- While freight access is the primary need, incorporate complete street principles where feasible, particularly along internal corridors, to support safe access for pedestrians, bicycles, and potential transit service in the future.
- Pedestrian and bicycle connectivity has not been fully evaluated; however, the transportation analysis found that the Ice Age Tonquin Trail can be accommodated through the site as currently envisioned in the preferred concept. Further coordination and evaluation of the exact alignment should occur as development occurs in the area.

4. Collaborate with Regional Partners and Consider Phased Implementation

- Work closely with Washington County, ODOT, and regional partners to ensure consistency with functional street classifications, spacing standards, and investment priorities to accommodate anticipated growth and future travel patterns.
- Consider a phased implementation approach for key transportation access points (SW Grahams Ferry Road, SW Tonquin Road, and potentially Cahalin Road) to be improved or added over time as development occurs and funding becomes available.
- Advance conceptual alignment studies and cost evaluations early to clarify feasibility before committing to major infrastructure investments.

C. Infrastructure Considerations for Implementation

The West Railroad area currently lacks basic infrastructure — including sanitary sewer, water, and stormwater systems — and extending these services will require significant public investment and regional coordination. Given these challenges, the City's approach should focus on strategic, scalable infrastructure planning that supports near-term feasibility while laying the groundwork for future buildout.

1. Plan for Scalable Infrastructure Investments

- Develop a phased approach that prioritizes strategic connections and essential services first, allowing incremental expansion as development demand materializes.
- Focus initial efforts on alignment within key streets and corridors (e.g., Basalt Creek Parkway, SW Tonquin Road, or Cahalin Road) to establish service entry points for both water and sewer infrastructure.

2. Coordinate Regional Partnerships

- Pursue state and regional funding sources (e.g., Business Oregon, Metro) to offset infrastructure costs for employment lands.

3. Integrate Green and Resilient Systems

- Use green infrastructure and low-impact development practices to manage stormwater.
- Preserve open space along the Coffee Lake Creek and natural drainage corridors as part of the stormwater system and long-term habitat strategy.
- Design infrastructure with climate resilience and adaptability in mind, recognizing the area's long buildout horizon.
- Consider including restoration or mitigation standards as a requirement of development, where feasible and appropriate, considering the significant tree and habitat loss already experienced in this area.

4. Maintain Long-Term Flexibility

- Avoid locking in costly infrastructure alignments before market direction becomes clearer; instead, establish conceptual utility corridors that identify key service entry points and trajectory of infrastructure, without committing to investments before the land is purchased by a developer.

- Ensure infrastructure design standards accommodate a range of development intensities, from lower-density industrial and logistics uses to potential future manufacturing or mixed employment.
- Continue to coordinate infrastructure planning with land use policy and economic development strategies, ensuring the City can respond to changing opportunities over time.

D. Economic Development Considerations for Implementation

The West Railroad area presents a significant opportunity but also notable development challenges, including fragmented ownership, limited access, and the need for major infrastructure investments.

Given these constraints, in order to achieve the type of high-quality development and return on investment envisioned, the City will need to take a leading role in shaping conditions for successful, market-ready employment growth.

The focus should be on creating a foundation of certainty, coordination, and readiness that can attract private investment over time. Strategies that should be considered include:

1. Facilitate Land Coordination and Aggregation

- Facilitate land assembly through public acquisition, land swaps, or partnerships with property owners to create larger, development-ready sites.
- Establish a redevelopment or land bank entity (e.g., urban renewal agency, development commission) to manage and prepare sites strategically.
- Use development agreements or master planning to coordinate multiple owners under a unified infrastructure and design framework.

2. Invest in Infrastructure Readiness

- Invest early in critical infrastructure (water, sewer, stormwater, road access) to clear a path for private developers.
- Pursue cost-sharing, reimbursement, or horizontal development agreements to spread infrastructure costs over multiple benefiting properties.
- Seek state and regional funding sources such as Business Oregon's Industrial Site Readiness Program or Metro's planning and development grants that help cities create master plans for industrially zoned land within the UGB.

3. Support Regulatory Efficiency

- Complete environmental impact and infrastructure studies in advance to remove additional steps developers have to take and to make site development more attractive.

4. Explore Incentives and Investment Tools

- Explore creative funding tools such as grants, earmarks, forgivable loans, tax increment financing (TIF), Local Improvement District, etc., to fund infrastructure and site preparation.
- Utilize the WIN (Wilsonville Investment Now) program or other tax incentive programs to attract high-value employers.
- Consider public-private partnerships for catalytic projects (e.g., shared logistics facilities, innovation centers).

5. Establish Branding and Market Positioning

- When the path to urbanization of this area becomes clear, establish a clear identity/brand for the area.
- Market the area regionally as a strategic employment hub with multimodal freight access and sustainable design potential.
- Coordinate branding and recruitment with regional economic development partners such as Greater Portland Inc. and local Chambers of Commerce.

Next Steps

The list of considerations will continue to be refined through and following discussions with the Planning Commission and City Council during their April and May meetings, as well as through ongoing coordination with City staff, as the West Railroad Preferred Concept is further developed and integrated into the Basalt Creek Concept Plan. Additional meetings with the Planning Commission and City Council regarding the larger update to the Basalt Creek Concept Plan will occur in early summer. In addition to the transportation analysis completed in early 2026, the City is conducting additional site infrastructure planning (i.e., water and sewer) to better understand potential opportunities and constraints. The findings from that work will also be incorporated into the evaluation and refinement of the preferred concept and Basalt Creek Concept Plan update.

Wilsonville Industrial Land Readiness (WILR)

JOINT PLANNING COMMISSION (PC) AND CITY COUNCIL (CC) WORK SESSION SUMMARY | OCTOBER 6, 2025

Meeting Format

The joint Planning Commission and City Council work session was held on October 6, from 5:00 – 6:40 p.m., in the Wilsonville City Council Chambers. Alex Dupey and Lauren Scott from the MIG Consultant Team attended in person to present while Meg Grzybowski hosted the virtual discussion on Mural Board. The team briefly reviewed the existing conditions within the West Railroad project area and then presented the three potential urban design concepts for the area for feedback and discussion. The team also hosted a discussion regarding the preferred design elements and components from the concepts presented to the Planning Commission and City Council.

Existing Conditions Presentation

During the presentation, the Team reviewed existing conditions for the West Railroad area of the Basalt Creek Concept Plan. Recent site analysis indicates that the area now contains significantly less habitat than it did in the 1990s. Still, only slightly more than half of the land is considered "unconstrained" for development. Natural resource constraints are primarily concentrated along the western edge near Coffee Lake Creek.

The area's large parcel sizes make it attractive for potential development, but existing land is largely dominated by contractor establishments and a mining operation. Currently, the West Railroad area lacks sewer, water, and stormwater infrastructure. However, it is well positioned relative to the regional transportation network, with close proximity to I-5. The site is separated from the rest of the Basalt Creek Planning Area by the Portland and Western Railroad line and a large BPA easement running parallel to it. A key infrastructure element for improving future connectivity will be the Grahams Ferry Road railroad undercrossing, which currently has too low of a clearance to accommodate freight traffic.

Draft Urban Design Concepts

The following draft concepts were presented to the City Council and Planning Commission as starting points for discussion.

C1: Tonquin Environment

This concept emphasizes natural resource enhancement and ecological integration. It envisions an improved creek edge, an extended Tonquin Trail corridor, and interconnected open space and forest areas. Employment areas would support campus-style development, craft industrial uses, and small-scale office or manufacturing spaces. The concept centers on creating a unique employment and innovation district where economic development is closely tied to environmental stewardship and access to high-quality natural and recreational amenities.

C2: Manufacturing & Industry

Focused on regional connectivity and employment generation, this concept envisions upgrades to key transportation infrastructure such as the Grahams Ferry Road railroad undercrossing and the Cahalin Road railroad crossing. The land use mix emphasizes large-scale industrial and office development to attract high-density employment opportunities. Overall, this concept positions the area as a hub for manufacturing and logistics supported by improved access and circulation.

C3: Limited Connectivity and Flexible Land Use

This market-driven concept allows for a broad mix of land uses not typically found elsewhere in Wilsonville. It emphasizes flexibility and responsiveness to market demand, potentially supporting commercial recreation, outdoor retail, storage, and low-intensity small businesses. Rather than a predetermined vision, this concept encourages organic growth and adaptation based on evolving economic conditions.

DISCUSSION

Guiding Principles

Of the market-driven, balanced, and aspirational Guiding Principles from the Basalt Creek Master Plan, a discussion was held to identify what principles felt the most relevant to West Railroad, what the opportunities were, and what would be more challenging in the area.

The discussion highlighted both opportunities and challenges in shaping guiding principles for the West Railroad area. Commissioners and Councilors noted that Wilsonville is well positioned to leverage its natural resources as an economic and community asset, with the potential for nature to support a broader business ecosystem. Large parcel sizes were recognized as unique advantages that could allow site aggregation and coordinated development without direct City intervention. There was also interest in fostering employment opportunities that complement nearby Tualatin, supporting a more regionally balanced mix of uses.

Key challenges include limited infrastructure, connectivity, and access—particularly across the railroad at Cahalin Road—and concerns about flood risk in areas near the wetlands. While preserving natural features like the Ice Age Tonquin Trail corridor remains a priority, participants acknowledged the need to balance conservation with job creation. Additional considerations include the difficulty of assembling properties and the limitations imposed by the railroad's proximity, which may restrict certain sensitive land uses.

Throughout the discussion, Commissioners and Councilors emphasized Wilsonville's history as a forward-thinking city, setting the stage for creative, sustainable, and strategic approaches to future planning in the West Railroad area.

Urban Design Concepts

The discussion of urban design concepts led to the group leaning towards a preferred concept that was a balance of C1 and C2. However, there were pros and cons to each concept that were taken into consideration, as summarized below:

C1: Tonquin Environment

Pros / Opportunities:
This concept presents a strong opportunity to capitalize on the Ice Age Tonquin Trail corridor and establish a continuous greenway along Coffee Lake Creek, enhancing connectivity and recreation while highlighting the area's natural assets.

Cons / Constraints:
Participants expressed concern that the significant environmental emphasis may come at the expense of job creation. The large share of land dedicated to natural areas could overly limit employment and economic potential.

