1 EXECUTIVE SUMMARY

This report presents the findings of the revised traffic impact analysis (TIA) prepared for the proposed expansion of Taylor Middle School in the Town of Warrenton, Virginia. The original TIA was submitted in September 2023 and the Town issued comments in November 2023. This revised TIA has been prepared to address those comments.

1.1 PROJECT OVERVIEW

The site is generally located south of E Shirley Street, north of Alwington Boulevard, and east of Culpeper Street as shown in Figure 1-1 (all figures are located at the end of their respective chapter).

The existing site encompasses Taylor Middle School and James G. Brumfield Elementary School. The middle school currently accommodates 510 students. The proposed expansion of the middle school will accommodate an increase of 340 students for a total of 850 students.

Access will be provided via three existing entrances on E Shirley Avenue and one new entrance via a connecting road to the existing elementary school and out to Alwington Boulevard. A conceptual plan is shown on Figure 1-2.

For the purposes of this analysis, the expansion was assumed to be complete and occupied by 2026.

When complete, the expansion will generate an increase of 145 AM peak hour trips (84 in and 61 out), 101 School PM peak hour trips (40 in and 61 out), 42 PM peak hour trips (30 in and 12 out) and 714 average daily trips.

Based on the trips generated by the site and the rezoning application, a traffic study is required by the Town of Warrenton, but a VDOT Chapter 527 TIA is not required.

The purpose of this analysis is to determine the impact of the proposed expansion of the middle school on the surrounding roadway network. The scope of this study was developed in conjunction with the Town of Warrenton and the Virginia Department of Transportation (VDOT). A copy of the scoping documents is included in Appendix A.

1.2 STUDY LIMITS

As agreed, upon in the scoping documents, the study limits include the following seven (7) existing intersections:

1. Shirley Avenue/Culpeper Street (signalized);
2. E Shirley Avenue/Site Entrance #1 (unsignalized);
3. E Shirley Avenue/Site Entrance #2 (signalized);
4. E Shirley Avenue/Site Entrance #3 (unsignalized);
5. E Shirley Avenue/Route 15 (roundabout);
6. E Shirley Avenue/Alwington Boulevard (signalized); and
7. Alwington Boulevard/Elementary School Entrance (unsignalized).

It is noted that the Shirley Avenue/Culpeper Street signal is maintained by the Town while the E Shirley Avenue/Alwington Boulevard signal is maintained by VDOT.

In accordance with the scoping agreement, analyses were completed for the following scenarios:

1. 2023 Existing Traffic Conditions;
2. 2026 Background Traffic Conditions (without proposed expansion of the site);
3. 2026 Future Traffic Conditions (with proposed expansion of the site);
4. 2032 Background Traffic Conditions (without proposed expansion of the site); and
5. 2032 Future Traffic Conditions (with proposed expansion of the site).

The analysis examines the AM peak hour (when the school peak coincides with the commuter peak), the school PM peak hour, and the commuter PM peak hour. It is noted the commuter PM peak hour is referred to as the "PM peak hour" and the school PM peak hour is referred to as the "School PM peak hour" in this analysis.

The following steps were taken to determine the potential traffic impacts associated with this project:

1. Data Collection – Existing AM (6-9 AM) and PM (2-6 PM) peak hour traffic counts were collected at the existing study intersections on May 16 and May 18, 2023.
2. Traffic Growth – As agreed upon in the scoping document, a 1% annual growth rate was applied to existing traffic volumes to account for development outside the study area.
3. Other Developments – The traffic from the approved Arrington Development was accounted for in the 2032 scenarios only.
4. Trip Generation – Traffic generated by the proposed development was estimated using the existing traffic counts at the school driveways (peak hours) and the 11th edition of the Institute of Transportation Engineers' Trip Generation Manual (average daily traffic).
5. Traffic Distributions – The distribution of trips generated by the proposed developed was based on the existing traffic volumes, the nature of the use, and local knowledge.
6. Site Traffic Projections – Future traffic volumes were determined by combining the 2026 and 2032 background traffic volumes with proposed new trips generated by the site to create the 2026 and 2032 total traffic volumes used in the analysis.
7. Traffic Capacity Analysis – Level of service calculations for existing, background, and future conditions were performed using SYNCHRO Version 11 with SimTraffic for signalized and unsignalized intersections and SIDRA version 9 for the roundabout.
8. Queuing Analysis – The 95th percentile queue lengths (Synchro) and maximum queues (SimTraffic) were reviewed at the intersections listed above.
9. Turn Lane Warrant Analysis – The need for turn lanes at the site entrances on E Shirley Avenue will be analyzed under 2026 and 2032 future traffic conditions.
10. Access Management Review – An evaluation of the access management spacing standards for the site entrances on E Shirley Avenue will be conducted for the reconfigured site entrances.

1.3 PRINCIPAL FINDINGS

Based on the analysis contained herein, the following principal findings are offered:

Under 2023 existing conditions:

1. The East Shirley/Culpeper Street intersection currently operates an overall LOS C in each of the peak hours. Each of the approaches operates at LOS D or better with no queueing concerns.
2. The school entrances along East Shirley Avenue operate at LOS C or better in each of the peak hours. The queues at the left and right turns into the school are contained within the available storage.
3. The roundabout at East Shirley Avenue/Route 15 (Falmouth Street) operates at LOS A in each of the peak hours with no queuing concerns.
4. The East Shirley Avenue/Alwington Boulevard intersections operates at LOS C or better in each of the peak hours. Each of the approaches operates at LOS D or better. Each of the queues are contained within the available storage.
5. Each of the movements at the Alwington Boulevard/School Entrance/Commercial Entrance intersection operates at LOS A in all peak hours.

Under 2026 background conditions, all intersections experience similar levels of service, delay, and queueing as under existing conditions. Specifically:

1. The East Shirley/Culpeper Street intersection will operate an overall LOS C in each of the peak hours. Each of the approaches operates at LOS D or better with no queueing concerns.
2. The school entrances along East Shirley Avenue operate at LOS C or better in each of the peak hours. The queues at the left and right turns into the school are contained within the available storage.
3. The roundabout at East Shirley Avenue/Route 15 (Falmouth Street) operates at LOS A in each of the peak hours with no queuing concerns.
4. The East Shirley Avenue/Alwington Boulevard intersections operates at LOS C in each of the peak hours. Each of the approaches operates at LOS D or better. Each of the queues are contained within the available storage.
5. Each of the movements at the Alwington Boulevard/School Entrance/Commercial Entrance intersection operates at LOS A in all peak hours.

Under 2026 total future conditions, with buildout of the proposed development, all intersections experience similar levels of service compared to 2026 background conditions. Specifically:

1. The East Shirley/Culpeper Street intersection will operate an overall LOS C in each of the peak hours. Each of the approaches operates at LOS D or better with no queuing concerns.
2. The school entrances along East Shirley Avenue operate at LOS C or better in each of the peak hours. The queues at the left and right turns into the school are contained within the available storage.
3. The roundabout at East Shirley Avenue/Route 15 (Falmouth Street) operates at LOS A in each of the peak hours with no queuing concerns.
4. The East Shirley Avenue/Alwington Boulevard intersections operates at LOS C in each of the peak hours. Each of the approaches operates at LOS D or better. Each of the queues are contained within the available storage.
5. Each of the movements at the Alwington Boulevard/School Entrance/Commercial Entrance intersection operates at LOS A in all peak hours.
6. The expansion of the middle school will have minimal impact on the external surrounding roadway network and no improvements are required at the study intersections.
 - a. The expansion will provide a link between the elementary school and the middle school during school pick up and drop off times only. During all other times, the connection between the schools will be gated.

Under 2032 background conditions, all intersections experience similar levels of service, delay, and queuing as under 2026 background conditions. Specifically:

1. The East Shirley/Culpeper Street intersection will operate an overall LOS C or D in each of the peak hours. Each of the approaches operates at LOS D or better with no queuing concerns with the exception of the eastbound left approach which will operate at LOS E in both PM peaks.
 - a. It is noted that the traffic signal is running under “free” operations and is likely giving more time to the mainline through movements which results in the LOS E. The delays are less than the overall cycle length of the intersection indicating that the average traffic waits at most one cycle length to traverse the intersection.
2. The school entrances along East Shirley Avenue operate at LOS D or better in each of the peak hours. The queues at the left and right turns into the school are contained within the available storage.
3. The roundabout at East Shirley Avenue/Route 15 (Falmouth Street) operates at LOS A or B in each of the peak hours with no queuing concerns.
4. The East Shirley Avenue/Alwington Boulevard intersections operates at LOS C in each of the peak hours. Each of the approaches operates at LOS D or better. Each of the queues are contained within the available storage.
5. Each of the movements at the Alwington Boulevard/School Entrance/Commercial Entrance intersection operates at LOS A in all peak hours.

Under 2032 total future conditions, with buildout of the proposed development, all intersections experience similar levels of service compared to 2026 background conditions. Specifically:

1. The East Shirley/Culpeper Street intersection will operate an overall LOS C or D in each of the peak hours. Each of the approaches operates at LOS D or better with no queueing concerns with the exception of the eastbound left approach which will operate at LOS E in both PM peaks.
 - a. It is noted that the traffic signal is running under “free” operations and is likely giving more time to the mainline through movements which results in the LOS E. The delays are less than the overall cycle length of the intersection indicating that the average traffic waits at most one cycle length to traverse the intersection.
2. The school entrances along East Shirley Avenue operate at LOS D or better in each of the peak hours. The queues at the left and right turns into the school are contained within the available storage.
3. The roundabout at East Shirley Avenue/Route 15 (Falmouth Street) operates at LOS A or B in each of the peak hours with no queueing concerns.
4. The East Shirley Avenue/Alwington Boulevard intersections operates at LOS C in each of the peak hours. Each of the approaches operates at LOS D or better. Each of the queues are contained within the available storage.
5. Each of the movements at the Alwington Boulevard/School Entrance/Commercial Entrance intersection operates at LOS A in all peak hours.
6. The expansion of the middle school will have minimal impact on the external surrounding roadway network and no improvements are required at the study intersections.
 - a. The expansion will provide a link between the elementary school and the middle school during school pick up and drop off times only. During all other times, the connection between the schools will be gated.

1.4 RECOMMENDATIONS

The expansion of the middle school will have minimal to no impact on the surrounding roadway network and no improvements are required at the study intersections.

The expansion will provide a link between the elementary school and the middle school during school pick up and drop off times only. During all other times, the connection between the schools will be gated.

