Draft Report

Electric Cost of Service Study

City of Lake Worth Beach, Florida

July 2021

This report has been prepared for the use of the client for the specific purposes identified in the report. The conclusions, observations and recommendations contained herein attributed to Leidos constitute the opinions of Leidos. To the extent that statements, information and opinions provided by the client or others have been used in the preparation of this report, Leidos has relied upon the same to be accurate, and for which no assurances are intended and no representations or warranties are made. Leidos makes no certification and gives no assurances except as explicitly set forth in this report.

July , 2021

The Honorable Mayor and City Commission City of Lake Worth Beach City Hall, 1900 2nd Avenue North Lake Worth Beach, Florida 33461

Subject: Electric Cost of Service Study

Honorable Mayor and Commissioners:

In keeping with the provisions of the professional services agreement between the City of Lake Worth Beach, Florida (the City) and Leidos Engineering, LLC, (the Consultant) and the direction provided by the City management and staff, the Electric Cost of Service Study (the Report) has been completed. The Report addresses the projected financial operations of the City's electric system (Electric System) for the fiscal years ending September 30, 2020 through 2024. We have summarized our assumptions and the results of our analyses and conclusions in this Report, which we hereby submit for your consideration. This Report summarizes the basis for the proposed rates for electric service that are necessary to meet the projected revenue requirements in the near future and which rates should recover such projected requirements from the customer classes generally in accordance with the direction provided by the City, the guidelines of the Florida Public Service Commission (the PSC) and the results of the allocated cost of service analyses.

In preparing the Electric Cost of Service Study, the Consultant relied upon historical and projected data for the development of operating revenues, operating expenses and capital requirements. Historical data were obtained from various monthly reports, the City's Comprehensive Annual Financial Reports, actual customer billing records, and analyses and discussions with members of the City management and staff. Projected data were, in part, derived from the Electric System's current forecast of demand and energy requirements, the Electric System Operating Budget for Fiscal Year 2020 (the Budget), and detailed information and data compiled and provided by members of the City management and staff.

The projected costs and revenues used in this Report are for the fiscal years ending Scptember 30, 2020 through 2024, and have been developed using the City's Budget as a basis for the projected costs. Such costs and revenues, as initially reflected in the Budget, were adjusted for known or anticipated changes.

The Honorable Mayor and City Commission City of Lake Worth Beach July ___, 2021 Page 2

SUMMARY OF FINDINGS

ADEQUACY OF EXISTING RATES

The various adjustments, assumptions and considerations are discussed in Section 2 regarding the projected number of customers, sales, and in Section 3 regarding the projected revenues and expenditures. In the fiscal years ending September 30, 2020 through 2024, the revenue requirements proposed herein include Operation and Maintenance expenses, a transfer to the City's General Fund, capital improvement expenditures, the payment of principal and interest on outstanding indebtedness, and an allowance for contingencies and reserves. Based on the foregoing, the Electric System revenue requirements for fiscal years ending September 30, 2020 through 2024 and the projected revenues, assuming the existing rates, are summarized on the following table:

| | Projected | | | | | | | | | | |
|----------------------------------|--------------|--------------|--------------|--------------|--------------|--|--|--|--|--|--|
| Description | FY 2020 | FY 2021 | FY 2022 | FY 2023 | FY 2024 | | | | | | |
| Net Revenue Requirements | \$58,158,995 | \$58,531,674 | \$60,360,905 | \$58,782,793 | \$62,340,635 | | | | | | |
| Total Existing Rate Revenue | 58,558,995 | 58,931,674 | 60,760,905 | 58,908,582 | 61,870,618 | | | | | | |
| Surplus/(Deficiency) | \$400,000 | \$400,000 | \$400,000 | \$125,789 | (\$470,017) | | | | | | |
| Percent of Base and Fuel Revenue | 0.8% | 0.8% | 0.8% | 0.2% | -0.9% | | | | | | |

As shown above, the existing rates produce revenues that are slightly greater than the projected revenue requirements in the fiscal years ending September 30, 2020 through 2023 and slightly under recover the projected revenue requirements in the fiscal year ending September 30, 2024.

Based on the analyses in this Report, the proposed rates represent a realignment of costs allocated among the residential and commercial classes. It is projected that the proposed rates will be sufficient to meet the projected revenue requirements for the fiscal years ending September 30, 2020 through 2023. For certain analyses, the "Test Year" has been identified as the fiscal year ending September 30, 2020.

COST OF SERVICE RESULTS

The Test Year revenue requirements were allocated to the customer classes based on a cost of service model that functionalizes costs among production, transmission, distribution and customer costs, and classifies costs according to demand related or energy related costs. Production (purchased power) demand related costs were allocated based on the contribution of each class to the average 12 month coincident peak demands and distribution demand related costs were allocated based on the contribution of each class to the annual system peak demand. Section 4 shows the development of allocation factors and Section 5 shows the results of the cost of service analysis.

The results of the cost of service analysis are summarized as follows:

The Honorable Mayor and City Commission City of Lake Worth Beach July ___, 2021 Page 3

| | T | est Year 2020 | |
|-------------------|---------------------------|---------------|----------|
| | Total Existing Revenue | Target Adj | ustments |
| Customer Class | (\$000) | (\$000) | (%)[1] |
| Residential | \$35,500 | \$ 0 | 0.0% |
| Commercial | 16,207 | (313) | -2.2% |
| Commercial Demand | 6,143 | (117) | -2.2% |
| Lighting | 708 | 30 | 5.0% |
| Total System | \$58,559 | (\$400) | -0.8% |

^[1] Percent of existing base rates and PCA revenues.