C2: Manufacturing & Industry

Pros / Opportunities:
C2 offers the strongest job creation potential, with opportunities to integrate vocational or higher education components. It is seen as providing the most long-term revenue and property value, while also maintaining flexibility to incorporate natural areas—such as extending the Coffee Lake Creek greenway into the development design.

Cons / Constraints:
The concept's success depends heavily on infrastructure feasibility. Both the Grahams Ferry Road undercrossing and the Cahalin Road crossing are critical elements, and participants questioned whether these improvements would be achievable or cost-effective.

C3: Limited Connectivity and Flexible Land Use

Pros / Opportunities:
This approach keeps future options open, allowing for a mix of uses and natural features that could include elements like commercial recreation or a multi-use complex. It provides flexibility for the community to respond to evolving market conditions.

Cons / Constraints:
Some felt the concept lacks the intentionality and forward-thinking approach that typically guides Wilsonville's planning efforts. Without a clearer direction, it may appear more reactive than strategic.

Preferred Elements

As previously mentioned, the Planning Commission and City Council expressed an affinity for the combination of C1 and C2. When asked what the preferred elements or pieces were from their ideal concept, several key elements came to the forefront:

- Balance between the natural and built environment
- Property values and job creation
- Creating a core space
- Intentional planning and intervention; though opportunity for flexibility
- A linear greenway
- Ability to align land uses with Tualatin

Strategies

A final piece of the discussion had the Commissioners and Councilors brainstorming how Wilsonville could achieve these concepts (or elements of the concepts); what the City's role was, and what tools or strategies could be considered when advancing the vision for West Railroad. Some suggestions included:

- Form-based regulations
- Incentives
- Partnership and legislative support

Defining Phrases

When asked to provide defining phrases or unique characteristics that would define the future of West Railroad, these phrases were presented as top of mind:

- Attractive
- Active
- High-use
- Jobs and industry
- Flexibility

Additional Questions

There were additional questions posed by the Planning Commission and City Council that will be included in the considerations for the preferred Concept.

Q: What was the initiator for the large levels of development over the last 15 years?

Q: Construction costs for Graham's Ferry Road railroad undercrossing improvements – are they in today's dollars or future estimates?

Q: Over time have we seen a change in gravel activity at the quarry and what do we know for the future?

A: We don't really know what their plans are. One of the landowners said they had acquired another firm, so they would be shifting to the Tualatin facility, but no plans in the immediate future for this part of their properties in West Railroad.

Q: Trail system and wetlands – is that integrated into the plan or is it separate?

A: Assuming trail / regional system and wetlands would remain.

Q. Has the city heard from developers/investors interested in the area? Could we use those conversations to tailor the approach?

A. Unlimited interest in industrial land in Wilsonville, though the land has to be served by infrastructure and there has to be a reasonable path forward to aggregating a site

Q. What prevents trucks from coming up to Graham's Ferry Road from the south?

A. That is a long way around – want access to the I-5 interchange – desirable for access
A. Haven't completed traffic study to analyze

Q. What top sectors can we attract if sensitive sectors (to noise and vibration) cannot come in?

Attachment 2. Joint Work Session Mural Board Notes (October 6, 2025)
Planning Commission Work Session November 12, 2025

GUIDING PRINCIPLES

Which principles feel most relevant here?

Are there any that will be more challenging to meet in West Railroad?

MARKET-DRIVEN:

- MEET REGIONAL RESPONSIBILITY FOR JOBS.
- MAXIMIZE ASSESSED PROPERTY VALUE.

BALANCED:

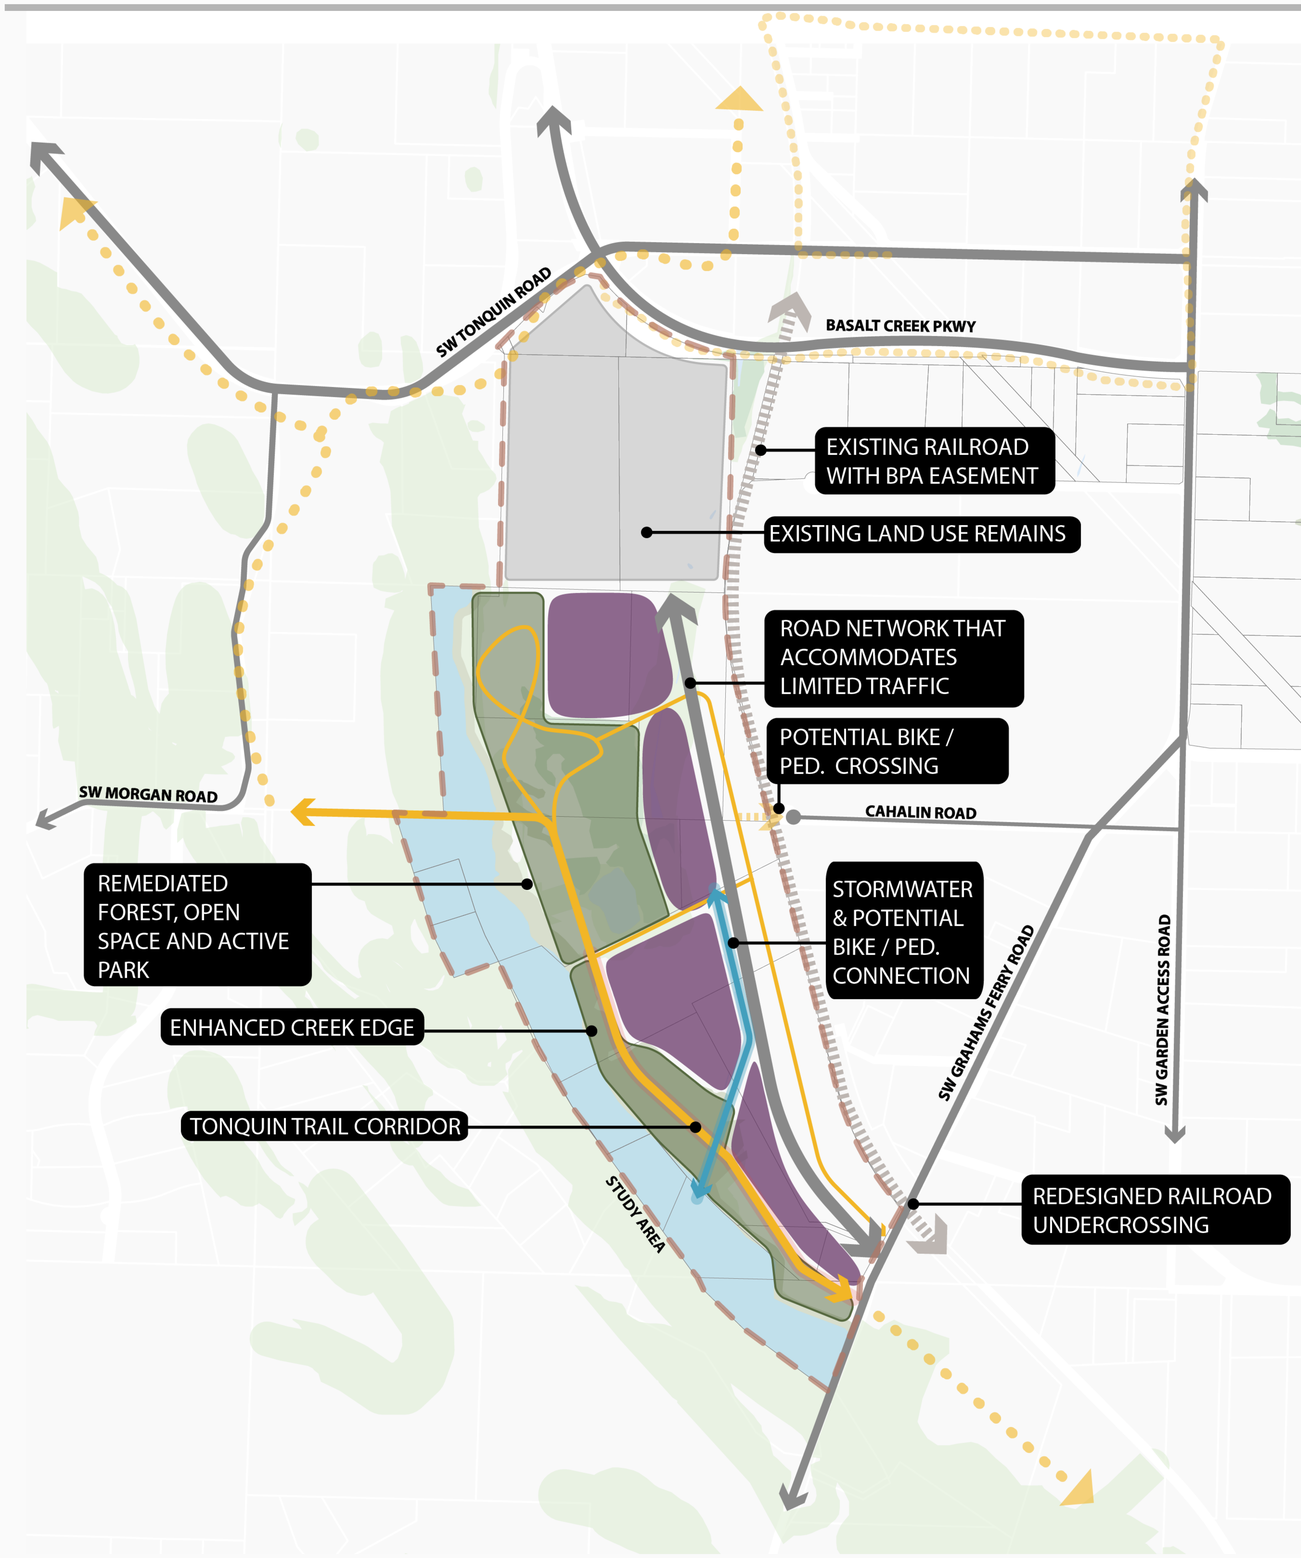
- CAPITALIZE ON THE AREA'S UNIQUE ASSETS AND NATURAL LOCATION.
- EXPLORE CREATIVE APPROACHES TO INTEGRATE JOBS AND HOUSING IN THE CRAFT INDUSTRIAL LAND USE TYPE.
- ENSURE APPROPRIATE TRANSITIONS BETWEEN LAND USES.
- DESIGN COHESIVE AND EFFICIENT TRANSPORTATION AND UTILITY SYSTEMS.

