Subject: APAR update

Jody

Finally have the recent sampling data back and am working on finishing up the APAR. Should make the deadline. It's coming together.

Only minor arsenic exceedance in one groundwater sample this time! That's good. Water and sediment were clean (no surprise).

Although no one drinks the water there, you still have to assess to residential levels and as the arsenic PCL is federal, I'm unable to easily dismiss it.

I'm going to spin this as an isolated exceedance not related to operations at or on the landfill. Naturally occurring arsenic in soil, etc.

TPH issues that were there...have been addressed by the tenant's surface cleanup activities.

Lead, arsenic and barium were observed in soil but only arsenic made it to GW. No other chemical issues were identified.

I was able to make lead and barium go away as concerns. Levels just aren't high enough.

Will update you further as things progress.