RATE DESIGN

The proposed electric rates shown in Section 6 reflect, to the extent permitted, (i) the lowest possible price consistent with the projected revenue requirements, (ii) the discouragement of wasteful, unnecessary use of service, (iii) the policies of the City, and (iv) the cost of service methodologies recommended by the Florida Public Service Commission (the PSC).

The principal effects of adopting the rates proposed herein would be:

- Rate structures and levels, in general, will be based, in part, on allocated cost of service techniques.
- Fuel and purchased power costs will continue to be shown in a separate charge, the Purchased Power Cost Adjustment (PCA).
- The proposed rates will be sufficient to meet the projected revenue requirements for the fiscal years ending September 30, 2020 through 2023.

RATE COMPARISONS

To assist the City in its evaluation and consideration of proposed rate adjustments, included in Table No. 7-1 are comparisons of typical monthly bills for the major rate classifications at various levels of usage. Typical bills calculated under the proposed rates have been compared with bills calculated under the existing rates. In addition, typical monthly bills calculated under the Electric System's existing and proposed rates have been compared with those calculated under the rates of other Florida investor-owned and municipal electric utilities in Table No. 7-2 for the billing month of January 2021.

The Honorable Mayor and City Commission City of Lake Worth Beach July ___, 2021 Page 4

When reviewing the comparisons of typical bills, it must be recognized that a substantial portion of the electric bill is comprised of fuel and purchased energy costs. For electric utilities other than the Electric System, the bill comparisons shown reflect fuel costs that were estimated in early 2021 and may not reflect actual current market prices for gas, oil and purchased energy.

As shown on Table No. 7-1, typical residential customers' bills under the proposed rates are approximately the same as under the existing rates, and typical commercial customers' bills can be expected to decrease slightly.

CONCLUSIONS

Based upon the results of our studies and analyses as summarized in this Report, which should be read in its entirety in conjunction with the following, and upon the numerous underlying assumptions and considerations relied upon in making such analyses and incorporated by reference herein, and the data and information provided by the City's management and staff and others, we are of the opinion that:

- (i) The existing rates produce revenues that are approximately equal to the projected revenue requirements in the fiscal years ending September 30, 2020 through 2023 and slightly under recover the projected revenue requirements in the fiscal year ending September 30, 2024;
- (ii) The proposed rates reflect a realignment of costs among the residential and commercial rate classes, and are projected to meet the revenue requirements for the fiscal years ending September 30, 2020 through 2023.
- (iii) The City should consider adopting the proposed rates shown in Section 6.
- (iv) The City should consider establishing a Rate Stabilization Fund to mitigate fluctuations in purchased power costs.
- (v) The City's existing and proposed rates are comparable to other Florida electric utilities;
- (vi) The City may want to investigate additional rate offerings such as an Economic Development Rider, Residential Time of Use Rate, Solar Subscription Rate, or Electric Vehicle Rate;
- (vii) The City should continue to monitor the cost of purchased power and current market conditions and should make adjustments, if necessary, to its power cost recovery factor to reflect such costs and conditions and to minimize the potential to under recover or over recover its fuel costs; and
- (viii) The City should consider submitting this Report, together with other appropriate filing requirements, to the PSC.

We are prepared to present our analyses and proposed rates to the City Commission and to assist the City with public meetings, with PSC filing requirements, and with presentations in connection with the adoption and implementation of the proposed rates.

The Honorable Mayor and City Commission City of Lake Worth Beach July ___, 2021 Page 5

We want to take this opportunity to express our appreciation for the spirited cooperation and valuable assistance given us throughout the course of this study by each member of the City management and staff.

Respectfully submitted,

LEIDOS ENGINEERING, LLC

Leidos Engineering, LLC

Section 1 INTRODUCTION, PURPOSE, AND SCOPE

Introduction

The City of Lake Worth Beach (City), located in south Florida, operates a municipal utility system serving 473,590 MWh in 2019 with a system peak load of 97.2 MW. Lake Worth Beach currently meets its load requirements using a variety of resources, including self-owned and self-operated on-site generation assets and off-site resources as a member of Florida Municipal Power Agency (FMPA). As a participant in FMPA Projects, the City benefits from the associated capacity and energy (Generation Entitlements) to meet its customers' load requirements.

Lcidos Engineering, LLC, (the Consultant or the firm) conducted this study, which relied upon historical and projected data for the development of operating revenues, operating expenses, and capital requirements. Historical data was obtained from various monthly reports, annual financial reports, actual billing records, analyses, and discussions with members of the management and staff of the City. Projected data was, in part, derived from historical data adjusted for current economic conditions, the Operating Budget for Fiscal Year ending September 30, 2020 and the Capital Improvement Plan for Fiscal Years 2020 through 2024, the City's demand and energy forecasts (including the effects of conservation), the various contracts, and the direction and instructions provided by the City, and other appropriate sources.

Purpose

The primary purposes of the Electric Rate Study are:

- 1. To determine the estimated annual revenue requirements for the Fiscal Year ending September 30, 2020, as adjusted for known changes (the Test Year); and Fiscal Years ending September 30, 2021 through 2024 (Study Period).
- 2. To test the adequacy of the existing rates on a system wide basis for the Fiscal Years 2020 through 2024;
- 3. To prepare a cost of service analysis to estimate the cost of providing electric service by customer class;
- 4. To adjust rate levels, if necessary, in order to recover the cost of providing service, and to reflect the policies established by the City; and
- 5. To continue to recover periodically the costs of purchased power.