ASPIRATIONAL:

- MAINTAIN AND COMPLEMENT WILSONVILLE'S UNIQUE IDENTITY.
- CREATE A UNIQUELY ATTRACTIVE BUSINESS COMMUNITY UNMATCHED IN THE METROPOLITAN REGION.
- INCORPORATE NATURAL RESOURCE AREAS AND PROVIDE RECREATIONAL OPPORTUNITIES AS COMMUNITY AMENITIES AND ASSETS.

THE OPPORTUNITIES

Ripe to maximize natural resources	Nature could feed into a broader business community	Large parcels are unique assets to the area
Jobs - key emphasis	Opportunity for West Railroad to aggregate sites without city intervention vs Coffee Creek/Basalt Creek	To blend with land uses in Tualatin - north of West Railroad



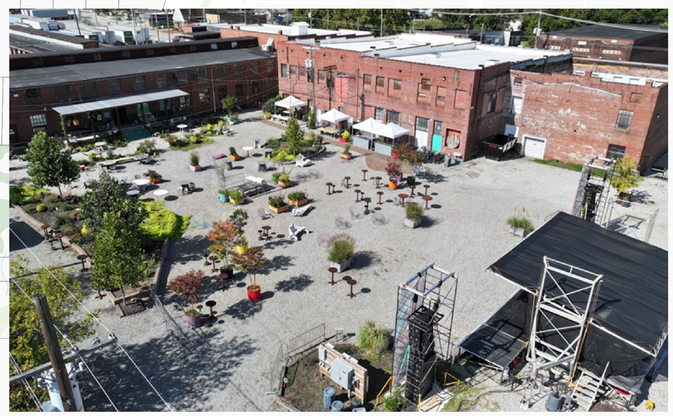
THE CHALLENGES

Infrastructure and access	Natural resources may have a limiting impact for what we can envision	Keep Tonquin and natural areas, but not at expense of jobs	Getting access across Cahalin
Site aggregation	Connectivity and transportation access	Sensitive uses could locate/site next to railroad	
Access spacing requirements and slope	Flood risk for roadways	Parkway is a barrier for connections to Tualatin	

WILSONVILLE FACTOR / UNIQUE IDENTITY

Forward thinking as a City			
			without the City driving development (owning the land), likely to see spec development

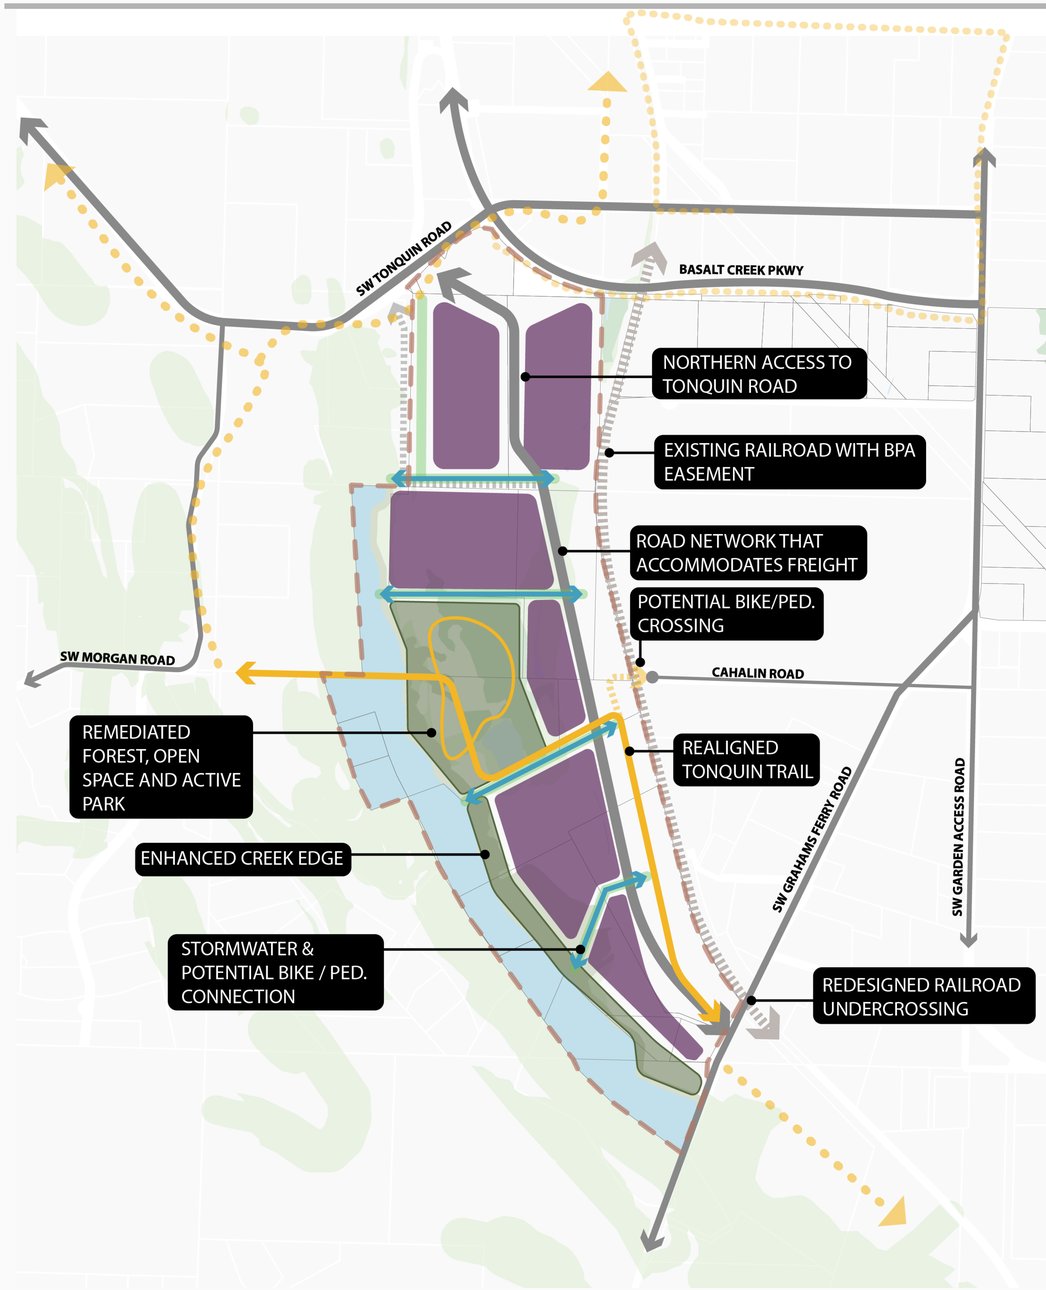
C1: TONQUIN ENVIRONMENT



capitalizing on Tonquin Trail

greenway across the entire Coffee Lake Creek

large environmental component may limit jobs too much



may not bring enough job creation

C2: MANUFACTURING & INDUSTRY

revenue stream

undercrossing a key element

could the primary access be at the north end off of Tonquin?

job emphasis

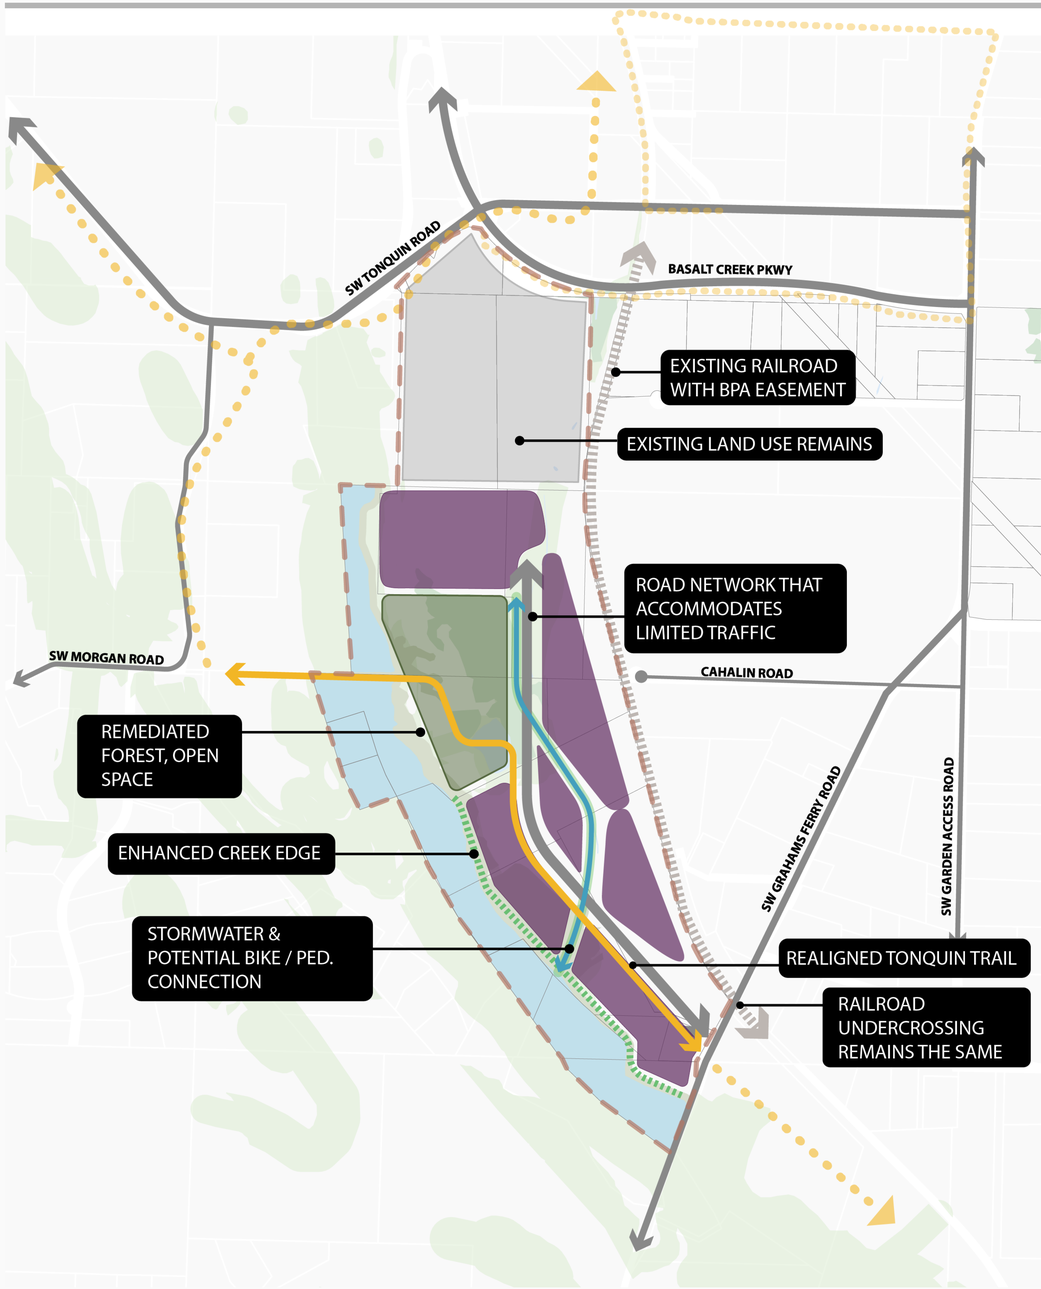
brings in ample environment to balance the two

provide the most property value in the long run → most flexibility in what can be located here

