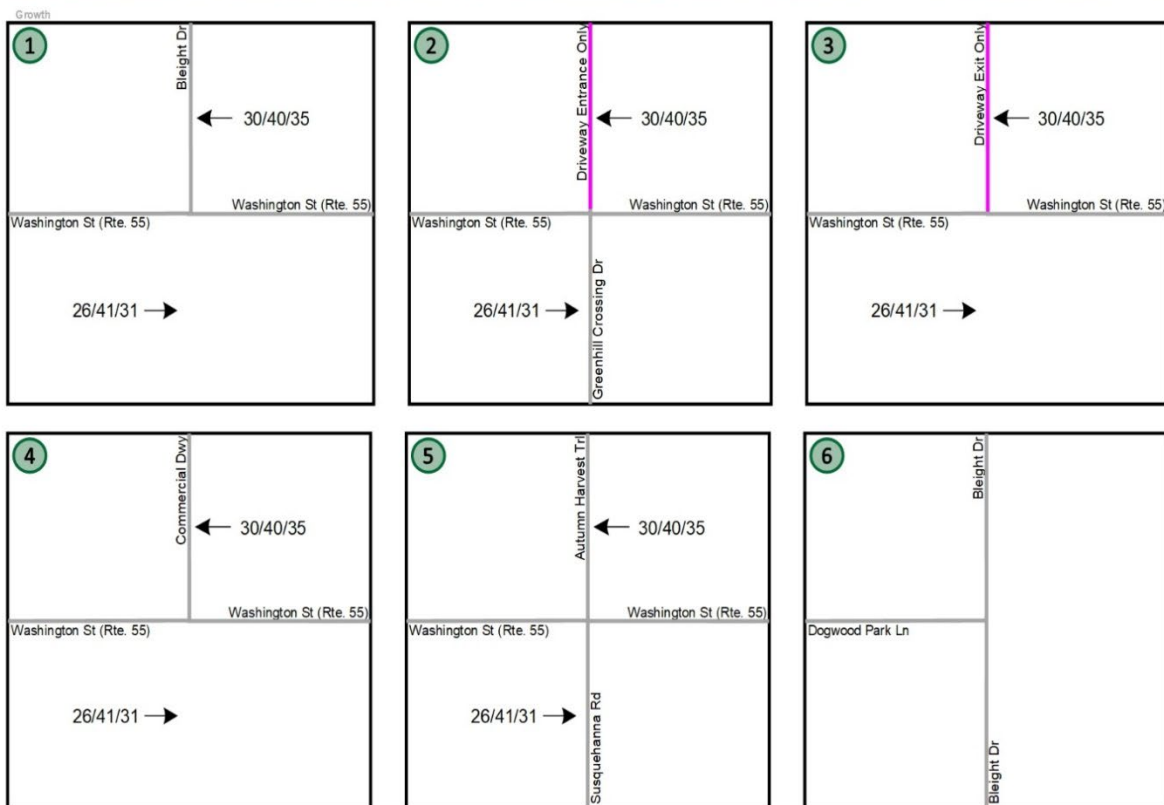

Figure 9: Projected Inherent Regional Growth Traffic Volumes (2025 to 2029)