Scope

The overall scope of services of the Electric Rate Study provided for (i) the development of a revenue requirements study for the Test Year and Study Period; (ii) the development

of proposed rate levels and rate structures that are designed to recover the revenue requirements for the Test Year and Study Period which reflect the City's policy and industry practices; and (iii) the development of comparisons of typical bills for electric service calculated using the existing and proposed rates and the rates charged by neighboring private and public electric utilities.

The Electric Rate Study consists of two parts or phases. The results are presented in this report. Working closely with management and staff, Phase I activities included, among other things, (i) obtaining and reviewing historical billing data, (ii) reconciling such data, (iii) identifying the proper sales forecast to use for purposes of projecting rate revenues and costs (iv) projecting billing determinants in order to calculate the effect on revenues based on revised rates, (v) preparing projections of revenues by major customer class, (vi) developing projected annual revenue requirements for the Test Year and Study Period, (vii) preparing a comparison of the City's existing rates and the rates of other utilities, and (viii) preparing a Phase I report.

Phase II includes (i) the making of revisions to the revenue requirements, (ii) the affirmation of City policies and direction, (iii) the allocation of costs, (iv) the design of proposed rates, and (v) the preparation of a final report.

ENERGY REQUIREMENTS AND CUSTOMER STATISTICS

General

The development of an accurate forecast of future power and energy requirements, sales, customers, and customer usage characteristics, is essential in the evaluation of the adequacy of electric rates and rate structures. This section summarizes the various factors considered and utilized in the development of the City's near term future power and energy requirements.

The estimates of energy and demand requirements developed for inclusion in this study were based on historical sales, customers, and customer usage characteristics.

Energy Requirements

Projection of Electricity Sales to Ultimate Customers

The projections of electric energy sales to ultimate customers are based on an analysis of historical information for the fiscal year ended September 30, 2019. Historical growth, usage patterns, and normalized weather were tested for reasonableness.

Based on information filed with the Energy Information Administration (EIA) and information provided by the City, the following tables show the historical number of residential and commercial customers and residential and commercial energy sales.

| Historical Number of Customers | | | | | | | | |
|--------------------------------|-------------|------------|--------|--|--|--|--|--|
| Fiscal Year | Residential | Commercial | Total | | | | | |
| 2014 | 22,179 | 3,648 | 25,827 | | | | | |
| 2015 | 22,830 | 3,728 | 26,558 | | | | | |
| 2016 | 23,053 | 3,739 | 26,792 | | | | | |
| 2017 | 23,357 | 3,748 | 27,105 | | | | | |
| 2018 | 23,399 | 3,746 | 27,145 | | | | | |
| 2019 | 23,528 | 3,748 | 27,276 | | | | | |
| 2020 | 23,758 | 3,763 | 27,520 | | | | | |

| Historical Retail Energy Sales (MWh) | | | | | | | | |
|--------------------------------------|-------------|------------|---------|--|--|--|--|--|
| Fiscal Year | Residential | Commercial | Total | | | | | |
| 2014 | 195,937 | 177,660 | 373,597 | | | | | |
| 2015 | 225,813 | 204,532 | 430,345 | | | | | |
| 2016 | 254,734 | 180,024 | 434,758 | | | | | |
| 2017 | 244,928 | 183,819 | 428,747 | | | | | |
| 2018 | 253,196 | 179,990 | 433,186 | | | | | |
| 2019 | 260,305 | 179,662 | 439,967 | | | | | |
| 2020 | 264,974 | 169,047 | 434,021 | | | | | |

Based on information provided by the City, it was projected that the reported number of customers and kWh sales would increase by 0.5% annually for the projected fiscal year 2021, and Study Period.

Projected Demand

The historical system peak demand for the fiscal year ending September 30, 2019 was 97.2 MW. For purposes of this Study, it was projected that the system peak demand the Test Year would be 96.8 MW.

Projected Energy Sales

The monthly system historical and projected energy sales are set forth in Table No. 2-1, page 2. The following tabulation is an annual summary of the historical and projected energy sales by major customer class:

| Retail Energy Sales (MWh) | | | | | | | | | | |
|---------------------------|-------------|------------|---------|--|--|--|--|--|--|--|
| Fiscal Year | Residential | Commercial | Total | | | | | | | |
| Historical 2019 | 260,305 | 179,662 | 439,967 | | | | | | | |
| Historical 2020 | 264,974 | 169,047 | 434,021 | | | | | | | |
| Projected 2021 | 268,937 | 165,635 | 434,572 | | | | | | | |

As can be seen from the summary table, energy sales in fiscal years ended September 30, 2019 were 439,967 MWh and 434,021 MWh in Fiscal Year 2020. Sales in Fiscal Year 2021 and the Study Period are based on a projected annual growth rate of 0.5 percent.

Projected Average Number of Customers

An integral part of the forecasting process is the average number of customers the City expects to serve by major customer class. The detailed historical and projected customers are set forth on Table No. 2-1, page 1. The following is a summary of the historical and projected average number of customers used as a basis for this study:

| Average Number of Customers | | | | | | | | | |
|-----------------------------|-------------|------------|--------|--|--|--|--|--|--|
| Fiscal Year | Residential | Commercial | Total | | | | | | |
| Historical 2019 | 23,528 | 3,748 | 27,276 | | | | | | |
| Historical 2020 | 23,758 | 3,763 | 27,520 | | | | | | |
| Projected 2021 | 24,070 | 3,842 | 27,911 | | | | | | |

Purchased Power

The City purchases capacity and energy requirements from a variety of sources, including the FMPA.