Consider greenway across the entire area - flexibility to use natural area to the west as part of development

consideration for vocational or higher education

Cahalin crossing is a key (straight shot) → can the State encourage the Cahalin crossing? → Challenging (private crossing) to get approved with the RR



ANCESTRY AS AN EXAMPLE

C3: LIMITED CONNECTIVITY WITH FLEXIBLE LAND USES

need to be more thoughtful in planning for this area rather than letting things evolve without intention / intervention

Wilsonville thinks forward and plans intentionally - C3 doesn't fully capture

Revenue considerations for multi-use/multi-sport complex?

Mix of C1, C2, C3 for flexibility between uses and natural environment → keeps the options open for opportunity

commercial recreation component could think more widely - aquatics?

PREFERRED ELEMENTS

What are the pieces/elements we want in a preferred concept?

Is there a starting point?

BALANCE BETWEEN NATURAL AND BUILT ENVIRONMENT	ADDRESS THE UNDERCROSSING	PROPERTY VALUE & JOB CREATION	CREATE A CORE SPACE
ALIGN LAND USES WITH TUALATIN?	**MONETARY & FEASIBILITY STANDPOINT: CAHALIN VEHICLE CROSSING**	INTENTIONAL PLANNING & INTERVENTION	
LINEAR GREENWAY	WRITING IN A PLAN B FOR LIMITING ACCESS POINTS	LEAVE OPTIONS OPEN	

DEFINING PHRASES

ATTRACTIVE	ACTIVE	HIGH USE
JOBS & INDUSTRY	FLEXIBILITY	

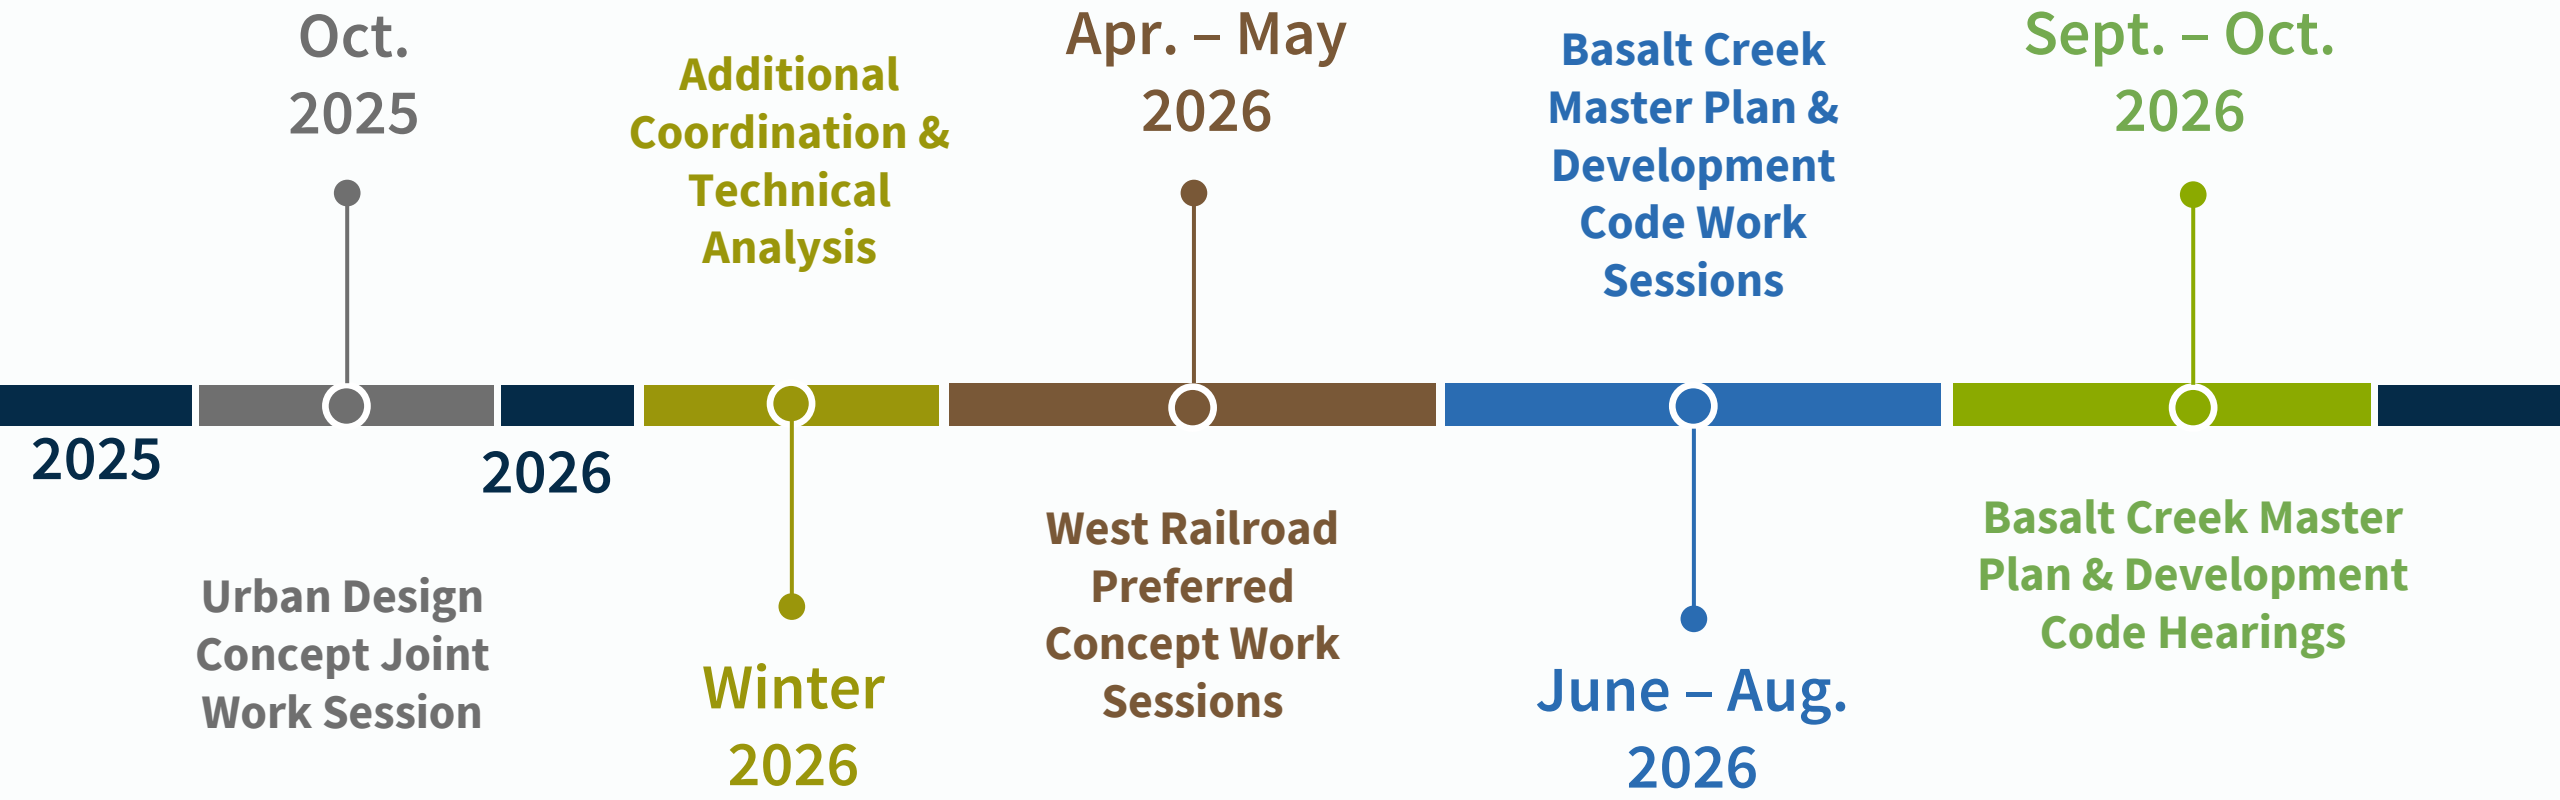
HOW DO WE GET THERE?

What do we need to make this happen?

What is the City's role?

What tools, incentives, and strategies should be considered?