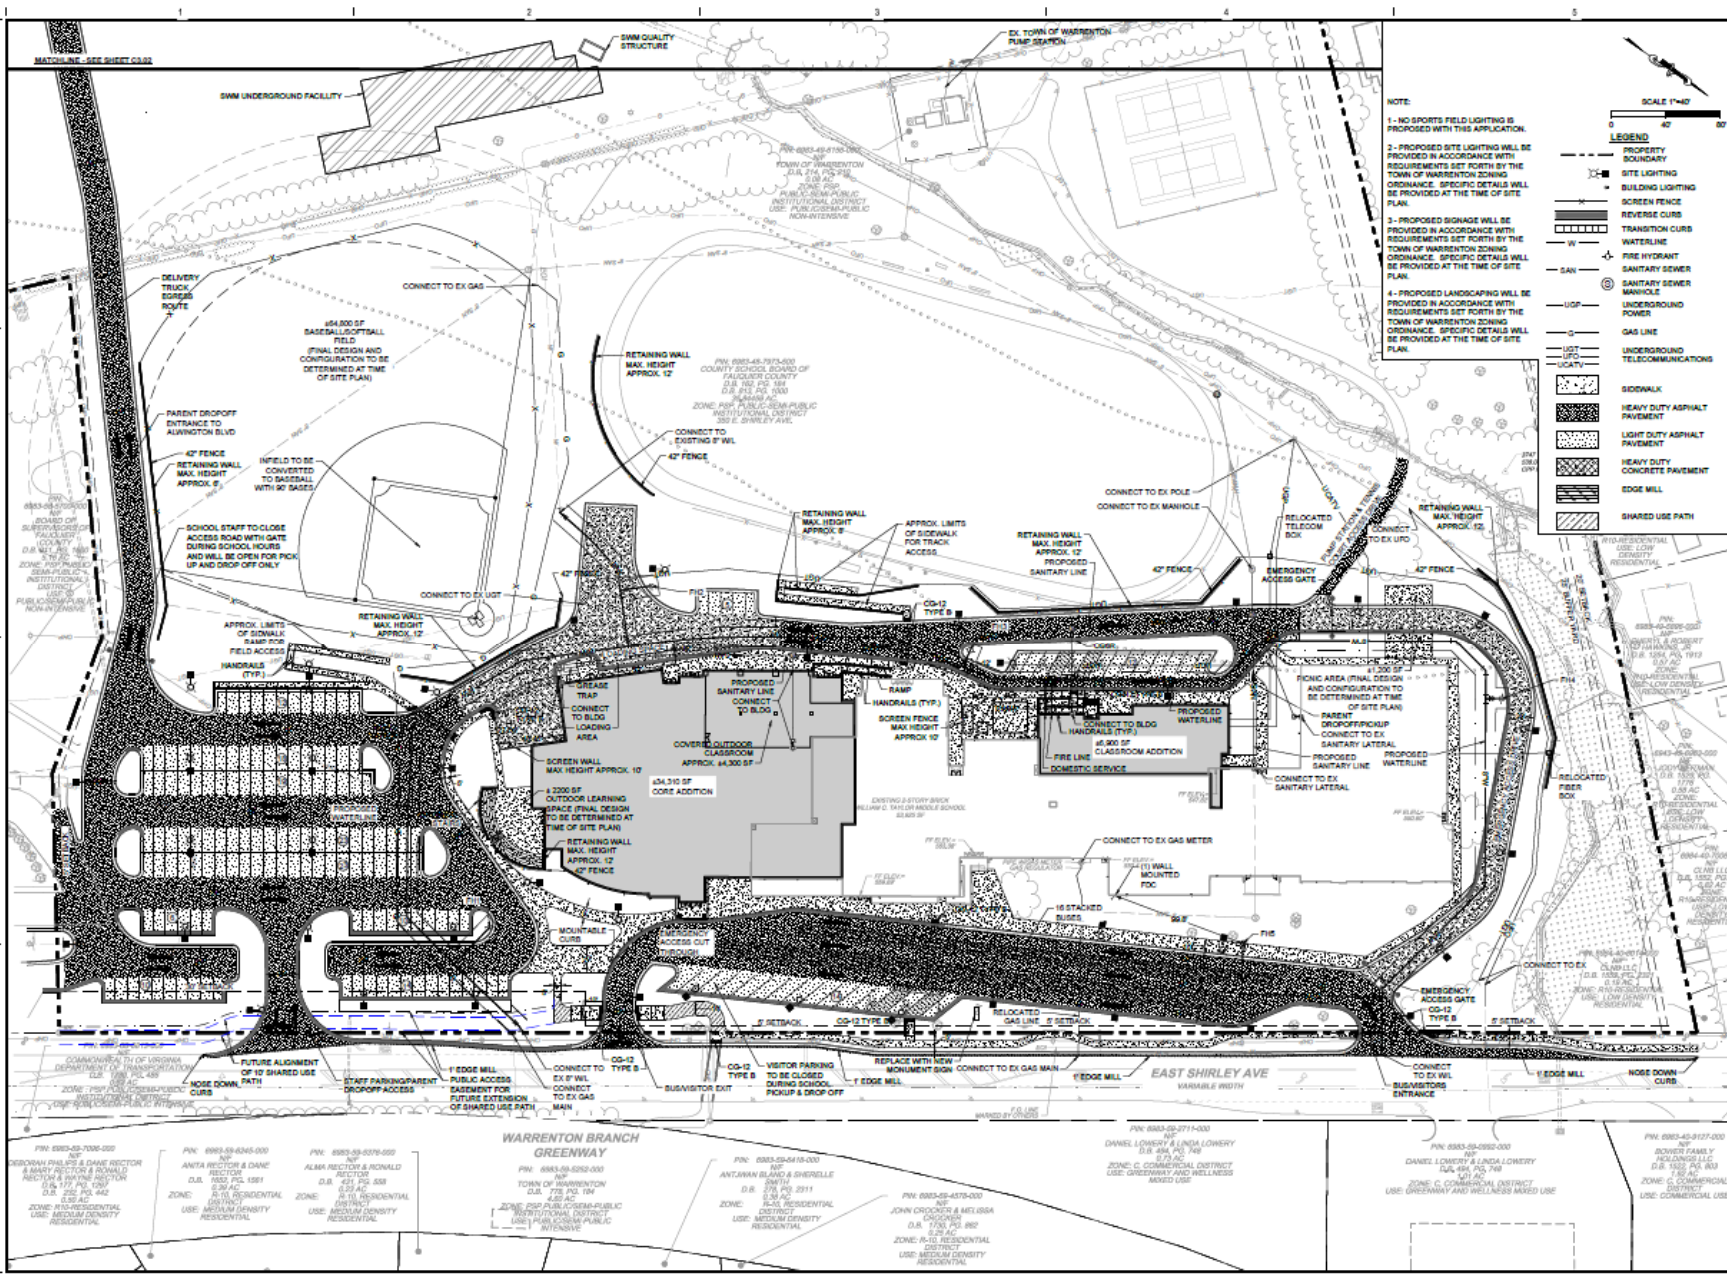

The traffic control at internal intersections to the school site was not reviewed as part of this study and will the specifics (signage, pavement markings, etc.) will be designed at the time of site plan approval.

2 BACKGROUND INFORMATION

2.1 DESCRIPTION OF ON-SITE DEVELOPMENT

The site is generally located south of E Shirley Street, north of Alwington Boulevard, and east of Culpeper Street as shown in Figure 1-1 (all figures are located at the end of their respective chapter).

The existing site encompasses Taylor Middle School and James G. Brumfield Elementary School. The middle school currently accommodates 510 students. The proposed expansion of the middle school will accommodate an increase of 340 students for a total of 850 students. Access will be provided via three existing entrances on E Shirley Avenue and one new entrance via a connecting road to the existing elementary school and out to Alwington Boulevard. A conceptual plan is shown on Figure 1-2.

For the purposes of this analysis, the expansion was assumed to be complete and occupied by 2026.

When complete, the expansion will generate an increase of 145 AM peak hour trips (84 in and 61 out), 101 School PM peak hour trips (40 in and 61 out), 42 PM peak hour trips (30 in and 12 out) and 714 average daily trips.

Based on the trips generated by the site and the rezoning application, a traffic study is required by the Town of Warrenton, but a VDOT Chapter 527 TIA is not required.

The purpose of this analysis is to determine the impact of the proposed expansion of the middle school on the surrounding roadway network. The scope of this study was developed in conjunction with the Town of Warrenton and the Virginia Department of Transportation (VDOT). A copy of the scoping documents is included in Appendix A.

2.2 STUDY LIMITS

As agreed, upon in the scoping documents, the study limits include the following seven (7) existing intersections:

1. Shirley Avenue/Culpeper Street (signalized);
2. E Shirley Avenue/Site Entrance #1 (unsignalized);
3. E Shirley Avenue/Site Entrance #2 (signalized);
4. E Shirley Avenue/Site Entrance #3 (unsignalized);
5. E Shirley Avenue/Route 15 (roundabout);
6. E Shirley Avenue/Alwington Boulevard (signalized); and
7. Alwington Boulevard/Elementary School Entrance (unsignalized).

2.3 EXISTING ROADWAY NETWORK

E Shirley Avenue (Route 17) is a two-lane, undivided, minor arterial with a posted speed limit of 40 mph from Culpeper Street to Route 15 and 25 mph from Route 15 to Alwington Boulevard. The 2021 VDOT traffic data shows that Route 17 carries approximately 15,000 vehicles per day between Culpeper Street and Route 15. The 2021 Virginia Roads traffic data shows that Route 17 carries approximately 9,7000 vehicles per day between the Town of Warrenton Line and the James Madison Highway/Bus US 15 interchange.

An existing school zone speed limit of 25 mph is present on E Shirley Avenue approximately 255 ft west of school entrance #1 and approximately 650 ft east of school entrance #3. It was assumed that the school zone speed limit was active in this area during the AM and school PM peak hour of this analysis.

Falmouth Street (Route 15) is a two-lane, undivided, minor arterial with a posted speed limit of 25 mph within the site vicinity. The 2021 VDOT traffic data shows that Route 15 carries approximately 4,300 vehicles per day between Route 17 and Mockingbird Lane.