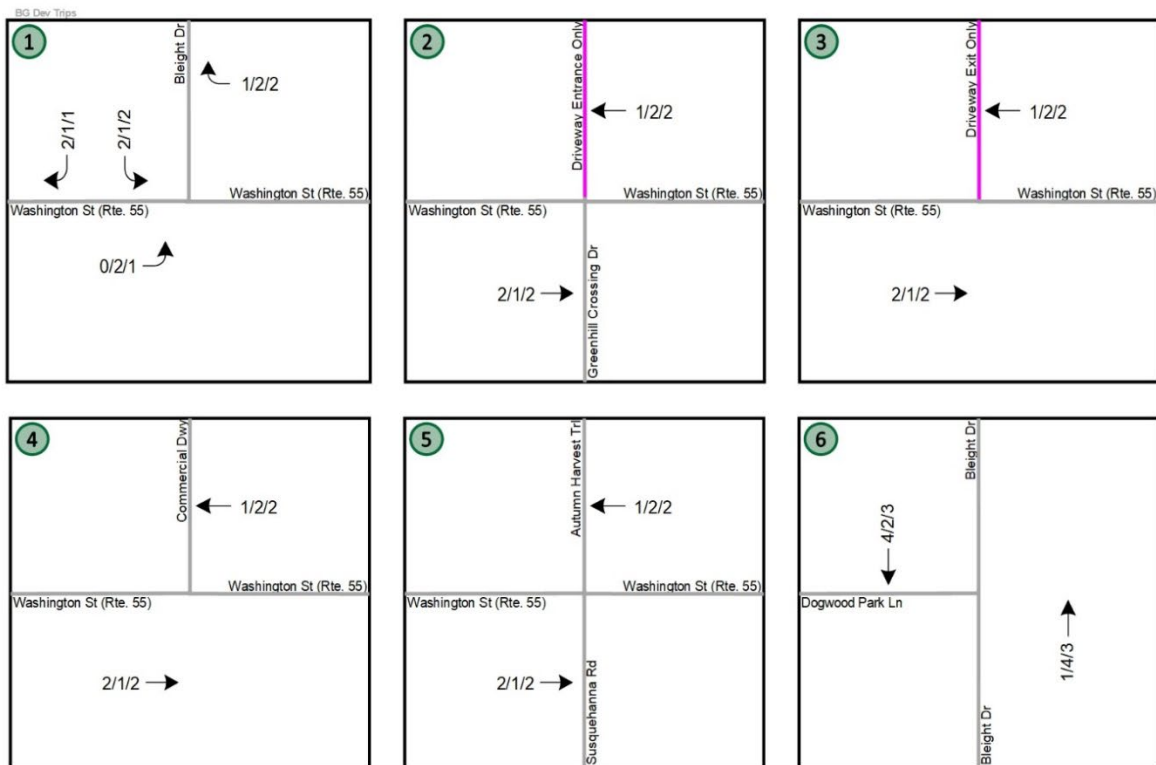

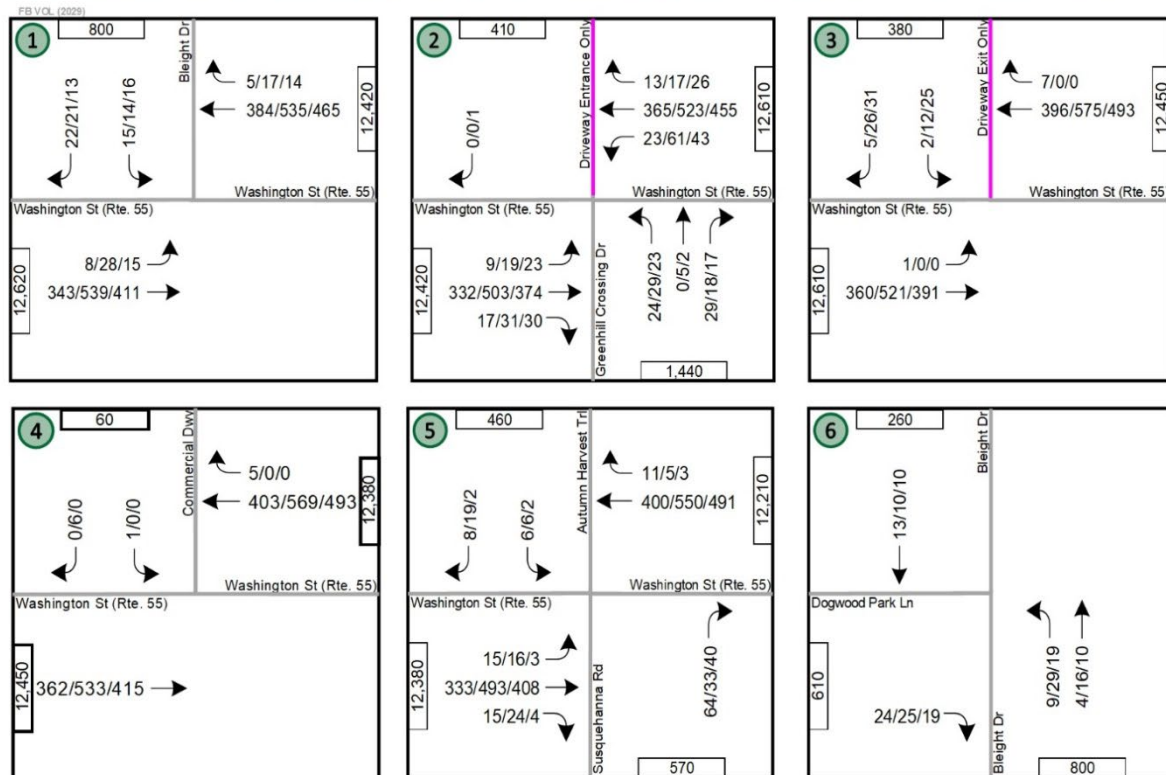

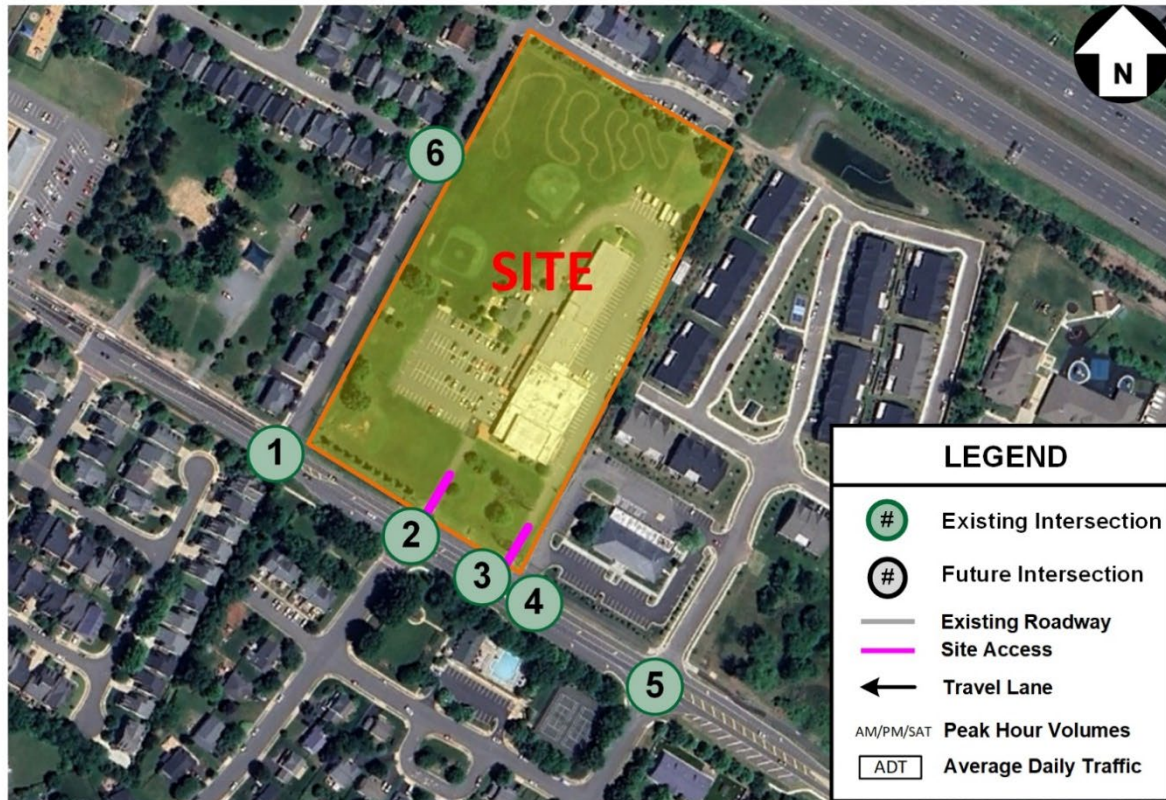

Figure 10: 6700 Bleight Drive Background Development Site Trips

The Future without Development (2029) volumes were derived by adding the projected inherent growth and background development site generated trips to the existing volumes and are illustrated in Figure 11.

*Please note, prohibited eastbound & southbound left turns observed at INT #3. Prohibited southbound left turn at Int #4

Figure 11: 2029 Future Conditions without Development – Vehicular Traffic Volumes

Future without Development Intersection Capacity and Queueing Analysis

Intersection capacity analyses were performed for the 2029 Future Conditions without Development scenario at the study area intersections during the AM, PM, and SAT peak hours. *Synchro*, version 11, was used to analyze the study intersections with results based on the HCM and analysis guidelines provided in VDOT's TOSAM. The analysis herein includes LOS, delay, and queue length comparisons for the turning movements analyzed.

The intersection PHF utilized in the analysis of future conditions was determined based on the existing traffic counts with a minimum of 0.92. The HV% were based on existing traffic count data.

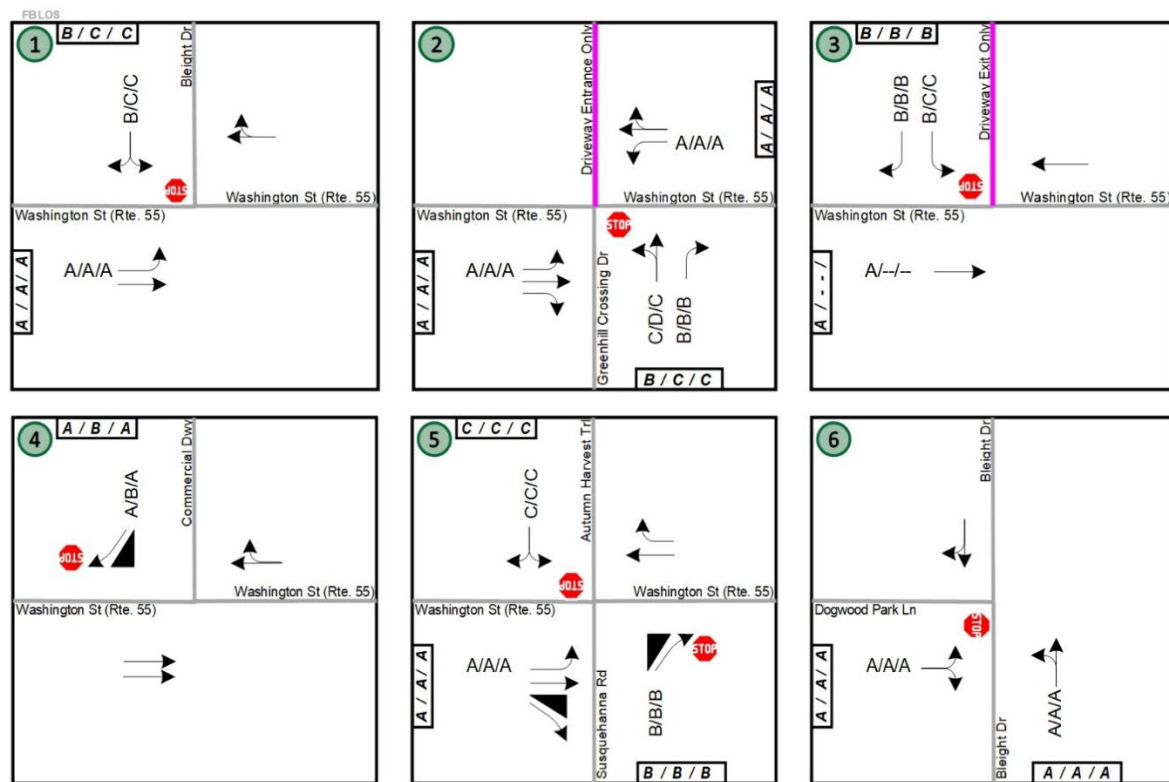

The results of the intersection capacity analyses from *Synchro* are presented in Table 7 and graphically in Figure 12. The results are expressed in LOS and delay (seconds per vehicle) for overall signalized intersections and per approach and lane group for all study intersections. The overall signalized intersections and any approaches that operate at LOS F and LOS E are displayed in red.

The 95th percentile queues were also determined from *Synchro* and are expressed in feet. The lane groups where the queue lengths exceeded the available storage lengths of future turn lanes are displayed in red.

The detailed analysis worksheets of the 2029 Future Conditions without Development are contained in Appendix E.

Table 7: Future Conditions without Development (2029) – Intersection Capacity and Queueing Analysis Results

| No. | Intersection (Movement) | Effective Storage | AM Peak Hour | | | PM Peak Hour | | | SAT Peak Hour | | |
|---|---|-------------------|--------------|-----------------|--------------------|--------------|-----------------|--------------------|---------------|-----------------|--------------------|

Figure 12: 2029 Future Conditions without Development – Level of Service Results

Analysis Terms:

- Level of Service (LOS) is based upon the traffic volume present in each lane on the roadway, the capacity of each lane at the intersection and the delay (in seconds) associated with each directional movement. This evaluation is consistent in all traffic analysis scenarios. Please refer to definitions of Level of Service in Appendix J.
- The 95th percentile queue length refers to the queue length within which 95% of all observed queues are contained during a specific analysis period. This evaluation is consistent in all traffic analysis scenarios.

The results of the Future without Development Conditions (2029) analysis scenario are as follows:

- All the approaches and the overall intersection operate at acceptable levels of service for all of the study intersections.
- All the anticipated 95th percentile queues are contained in the available storage length for all the study intersections.

Analysis of Future Conditions with Development (2029)

For the purposes of this study, the development is anticipated to be constructed by 2029.

Site Description

The site is located in the Town of Haymarket. The site is generally bounded by Alexandra's Keep Ln to the north, Washington St (Rte. 55) to the south, an existing residential community and office space to the east, and Bleight Dr to the west.

The planned development program for the site includes mix uses with approximately 26,000 SF of commercial/office land uses and about 61 single family attached (townhome) units. Please note, a portion of the site is currently occupied by existing commercial uses. A portion of the commercial uses, approximately 5,900 SF of office space, are planned to be removed with this application while the remaining 26,000 SF is anticipated remain.

Proposed Site Access

The current plan for the development proposes one full access entrance (inbound and outbound) along Washington St at the existing entrance which is used as a one-way loop today. The existing exit only is planned to be removed due to the proximity to the existing commercial driveway to the east. The removal of the access along Washington St is anticipated to increase the safety of the vehicles using the commercial entrance to the east. The development is also planning to construct a fourth leg to the intersection of Bleight Dr & Dogwood Park Ln as illustrated in Figure 13. Please note that the plans shown in this report are subject to change.

Figure 13: Preliminary Site Layout Plan (For Illustrative Purposes Only; Subject to Change)

Projected Site Trip Generation

In order to calculate the trips generated by the proposed development, the Institute of Transportation Engineers' (ITE) Trip Generation Manual, 11th Edition, publication was used to determine the total trips going into and out of the subject study site during the weekday morning (AM), weekday afternoon (PM) peak hours, typical weekday daily trips, and weekend (SAT) peak hour and daily trips. The projected trip generation for the proposed development is depicted in Table 8. The anticipated development program will consist of approximately 61 single-family attached dwelling units. For the purposes of evaluating a conservative operational analysis, the development program analyzed assumes 65 dwelling units.

Table 8: Site Trip Generation (Peak Hour of the Adjacent Street; ITE 11th Ed.)

| Land Use | ITE Code | Size | Weekday | | | | | | Weekend | | | | |
|--|----------|-------|--------------|-----|-------|--------------|-----|-------|-------------|--------------------|-----|-------|-----------------|
| | | | AM Peak Hour | | | PM Peak Hour | | | Daily Total | Saturday Peak Hour | | | Sat Daily Total |
| | | | In | Out | Total | In | Out | Total | | In | Out | Total | |
| Proposed Use | | | | | | | | | | | | | |
| Single-Family Attached Housing (EQUA [*]) | 215 | 65 DU | 7 | 21 | 28 | 21 | 14 | 35 | 566 | 23 | 24 | 47 | 414 |
| Total Proposed Trips without Reduction | | | 7 | 21 | 28 | 21 | 14 | 35 | 566 | 23 | 24 | 47 | 414 |
| Internal Capture Residential - Restaurant ¹ | | | 0 | 0 | 0 | -3 | -2 | -5 | -85 | -3 | -4 | -7 | -62 |
| Total Proposed Trips with Reduction | | | 7 | 21 | 28 | 18 | 12 | 30 | 481 | 20 | 20 | 40 | 352 |

The internal reduction is based on the VDOT Updated Administrative Guidelines for the Traffic Impact Analysis Regulations:

(1) residential / non-residential components - smaller of 15% of residential trips or 15% of non-residential trips

As illustrated in the table above, the proposed land use is expected to generate approximately 28 AM peak hour trips, 35 PM peak hour trips, 566 weekday trips, 47 Saturday peak hour trips and 414 Saturday daily trips. The total proposed trip generation with an assumed 15% internal capture reduction (residential to retail/restaurant) is expected to generate approximately 28 AM peak hour trips, 30 PM peak hour trips, 481 weekday trips, 40 Saturday peak hour trips and 352 Saturday daily trips.