Energy Losses

The loss factors utilized in developing the projected energy requirements for the Test Year are 7.3 percent of annual energy requirements and 7.8 percent of energy sales. This factor is used to take into account transmission and distribution losses and unaccounted for energy and demand.

Summary of Projected Demand and Energy Requirements

The following tabulation sets forth the projected annual peak demand at the generation level, energy requirements and the system load factor used in this study:

| Description | 2020 Test Year |
|---|-------------------|
| Annual 60-Minute Peak Demand (MW) | 96.8 |
| Annual Energy Sales (MWh) | 434,021 |
| Losses and Unaccounted for Energy (MWh) | <u>33,854</u> |
| Annual Energy Requirements (MWh) | 467,875 |
| Annual System Load Factor (%) | <u>55.2</u> % |

Customer Statistics

Projected customer statistics by major rate classification are set forth on Table No. 2-1 and No. 2-2. Table No. 2-1 sets forth for fiscal years ending September 30, 2019, 2020 and 2021 the historical and projected number of customers and energy sales. Table No. 2-2 sets forth the projected annual billing determinants by major rate classes for fiscal year 2020. The projected average annual number of customers and annual energy sales for the fiscal year ending September 30, 2020 incorporate the following considerations:

- i. continuation of recent historical sales and/or usage characteristics;
- continuation of past, present, and projected conservation and dcmand-side management programs; and

iii. continuation of the existing regulatory structure.

Any departure from those assumptions (e.g., change in economic activity) could have a material adverse effect on energy sales and revenues.

As derived from Table No. 2-1 and No. 2-2, the projected fiscal year 2020 composition of the City's ultimate customers and associated energy sales by major rate classification is tabulated below:

| Customer Class Residential Commercial Commercial Demand Lighting otal Customers | Test Year 2020 | | | | | | | | | | |
|---|-----------------------------|---------------------|---------------------|---------------------|--|--|--|--|--|--|--|
| Customer Class | Average Number of Customers | Percent of Total | Annual MWh Sales | Percent of Total | | | | | | | |
| Residential | 23,758 | 86.3% | 264,974 | 61.1% | | | | | | | |
| Commercial | 3,128 | 11.4% | 115,953 | 26.7% | | | | | | | |
| Commercial Demand | 85 | 0.3% | 49,286 | 11.4% | | | | | | | |
| Lighting | 550 | 2.0% | 3,808 | 0.9% | | | | | | | |
| Total Customers | | | | | | | | | | | |
| and MWh Sales | 27,520 | 100.0% | 434,021 | 100.0% | | | | | | | |

Section 3 REVENUE REQUIREMENTS

General

The various components of costs associated with the operation, maintenance, funding of improvements, renewal and replacement of facilities, and assurance of the adequacy and continuity of reliable service to customers are generally referred to as the revenue requirements of a municipally owned and operated utility. The determination of the revenue requirements as they relate to the City, consistent with the methods of other publicly owned utilities, includes the various generalized cost components described below.

Operation and Maintenance Expenses: These expenses include the cost of purchased power, labor, materials, supplies, transportation, services, and other expenses, which are necessary to the operation and maintenance of the Electric Utility. These expenses do not include an allowance for depreciation or replacement of capital assets, any monies for the payment of interest on indebtedness or any monies transferred to a Reserve Fund.

Debt Service: Included in the debt service component of cost is the annual principal of and interest on bonds and related costs/transfers payable from the net revenues.

Capital Improvements: These expenditures are for the purpose of paying the cost of construction or acquisition of necessary improvements, betterments, extensions, enlargements or additions to, or the renewal and replacement of capital assets of the system and for unusual or extraordinary repairs thereto.

Revenues Available for Other Lawful Purposes: This component of cost is paid out of revenues and includes (a) any additional capital improvements to be financed from revenues; (b) additional working cash to provide for the payment of expenses incurred in providing service prior to the receipt of revenues associated with such service; (c) the establishment of operating reserves for special purposes such as providing funds for self-insuring the facilities against certain perils and for the stabilization of rates to smooth out rate increases and minimize customer rate shock, (d) transfers of certain amounts of revenues from the earnings of the Electric Utility to the City; and (e) allowances for any other lawful purpose.

Revenue Credits: In the determination of projected annual costs, adjustments should be made to reflect among other things, (a) the receipt of revenues from the investment of monies, and (b) the receipt of revenues from other operating sources such as the rental of land, the use of poles and the sale of serap. The recognition of these revenue credits reduces the overall annual revenue requirement from electric rates to ultimate customers.

Total Annual Net Revenue Requirements: The total of the cost components described above less other income and other operating revenues is the total annual net revenue

requirements and such total represents the amount of revenues required to he recovered through rates and charges to ultimate customers.

Projected Revenue Requirements

Electric rates should be set at a level such that the revenues produced will be sufficient to meet near future revenue requirements. An important objective of a projected test year is to establish rates and rate levels that will also reflect the then current and near future costs of providing service and market conditions. Thus, it is necessary to estimate or project the various cost components over a reasonable period of time in order to determine the required rate levels. Projections must consider changes in operating practices, new facilities, increased regulatory (environmental) costs, expected changes in cost, and other factors that may affect the overall cost of operating and maintaining the utility system.