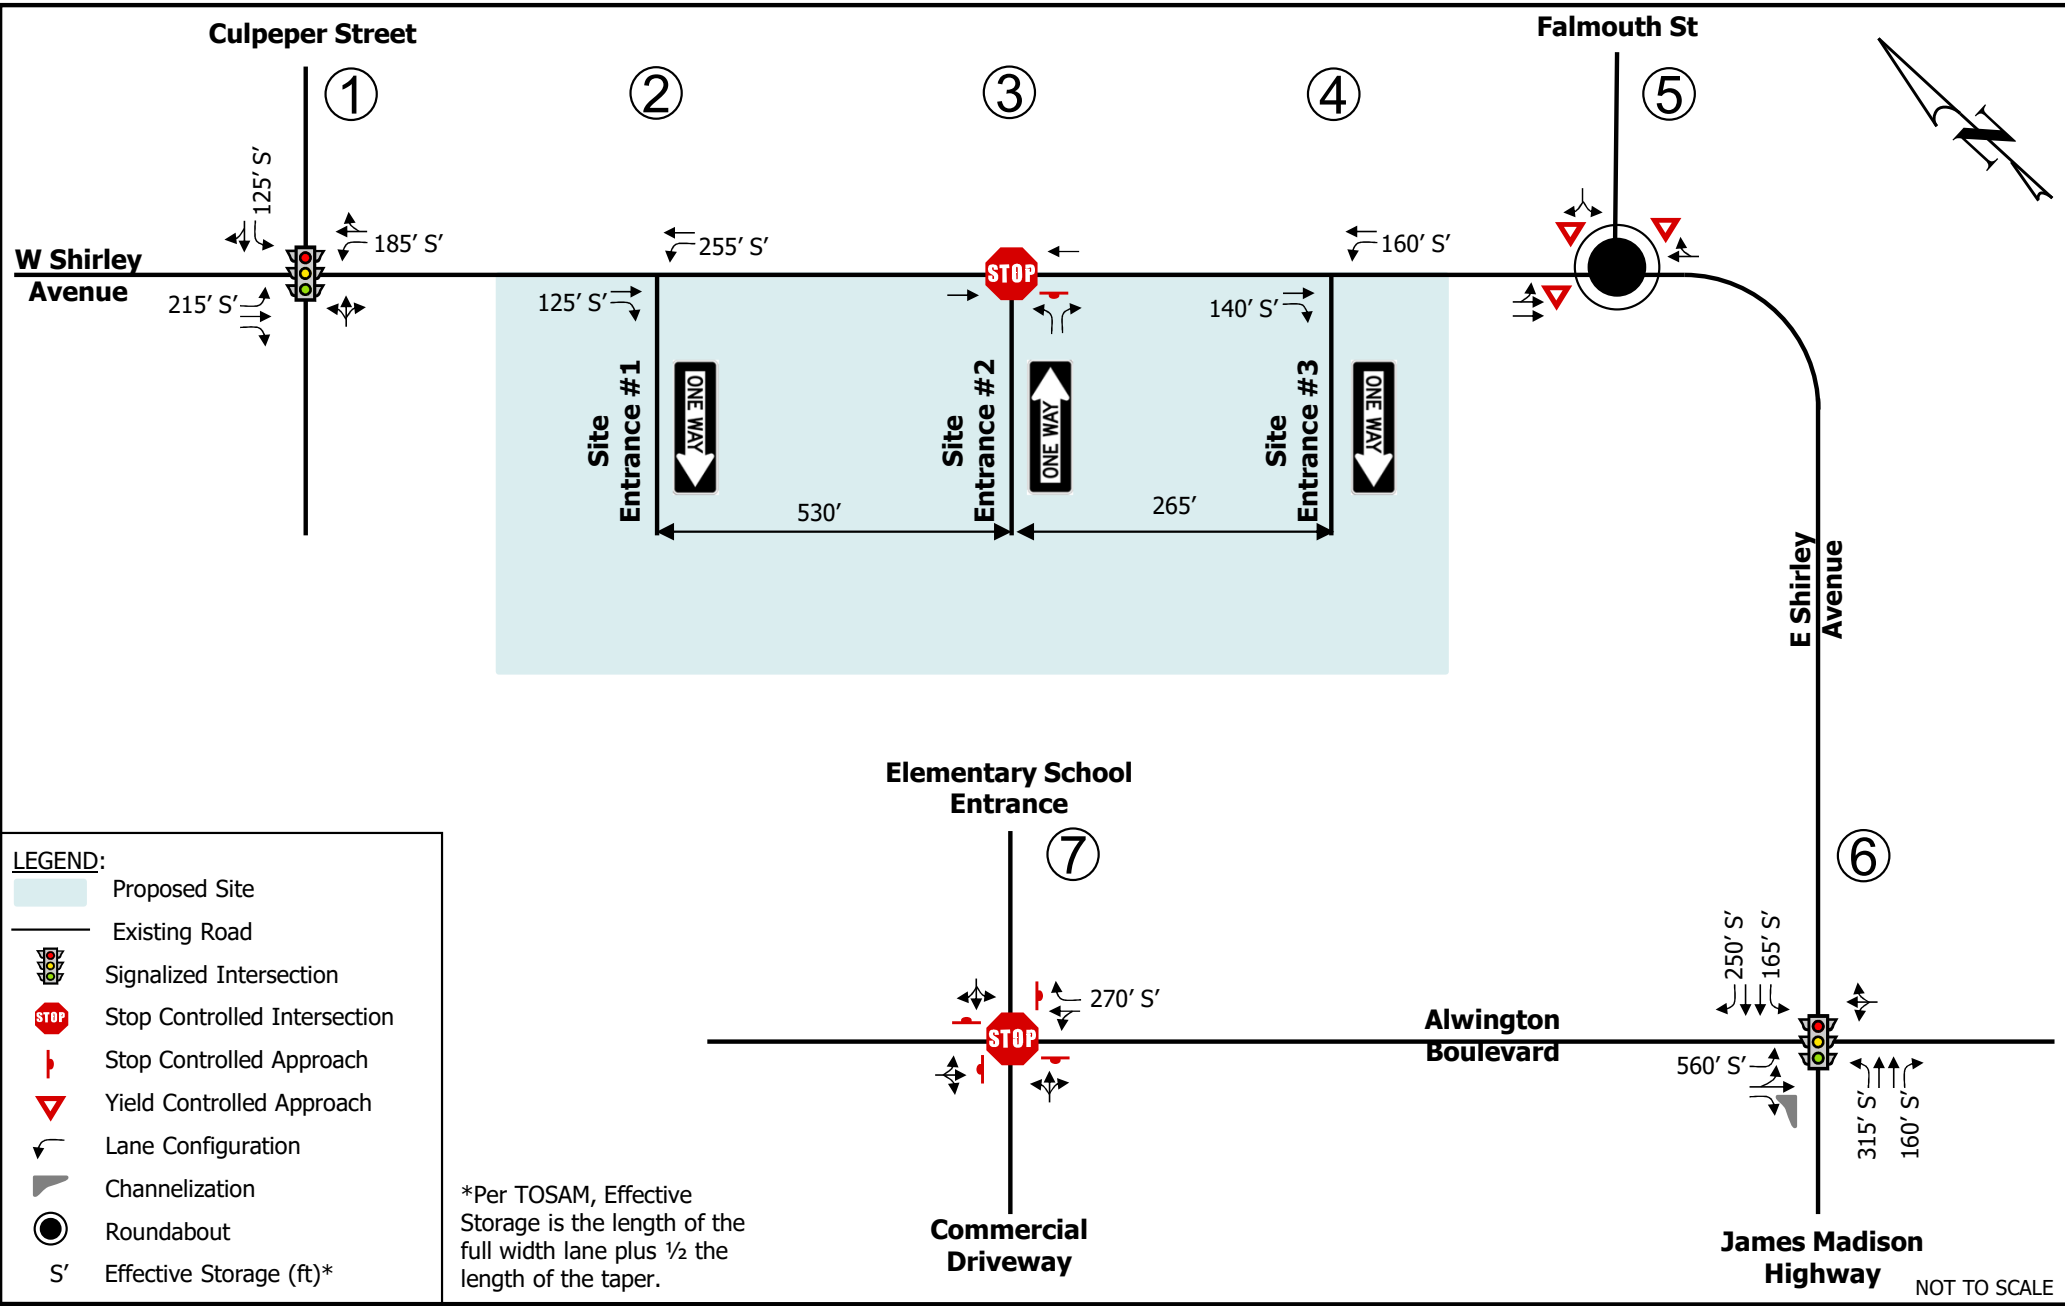

Culpeper Street is a two-lane, undivided, major collector to the west and a minor arterial to the east of E Shirley Avenue, with a posted speed limit of 25 mph within the site vicinity. The 2021 VDOT traffic data shows that Culpeper Street carries approximately 3,300 vehicles per day between Shirley Avenue and Hotel Street.

Alwington Boulevard is a four-lane, divided, local road with a posted speed limit of 35 mph. No VDOT traffic data available for Alwington Boulevard. The 2016 Virginia Roads traffic data shows that Alwington Boulevard carries approximately 7,000 vehicles per day.

The existing lane use and traffic control at the study intersections is shown on Figure 2-1.

2.4 FUTURE IMPROVEMENTS

There are no improvements at the study intersections that will occur within the timeframe analyzed in the study except the realignment of the Alwington Boulevard/Elementary School Entrance/Commercial Driveway intersection. This improvement is a realignment only and will not impact the capacity of the intersection.

Existing Roadway Geometry and Stop Control
 Taylor Middle School – Addition
 Town of Warrenton, Virginia

Figure
 2-1

3 2023 EXISTING CONDITIONS

3.1 EXISTING TRAFFIC VOLUMES

Directional turning movement counts (TMCs) were collected during the AM (6:00-9:00) and PM (2:00-6:00) peak traffic hours. The counts were conducted on May 16, 2023, at intersections 2 through 7 and on May 18, 2023, at intersection 1 on a typical weekday when public schools were in session. The TMCs included heavy vehicles by movement and pedestrian/bicycles counts, where applicable. A copy of the count data is included in Appendix B.

The peak hours analyzed in this report align with the highest traffic volumes of the roadway network. The morning peak hour (7:15-8:15 AM), school PM peak hour (2:15-3:15 PM), and commuter PM peak hour (4:30-5:30 PM) were determined by the highest hour of total traffic on the study area road network. The 2023 existing bus peak hour volumes are shown on Figure 3-1 and the 2023 existing vehicle (no-bus) peak hour volumes are shown on Figure 3-2. Figures 3-1 and 3-2 were added together to yield the 2023 total existing peak hour volumes as shown on Figure 3-3.