Distribution and Assignment of Site Traffic

The distribution and assignment of the site generated trips were based on the existing traffic patterns, engineering judgement, the nature of the proposed development, and with the guidance and input from the VDOT and the Town staff. The site direction of approach for the peak hours trips is illustrated in Figure 14.

Figure 14: Global Vehicular Direction of Approach

Total Future with Development (2029) Lane Configuration

Intersection #2 (Washington St & Greenhill Crossing Dr/Future Site Access #1) which in existing conditions operates as a driveway entrance only, will be reconfigured to be a full access intersection and include a westbound right turn lane. Additionally, Intersection #3 (Washington St & Future Site Access #2) will be removed . Construction of a fourth leg at Intersection #6 (Bleight Dr & Dogwood Park Ln/Future Site Access #3), will serve as the third site access for the proposed development. The Future with Development (2029) Lane Configurations are illustrated in Figure 15.

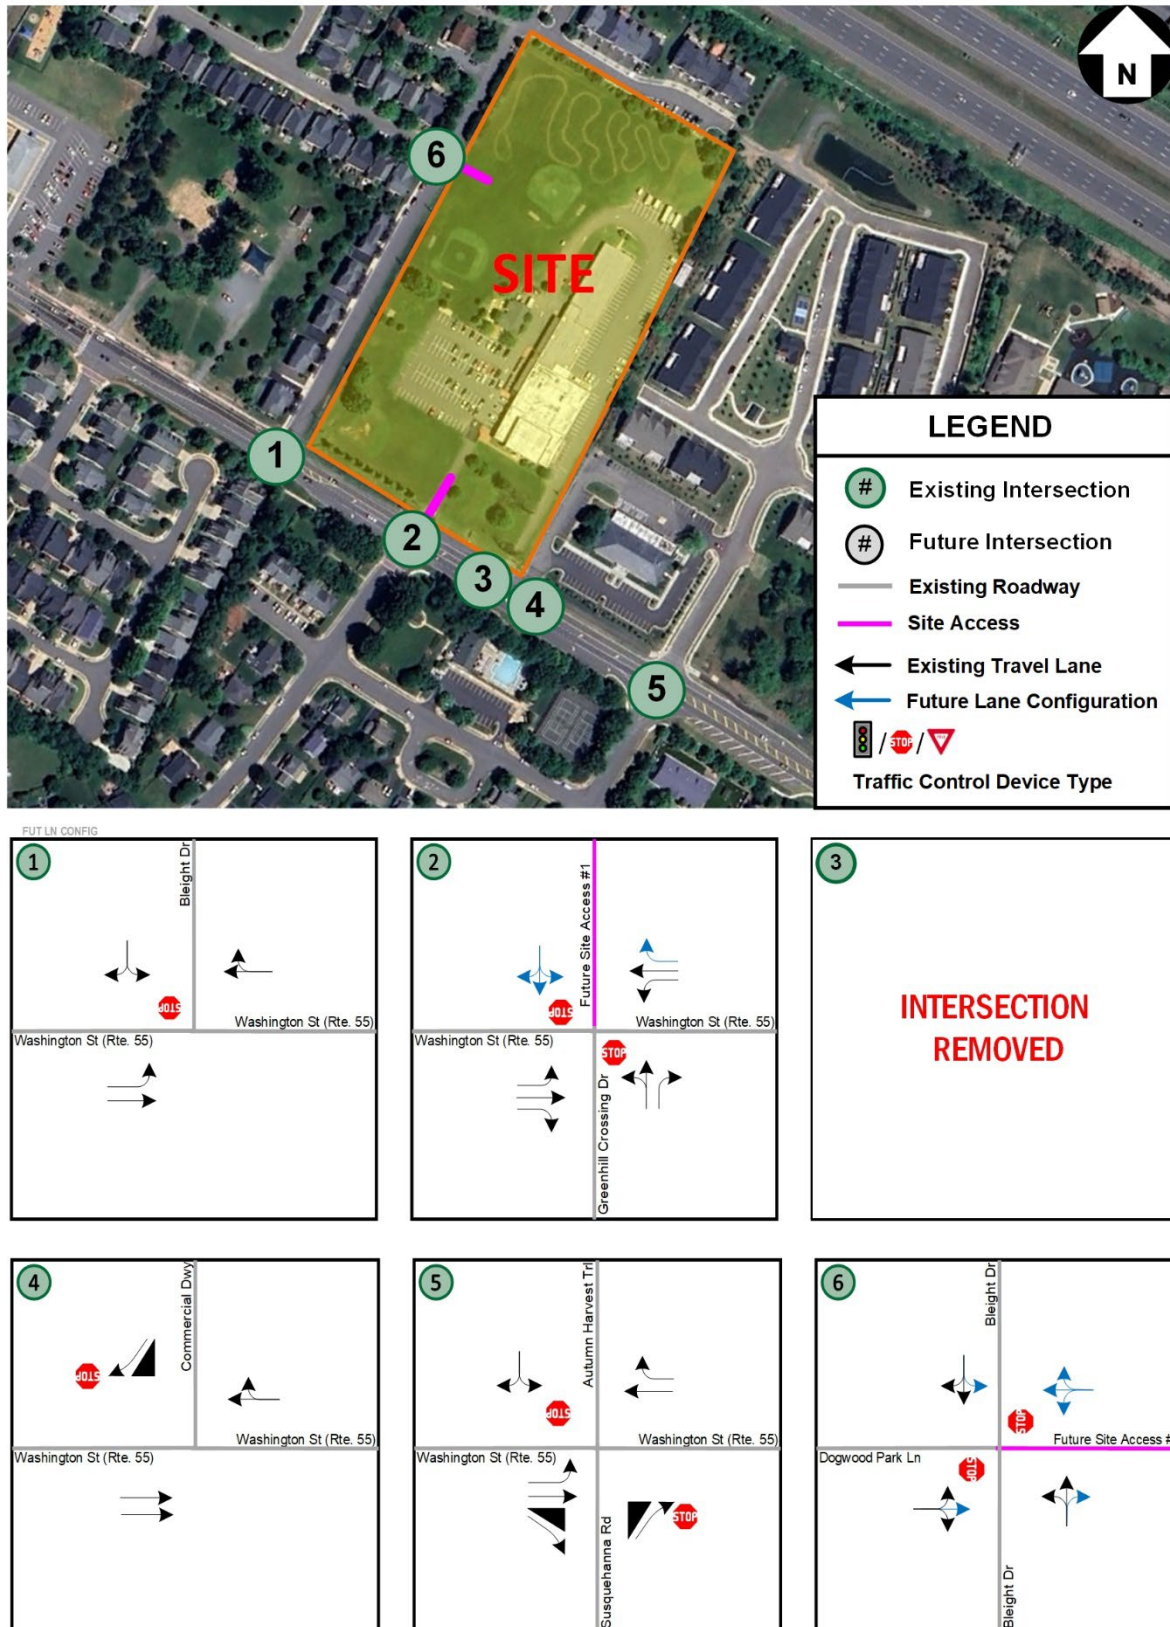

Figure 15: Future with Development 2028 (Roadway Network Geometric Configuration and Traffic Control Devices)

Analysis Scenario: Total Future with Development (2028)

Using the direction of approach, the nature of the proposed development with the associated trip generation, and the location of proposed site entrance per current plans for the development, the site generated trips were assigned to the road network as illustrated in Figure 16. The figure shows site trips assigned to the study area network for the analysis.

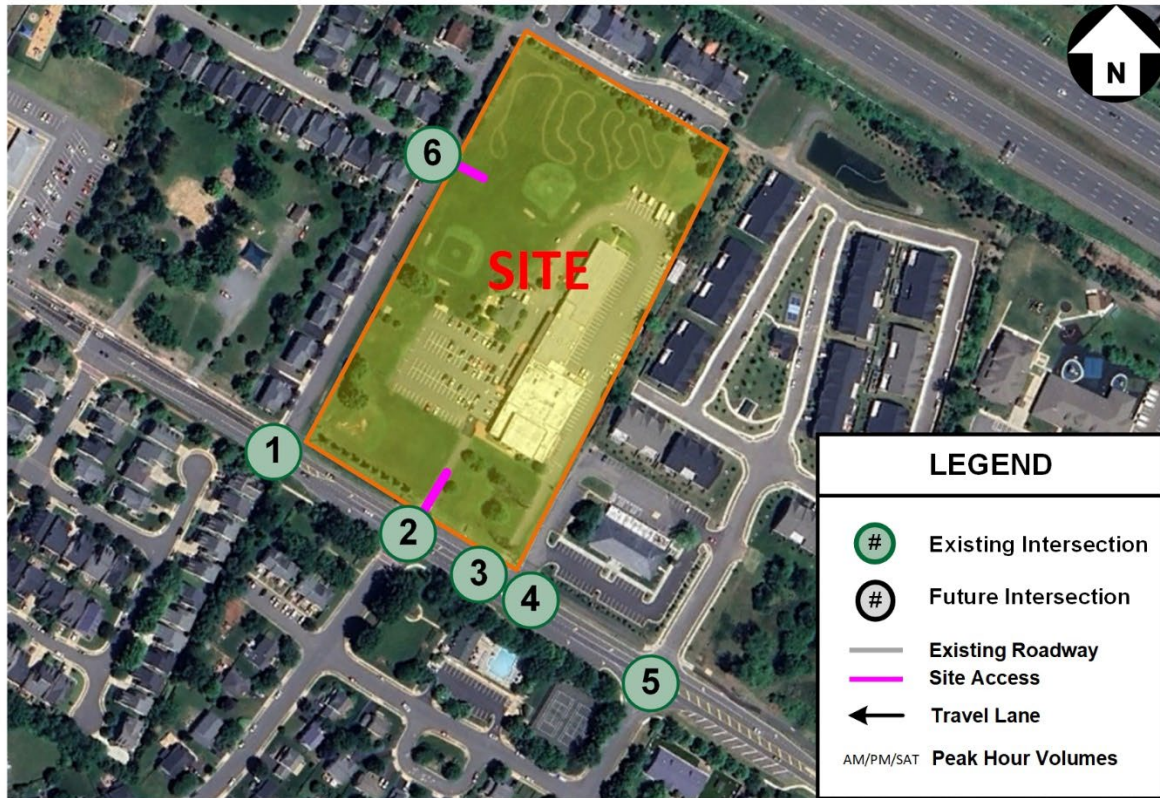

Figure 16: Site Generated Trip Assignment

Rerouted Existing Driveway Volumes

As mentioned previously, Intersection #2 (Washington St & Greenhill Crossing Dr/Future Site Access #1) which in existing conditions operates as a driveway entrance only, will be reconfigured to be a full access intersection. In order to account for the change in access, all of the existing outbound volumes at Intersection #3 were rerouted to the main entrance at Intersection #2. This assumption was made based on the existing surface parking lot located west of the existing site buildings and reconfiguration of the intersection to allow for outbound movements at Intersection 2. The rerouted existing volumes are shown in Figure 17 below.