It was determined that the revenue requirements for this Electric Cost of Service Study would be predicated on the budgeted costs of the Electric Utility for the fiscal year ending September 30, 2020. The budgeted expenditures were used as a baseline in the development of the projections of the annual revenue requirements for the fiscal period ending September 30, 2020 through 2024. Based upon that detailed data and certain adjustments to reflect any known and anticipated changes and certain pro forma adjustments, the Consultant, together with members of the management and staff of the City, developed detailed estimates of projected expenditures for the fiscal years 2020 through 2024.

Assumptions and Considerations

The development of the projected revenue requirements for the Test Year required certain assumptions and considerations in order to reflect certain known or anticipated changes and certain pro forma adjustments. The analyses, estimates and projections summarized herein have been based upon an understanding of certain contracts, agreements, regulations, statutory requirements and planned operations. In the preparation of this report, certain assumptions have been made with respect to conditions, which may occur in the future. While these assumptions are reasonable for the preparation of this study, they are dependent upon future events and actual conditions may differ from those assumed. To the extent that actual future conditions differ from those assumed herein or provided to us by others, the actual results will vary from those projected.

The major assumptions and considerations included in the development of the projected annual revenue requirements have been divided into two categories and are listed below:

General

1. The general economic activity will not have a major impact on the City's electric sales and annual inflation will be approximately 1.5 percent.

- 2. Existing federal and state environmental laws, including the Clean Air Act Amendments of 1990, the Clean Air Interstate Rule and the Clean Air Mercury Rule, will continue to be implemented, applied and enforced, and no new laws, regulations, rules and interpretations will be imposed on the City or its wholesale suppliers resulting in more stringent environmental restrictions in the near term.
- 3. There will be no material change in the taxation of fuel used to produce electricity.
- There will be no material change in the taxation of municipally-owned or municipally financed electric generation or purchased power, transmission and distribution systems.
- 5. There will be no material change in the level of federal, state or local regulation of municipally-owned utilities.
- 6. There will be no material change in the City's existing ability to import or export power over the transmission grid.
- 7. The existing form of governance and policies established by the City will continue throughout the Study Period.
- 8. The City will continue to be the exclusive owner and operator of the Electric Utility, including its transmission, distribution, and customer care facilities.

Specific

- 1. The fiscal year period ending September 30, 2020 through 2024 revenues and expenses for the Electric Utility and the underlying assumptions included therein provide a reasonable basis and reflect normalized system operation.
- 2. As discussed in Section 2, the sales forecast was the basis for the development of the projected retail energy and demand requirements for the Test Year. It should be recognized that (a) any meaningful variances in the load characteristics of existing or new customers, and/or (b) any differences in expected initiation of service for anticipated new customers, and/or (c) differences in the expected effectiveness of the various conservation programs initiated and contemplated by the City and/or (d) any changes in federal or state legislation that permit customers to select their energy service provider may result in a distortion and/or an over or under recovery of revenue requirements for the Test Year.
- Power supply costs used herein are predicated in part on cost data provided by the City and on the continued purchase of power supply from its wholesale suppliers.
- 4. Expenses for the fiscal years 2020 through 2024 have been increased based on an assumed inflation rate of 1.5 percent per year except where noted in Table No. 3-1. Salaries have been escalated at 3.0 percent, benefits at 6.5 percent, insurance at 5.0 percent, and information technology at 15.0 percent for 2021 and 5.0 percent for years 2022 through 2024.

- 5. Projected purchased power expenses have been estimated based on an analysis of purchased power expenses assuming an overall increase in kWh usage from 2020 of 0.5 percent per year, as shown on Table No. 3-4.
- 6. Projected debt service payments have been based on information provided by the City.
- Capital improvement expenditures have been assumed to be funded from bond proceeds.
- 8. The amount for the Transfer to the General Fund has been based on current City policies and assumed to be constant at the current level.
- 9. Other Revenue has been projected based on the adopted fiscal year ending September 30, 2020 Budget and is set forth in Table No. 3-3.
- Projected revenues from existing rates have been estimated based on the projected increases in sales from 2020 levels of 0.5 percent per year, as shown on Table No. 3-2.

Shown on Table No. 3-1 are the various expenditures and revenues for the fiscal years ending September 30, 2020 through 2024, and the adjustments discussed herein. In addition, each of the adjustments is noted in the footnotes to Table No. 3-1.

Summary

Based on the projected Test Year revenue requirements developed on Table No. 3-1, the existing rates produce revenues that are slightly greater than the cost of providing service on a system wide basis through fiscal year 2023. The projected revenue requirements and existing rate revenues are summarized below.

| | | | Projected | 3 | |
|----------------------------------|--------------|--------------|--------------|--------------|--------------|
| Description | FY 2020 | FY 2021 | FY 2022 | FY 2023 | FY 2024 |
| Net Revenue Requirements | \$58,158,995 | \$58,531,674 | \$60,360,905 | \$58,782,793 | \$62,340,635 |

Section 4

FUNCTIONALIZATION AND CLASSIFICATION OF COSTS AND DEVELOPMENT OF ALLOCATION FACTORS

Functionalization and Classification

In allocating utility costs to the various customer classes, there are three major processes: functionalization, classification, and allocation. The functionalization and classification of the Test Year revenue requirement are discussed in the first part of this section. The development of allocation factors for the Test Year revenue requirement is discussed and set forth in the second half of this section.