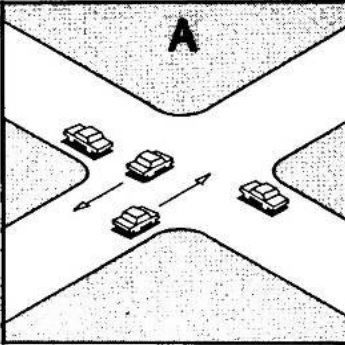

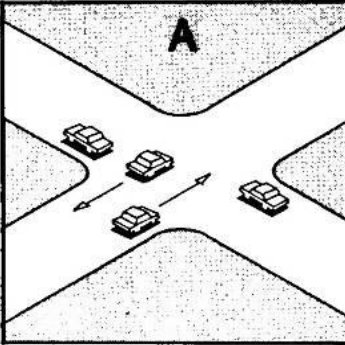

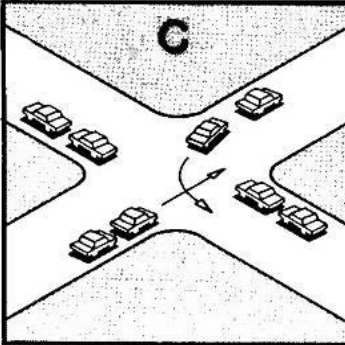

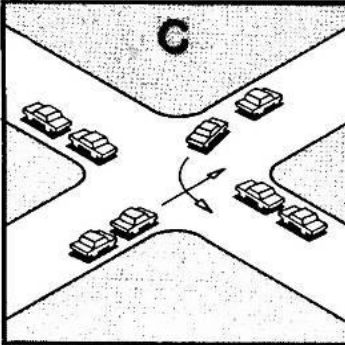

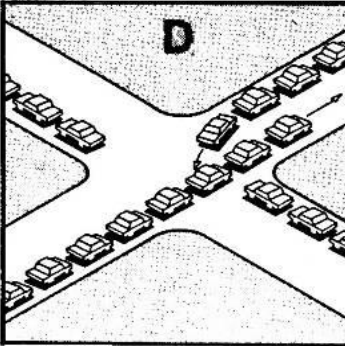

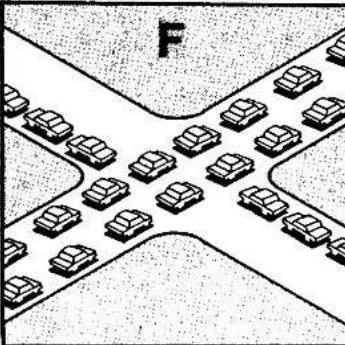

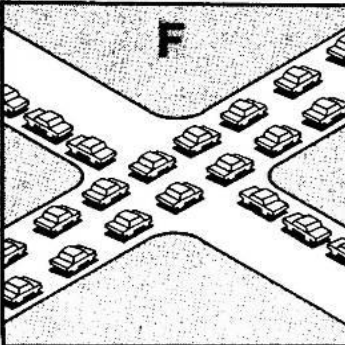

Existing signal timings for the Shirley Avenue/Culpeper Street intersection was provided by the Town of Warrenton and the E Shirley Avenue/Alwington Boulevard intersection was provided by VDOT. A copy of the signal timings included in Appendix C.

It is noted that both signals operate under “free” operations and are not coordinated with any other traffic signals.

3.2 CAPACITY ANALYSIS

Capacity analysis allows traffic engineers to determine the impacts of traffic on the surrounding roadway network. The Transportation Research Board’s (TRB) *Highway Capacity Manual* (HCM) methodologies govern how the capacity analyses are conducted and how the results are interpreted. There are six letter grades of Levels of Service (LOS) from A to F, with LOS A representing the best operating conditions and LOS F the worst operating conditions. Table 3-1 shows in detail how each of these levels of service are interpreted.

Table 3-1: Level of Service Definitions

Level of Service	Roadway Segments or Controlled Access Highways	Intersections	
A	Free flow, low traffic density.	No vehicle waits longer than one signal indication.	
B	Delay is not unreasonable, stable traffic flow.	On a rare occasion motorists wait through more than one signal indication.	
C	Stable condition, movements somewhat restricted due to higher volumes, but not objectionable for motorists.	Intermittently drivers wait through more than one signal indication, and occasionally backups may develop behind left turning vehicles, traffic flow still stable and acceptable.	
D	Movements more restricted, queues and delays may occur during short peaks, but lower demands occur often enough to permit clearing, thus preventing excessive backups.	Delays at intersections may become extensive with some, especially left-turning vehicles waiting two or more signal indications, but enough cycles with lower demand occur to permit periodic clearance, thus preventing excessive backups.	
E	Actual capacity of the roadway involves delay to all motorists due to congestion.	Very long queues may create lengthy delays, especially for left-turning vehicles.	
F	Forced flow with demand volumes greater than capacity resulting in complete congestion. Volumes drop to zero in extreme cases.	Backups from locations downstream restrict or prevent movement of vehicles out of approach creating a storage area during part or all of an hour.	

SOURCE: "A Policy on Design of Design of Urban Highways and Arterial Streets" - AASHTO, 1973 based upon material published in "Highway Capacity Manual", National Academy of Sciences, 1965.

For signalized and unsignalized intersections, level of service is defined in terms of **delay**, a measure of driver discomfort, frustration, fuel consumption and lost travel time. Table 3-2 summarizes the delay associated with each LOS category:

Table 3-2: Signalized and Unsignalized Intersection Level of Service Criteria

Signalized Intersections		Unsignalized Intersections	
Level of Service	Control Delay per Vehicle (sec/veh)	Level of Service	Average Control Delay (sec/veh)
A	≤ 10	A	0 to 10
B	> 10 to ≤ 20	B	> 10 to ≤ 15
C	> 20 to ≤ 35	C	> 15 to ≤ 25
D	> 35 to ≤ 55	D	> 25 to ≤ 35
E	> 55 to ≤ 80	E	> 35 to ≤ 50
F	> 80	F	> 50

Source: Exhibit 16-2 and Exhibit 17-2 from TRB's "Highway Capacity Manual 2000"

Capacity analyses were performed to assess existing (2023), background (2026 and 2032), and future (2026 and 2032) operational conditions. The signalized and unsignalized intersections were analyzed using SYNCHRO Version 11 and the roundabout was analyzed using SIDRA Version 9.0. All intersections were analyzed based on HCM 2000 methodologies except the all-way stop-control intersection (Alwington Boulevard/Elementary School Entrance/Commercial Entrance) which was based on HCM 6th edition. All analysis uses the with the following assumptions:

- Level terrain;
- 12-foot lane widths;
- Existing peak hour factor as determined by the traffic counts (by intersection) for existing scenario;
- The higher of the existing peak hour factor as determined by traffic counts (by intersection) or a peak hour factor of 0.92 for the background and total future scenarios;
- Grades as obtained through Google Earth;
- Turning movements into or out of the school will have a peak hour factor of 0.50;
- Heavy vehicle percentage as determined by the traffic counts (by movement); and
- Traffic signals timing data provided by the Town of Warrenton and VDOT.

Queuing analyses were conducted using both the HCM 2000 Edition methodology (as calculated by SYNCHRO/SIDRA) and SimTraffic simulations. The Synchro 95th percentile queue is the maximum back of queue for a particular lane within a lane group considering 95th percentile traffic volumes. The SimTraffic maximum queues are the average maximum queues after 10 runs of 60 minutes each.

Note that it is possible for the 95th percentile queue to be higher than the SimTraffic maximum queue due to the method in which each software calculates its respective value. The 95th percentile queue is based on an HCM formula while the SimTraffic maximum queue varies based on simulation results.

The signals operate under “free” operations and therefore all splits were optimized in each analysis scenario.

Additionally, the roundabout was modeled in Synchro for simulation purposes only, but all roundabout analysis results were obtained from SIDRA.

3.3 EXISTING CONDITIONS CAPACITY ANALYSIS RESULTS

Table 3-3 summarizes the 2023 existing intersection LOS, delay, 95th percentile queue lengths (Synchro), and maximum queue lengths (SimTraffic) based on the 2023 existing intersection geometry (Figure 2-1), peak hour traffic volumes shown on Figure 3-3 and the existing signal timings as provided by the Town of Warrenton and VDOT. The corresponding SYNCHRO and SimTraffic reports are included in Appendix D.

Note that the intersection numbers shown on the LOS, delay, and queue length summary tables correspond with the intersection numbers used in the SYNCHRO models and report figures.

As shown in Table 3-3, under 2023 existing conditions:

1. The East Shirley/Culpeper Street intersection currently operates an overall LOS C in each of the peak hours. Each of the approaches operates at LOS D or better with no queueing concerns.
2. The school entrances along East Shirley Avenue operate at LOS C or better in each of the peak hours. The queues at the left and right turns into the school are contained within the available storage.
3. The roundabout at East Shirley Avenue/Route 15 (Falmouth Street) operates at LOS A in each of the peak hours with no queuing concerns.
4. The East Shirley Avenue/Alwington Boulevard intersections operates at LOS C or better in each of the peak hours. Each of the approaches operates at LOS D or better. Each of the queues are contained within the available storage.
5. Each of the movements at the Alwington Boulevard/School Entrance/Commercial Entrance intersection operates at LOS A in all peak hours.

Table 3-3: 2023 Existing Traffic Intersection Level of Service and Delay Summary

4 2026 BACKGROUND CONDITIONS

The background 2026 volumes were analyzed assuming existing intersection geometry in conjunction with projected background traffic volumes, which consists of general traffic growth in the area.

4.1 GENERAL TRAFFIC GROWTH

The background volumes were based on a 1.0% annual growth rate and applied to all movements except the turns into and out of the existing school entrances. The growth rate was compounded annually for the three-year period from 2023 to 2026 and was applied to all movements at the study intersections. The resulting 2026 vehicle background (existing + growth) volumes are shown on Figure 4-1.

4.2 BACKGROUND 2026 CAPACITY ANALYSIS RESULTS

Table 4-1 summarizes the 2026 background intersection LOS, delay, 95th percentile queue lengths (Synchro), and maximum queue lengths (SimTraffic) based on the intersection geometry (Figure 2-1), 2026 background peak hour traffic volumes shown on Figure 4-1 and the existing signal timings as provided by the Town of Warrenton and VDOT. The corresponding SYNCHRO and SimTraffic reports are included in Appendix E.

Note that the intersection numbers shown on the LOS, delay, and queue length summary tables correspond with the intersection numbers used in the SYNCHRO models and report figures.

