

## WATERLINE 1621 MILIAN CIR.

In the past, these three (3) properties were owned by the same family. The water and gas meters for all 3 homes were located in the approximate location on the green box, across properties. When Public Works replaced the water meter, the old line was capped, and a new waterline was run sometime between October and November 2023.

The objective was to replace the customer's line taking the 'path of least resistance' in response to an identified water leak on the customer's side of the meter. By capping the old line and installing a new waterline, no excavation on neighboring properties was needed.

The old waterline was a steel 1" line, and the newly installed line is a 3/4" poly line.

Due to the age and composition of the old line and registered water usage, concluding a water leak was reasonable, especially with consideration to the Summer 2023 drought.