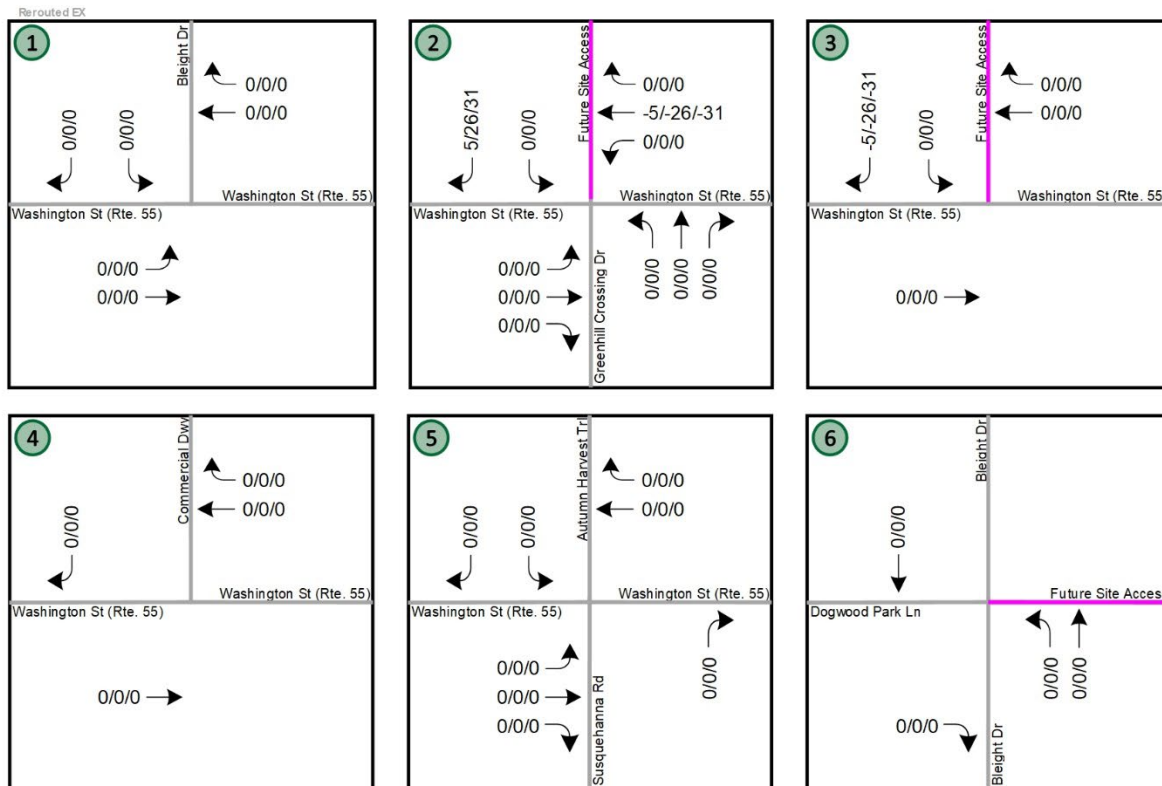

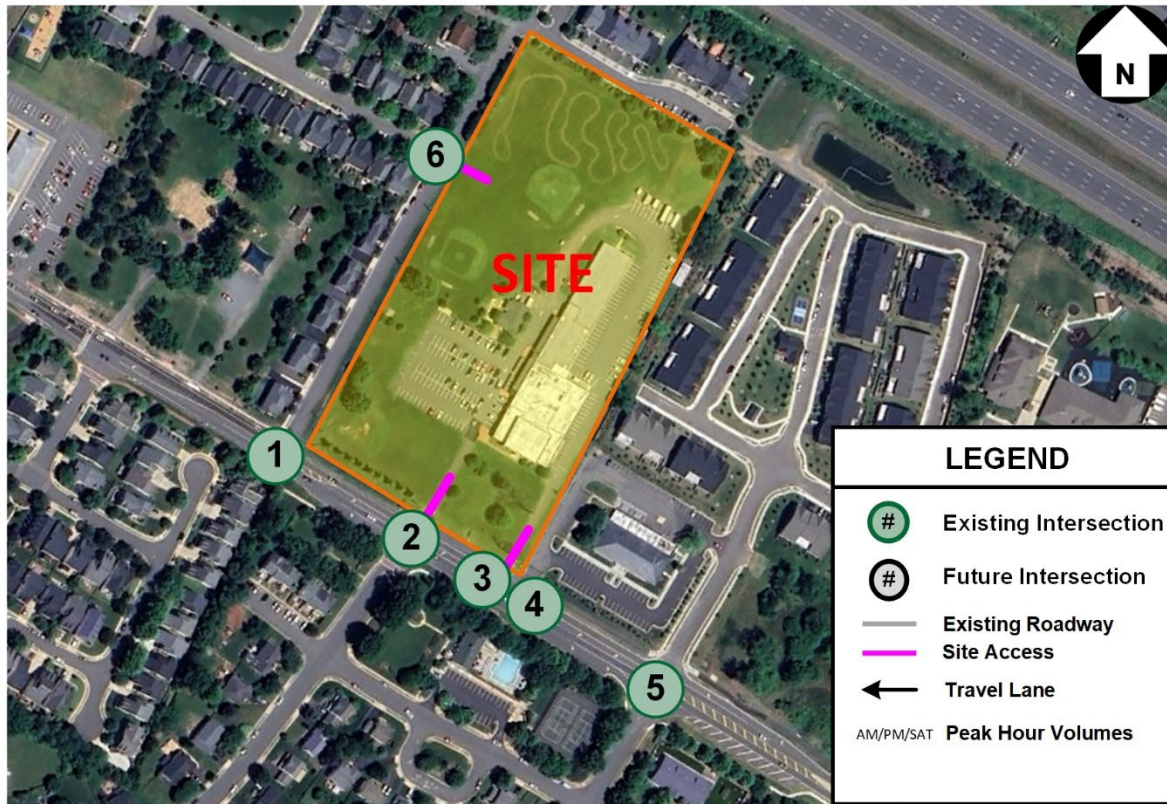

Figure 17: Rerouted Existing Driveway Volumes

Future with Development (2029) Traffic Volumes

The Future with Development (2029) traffic volumes were obtained by adding the site generated trips presented in Figure 16 to the Future without Development (2029) volumes presented previously in Figure 11 and the rerouted existing driveway volumes presented in Figure 17. The Future with Development (2029) vehicular traffic volumes are shown in Figure 18.

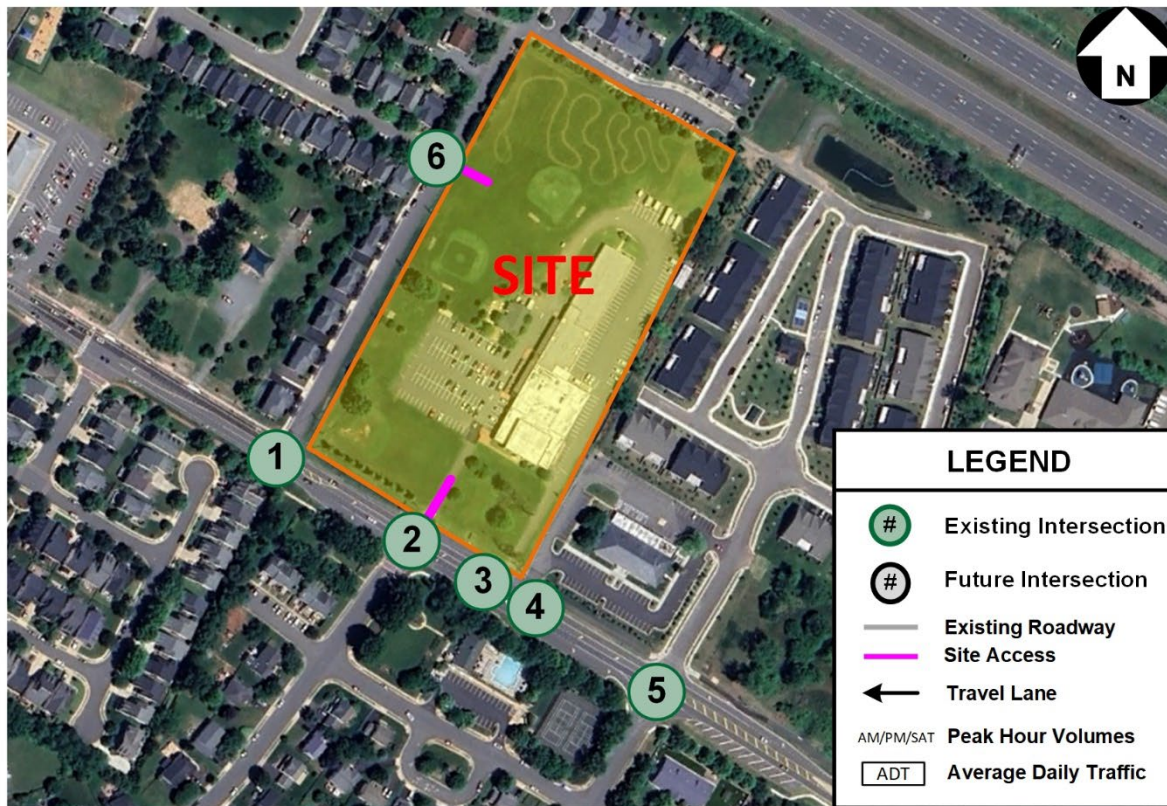

Figure 18: Total Future with Development (2029) Volumes

Future with Development (2029) Intersection Capacity and Queueing Analysis

Intersection capacity analyses were performed for the Future with Development 2029 scenario at the study area intersections during the AM and PM peak hours. *Synchro*, version 11, was used to analyze the study intersections with results based on the HCM and analysis guidelines provided in VDOT's TOSAM. The analysis herein includes LOS, delay, and queue length comparisons for the turning movements analyzed.

The intersection peak hour factor utilized in the analysis of future conditions was determined based on the existing traffic counts with a minimum of 0.92. The HV% were based on existing traffic count data.