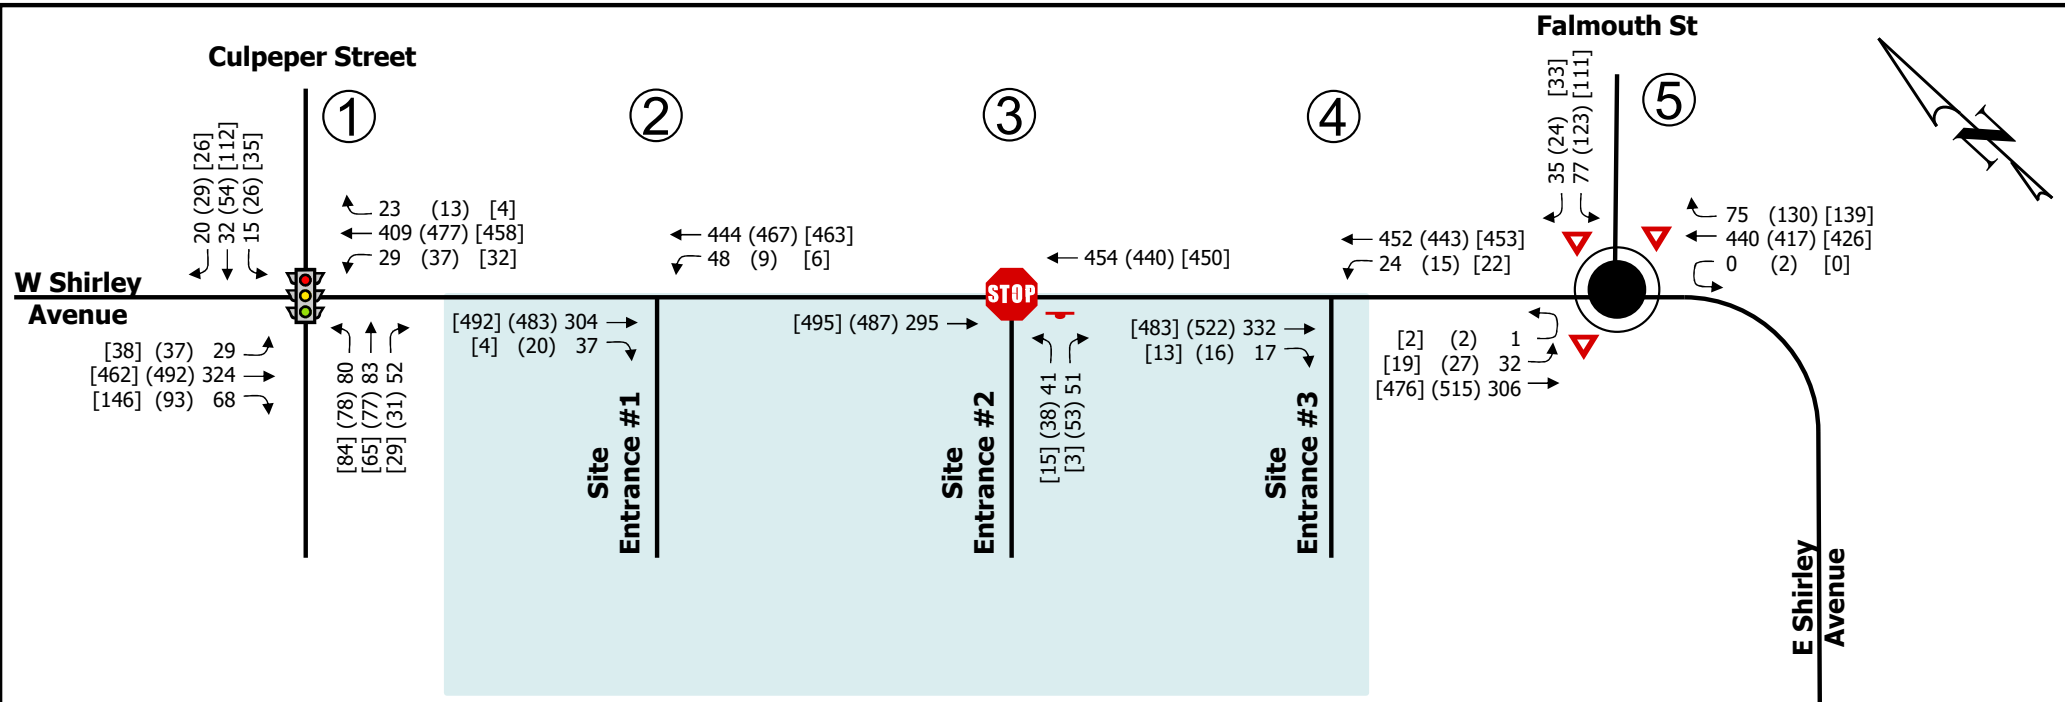

As shown in Table 4-1, under 2026 background conditions, all intersections experience similar levels of service, delay, and queueing as under existing conditions. Specifically:

1. The East Shirley/Culpeper Street intersection will operate an overall LOS C in each of the peak hours. Each of the approaches operates at LOS D or better with no queueing concerns.
2. The school entrances along East Shirley Avenue operate at LOS C or better in each of the peak hours. The queues at the left and right turns into the school are contained within the available storage.
3. The roundabout at East Shirley Avenue/Route 15 (Falmouth Street) operates at LOS A in each of the peak hours with no queuing concerns.
4. The East Shirley Avenue/Alwington Boulevard intersections operates at LOS C in each of the peak hours. Each of the approaches operates at LOS D or better. Each of the queues are contained within the available storage.
5. Each of the movements at the Alwington Boulevard/School Entrance/Commercial Entrance intersection operates at LOS A in all peak hours.

Town of Warrenton, Virginia

Figure
4-1

5 TRIP GENERATION

For purposes of this analysis, the proposed expansion of the middle school will accommodate an increase of 340 students and anticipated to occur by 2026.

Access to the site will be provided via three existing entrances into the site from E Shirley Avenue and one new alternate access from Alwington Boulevard. A site layout is shown on Figure 1-2.

With the expansion, the access to the site will be reworked as shown in Figure 5-1. The two western entrances on East Shirley Avenue will be a bus loop only and the eastern entrance will serve all other vehicles. The new entrance off of Alwington Boulevard will service passenger vehicles.

It is anticipated that passenger vehicle traffic from the south on East Shirley Avenue will use the entrance off Alwington Boulevard while all other traffic will use the entrances on East Shirley Avenue.

5.1 ACCESS MANAGEMENT REVIEW

As noted above, the expanded Middle School will utilize the existing three entrances points along E Shirley Avenue under a reworked access scenario. No new access points are proposed on E Shirley Avenue.

As shown on Figure 2-1, the western access point (bus entrance only) is located approximately 530 feet from the middle entrance (bus out only). The middle entrance is spaced approximately 265 feet from the eastern entrance (vehicle in and out).

In accordance with VDOT's Road Design Manual, Appendix F, Table 2-2, on a roadway like E Shirley Avenue (minor arterial with a posted 40 mph speed limit), a Type 3 (full access) entrance requires 470 feet of spacing to other signalized or full access intersections. A Type 4 (partial access) requires 250 feet of spacing from all other intersections.

Since the eastern and middle entrance are Type 4 (partial access), 250 feet of spacing is required between each of the entrances.

The spacing between each entrance exceeds 250 feet and therefore all access management standards are met at the entrances.

5.2 REROUTED TRAFFIC

As noted above, with the expansion, the site driveways will be changed as shown in Figure 5-1. As a result, the existing traffic entering and exiting the school will be rerouted to the new entrances as shown on Figure 5-2 (bus trips) and Figure 5-3 (vehicle trips).

5.3 SITE TRIP GENERATION

The peak hour site-generated traffic volumes shown in Table 5-1 were estimated using existing driveway counts at the school pro-rated for the expansion in students. The average daily traffic was estimated using the 11th Edition of the Institute of Transportation Engineers' (ITE) *Trip Generation Manual*.

Table 5-1: Trip Generation Summary

Land Use	Size	Units	Land Use Code	School AM Peak Hour ⁽¹⁾			School PM Peak ⁽¹⁾			Commuter PM Peak Hour ⁽¹⁾			Average Daily Trips ⁽²⁾
				In	Out	Total	In	Out	Total	In	Out	Total	
Existing Capacity													
Middle School	510	Students	522	126	92	218	60	91	151	45	18	63	1071
New Capacity													
Middle School	850	Students	522	210	153	363	100	152	252	75	30	105	1785
Increase	340	Students		84	61	145	40	61	101	30	12	42	714

Note: (1) Peak hour counts based on existing driveway counts conducted for the site for the existing school capacity. New capacity trips pro-rated based on the existing counts and the percent increase in students.

(2) Average Daily Trips based on the Institute of Transportation Engineers Trip Generation, 11th Edition. Assumes General Urban/Suburban land use category.

As shown in Table 5-1, the overall expansion will generate an increase of 145 AM peak hour trips (84 in and 61 out), 101 School PM peak hour trips (40 in and 61 out), 42 PM peak hour trips (30 in and 12 out) and 714 average daily trips.

5.4 EXTERNAL TRIP DISTRIBUTIONS

The distribution of trips generated by the proposed developed was based on other traffic studies in the area, the existing traffic volumes, the nature of the use, the school attendance map and local knowledge.

The following directional distributions were assumed for the site:

- 40% from the west on East Shirley Avenue;
- 10% from the north on Falmouth Street; and
- 50% from the south on East Shirley Avenue.