Functionalization of Test Year Expenditures

Although budgeting and accounting systems generally follow functional groups, i.e., production, transmission, etc., certain costs such as those associated with administrative and general expenses and bond service generally are not assigned by accounting and budgetary convention to a major function. A COS study usually requires the rearrangement of certain expenditures into functional groups (i) to be more representative of the expenditure causation, (ii) to combine costs that have been incurred for a similar purpose, and (iii) to facilitate the allocation of cost responsibility. Thus, the functionalization of certain costs is merely a ratemaking mechanism to apportion such costs to the common utility function.

The typical functions of the Test Year Revenue Requirements are developed in the COS model and summarized on Table 4-1 and below.

| <u>Function and Description</u> | Test Year <u>Amount</u> |
|--|----------------------------|
| Production. Those costs associated with generating or purchasing power and delivering that power to the utility's bulk transmission system | \$40,313,652 |
| Transmission and Distribution. Those costs incurred in connection with the delivery of power over the bulk transmission system through the primary and secondary distribution system to the utility's consumers | \$13,863,265 |
| Customer. Those costs that are related to the number, type and size of customers | <u>\$3,982,058</u> |
| Total | <u>\$58.158.995</u> |

An analysis of the Test Year revenue requirements was made to estimate the functionalized Test Year revenue requirements.

Classification of Various Costs

Historically, electric utility costs or the components of the annual revenue requirement have generally been classified as (1) demand-related, (2) variable or energy-related, and (3) customer-related. Thus, if a cost or expense is fixed or does not vary directly with the level of kWh purchased or sold, the cost was assumed to be generally related to the demands or load of the customers and was allocated to the various customer classes on the basis of demand or load relationships. Debt service is one example of an expenditure generally classified as demand-related. If a cost or expense was viewed to vary with the amount of kWh the electric utility sold, the cost or expense was usually classified as energy-related and allocated to the various customer classes on the basis of kWh relationships. Purchased energy costs are a primary example of expenses classified as variable or energy-related and allocated on the basis of kWh sales. If the cost is directly related to the number of customers which are being served, these costs would generally be classified as such and allocated to the customer classes based on the customer relationship among the customer classes. An example of customer-related costs is meter reading expenses.

Until such time that the development of more detailed data with regard to hourly usage characteristics and costs is economically justified or legally required, the classification of costs described below reflects usual regulatory practice as well as a reasonable and equitable approach.

Demand (Fixed) Costs: Are defined as those costs incurred to maintain in readiness-to-serve an electric system capable of meeting the total combined demands of all classes of customers. Demand costs are those costs that are generally fixed in the short-run, that do not materially vary directly with the number of kWh generated or sold, and that are not defined as customer costs. Demand costs will include that portion of operation and maintenance expenses; debt service; renewals, replacements and improvements; and other costs which are not designated as specifically customer or variable energy costs.

Customer Costs: Are defined as those costs directly related to the number, type and size of customers, such as customer accounting and collecting, and costs of meters and services.

Energy (Variable) Costs: Are defined as those costs that vary substantially or directly with the amount of energy sold or generated and purchased, including such items as fuel and a portion of operation and maintenance expense for production facilities.

Development of Allocation Factors

General

This section discusses the development of the factors utilized to allocate the capacity related, energy related, customer related, and other costs to the various customer classes. The aforementioned costs are allocated to the customer classes according to their respective customer class, and the particular cost allocation factor developed for each

class and for each type of cost. The customer classes include Residential, Commercial, Commercial Demand, and Lighting.

Demand Allocation Factors

"Demand Allocation" refers to the basis on which capacity and other demand related costs are distributed or assigned (allocated) among the various customer classes for the purpose of determining the revenues required from each class to recover such costs. The demand allocation factors, as developed and used herein, reflect the cost responsibility for each of the various customer classes in relation to the capacity or demand related costs to be allocated. The demand allocation factors were used to apportion the following capacity or demand related costs among the various customer classes.

- Production and purchased power expenses (fixed capacity costs only);
- Transmission and distribution expenses;
- Debt service requirements;
- Allowances for renewal and replacements, and reserves; and
- Payments to the City.

The demand allocation factors were developed based on historical demand and energy relationships filed with the Public Service Commission by the investor—owned utilities in Florida for 2018 and an analysis of the City's billing demands. The demand allocation factors are based on the estimated annual coincident and non-coincident peak demands. Table No. 4-2 summarizes the demand allocation factors. Table No. 4-5 shows a comparison of the results of the load research for the investor-owned utilities.

Energy Allocation Factors

Energy allocation factors are the basis for apportioning those costs or expenses classified as variable or energy related and assumed to vary directly with the level of kWh sales or generation. The costs classified herein as variable or energy related are fuel, purchased power, and the variable portion of other production expenses.

The projected fiscal year energy sales data are discussed in Section 2. The resulting energy allocation factors are shown on Table No. 4-3.

Customer Allocation Factors

Customer costs are defined herein as those costs related to the number of customers and the size of service required. Included in the customer related costs are the costs associated with meter reading, meter maintenance, customer installations, billing, collecting, and other customer related accounting, service, and information functions. The customer allocation factors were based on the projected average number of customers in each customer classification during the Test Year.

In apportioning customer related costs and revenues to the various customer classifications, customer allocation factors were utilized that recognized weighted and unweighted customers and fixtures. The customer weighting factors were based on FPL customer charges. The customer allocation factors are shown on Table No. 4-4.

Other Allocation Factors

Certain elements of the annual revenue requirement are related to revenues. Miscellancous other allocation factors including the revenue allocation factors are included in the COS model.