Per the scoping meeting with VDOT and the Town staff, it would be considered acceptable and/or desirable to achieve an approach LOS of D or better for traffic operations using the HCM methodology per request by the Town of Haymarket. The results of the intersection capacity analyses from *Synchro* are presented in Table 9 and graphically in Figure 19. The results are expressed in LOS and delay (seconds per vehicle) for overall signalized intersections and per approach and lane group for all study intersections.

The overall signalized intersections and any approaches that operate at LOS E and LOS F are displayed in red.

The 95th percentile queues were also determined from *Synchro* and are expressed in feet. The lane groups where the queue lengths exceeded the available storage lengths of future turn lanes are displayed in red.

The detailed analysis worksheets of the Future with Development (2029) are contained in Appendix F of this report.

NOTES:

[1] Effective storage length is based on the storage length plus one-half of the taper length per TOSAM guidelines.

*Intersection #2 mitigation includes the addition of a westbound right turn lane.

The proposed mitigation for the Future with Development (2029) scenario includes the addition of a westbound right turn lane at Intersection #2 and the closing of the existing exit only driveway.

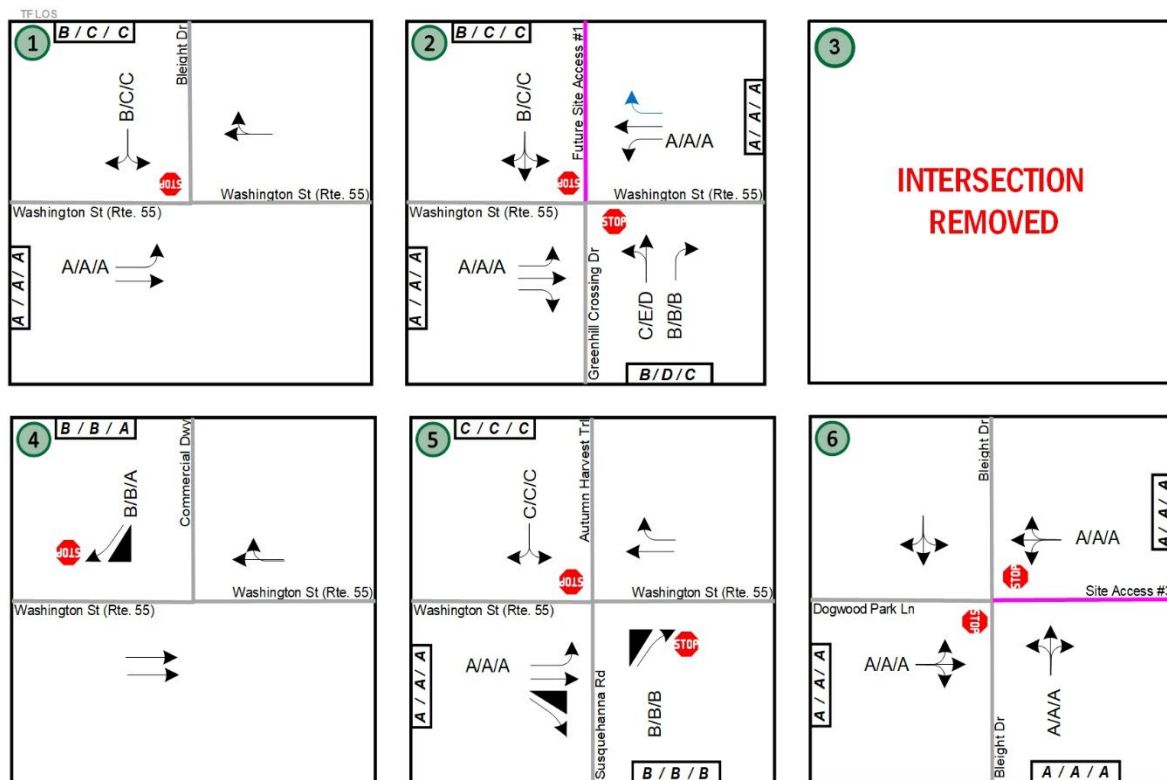

Figure 19: Total Future with Development (2029) – Level of Service Results

Analysis Terms:

- Level of Service (LOS) is based upon the traffic volume present in each lane on the roadway, the capacity of each lane at the intersection and the delay (in seconds) associated with each directional movement. This evaluation is consistent in all traffic analysis scenarios. Please refer to definitions of Level of Service in Appendix J.
- The 95th percentile queue length refers to the queue length within which 95% of all observed queues are contained during a specific analysis period. This evaluation is consistent in all traffic analysis scenarios.

The results of the Future with Development Conditions (2029) analysis scenario are as follows:

- All the approaches and the overall intersection operate at acceptable levels of service for all of the study intersections.
- All the anticipated 95th percentile queues are contained in the available storage length for all the study intersections.

Please note that while all study intersections and approaches operate at acceptable levels of service, the following lane group was observed to experience larger delay:

- Intersection #2 Washington St (Rte. 55) & Greenhill Crossing Dr/Site Access #1 – Northbound shared left/thru lane operates at LOS D (26.1 s) in the existing PM peak hour & LOS E (38.3 s) in the future with development PM peak hour.
- The 95th percentile queue for the northbound shared left/thru lane is approximately 23 ft (less than one car). Therefore, the queues do not extend to the downstream driveways that serve the residential community.
- The reconfigurations and mitigations for this analysis scenario are as follows:
 - The existing primary driveway entrance (Access #1) will be reconfigured to a full-access driveway (inbound & outbound).
 - The existing exit only driveway (Access #2) is planned to be closed to address the existing safety issues due to the proximity to the driveway to the east.
 - The addition of a westbound right turn lane at Intersection #2 (Washington St (Rte. 55) & Greenhill Crossing Dr/Site Access) is a proposed mitigation. Please note only a right turn taper is warranted using VDOT Road Design Manual (RDM) Turn Lane Assessment.

The detailed analysis worksheets of the Future Conditions with Development (2029) Mitigated are contained in Appendix G.

An additional section discussing the alternative route options for the vehicles making the northbound left turn at Intersection has been included below.

Alternative Routes Analysis

As noted above, the northbound approach at Intersection #2 operates at an acceptable LOS; however the northbound left movement increase to LOS E. Therefore analysis was included to show that alternative routes are available with additional capacity if those vehicles chose to use alternative routes. For the purposes of this analysis, engineering judgment was used to evaluate an alternative route where a proportion of the northbound left turn volumes (45%) were rerouted to make a northbound right turn at Intersection #2 during the weekday peak hours only (AM & PM). These volumes were rerouted to the downstream roundabout intersection of Washington St (RTE. 55) & Gillis Way/Piedmont Center Plaza.

The volumes for this alternative are shown in Figure 20 below.

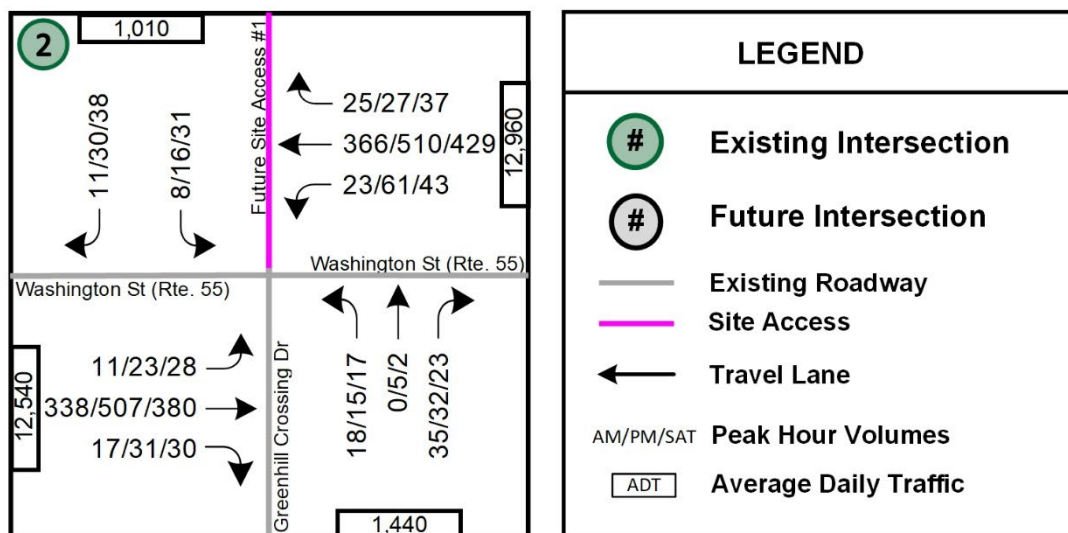

Figure 20: Total Future with Development (2029) Alternative Volumes

Per the scoping meeting with VDOT and the Town staff, it would be considered acceptable and/or desirable to achieve an approach LOS of D or better for traffic operations using the HCM methodology per request by the Town of Haymarket. The results of the intersection capacity analyses from *Synchro* are presented in Table 10 and graphically in Figure 21. The results

are expressed in LOS and delay (seconds per vehicle) for overall signalized intersections and per approach and lane group for all study intersections.

Table 10: Total Future with Development (2029) Alternative – Intersection Capacity and Queuing Analysis Results

| No. | Intersection (Movement) | Effective Storage | AM Peak Hour | | | PM Peak Hour | | | SAT Peak Hour | | |

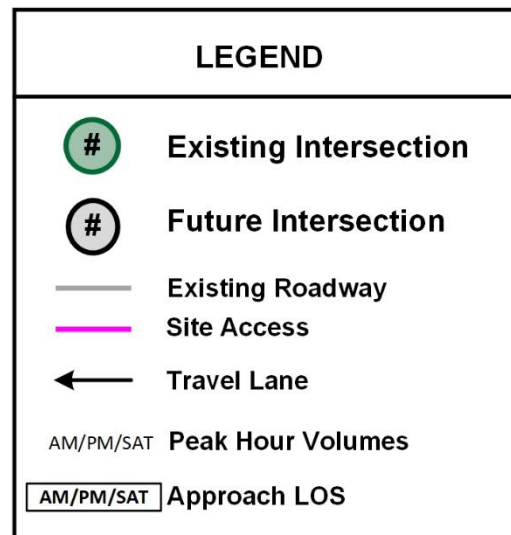

Figure 21: Total Future with Development (2029) Alternative – Level of Service

Sidra (HCM methodology) was used to analysis the existing roundabout intersection of Washington St (RTE. 55) & Gillis Way/Piedmont Center Plaza. The results of the analysis are shown in Table 11 below.