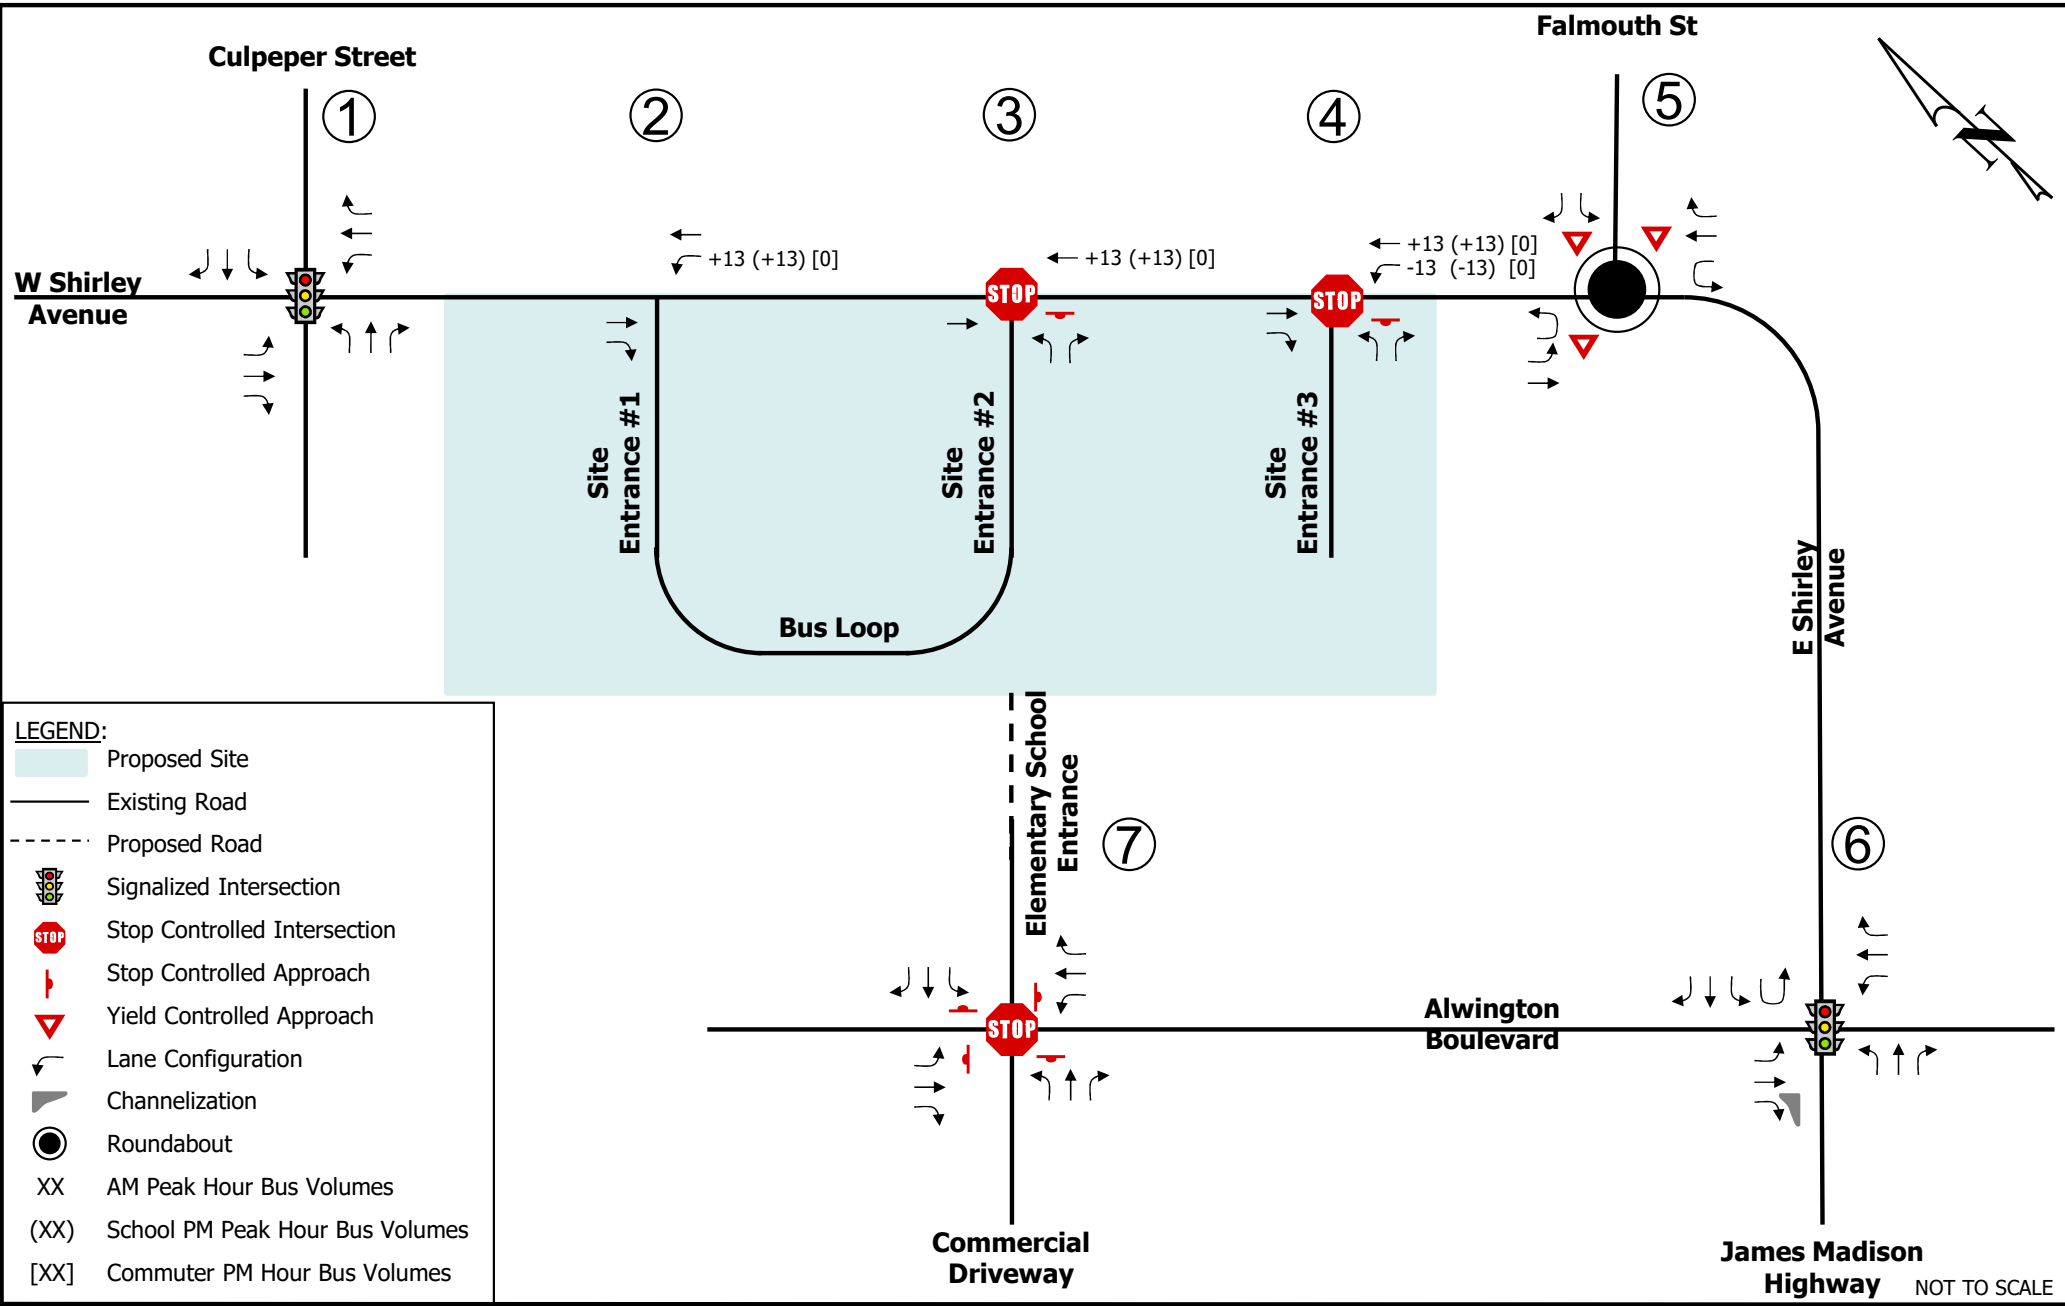

5.5 TRAFFIC ASSIGNMENT

The trip distribution percentages for the new traffic generated by the site were applied to the site driveways as shown in Figure 5-4 (bus trips) and Figure 5-5 (vehicle trips). The distributions were then applied to the new trips shown in Table 5-1 and the resulting new external trips are shown in Figure 5-6 (bus trips) and Figure 5-7 (vehicle trips).

6 2026 TOTAL FUTURE CONDITIONS

To complete the analysis of 2026 total conditions (with the proposed development), the estimated site trips were added to the background 2026 traffic volumes. The projected volumes were then used to complete the capacity analysis.

6.1 TOTAL FUTURE TRAFFIC VOLUMES

The rerouted existing trips shown on Figures 5-2 and 5-3 and site generated trips shown on Figures 5-6 and 5-7 were added to the 2026 background traffic volumes (Figure 4-1) to yield the 2026 total future traffic volumes shown in Figure 6-1.

6.2 2026 FUTURE CONDITIONS ANALYSIS RESULTS

Table 6-1 summarizes the 2026 future intersection LOS, delay, 95th percentile queue lengths (Synchro), and maximum queue lengths (SimTraffic) based on the future intersection geometry (Figure 5-1), 2026 future peak hour traffic volumes shown on Figure 6-1 and the existing signal timings as provided by the Town of Warrenton and VDOT. The corresponding SYNCHRO and SimTraffic reports are included in Appendix F.

Note that the intersection numbers shown on the LOS, delay, and queue length summary tables correspond with the intersection numbers used in the SYNCHRO models and report figures.

As shown in Table 6-1, under 2026 future conditions, all intersections experience similar levels of service, delay, and queueing as under 2026 background conditions. Specifically:

1. The East Shirley/Culpeper Street intersection will operate an overall LOS C in each of the peak hours. Each of the approaches operates at LOS D or better with no queueing concerns.
2. The school entrances along East Shirley Avenue operate at LOS C or better in each of the peak hours. The queues at the left and right turns into the school are contained within the available storage.
3. The roundabout at East Shirley Avenue/Route 15 (Falmouth Street) operates at LOS A in each of the peak hours with no queuing concerns.
4. The East Shirley Avenue/Alwington Boulevard intersections operates at LOS C in each of the peak hours. Each of the approaches operates at LOS D or better. Each of the queues are contained within the available storage.
5. Each of the movements at the Alwington Boulevard/School Entrance/Commercial Entrance intersection operates at LOS A in all peak hours.
6. The expansion of the middle school will have minimal impact on the external surrounding roadway network and no improvements are required at the study intersections.
 - a. The expansion will provide a link between the elementary school and the middle school during school pick up and drop off times only. During all other times, the connection between the schools will be gated.

**Table 6-1: 2026 Total Future Conditions

¹ Overall intersection LOS and delay reported for signalized intersections and roundabouts only.
² SimTraffic Queues are average maximum queues after 10 runs of 60 minutes each.
³ Channelized right turn not controlled by the signal.
- 95th percentile volume exceeds capacity, queue may be longer. Queue shown is maximum after two cycles.
† SYNCHRO does not provide level of service or delay for unsignalized movements with no conflicting volumes.
* Note: SIDRA was used to analyze the roundabout at intersection 5.
** Note: HCM 6th Edition was used to analyze the all way stop controlled intersection at intersection 7.

6.3 2026 TURN LANE WARRANT ANALYSIS

As shown in Figures 2-1 and 5-1, the following right and left turn lanes are present under existing conditions at the site entrances on E Shirley Avenue:

Western Site Entrance (Bus Ingress Only)

Eastbound right turn lane with 125 feet of storage

Westbound left turn lane with 255 feet of storage

Eastern Site Entrance (Vehicle Ingress and Egress)

Eastbound right turn lane with 140 feet of storage

Westbound left turn lane with 160 feet of storage

As shown in Table 6-1, under 2026 future conditions, the 95th percentile and maximum queues at the site entrances will be contained within the existing available storage. No additional storage is required.

2026 Total Future Peak Hour Volumes
 Taylor Middle School – Addition
 Town of Warrenton, Virginia

Figure
 6-1

7 2032 BACKGROUND CONDITIONS

The background 2032 volumes were analyzed assuming existing intersection geometry in conjunction with projected background traffic volumes, which consists of general traffic growth and growth due to an approved and the neighboring Arrington development.

7.1 GENERAL TRAFFIC GROWTH

The background volumes were based on a 1.0% annual growth rate. The growth rate was compounded annually for the nine-year period from 2023 to 2032 and was applied to all movements at the study intersections. The resulting 2032 vehicle background (existing + growth) volumes are shown on Figure 7-1.