Section 5 ALLOCATED COST OF SERVICE

General

As one of the factors considered in the development of the proposed rate levels and rate structures included herein, certain analyses common in ratemaking have been employed which provide a reasonable indication of the revenue levels required to recover the full cost of service or revenue requirement of each customer class. Since it is not the practice in utility accounting to maintain a subdivision of accounts that will report the cost of rendering service to each customer class, an allocation of costs must be made on the basis of parameters predicated upon the available classifications of operating expense and utility plant.

Present and Proposed Rate Classifications

The present customer classifications are as follows:

- Residential
- Commercial
- Commercial Demand
- Lighting

Allocation and Assignment of the Cost of Service

The allocated cost of service was developed, along with the target rate change for each class, based on a comparison of existing rate revenues.

Table No. 5-1 summarizes the results of the allocated COS study. Table No. 5-2 shows the results of the functionalization and classification of the Test Year revenue requirements and Table No. 5-3 summarizes the cost of service by customer class.

The target rate changes by customer class were developed to move toward the cost of service. The projected Test Year revenues under the existing rates and charges, the target revenue adjustments, and the percentage change necessary to recover the revenue requirements to move toward the cost of service for each of the major rate classifications, as summarized from the COS model, are as follows:

| Took | Vane | 2020 |
|------|--------|--------|
| 1291 | Y 62 F | 711711 |

| 10011001 | | | | | |
|----------------|--|--|--|--|--|

^[1] Based on Electric Cost of Service Study.

^[2] From Table No. 5-1.

^[3] From Table No. 2-1.

General Rate Design Criteria

Rate design is the culmination of a rate study whereby the rates and charges for each customer classification are established in such a manner that the total revenue requirement of the system will be recovered in an equitable manner consistent with the results of the allocated cost of service study and any applicable orders and/or requirements of local, state, and federal regulatory authorities. To the extent possible, rate design should consider and reflect overall revenue stability, historical rate form, conservation considerations, competitiveness with neighboring utility systems, and the policies of those charged with the management and operation of the City.

The proposed rate levels and rate structures developed and submitted to the City for consideration and adoption should continue to meet the following electric utility rate criteria for service provided by municipally owned utilities:

- Electric rates should be based on a rate policy which calls for the lowest possible prices consistent with customer requirements, quality service efficiently rendered, and a payment to the City.
- Electric rates should be simple and understandable.
- Electric rates should be equitable among classes of customers and individuals within classes, taking into consideration the cost of service.
- Electric rates should be designed to encourage the most efficient use of the utility plant and discourage unnecessary or wasteful use of service.
- Electric rates should comply with applicable orders and requirements of local, state and federal regulatory authorities that have jurisdiction.

Proposed Rates

The existing rates and the proposed rates necessary to recover the revenue requirements are summarized on Table No. 6-1. The proposed rates reflect with the required rate changes by class applied to the customer, demand and energy charges. Table No. 6-2 shows calculation of the projected revenues at the proposed rates.

Table No. 6-1 also shows the existing and proposed minimum bills for each rate class. Base on the cost of service shown on Table No. 5-1 and Table No. 5-4, the fixed distribution and customer costs allocated to the residential class are \$8,664,650 and \$3,386,718, respectively, for a total of \$12,051,368. Dividing this total by 23,758 residential customers results in \$507 per customer per year, or approximately \$42 per customer per month. This does not include fixed purchased power costs. Based on this fixed cost per customer, it is proposed that the residential minimum charge be increased

to \$35 per month. Similarly, the fixed distribution and customer costs allocated to the commercial class results in approximately \$111 per customer per month, and it is proposed that the commercial minimum charge be increased to \$100 per month.

Rate Stabilization Fund

It is recommended that the City establish a Rate Stabilization Fund to use if necessary to avoid variations in customers' bills because of changes in the cost of purchased power. Section 4.08 of the City's Bond Resolution states "The issuer may transfer into the Rate Stabilization Fund such moneys which are on deposit in the Utility Reserve Fund as it deems appropriate. The issuer may transfer such amount of moneys from the Rate Stabilization Fund to the Revenue Fund as it deems appropriate."

Power Cost Adjustment

It is recommended that a separate rate component continue to be implemented that recovers the cost of purchased power. It is proposed that this factor be calculated every year and adjusted as necessary. The proposed factor includes the variable Stanton costs, capacity and energy purchased power costs, fuel and transmission costs. Table No. 3-4 shows the proposed calculation of the PCA.

Summary

The following is a comparison of the projected Fiscal Year 2021 revenues produced by applying the projected billing determinants to the existing rates and the proposed rates for each classification, plus an allocation of other revenues:

| | Fiscal Year 2021 | | | | | | | |
|-------------------|------------------|----------|-------------|--|--|--|--|--|
| | Total Existing | Proposed | Rate | | | | | |
| | Revenue | Revenue | Adjustment- | | | | | |

General

This section provides a summary of the billing effects of the proposed rates for major rate classifications. Specifically, the tables in this section provide for two types of billing comparisons for each major rate classification at various levels of usage which include (i) monthly bills calculated under the City's proposed rates compared with bills calculated under its existing rates, and (ii) monthly bills calculated under the City's existing and proposed rates compared with those calculated under the rates of selected utilities for the billing month of January 2021.

Existing and Proposed Rates

Table No. 7-1 provides a comparison of monthly bills calculated under the proposed rates and the existing rates over a wide range of usage levels.