Table 11: Roundabout Analysis at Washington St (RTE. 55) & Gillis Way/Piedmont Center Plaza

| No. | Intersection (Movement) | AM Peak Hour | | | PM Peak Hour | | | SAT Peak Hour | | |
|-----|---|--------------|--------------------|-----------------------|--------------|--------------------|-----------------------|---------------|--------------------|-----------------------|
| | | LOS | Delay (sec/veh) | 95th % Queue (ft.) | LOS | Delay (sec/veh) | 95th % Queue (ft.) | LOS | Delay (sec/veh) | 95th % Queue (ft.) |
| | | Synchro | | | Synchro | | | Synchro | | |
| 1 | Gillis Way/Piedmont Center Plaza (N/S) & Washington St (Rte. 55) (E/W) (TWSC) (Overall) | A | 6.9 | | A | 9.0 | | A | 6.6 | |
| | Eastbound Approach | A | 7.4 | 72 | A | 9.1 | 100 | A | 6.5 | 69 |
| | Westbound Approach | A | 6.7 | 65 | A | 9.5 | 108 | A | 6.7 | 84 |
| | Northbound Approach | A | 5.7 | 12 | A | 7.8 | 22 | A | 5.0 | 2 |
| | Southbound Approach | A | 5.7 | 9 | A | 7.4 | 18 | A | 5.5 | 5 |

[1] Effective storage length is based on the storage length plus one-half of the taper length per TOSAM guidelines.

The results of the roundabout analysis show that the intersection operates at acceptable levels of service and does not experience extensive queues even with additional volumes. Therefore, it would be reasonable for drivers to reroute themselves using the roundabout to travel westbound on Washington St (Rte. 55) if they did not want to wait for a gap.

The detailed analysis worksheets of the Future Conditions with Development (2029) Alternative are contained in Appendix H.

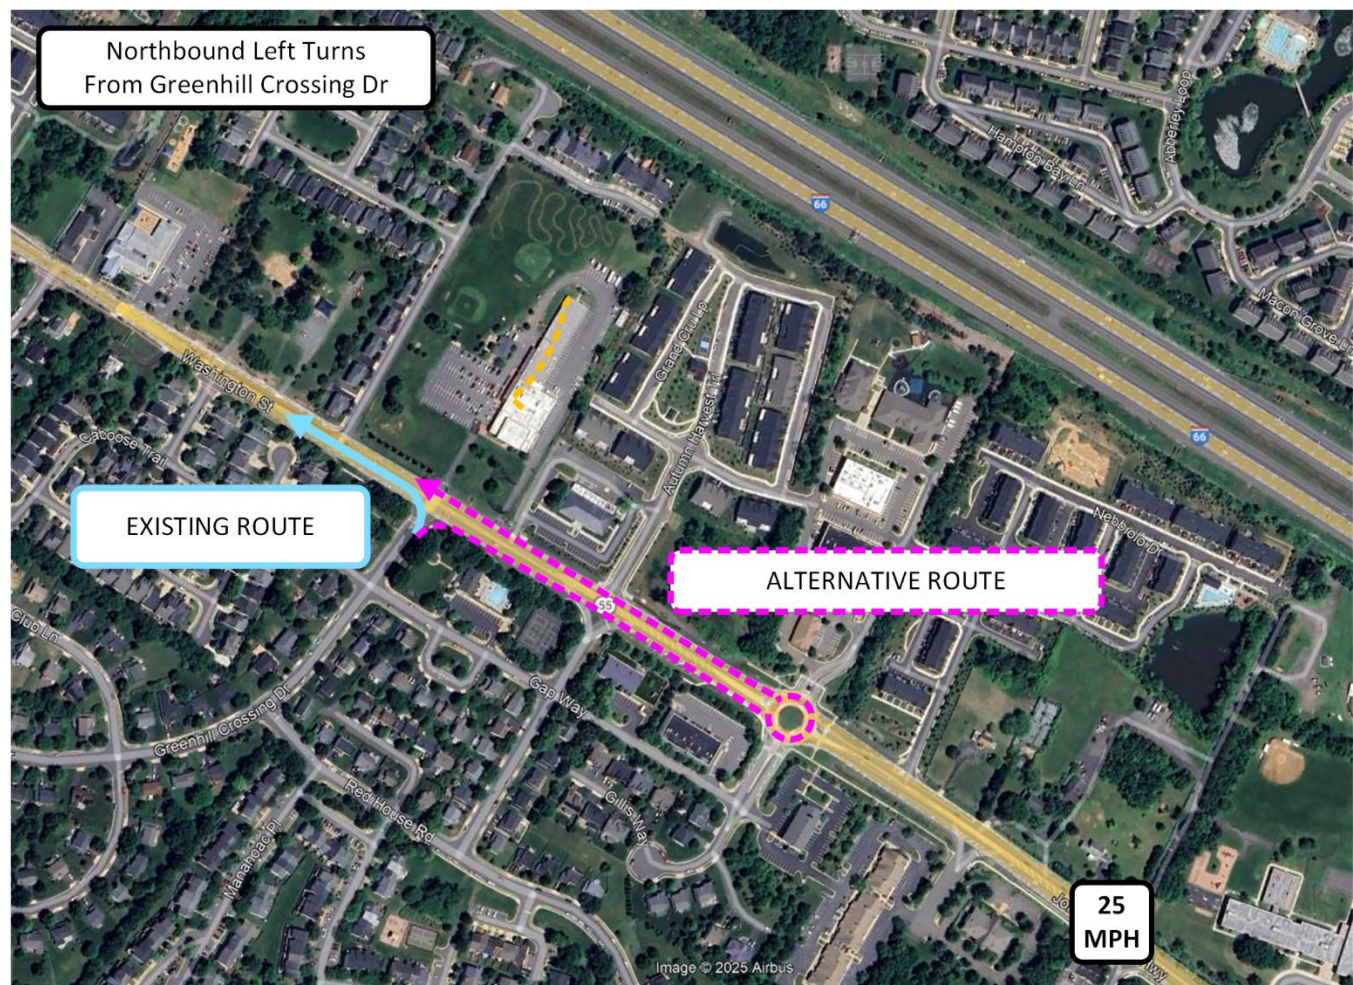

Figure 22: Assumed Reroute Time and Distance

Overall Comparison of Analysis Scenarios

A level of service and delay comparison for all scenarios is presented in Table 12 and queue length comparison is presented in Table 13.

*Intersection #2 mitigation includes the addition of a westbound right turn lane.

**Intersection #3 to be removed in future scenarios

The results of all the analysis scenarios show the proposed development is not anticipated to have a detrimental effect on the surrounding transportation network as all intersections and all approaches continue to operate at acceptable LOS. It should be noted however that the northbound left movement at Intersection #2 (Washington St (Rte. 55) & Greenhill Crossing Dr/Site Access #1) operates at LOS E. This intersection was mitigated through the conversion of the existing driveway inbound only entrance to a full access (inbound & outbound) and the addition of a westbound right turn lane. As discussed in the alternative scenario, a portion of the northbound left turns were rerouted to the existing roundabout. The evaluation of the total future with development conditions with the proposed mitigations and alternative scenario show that the development will not have a significant impact on transportation network.

Turn Lane Warrant Assessments

Left and right turn lane warrants are based off VDOT's Road Design Manual (RDM), Appendix F. In order to determine the need for exclusive left or right turn lanes at the site entrance along Washington St (Rte. 55) and the site entrance along Bleight Dr, the traffic data and anticipated development program provided in the 2029 Future with Development scenario section were utilized to provide a conservative analysis.

Right Turn Lane Assessments

Warrants for right-turn storage lanes on two- and four-lane highways at intersections are based on Figure 3-26 and Figure 3-27 in Appendix F of VDOT's RDM. These figures provide a graphical representation for determining the necessity of a right turn lane by comparing the total volumes of a given approach with their respective right turn volumes.

The results of the northbound right (Bleight Dr) and westbound right (Washington St) turn lane warrant analysis are presented on Table 14 and Figure 23.

Table 14: Right Turn Lane Warrant Assessments at Site Entrances (VDOT RDM-F Fig. 3-27)

| Study Scenario | Approach Volume | Right Turn Volume | Minimum Right Turn Taper Threshold | Minimum Right Turn Full Lane Threshold | Treatment |
|----------------------------------|-----------------|-------------------|------------------------------------|--|----------------|
| Intersection 2 WBR AM Peak Hour | 408 | 24 | 29 | 65 | Not Warranted |
| Intersection 2 WBR PM Peak Hour | 585 | 27 | 20 | 42 | Taper Required |
| Intersection 2 WBR SAT Peak Hour | 503 | 37 | 20 | 53 | Taper Required |
| Intersection 6 NBR AM Peak Hour | 14 | 1 | 69 | 116 | Not Warranted |
| Intersection 6 NBR PM Peak Hour | 49 | 4 | 65 | 112 | Not Warranted |
| Intersection 6 NBR SAT Peak Hour | 33 | 4 | 67 | 114 | Not Warranted |

Figure 23: Right Turn Warrant Analysis Chart (VDOT RDM FIGURE 3-27)

As shown above, a westbound right taper is warranted for the site entrance at Intersection #2 (Washington St & Site Access #1) per VDOT RDM based on the Total Future with Development (2029) volumes, design speed (30 mph), and number of right turns. VDOT's RDM requires a 100' (single lane) taper for roadways with a design speed of 30 mph or less.

Intersection 2 – Greenhill Crossing Dr/Site Access #1 (N/S) & Washington St (Rte. 55) (E/W)

- i. Westbound Right – Design Speed (30 mph)

100 feet taper length is required (RDM);

Left Turn Lane Assessment

Warrants for left-turn storage lanes on two-lane highways at unsignalized intersections are based on Figure 3-4 to Figure 3-21 in Appendix F of the Virginia Department of Transportation's (VDOT) Road Design Manual (RDM). Please note there is an existing left-turn lane at Intersection #2 (Washington St & Site Access) and a left-turn lane is not feasible nor needed at other proposed site access location.

Access Management Assessment (Intersection Spacing with Adjacent Intersections)

The minimum spacing standards for the Commonwealth of Virginia are specified in VDOT's Road Design Manual (RDM). Appendix F of the RDM focuses primarily on access management practices. The minimum spacing standards are particularly specified in Table 2-2 through Table 2-4. Table 2-2 provides guidance on the minimum spacing standard for commercial entrances, intersections, and median crossovers, and are based on a roadway's speed limit and functional classification. Table 2-3 and 2-4 provide guidance for minimum spacing standards for the spacing between interchanges and intersections or commercial entrances.