FORM BASED REGULATION	INCENTIVES	PARTNERSHIPS OR LEGISLATIVE SUPPORT	

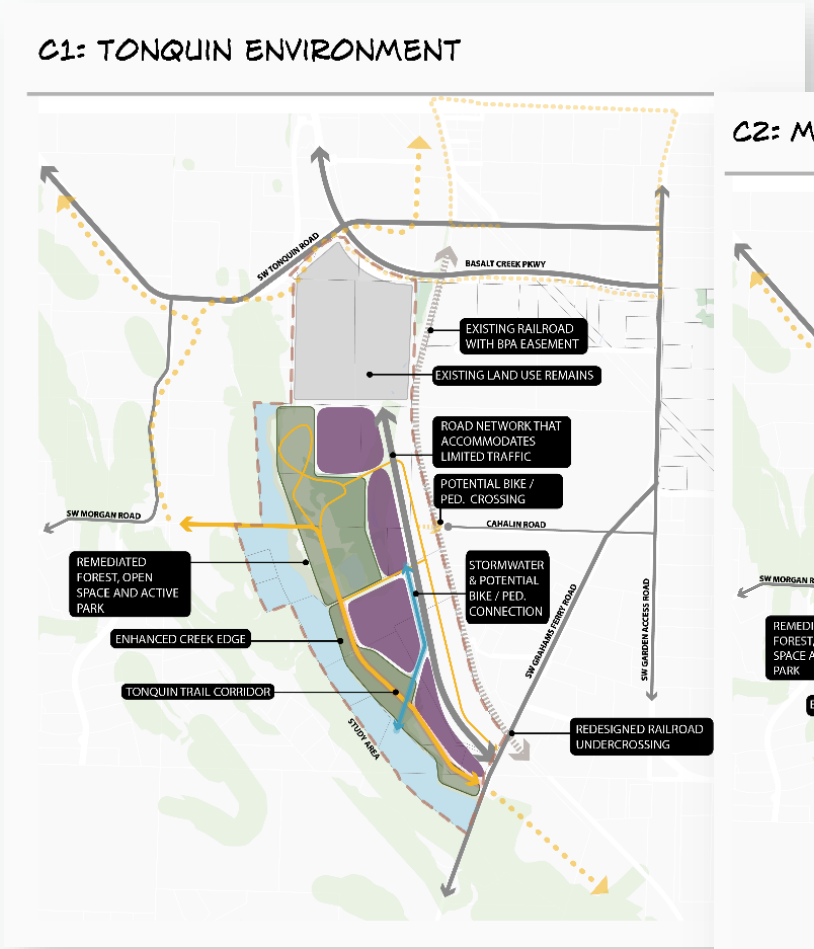


Wilsonville Industrial Land Readiness: West Railroad

City Council Work Session

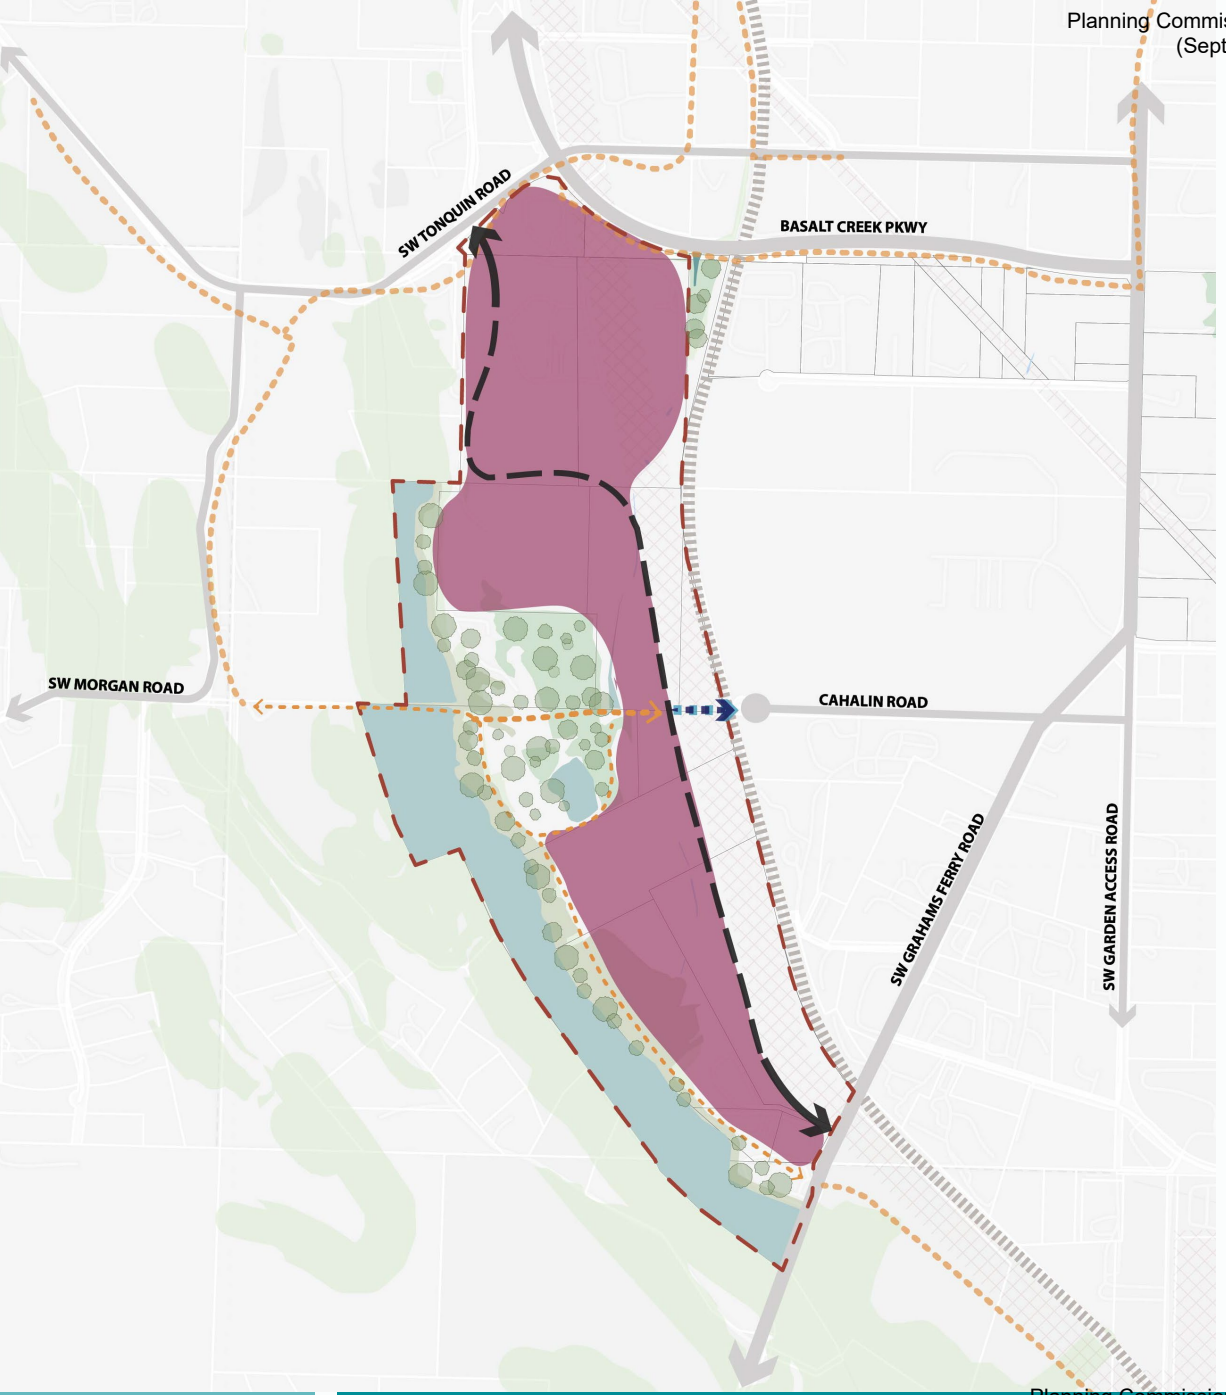
April 20, 2026

WILSONVILLE
OREGON

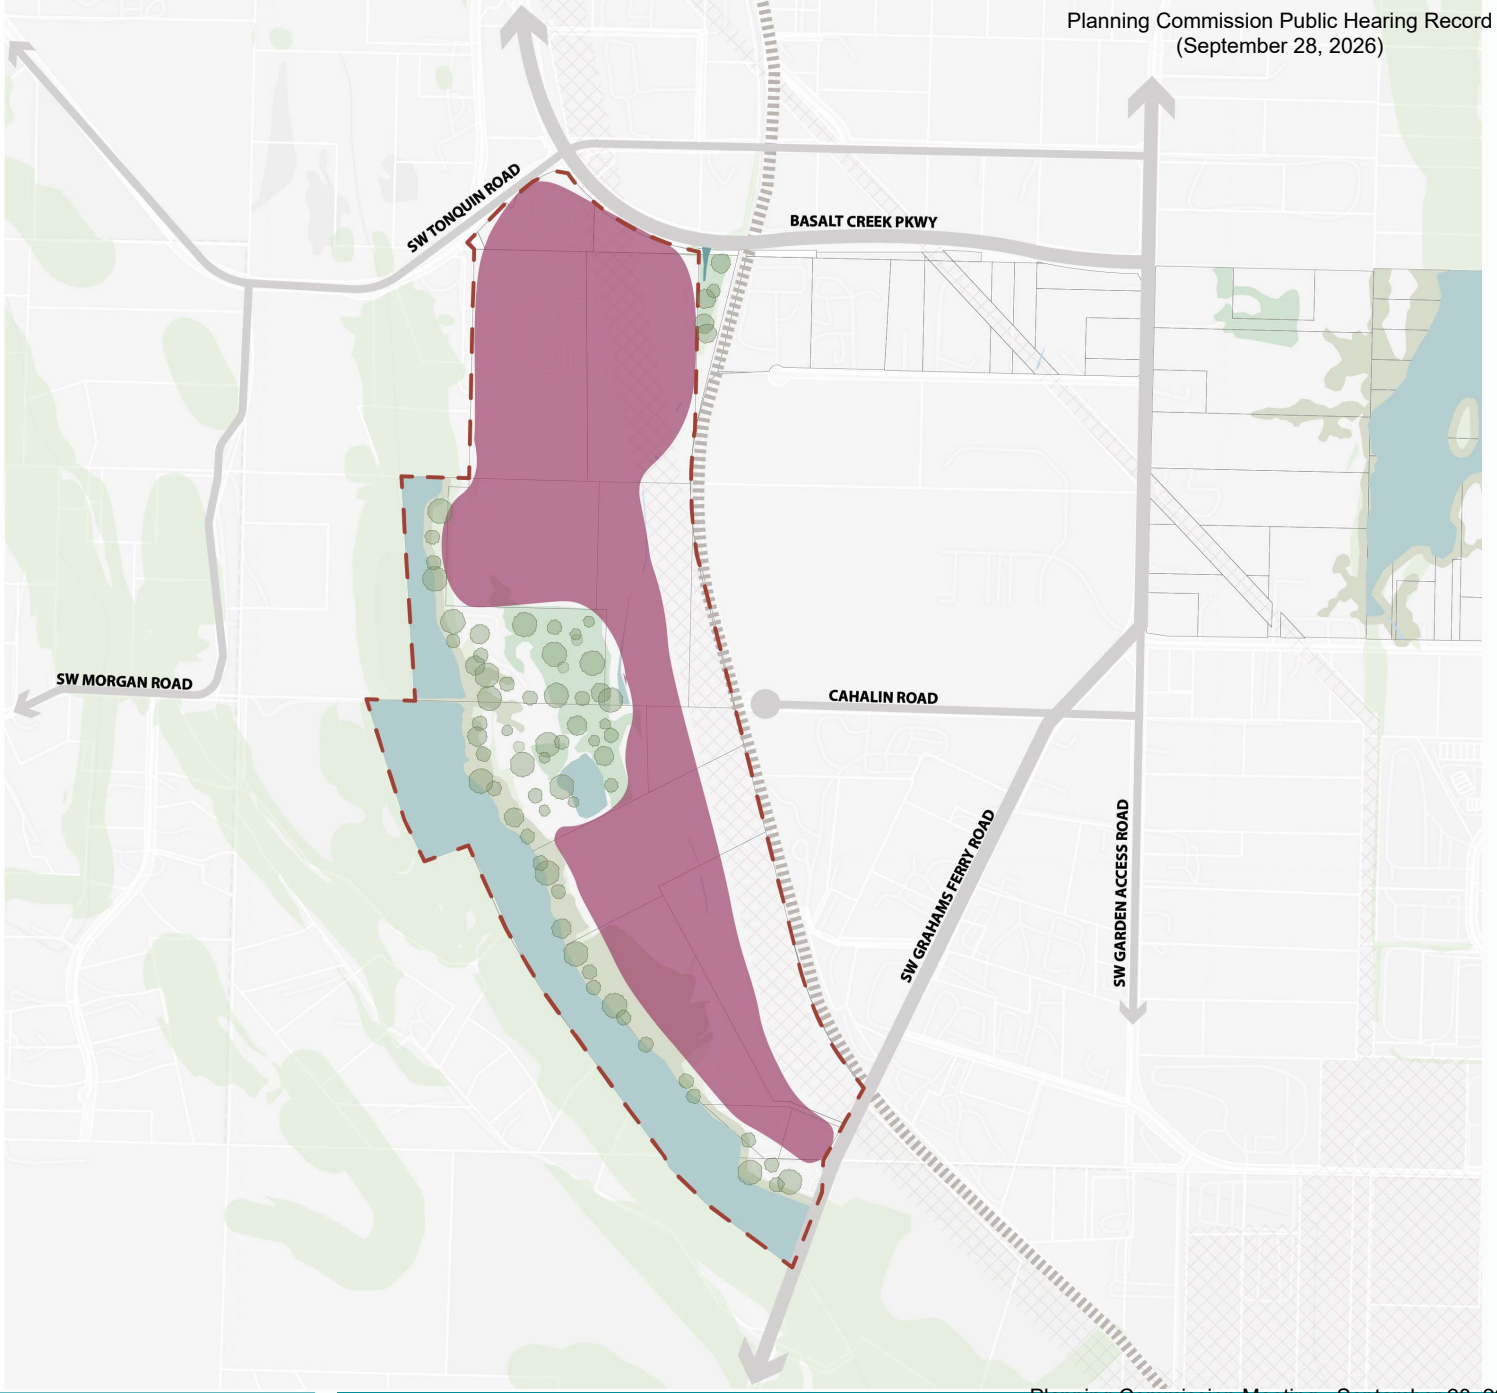


Project Process