Comparisons with Other Utilities

Table No. 7-2 show the City's existing and proposed rates along with those of other electric utilities. As can be seen from these tables, the City's rates are comparable to other utilities.

GLOSSARY [1]

Administrative and general expenses: Expenses of an electric utility relating to the overall directions of its corporate offices and administrative affairs, as contrasted with expenses incurred for specialized functions. Examples include office salaries, office supplies, advertising, and other general expenses.

AMI: Advanced Metering Infrastructure is a term denoting electricity meters that measure and record usage data at a minimum, in hourly intervals, and provide usage data to both consumers and energy companies at least once daily.

Base rate: A fixed kilowatthour charge for electricity consumed that is independent of other charges and/or adjustments.

Bulk power transactions: The wholesale sale, purchase, and interchange of electricity among electric utilities. Bulk power transactions are used by electric utilities for many different aspects of electric utility operations, from maintaining load to reducing costs.

Capacity (purchased): The amount of energy and capacity available for purchase from outside the system.

Capacity charge: An element in a two-part pricing method used in capacity transactions (energy charge is the other element). The capacity charge, sometimes called Demand Charge, is assessed on the amount of capacity being purchased.

Capacity factor: The ratio of the electrical energy produced by a generating unit for the period of time considered to the electrical energy that could have been produced at continuous full power operation during the same period.

Capital cost: The cost of field development and plant construction and the equipment required for industry operations.

Class rate schedule: An electric rate schedule applicable to one or more specified classes of service, groups of businesses, or customer uses.

Classes of service: Customers grouped by similar characteristics in order to be identified for the purpose of setting a common rate for electric service. Usually classified into groups identified as residential, commercial, industrial, and other.

Coincidental demand: The sum of two or more demands that occur in the same time interval.

Coincidental peak load: The sum of two or more peak loads that occur in the same time interval.

Consumer charge: An amount charged periodically to a consumer for such utility costs as billing and meter reading, without regard to demand or energy consumption.

Cost of service: A ratemaking concept used for the design and development of rate schedules to ensure that the filed rate schedules recover only the cost of providing the electric service at issue. This concept attempts to correlate the utility's costs and revenue with the service provided to each of the various customer classes.

Demand charge: That portion of the consumer's bill for electric service based on the consumer's maximum electric capacity usage and calculated based on the billing demand charges under the applicable rate schedule.

Distribution system: The portion of the transmission and facilities of an electric system that is dedicated to delivering electric energy to an end-user.

Electric rate: The price set for a specified amount and type of electricity by class of service in an electric rate schedule or sales contract.

Electric rate schedule: A statement of the electric rate and the terms and conditions governing its application, including attendant contract terms and conditions that have been accepted by a regulatory body with appropriate oversight authority.

Electricity sales: The amount of kilowatthours sold in a given period of time; usually grouped by classes of service, such as residential, commercial, industrial, and other. "Other" sales include sales for public street and highway lighting and other sales to public authorities, sales to railroads and railways, and interdepartmental sales.

Encrgy charge: That portion of the charge for electric service based upon the electric energy (kWh) consumed or billed.

Federal Energy Regulatory Commission (FERC): The Federal agency with jurisdiction over interstate electricity sales, wholesale electric rates, hydroelectric licensing, natural gas pricing, oil pipeline rates, and gas pipeline certification. FERC is an independent regulatory agency within the Department of Energy and is the successor to the Federal Power Commission.

FERC guidelines: A compilation of the Federal Energy Regulatory Commission's enabling statutes; procedural and program regulations; and orders, opinions, and decisions.

Fixed cost (expense): An expenditure or expense that does not vary with volume level of activity.

Fixed operating costs: Costs other than those associated with capital investment that do not vary with the operation, such as maintenance and payroll.

Investor-owned utility (IOU): A privately-owned electric utility whose stock is publicly traded. It is rate regulated and authorized to achieve an allowed rate of return.

Kilowatt (kW): One thousand watts.

Kilowatthour (kWh): A measure of electricity defined as a unit of work or energy, measured as 1 kilowatt (1,000watts) of power expended for 1 hour. One kWh is equivalent to 3,412 Btu.

Load diversity: The difference between the peak of coincident and noncoincident demands of two or more individual loads.

Load factor: The ratio of the average load to peak load during a specified time interval.

Megawatt (MW): One million watts of electricity.

Megawatthour (MWh): One thousand kilowatt-hours or Imillion watt-hours.

Noncoincident demand: Sum of two or more demands on individual systems that do not occur in the same demand interval.

Noncoincidental peak load: The sum of two or more peak loads on individual systems that do not occur in the same time interval. Meaningful only when considering loads within a limited period of time, such as a day, week, month, a heating or cooling season, and usually for not more than 1 year.

O&M: Operation and Maintenance.

Peak demand: The maximum load during a specified period of time.

Purchased power: Power purchased or available for purchase from a source outside the system.

Rate schedule (electric): The rates, charges, and provisions under which service is supplied to the designated class of customers.

Ratemaking authority: A utility commission's legal authority to fix, modify, approve, or disapprove rates as determined by the powers given the commission by a State or Federal legislature.

Rates: The authorized charges per unit or level of consumption for a specified time period for any of the classes of utility services provided to a customer.

Time-of-day rate: The rate charged by an electric utility for service to various classes of customers. The rate reflects the different costs of providing the service at different times of the day.

Watt (W): The unit of electrical power equal to one ampere under a pressure of one volt. A Watt is equal to 1/746 horse power.
