

LA RINCONADA COUNTRY CLUB

Project Description

The Club proposes to renovate its existing golf course maintenance facilities to create a modern, environmentally sustainable, and safe workspace for staff while supporting the long-term quality and playability of the golf course. The current facilities, built in the 1970s, consist of two metal-framed structures and a small employee break room that no longer meet the needs of modern golf course operations.

The renovation will include construction of (2) updated maintenance buildings designed to accommodate today's larger and more advanced equipment. Rooftop solar panels will be installed to generate clean energy, powering a new fleet of electric maintenance vehicles and equipment. This transition will significantly reduce noise and emissions, benefiting both staff and the surrounding residential community. The project also includes demolishing the (2) existing metal buildings and (1) conventionally framed building.

Overall, the project supports the Club's commitment to environmental stewardship, operational efficiency, and providing a high-quality golf experience for future generations.