Preferred Elements and Approach



Urban Design Concepts Takeaways

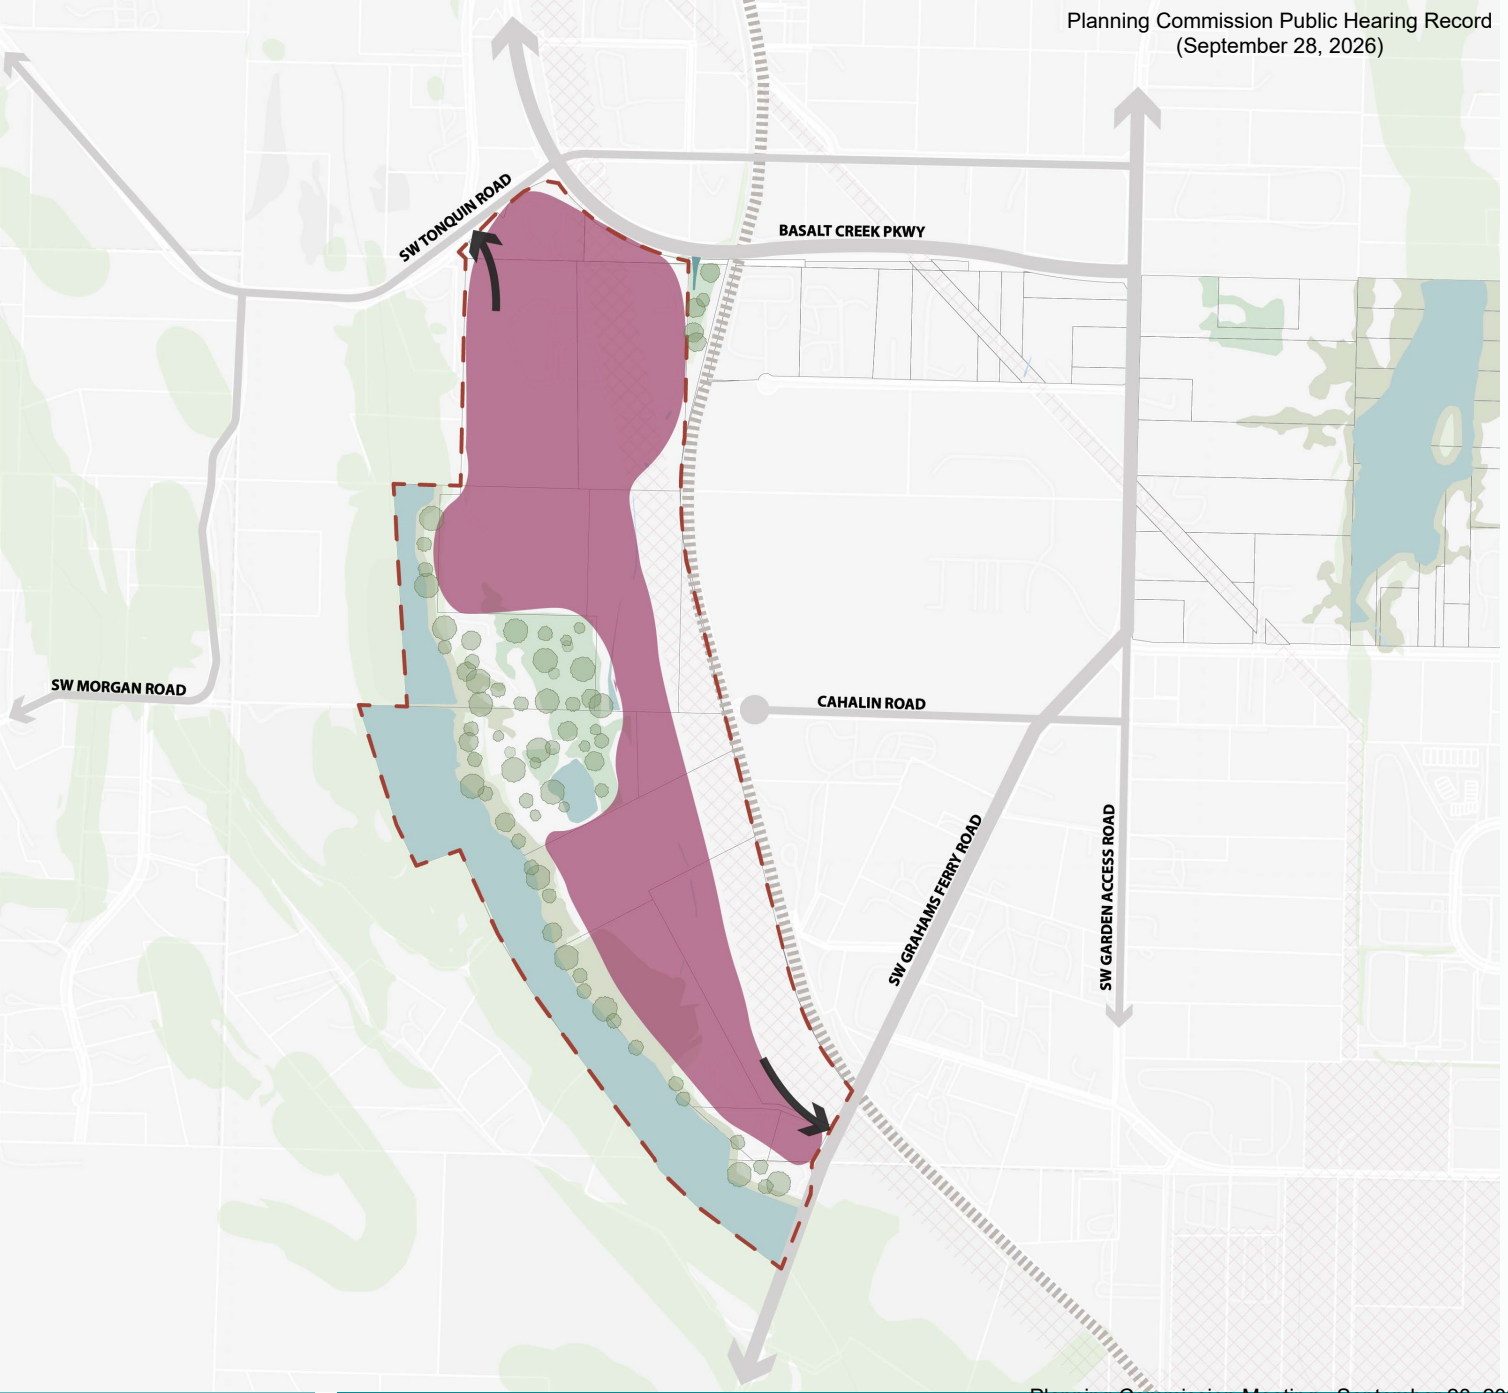


Preliminary Preferred Concept

- **Maximizes developable land**
- **Preserves remaining habitat**, and restores creek edge
- Considers **additional road connections**
- **Links Ice Age Tonquin Trail** with internal circulation