Washington St (Rte. 55) in the vicinity of the study area is classified as a "Major Collector" with a speed limit of 25 mph per VDOT Speed Limits Map. This section evaluates the minimum spacing requirements at the proposed site entrances. The applicable intersection spacing requirements (centerline-to-centerline) per RDM Appendix F Table 2-2 are illustrated in Figure 24 below.

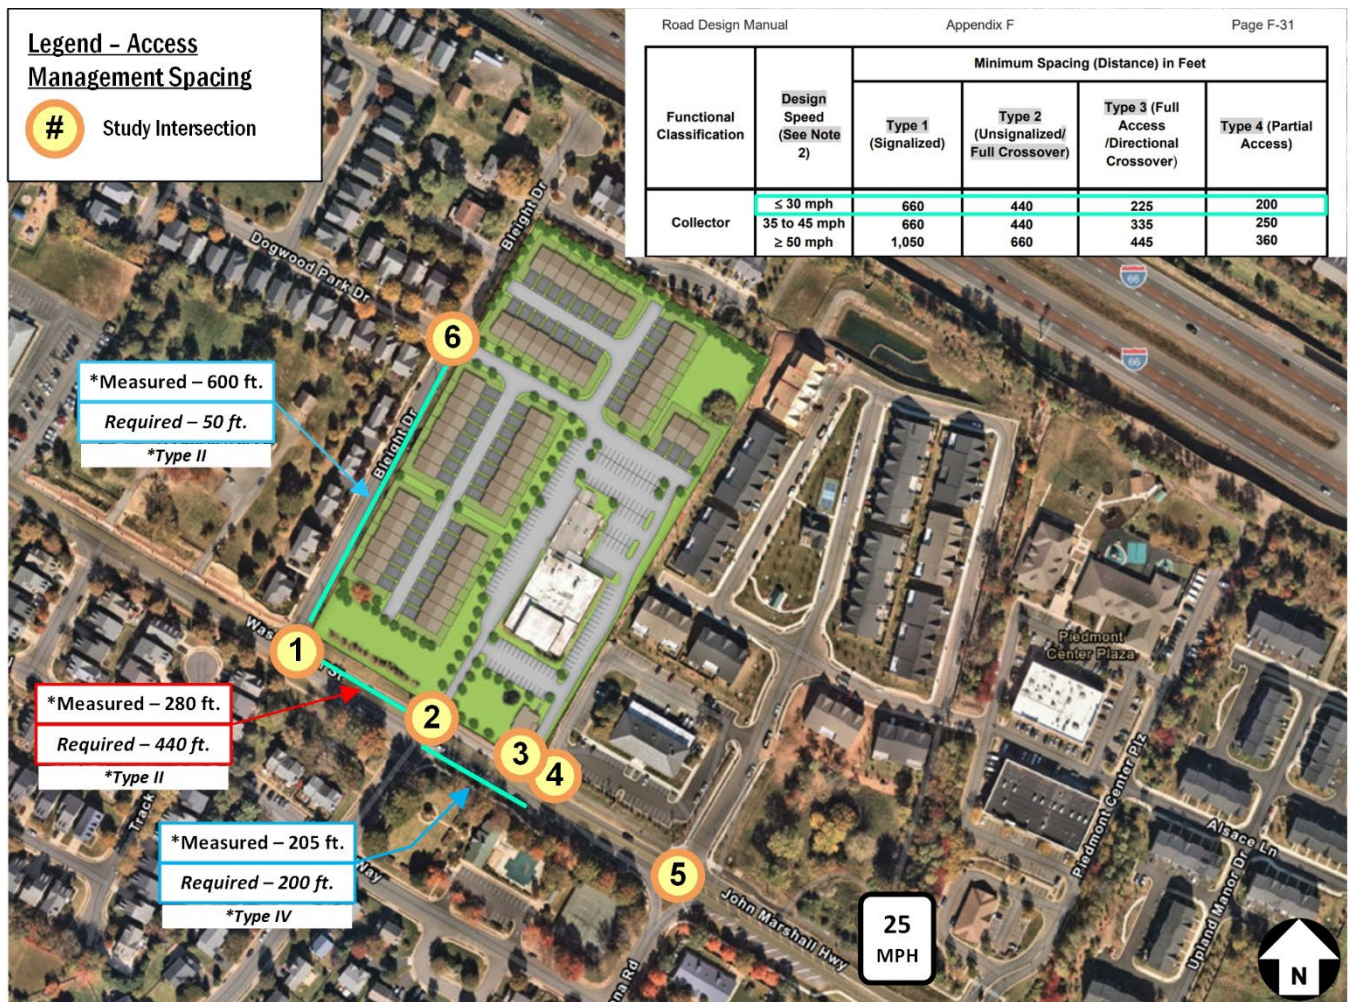

Figure 24: Proposed Intersection Spacing Evaluations

The following intersections would not meet VDOT intersection spacing requirements based on the current design:

- Washington St (Rte. 55)/Bleight Dr & Site Access #1 (Type II Intersection – Full Access)
 - Required spacing – 440 feet; Approximate measured spacing between intersections – 280 feet;
 - This is an existing intersection and is consistent with the character of historically rural towns like Haymarket.

- Washington St (Rte. 55) & Existing Exit Only Driveway – The existing intersection is planned to be removed due to the proximity to the commercial driveway to the east. The existing spacing between the intersections does not meet VDOT access management standards and presents an unsafe maneuver for the trips coming in to the development and the trips coming out of the commercial driveway.

Please note the locations of Site Access #1 already exists and is not proposed to shift locations.

Conclusion

The analysis presented in this report supports the following assumptions and findings:

Analysis Components

- Existing counts, dated Tuesday June 3, 2025, were collected while most schools were in session to reflect typical traffic patterns, and serve as the basis for this study. Existing traffic counts were conducted at the existing intersections on Saturday June, 14, 2025.
- As determined based on discussions at the scoping meeting, an inherent growth rate of 2% (compounded annually) for the period 2025-2029 has been applied to all through movements along Washington St at all intersections.
- The site is anticipated to generate approximately 28 total trips during the AM peak hour, 30 total trips during the PM peak hour, 481 total daily trips on a typical weekday, 40 total trips during the Saturday peak hour, and 352 Saturday daily trips.
- One (1) identified background development was included in the study – 6700 Bleight Drive – Which will consist of approximately 11 single family attached units
- The scenarios to be included in this study are Existing Conditions (2025), Future without Development (2029), Future with Development (2029)
- The existing access to the site is served via two (2) intersections, one entrance and one egress. The development proposes to convert the existing entrance only driveway to a full access (inbound and outbound) driveway. The development also proposes to remove the existing exit only driveway as the primary bidirectional entrance would reduce driver confusion and better meet driver expectation. The proposed development is also planning to construct a fourth leg to the intersection of Bleight Dr & Dogwood Park Ln.

Infrastructure

- There is one (1) identified infrastructure change with this proposed development. Construction of a fourth leg to the intersection of Bleight Dr & Dogwood Park Ln, will serve as another site access for the proposed development. No additional infrastructure changes were identified and agreed upon in the scope.

Analysis Results

Analysis Terms:

- Level of Service (LOS) is based upon the traffic volume present in each lane on the roadway, the capacity of each lane at the intersection and the delay (in seconds) associated with each directional movement. This evaluation is consistent in all traffic analysis scenarios. Please refer to definitions of Level of Service in Appendix J.
- The 95th percentile queue length refers to the queue length within which 95% of all observed queues are contained during a specific analysis period. This evaluation is consistent in all traffic analysis scenarios.

Existing Conditions (2025):

- All approaches and the overall intersections operate at an acceptable level of service.
- All the anticipated 95th percentile queues are contained in the available storage lane lengths for all the study intersections.

Total Future without Development (2029):

- All approaches and the overall intersections operate at an acceptable level of service.
- All the anticipated 95th percentile queues are contained in the available storage length for all the study intersections.

Total Future with Development (2029):

The results of the Future with Development Conditions (2029) analysis scenario are as follows:

- All the approaches and the overall intersection operate at acceptable levels of service for all of the study intersections.
- All the anticipated 95th percentile queues are contained in the available storage length for all the study intersections.
- Please note that while all study intersections and approaches operate at acceptable levels of service, the following lane group was observed to experience larger delay:
 - Intersection #2 Washington St (Rte. 55) & Greenhill Crossing Dr/Site Access #1 – Northbound shared left/thru lane operates at LOS E in the PM peak hour. The overall approach operates acceptably.
 - The 95th percentile queue for the northbound shared left/thru lane is approximately 23 ft (less than one car). Therefore, the queues do not extend to the downstream driveways that serve the residential community.
- The reconfigurations and mitigations for this analysis scenario are as follows:
 - The existing primary driveway entrance (Access #1) will be reconfigured to a full-access driveway (inbound & outbound).
 - The existing exit-only driveway (Access #2) is planned to be closed to address the existing safety issues due to the proximity to the driveway to the east.
 - The addition of a westbound right turn lane at Intersection #2 (Washington St (Rte. 55) & Greenhill Crossing Dr/Site Access) is a proposed mitigation. Please note only a right turn taper is warranted using VDOT Road Design Manual (RDM) Turn Lane Assessment.
- In addition to the mitigation implemented for the Future Conditions with Development (2029) scenario, an alternative scenario was provided that reviewed the capacity of the adjacent roundabout to understand the capacity if existing vehicles were to reroute to utilize the intersection. The analysis confirms that the roundabout operates acceptably if additional vehicles were to use it.

Overall Conclusion

Based on the capacity and queueing analysis results, the proposed development will not have a significant impact to the surrounding transportation and roadway network, assuming that all designs planned with the subject proposal, and mitigations discussed in this report are implemented.