7.2 APPROVED BACKGROUND DEVELOPMENTS

Per coordination with the Town of Warrenton, the traffic associated with the approved Arrington Development was included in the 2032 background conditions analysis.

The generated site trips were included in the approved Arrington Development TIA were extracted and applied to the study area intersections and are shown on Figure 7-2. Note that the study area for the Arrington Development TIA is south of the study area for this report. As a result, the distributions were assigned to the study area road network according to existing travel patterns, the nature of the use, the 2023 existing traffic volumes, and local knowledge.

7.3 2032 TOTAL BACKGROUND

The Arrington development trips shown on Figure 7-2 were added to the existing + growth traffic shown on Figure 7-1 to yield the total 2032 background traffic forecasts which are shown on Figure 7-3.

7.4 BACKGROUND 2032 CAPACITY ANALYSIS RESULTS

Table 7-1 summarizes the 2032 background intersection LOS, delay, 95th percentile queue lengths (Synchro), and maximum queue lengths (SimTraffic) based on the existing intersection geometry (Figure 2-1), 2032 background peak hour traffic volumes shown on Figure 7-3 and the existing signal timings as provided by the Town of Warrenton and VDOT.

The corresponding SYNCHRO and SimTraffic reports are included in Appendix G. Note that the intersection numbers shown on the LOS, delay, and queue length summary tables correspond with the intersection numbers used in the SYNCHRO models and report figures.

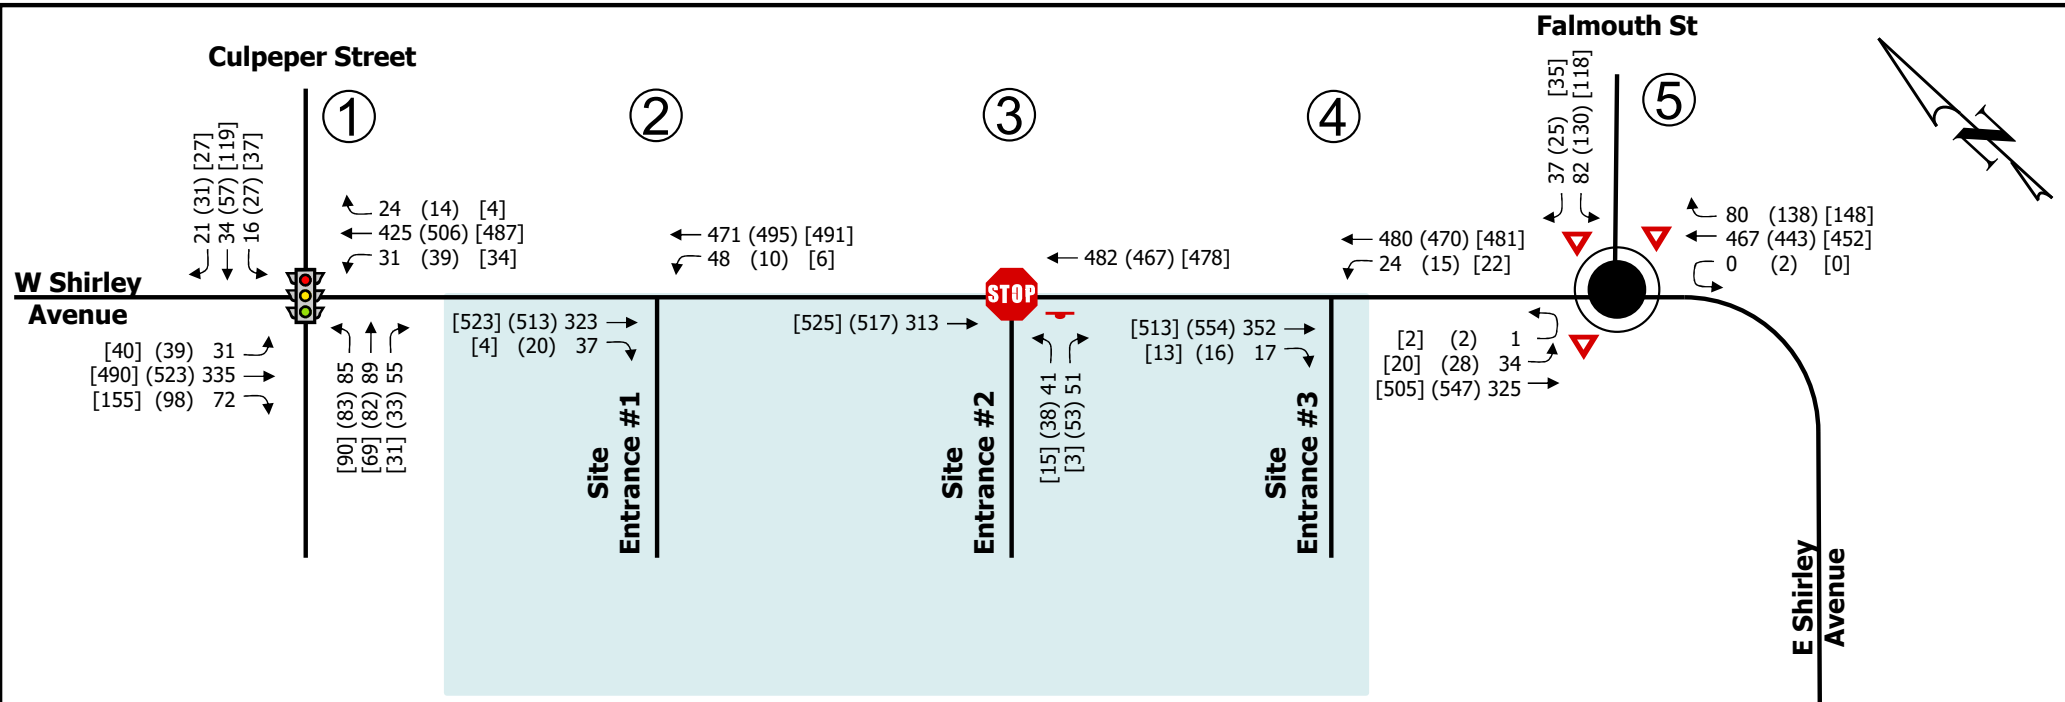

As shown in Table 7-1, under 2032 background conditions, all intersections experience similar levels of service, delay, and queueing as under 2026 background conditions. Specifically:

1. The East Shirley/Culpeper Street intersection will operate an overall LOS C or D in each of the peak hours. Each of the approaches operates at LOS D or better with no queueing concerns with the exception of the eastbound left approach which will operate at LOS E in both PM peaks.
 - a. It is noted that the traffic signal is running under “free” operations and is likely giving more time to the mainline through movements which results in the LOS E. The delays are less than the overall cycle length of the intersection indicating that the average traffic waits at most one cycle length to traverse the intersection.
2. The school entrances along East Shirley Avenue operate at LOS D or better in each of the peak hours. The queues at the left and right turns into the school are contained within the available storage.
3. The roundabout at East Shirley Avenue/Route 15 (Falmouth Street) operates at LOS A or B in each of the peak hours with no queuing concerns.
4. The East Shirley Avenue/Alwington Boulevard intersections operates at LOS C in each of the peak hours. Each of the approaches operates at LOS D or better. Each of the queues are contained within the available storage.
5. Each of the movements at the Alwington Boulevard/School Entrance/Commercial Entrance intersection operates at LOS A in all peak hours.

8 2032 TOTAL FUTURE CONDITIONS

To complete the analysis of 2032 total conditions (with the proposed expansion), the estimated site trips were added to the background 2032 traffic volumes. The projected volumes were then used to complete the capacity analysis.

8.1 2032 TOTAL FUTURE TRAFFIC VOLUMES

The rerouted existing trips shown on Figure 5-2 and Figure 5-3 and The site generated trips shown on Figures 5-6 and 5-7 were added to the 2032 total background traffic volumes (Figure 7-3) to yield the 2032 total future traffic volumes shown in Figure 8-1.

8.2 2032 FUTURE CONDITIONS ANALYSIS RESULTS

Table 8-1 summarizes the 2032 future intersection LOS, delay, 95th percentile queue lengths (Synchro), and maximum queue lengths (SimTraffic) based on the future intersection geometry (Figure 5-1), 2032 future peak hour traffic volumes shown on Figure 8-1 and the existing signal timings as provided by the Town of Warrenton and VDOT. The corresponding SYNCHRO and SimTraffic reports are included in Appendix H.

Note that the intersection numbers shown on the LOS, delay, and queue length summary tables correspond with the intersection numbers used in the SYNCHRO models and report figures.

As shown in Table 8-1, under 2032 future conditions, all intersections experience similar levels of service, delay, and queueing as under 2032 background conditions. Specifically:

1. The East Shirley/Culpeper Street intersection will operate an overall LOS C or D in each of the peak hours. Each of the approaches operates at LOS D or better with no queueing concerns with the exception of the eastbound left approach which will operate at LOS E in both PM peaks.
 - a. It is noted that the traffic signal is running under “free” operations and is likely giving more time to the mainline through movements which results in the LOS E. The delays are less than the overall cycle length of the intersection indicating that the average traffic waits at most one cycle length to traverse the intersection.
2. The school entrances along East Shirley Avenue operate at LOS D or better in each of the peak hours. The queues at the left and right turns into the school are contained within the available storage.
3. The roundabout at East Shirley Avenue/Route 15 (Falmouth Street) operates at LOS A or B in each of the peak hours with no queuing concerns.
4. The East Shirley Avenue/Alwington Boulevard intersections operates at LOS C in each of the peak hours. Each of the approaches operates at LOS D or better. Each of the queues are contained within the available storage.
5. Each of the movements at the Alwington Boulevard/School Entrance/Commercial Entrance intersection operates at LOS A in all peak hours.
6. The expansion of the middle school will have minimal impact on the external surrounding roadway network and no improvements are required at the study intersections.

- a. The expansion will provide a link between the elementary school and the middle school during school pick up and drop off times only. During all other times, the connection between the schools will be gated.

2032 TURN LANE WARRANT ANALYSIS

As shown in Figures 2-1 and 5-1, the following right and left turn lanes are present under existing conditions at the site entrances on E Shirley Avenue:

Western Site Entrance (Bus Ingress Only)

Eastbound right turn lane with 125 feet of storage

Westbound left turn lane with 255 feet of storage

Eastern Site Entrance (Vehicle Ingress and Egress)

Eastbound right turn lane with 140 feet of storage

Westbound left turn lane with 160 feet of storage

As shown in Table 8-1, under 2032 future conditions, the 95th percentile and maximum queues at the site entrances will be contained within the existing available storage. No additional storage is required.