Preferred Concept

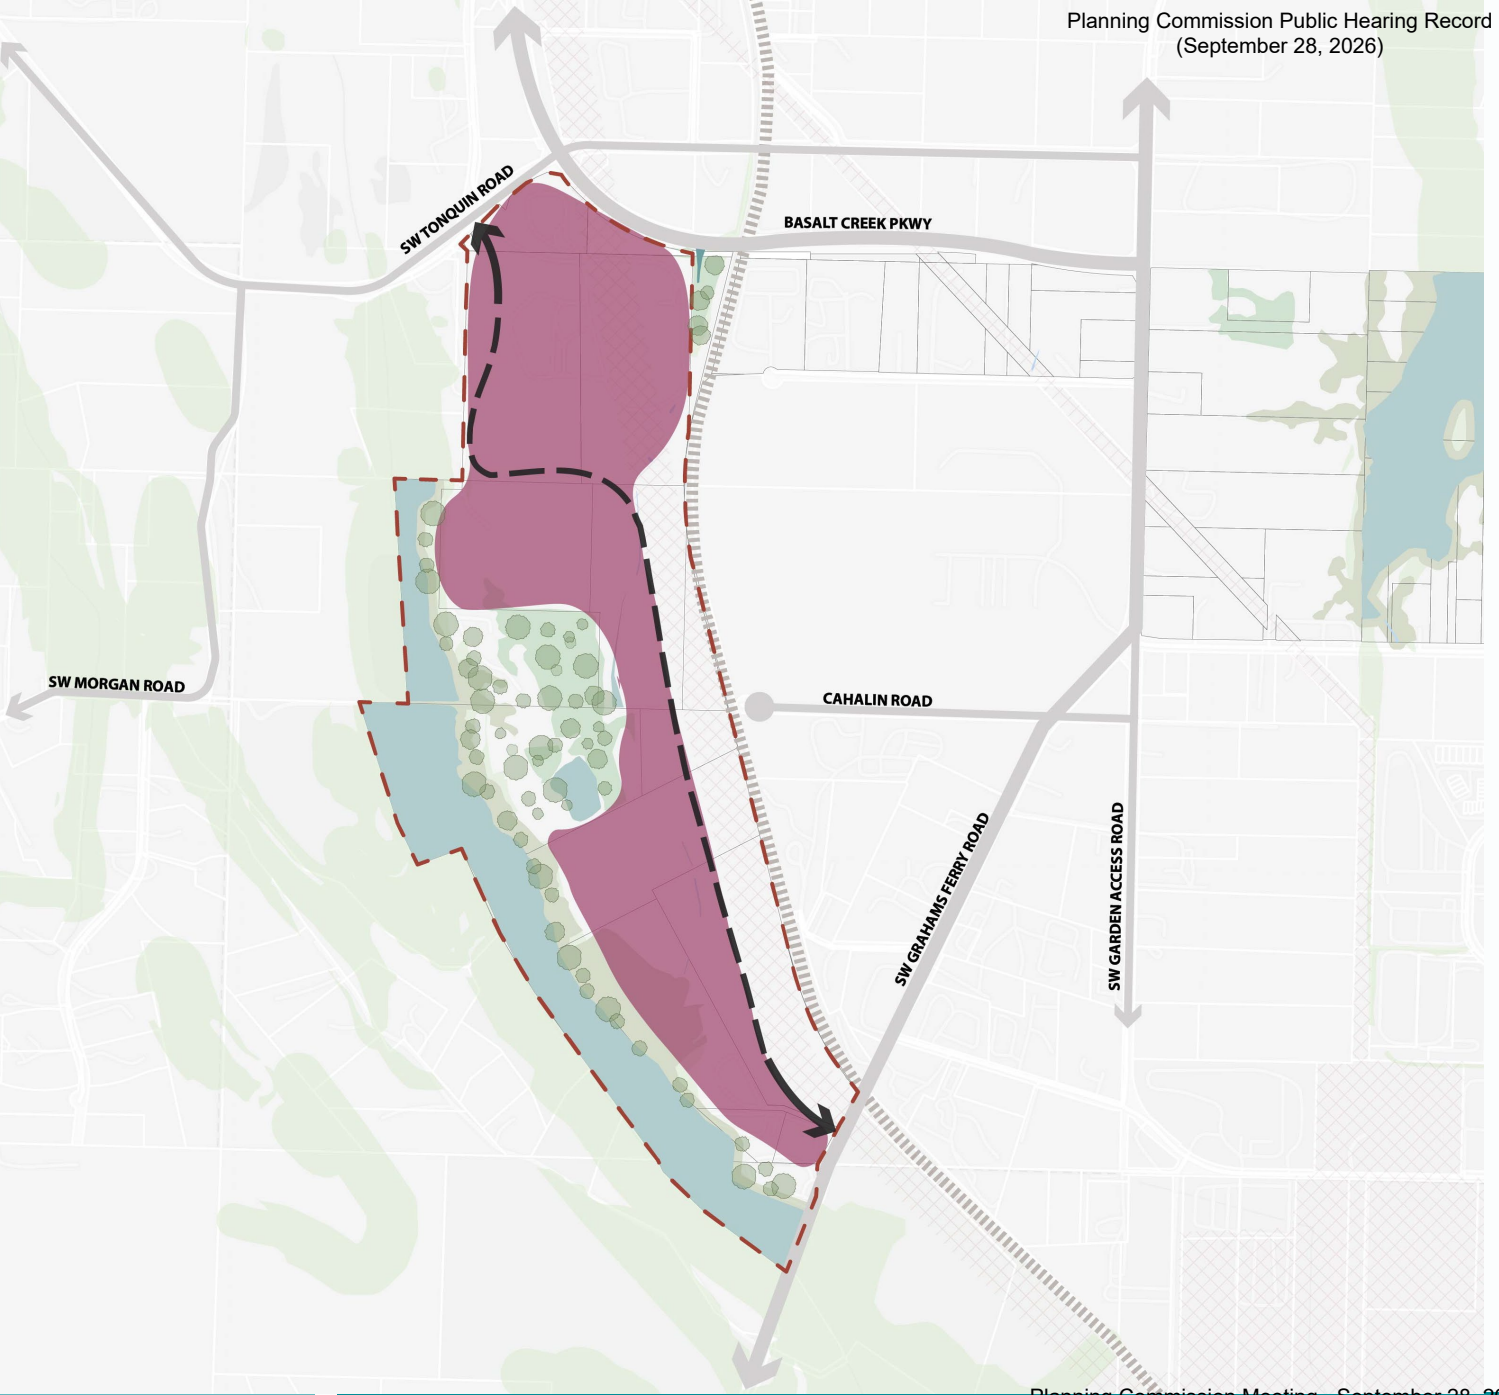
SW TONQUIN ROAD
BASALT CREEK PKWY
SW MORGAN ROAD
CAHALIN ROAD
SW GRAHAMS FERRY ROAD
SW GARDEN ACCESS ROAD