TECHNICAL APPENDICES

APPENDIX LIST

Appendix A – Signed Scoping Document

Appendix B – Existing Turning Movement Counts

Appendix C – Intersection Analysis Worksheets – Existing 2025

Appendix D – Background Development Trip Generation

Appendix E – Intersection Analysis Worksheets – Future without Development (2029)

Appendix F – Intersection Analysis Worksheets – Future with Development (2029)

Appendix G – Intersection Analysis Worksheets – Future with Development (2029) Mitigated

Appendix H – Intersection Analysis Worksheets – Future with Development (2029) Alternative

Appendix I – Crash Data

Appendix J – Description of Traffic Level of Service

APPENDIX A: SIGNED SCOPING DOCUMENT

THIS IS NOT A CHAPTER 870 STUDY

| Project Information | | | | |
| Project Name: | 14600 Washington St Development | Locality/County: | Town of Haymarket | |
| Project Location: (Attach regional and site specific location map) | The proposed development is located north of Washington St, south of I-66, and east of Bleight Dr in the Town of Haymarket. | | | |
| Submission Type | Comp Plan <input type="checkbox"/> | Rezoning <input checked="" type="checkbox"/> | Site Plan <input type="checkbox"/> | Subd Plat <input type="checkbox"/> |
| Project Description: (Including details on the land use, acreage, phasing, access location, etc. Attach additional sheet if necessary) | <p>The site can be identified with the GPIN 7397-19-1734 and is currently zoned B-1 (Town Center). The development program for the site proposes mixed uses including 26,063 SF of commercial/office uses and up to 60 townhome units. The projected build-out date for the site is 2029. A portion of the site is currently occupied by existing commercial uses. A portion of the commercial uses (5,986 SF of Office) are planned to be removed with this application while the remaining 26,063 SF is anticipated to remain.</p> <p>The site currently has 2 access points on Washington St, one of which aligns with Greenhill Crossing Drive. One additional entrance is proposed along Bleight Dr as the fourth leg to the existing intersection of Bleight Dr and Dogwood Park Ln.</p> | | | |
| Proposed Use(s): | Residential <input type="checkbox"/> | Commercial <input type="checkbox"/> | Mixed Use <input checked="" type="checkbox"/> | Other <input type="checkbox"/> |

It is important for the applicant to provide sufficient information to county and VDOT staff so that questions regarding geographic scope, alternate methodology, or other issues can be answered at the scoping meeting.

| | | | | |

It is important for the applicant to provide sufficient information to county and VDOT staff so that questions regarding geographic scope, alternate methodology, or other issues can be answered at the scoping meeting.

NOTES on ASSUMPTIONS:

1. Turning Movement Counts collected in 2025. The through volumes on the major movements will be balanced appropriately.
2. The scenarios to be included in the study are Existing Conditions (2025), Future without Development (2029) and Future with Development (2029).
3. Peak hour factors will be consistent with VDOT guidelines (VDOT TOSAM v2.0)
 - a. Existing peak hour factors by overall intersection (minimum of 0.85) will be used for existing year analysis.
 - b. For future year analysis, the PHF will be 0.92 or existing, whichever is higher.
4. Heavy vehicle percentages will be obtained from the collected traffic count data and a minimum of 2% will be used if not specified in counts. For any new intersection, the HV% will be based on a default Synchro value of 2%.
5. Acceptable Level of Service (LOS) for intersection approaches will be per Town of Haymarket's approved Comprehensive Plan. The analysis results will show intersection, approach, and movement LOS.
6. Will provide 95th percentile queues from Synchro at analyzed locations.
7. HCM 6 methodology will be utilized where applicable; HCM 2000 methodology will be utilized if HCM 6 methodology is not applicable for a certain location.
8. Preliminary Access Management/Intersections Spacing and Turn Lanes will be evaluated for the site entrances.
9. An inherent growth rate of 2% (compounded annually) for the period 2025-2029 will be applied to through movements along Washington St at all the intersections.
10. A safety assessment for all the study intersections will be included.
11. All improvements proposed by the background developments will be considered in the study.

Table 1: Trip Generation for Existing Commercial to be Removed – Peak Hour of Adjacent Street Traffic (ITE 11th Edition)

| Land Use | ITE Code | Size | Weekday | | | | | | | Weekend | | | |
|-------------------------------------|----------|----------------|--------------|-----|-------|--------------|-----|-------|----------------|--------------------|-----|-------|--------------------|
| | | | AM Peak Hour | | | PM Peak Hour | | | Daily Total | Saturday Peak Hour | | | Sat Daily Total |
| | | | In | Out | Total | In | Out | Total | | In | Out | Total | |
| Existing Uses to be Removed | | | | | | | | | | | | | |
| General Office Building (EQUATIONS) | 710 | 6.0 KSF of GFA | -13 | -2 | -15 | -3 | -13 | -16 | -100 | -2 | -1 | -3 | -13 |
| Total Exsting Trips to be Removed | | | -13 | -2 | -15 | -3 | -13 | -16 | -100 | -2 | -1 | -3 | -13 |

Note - The office uses are currently vacant. The trips shown in the table represent the trips that the office uses could generate if fully occupied.

Table 2: Trip Generation for Proposed Development - Peak Hour of Adjacent Street Traffic (ITE 11th Edition)

| Land Use | ITE Code | Size | Weekday | | | | | | | Weekend | | | |
|--|----------|-------|--------------|-----|-------|--------------|-----|-------|----------------|--------------------|-----|-------|--------------------|
| | | | AM Peak Hour | | | PM Peak Hour | | | Daily Total | Saturday Peak Hour | | | Sat Daily Total |
| | | | In | Out | Total | In | Out | Total | | In | Out | Total | |
| Proposed Use | | | | | | | | | | | | | |
| Single-Family Attached Housing (EQUATIONS) | 215 | 60 DU | 6 | 20 | 26 | 19 | 13 | 32 | 522 | 21 | 23 | 44 | 348 |
| Total Proposed Trips without Reduction | | | 6 | 20 | 26 | 19 | 13 | 32 | 522 | 21 | 23 | 44 | 348 |
| Internal Capture Residential - Restaurant ¹ | | | 0 | 0 | 0 | -3 | -2 | -5 | -78 | -3 | -3 | -7 | -52 |
| Total Proposed Trips with Reduction | | | 6 | 20 | 26 | 16 | 11 | 27 | 444 | 18 | 20 | 37 | 296 |
| Difference in Trips (Proposed - Existing) | | | -7 | 18 | 11 | 13 | -2 | 11 | 344 | 16 | 19 | 34 | 283 |

¹ Internal capture rates consider site trips "captured" within a mixed use development, recognizing that trips from one land use can access another land use within a site development without having to access the adjacent street system. Internal capture allows reduction of site trips from adjacent intersections and roadways.

The internal reduction is based on the VDOT Updated Administrative Guidelines for the Traffic Impact Analysis Regulations:

(1) residential / non-residential components - smaller of 15% of residential trips or 15% of non-residential trips

APPENDIX J: DESCRIPTION OF TRAFFIC LEVEL OF SERVICE

TECHNICAL MEMORANDUM

Subject: Level of Service Definitions

Introduction

The purpose of this memorandum is to define the level of service (LOS) metric that commonly used as a measure of effectiveness (MOE) for traffic operations.

All capacity analyses are based on the procedures specified by the Transportation Research Board's (TRB) Highway Capacity Manual (HCM), which is currently on its sixth edition. Level of service ranges from A to F. A brief description of each level of service for signalized and unsignalized intersections is provided below.

Signalized Intersections

Level of service is based upon the traffic volume present in each lane on the roadway, the capacity of each lane at the intersection and the delay associated with each directional movement. The levels of service for signalized intersections are defined below:

- **Level of Service A** describes operations with very low average delay per vehicle, i.e., less than 10.0 seconds. This occurs when progression is extremely favorable, and most vehicles arrive during the green phase. Most vehicles do not stop. Short signal cycle lengths may also contribute to low delay.
- **Level of Service B** describes operations with average delay in the range of 10.1 to 20.0 seconds per vehicle. This generally occurs with good progression and/or short cycle lengths. More vehicles stop than for LOS A, causing higher levels of average delay.
- **Level of Service C** describes operations with delay in the range of 20.1 to 35.0 seconds per vehicle. These higher delays may result from fair progression and/or longer cycle lengths. Individual cycle failures may begin to appear at this level. The number of vehicles stopping is significant at this level although many still pass through the intersection without stopping. This is generally considered the lower end of the range of the acceptable level of service in rural areas.
- **Level of Service D** describes operations with delay in the range of 35.1 to 55.0 seconds per vehicle. At LOS D, the influence of congestion becomes more noticeable. Longer delays may result from some combination of unfavorable progression, long cycle lengths, and/or high traffic volumes as compared to the roadway capacity. Many vehicles are required to stop and the number of vehicles that do not have to stop declines. Individual signal cycle failures, where all waiting vehicles do not clear the intersection during a single green time, are noticeable. This is generally considered the lower end of the range of the acceptable level of service in urban areas.
- **Level of Service E** describes operations with delay in the range of 55.1 to 80.0 seconds per vehicle. These higher delay values generally indicate poor progression, long cycle lengths, and high traffic volumes. Individual cycle failures are frequent occurrences. LOS E has been set as the limit of acceptable conditions.
- **Level of Service F** describes operations with average delay in excess of 80.0 seconds per vehicle. This is considered to be unacceptable to most drivers. This condition often occurs with over-saturation, i.e., when traffic arrives at a flow rate that exceeds the capacity of the intersection. It may also occur at high volumes with many individual cycle failures. Poor progression and long cycle lengths may also contribute to such delays.

Unsignalized Intersections

At an unsignalized intersection, the major street through traffic and right-turns are assumed to operate unimpeded and therefore receive no level of service rating. The level of service for the minor street and the major street left-turn traffic is dependent on the volume and capacity of the available lanes, and, the number and frequency of acceptable gaps in the major street traffic to make a conflicting turn. The level of service grade is provided for each conflicting movement at an unsignalized intersection and is based on the total average delay experienced by each vehicle. The delay includes the time it takes a vehicle to move from the back of a queue through the intersection.

The unsignalized intersection level of service analysis does not account for variations in driver behavior or the effects of nearby traffic signals. Therefore, the results from this analysis usually indicate worse levels of service than may be experienced in the field. The unsignalized intersection level of service descriptions are provided below:

- **Level of Service A** describes operations where there is very little to no conflicting traffic for a minor side street movement, i.e., an average total delay of less than 10.0 seconds per vehicle.
- **Level of Service B** describes operations with average total delay in the range of 10.1 to 15.0 seconds per vehicle.
- **Level of Service C** describes operations with average total delay in the range of 15.1 to 25.0 second per vehicle.
- **Level of Service D** describes operations with average total delay in the range of 25.1 to 35.0 seconds per vehicle.
- **Level of Service E** describes operations with average total delay in the range of 35.1 to 50.0 seconds per vehicle.
- **Level of Service F** describes operations with average total delay of 50 seconds per vehicle. LOS F exists when there are insufficient gaps of suitable size to allow a side street demand to cross safely through or enter a major street traffic stream. This level of service is generally evident from extremely long total delays experienced by side street traffic and by queuing on the minor approaches. It is important to note that LOS F may not always result in long queues but may result in adjustments to normal driver behavior.