**Table 8-1: 2032 Total Future Conditions

9 CONCLUSIONS

9.1 PRINCIPAL FINDINGS

Based on the analysis contained herein, the following principal findings are offered:

Under 2023 existing conditions:

1. The East Shirley/Culpeper Street intersection currently operates an overall LOS C in each of the peak hours. Each of the approaches operates at LOS D or better with no queueing concerns.
2. The school entrances along East Shirley Avenue operate at LOS C or better in each of the peak hours. The queues at the left and right turns into the school are contained within the available storage.
3. The roundabout at East Shirley Avenue/Route 15 (Falmouth Street) operates at LOS A in each of the peak hours with no queueing concerns.
4. The East Shirley Avenue/Alwington Boulevard intersections operates at LOS C or better in each of the peak hours. Each of the approaches operates at LOS D or better. Each of the queues are contained within the available storage.
5. Each of the movements at the Alwington Boulevard/School Entrance/Commercial Entrance intersection operates at LOS A in all peak hours.

Under 2026 background conditions, all intersections experience similar levels of service, delay, and queueing as under existing conditions. Specifically:

1. The East Shirley/Culpeper Street intersection will operate an overall LOS C in each of the peak hours. Each of the approaches operates at LOS D or better with no queueing concerns.
2. The school entrances along East Shirley Avenue operate at LOS C or better in each of the peak hours. The queues at the left and right turns into the school are contained within the available storage.
3. The roundabout at East Shirley Avenue/Route 15 (Falmouth Street) operates at LOS A in each of the peak hours with no queueing concerns.
4. The East Shirley Avenue/Alwington Boulevard intersections operates at LOS C in each of the peak hours. Each of the approaches operates at LOS D or better. Each of the queues are contained within the available storage.
5. Each of the movements at the Alwington Boulevard/School Entrance/Commercial Entrance intersection operates at LOS A in all peak hours.

Under 2026 total future conditions, with buildout of the proposed development, all intersections experience similar levels of service compared to 2026 background conditions. Specifically:

1. The East Shirley/Culpeper Street intersection will operate an overall LOS C in each of the peak hours. Each of the approaches operates at LOS D or better with no queueing concerns.
2. The school entrances along East Shirley Avenue operate at LOS C or better in each of the peak hours. The queues at the left and right turns into the school are contained within the available storage.
3. The roundabout at East Shirley Avenue/Route 15 (Falmouth Street) operates at LOS A in each of the peak hours with no queuing concerns.
4. The East Shirley Avenue/Alwington Boulevard intersections operates at LOS C in each of the peak hours. Each of the approaches operates at LOS D or better. Each of the queues are contained within the available storage.
5. Each of the movements at the Alwington Boulevard/School Entrance/Commercial Entrance intersection operates at LOS A in all peak hours.
6. The expansion of the middle school will have minimal impact on the external surrounding roadway network and no improvements are required at the study intersections.
 - a. The expansion will provide a link between the elementary school and the middle school during school pick up and drop off times only. During all other times, the connection between the schools will be gated.

Under 2032 background conditions, all intersections experience similar levels of service, delay, and queueing as under 2026 background conditions. Specifically:

1. The East Shirley/Culpeper Street intersection will operate an overall LOS C or D in each of the peak hours. Each of the approaches operates at LOS D or better with no queueing concerns with the exception of the eastbound left approach which will operate at LOS E in both PM peaks.
 - a. It is noted that the traffic signal is running under "free" operations and is likely giving more time to the mainline through movements which results in the LOS E. The delays are less than the overall cycle length of the intersection indicating that the average traffic waits at most one cycle length to traverse the intersection.
2. The school entrances along East Shirley Avenue operate at LOS D or better in each of the peak hours. The queues at the left and right turns into the school are contained within the available storage.
3. The roundabout at East Shirley Avenue/Route 15 (Falmouth Street) operates at LOS A or B in each of the peak hours with no queuing concerns.
4. The East Shirley Avenue/Alwington Boulevard intersections operates at LOS C in each of the peak hours. Each of the approaches operates at LOS D or better. Each of the queues are contained within the available storage.

5. Each of the movements at the Alwington Boulevard/School Entrance/Commercial Entrance intersection operates at LOS A in all peak hours.

Under 2032 total future conditions, with buildout of the proposed development, all intersections experience similar levels of service compared to 2026 background conditions. Specifically:

1. The East Shirley/Culpeper Street intersection will operate an overall LOS C or D in each of the peak hours. Each of the approaches operates at LOS D or better with no queuing concerns with the exception of the eastbound left approach which will operate at LOS E in both PM peaks.
 - a. It is noted that the traffic signal is running under “free” operations and is likely giving more time to the mainline through movements which results in the LOS E. The delays are less than the overall cycle length of the intersection indicating that the average traffic waits at most one cycle length to traverse the intersection.
2. The school entrances along East Shirley Avenue operate at LOS D or better in each of the peak hours. The queues at the left and right turns into the school are contained within the available storage.
3. The roundabout at East Shirley Avenue/Route 15 (Falmouth Street) operates at LOS A or B in each of the peak hours with no queuing concerns.
4. The East Shirley Avenue/Alwington Boulevard intersections operates at LOS C in each of the peak hours. Each of the approaches operates at LOS D or better. Each of the queues are contained within the available storage.
5. Each of the movements at the Alwington Boulevard/School Entrance/Commercial Entrance intersection operates at LOS A in all peak hours.
6. The expansion of the middle school will have minimal impact on the external surrounding roadway network and no improvements are required at the study intersections.
 - a. The expansion will provide a link between the elementary school and the middle school during school pick up and drop off times only. During all other times, the connection between the schools will be gated.

9.2 RECOMMENDATIONS

The expansion of the middle school will have minimal to no impact on the surrounding roadway network and no improvements are required at the study intersections.

The expansion will provide a link between the elementary school and the middle school during school pick up and drop off times only. During all other times, the connection between the schools will be gated.

The traffic control at internal intersections to the school site was not reviewed as part of this study and will the specifics (signage, pavement markings, etc.) will be designed at the time of site plan approval.

Traffic Signal Proposed or Affected (Analysis software to be used, progression speed, cycle length)	Existing Signals: Culpeper St/Shirley Ave and Route 17/Alwington Boulevard	
Improvement(s) Assumed or to be Considered	<p>1. The traffic generated by the Arrington development will be included in all future analyses.</p> <p>2. With the Arrington development, the elementary school entrances will be reconfigured. This will be assumed in all future analyses.</p> <p>3. VDOT Pipeline Study on Route 17 - this will be discussed in the report but not analyzed in any scenario as the improvements are not funded.</p>	
Background Traffic Studies Considered	TIA for the Arrington Development will be used to compare traffic counts, growth rates, etc.	
Plan Submission	<input type="checkbox"/> Master Development Plan (MDP) <input checked="" type="checkbox"/> Generalized Development Plan (GDP) <input type="checkbox"/> Preliminary/Sketch Plan <input type="checkbox"/> Other Plan type (Final Site, Subd. Plan)	
Additional Issues to be Addressed	<input checked="" type="checkbox"/> Queuing analysis <input type="checkbox"/> Actuation/Coordination <input type="checkbox"/> Weaving analysis <input type="checkbox"/> Merge analysis <input checked="" type="checkbox"/> Bike/Ped Accommodations <input checked="" type="checkbox"/> Intersection(s) <input type="checkbox"/> TDM Measures <input checked="" type="checkbox"/> Other Turn Lane Warrant Analysis	

NOTES on ASSUMPTIONS: See Tables 1/2 for the trip generation table for traffic generated by the site. Table 1 shows the trip generation based on the existing driveway counts and Table 2 shows the trip generation based on ITE rates/equations. It is proposed to use the local counts (Table 1) as they represent actual operations at the school and are generally in line with ITE rates/equations.

The overall site trip distributions are shown on Figure 3 and are based on the existing traffic counts at the school driveways and the County school attendance map for Taylor Middle School.

Turn lane warrant analyses will be completed for all site entrances

Study will include a review of Access Management Spacing Standards.

It is important for the applicant to provide sufficient information to county and VDOT staff so that questions regarding geographic scope, alternate methodology, or other issues can be answered at the scoping meeting.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).
 Roundabout LOS Method: SIDRA Roundabout LOS.
 Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.
 LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).
 Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 6).
 Roundabout Capacity Model: SIDRA Standard.
 Delay Model: HCM Delay Formula (Geometric Delay is not included).
 Queue Model: HCM Queue Formula.
 Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).
 HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).
 Roundabout LOS Method: SIDRA Roundabout LOS.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 6).

Roundabout Capacity Model: SIDRA Standard.

Delay Model: HCM Delay Formula (Geometric Delay is not included).

Queue Model: HCM Queue Formula.

Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).
 Roundabout LOS Method: SIDRA Roundabout LOS.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 6).

Roundabout Capacity Model: SIDRA Standard.

Delay Model: HCM Delay Formula (Geometric Delay is not included).

Queue Model: HCM Queue Formula.

Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).
 Roundabout LOS Method: SIDRA Roundabout LOS.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 6).

Roundabout Capacity Model: SIDRA Standard.

Delay Model: HCM Delay Formula (Geometric Delay is not included).

Queue Model: HCM Queue Formula.

Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).
 Roundabout LOS Method: SIDRA Roundabout LOS.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 6).

Roundabout Capacity Model: SIDRA Standard.

Delay Model: HCM Delay Formula (Geometric Delay is not included).

Queue Model: HCM Queue Formula.

Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).
 Roundabout LOS Method: SIDRA Roundabout LOS.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 6).

Roundabout Capacity Model: SIDRA Standard.

Delay Model: HCM Delay Formula (Geometric Delay is not included).

Queue Model: HCM Queue Formula.

Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).
 Roundabout LOS Method: SIDRA Roundabout LOS.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 6).

Roundabout Capacity Model: SIDRA Standard.

Delay Model: HCM Delay Formula (Geometric Delay is not included).

Queue Model: HCM Queue Formula.

Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).
 Roundabout LOS Method: SIDRA Roundabout LOS.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 6).

Roundabout Capacity Model: SIDRA Standard.

Delay Model: HCM Delay Formula (Geometric Delay is not included).

Queue Model: HCM Queue Formula.

Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.

Site Level of Service (LOS) Method: Delay & v/c (HCM 6). Site LOS Method is specified in the Parameter Settings dialog (Site tab).
 Roundabout LOS Method: SIDRA Roundabout LOS.

Vehicle movement LOS values are based on average delay and v/c ratio (degree of saturation) per movement.

LOS F will result if v/c > 1 irrespective of movement delay value (does not apply for approaches and intersection).

Intersection and Approach LOS values are based on average delay for all movements (v/c not used as specified in HCM 6).

Roundabout Capacity Model: SIDRA Standard.

Delay Model: HCM Delay Formula (Geometric Delay is not included).

Queue Model: HCM Queue Formula.

Gap-Acceptance Capacity: SIDRA Standard (Akçelik M3D).

HV (%) values are calculated for All Movement Classes of All Heavy Vehicle Model Designation.