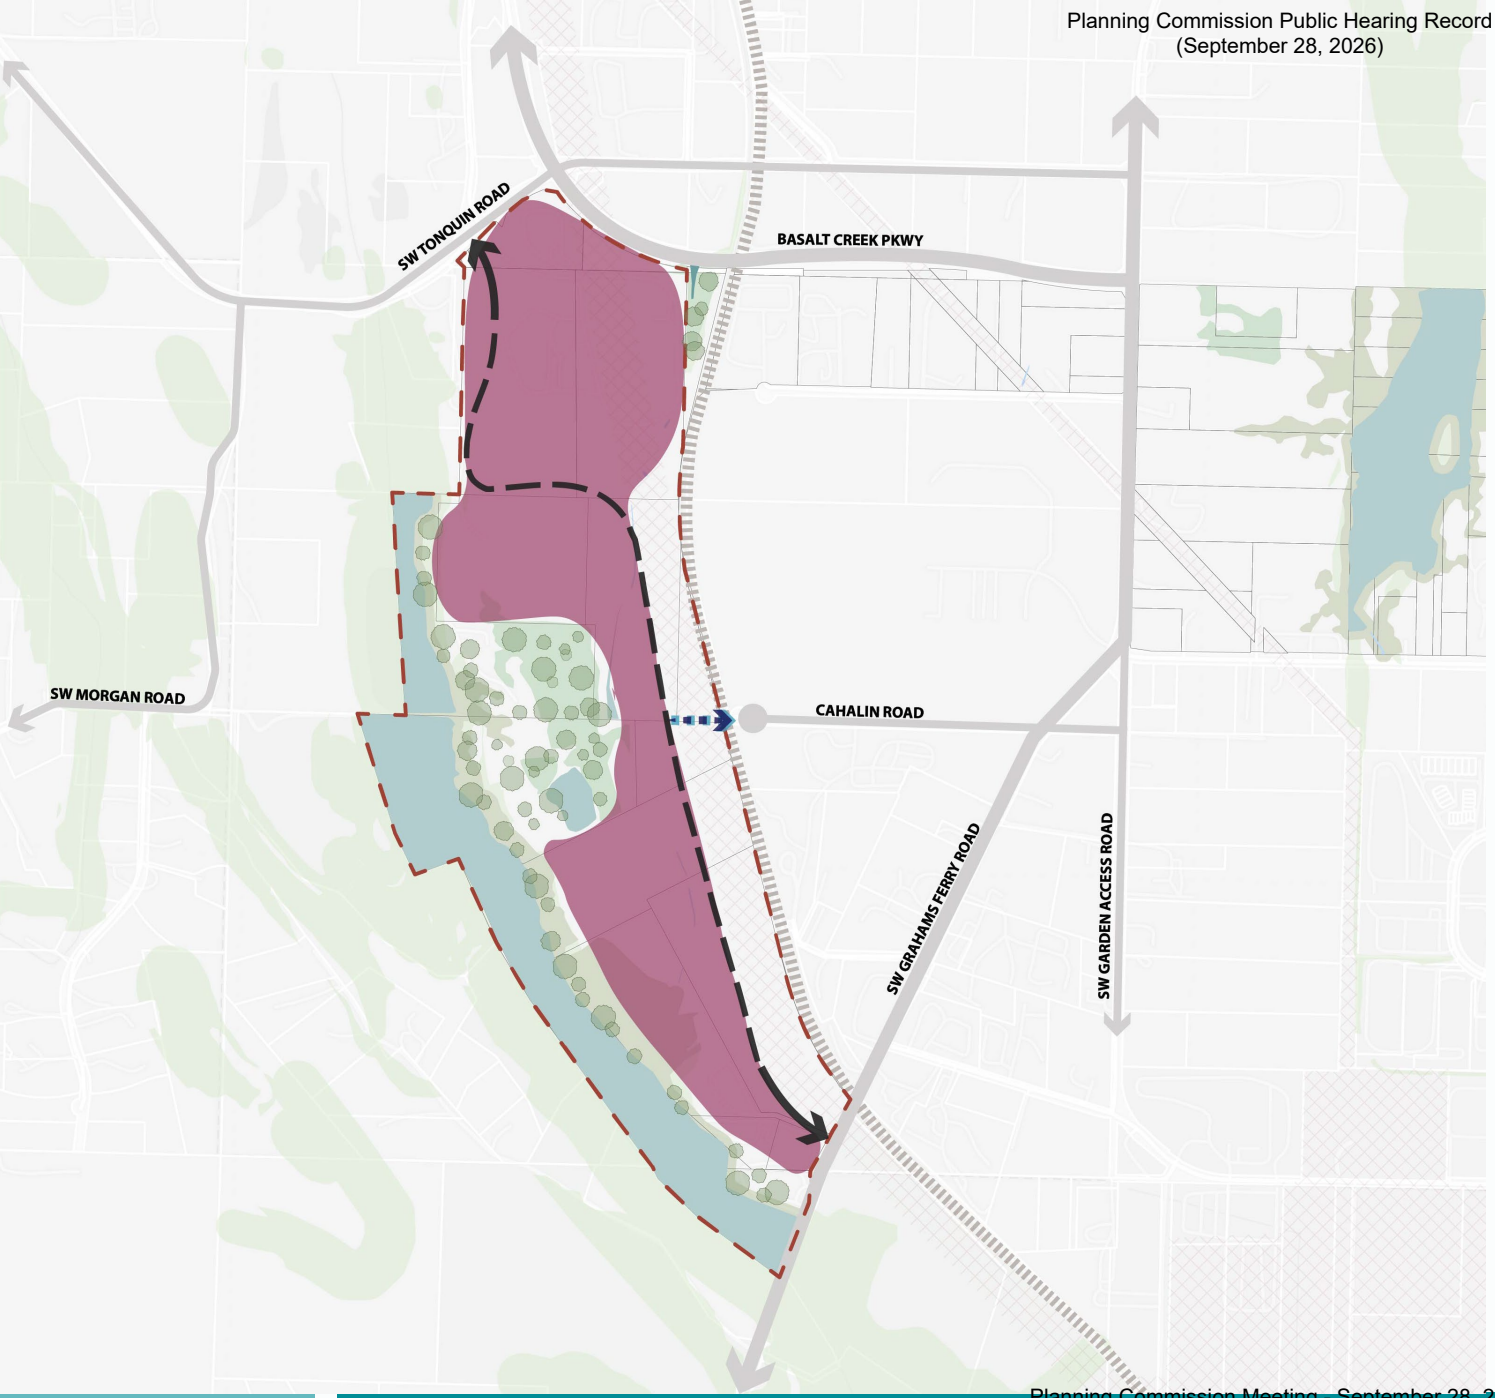
Land Use

TRANSPORTATION ANALYSIS

Methodology & Approach



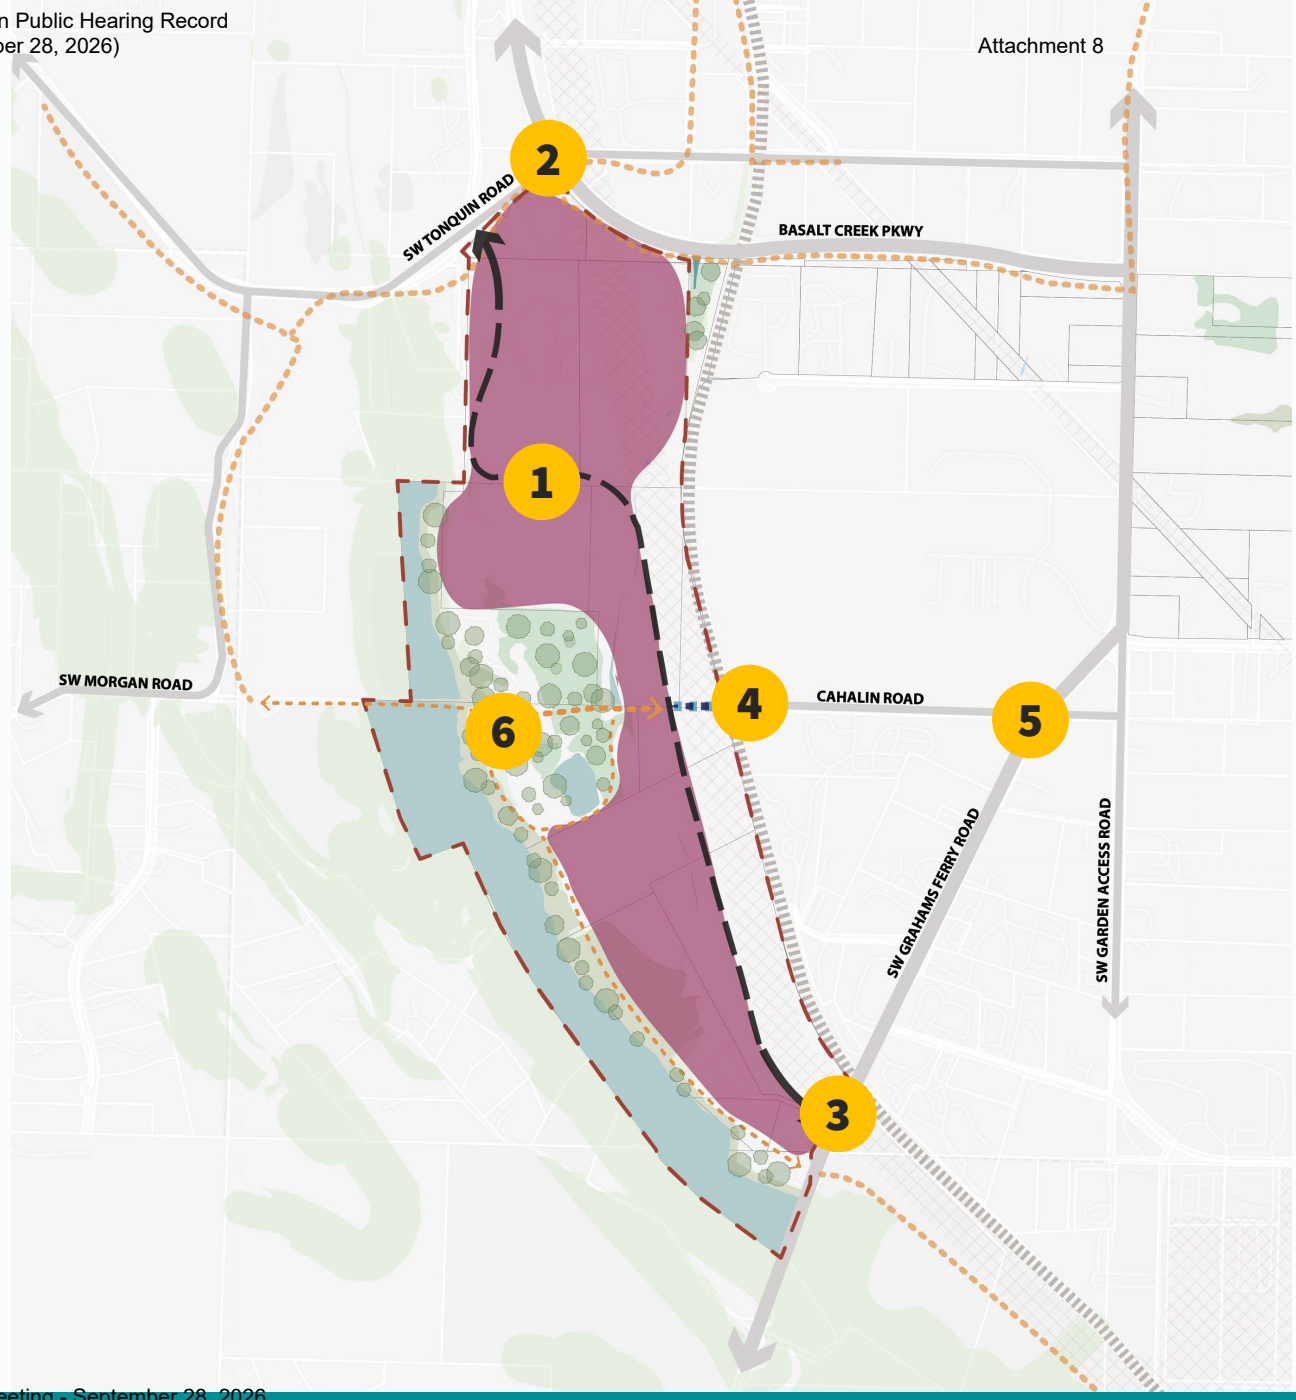
- Evaluated a 20-year horizon based on planned network improvements
- Applied preferred land use scenario for development intensity
- Assessed multimodal access at a planning level
- Coordinated with jurisdictional partners and railroad operator



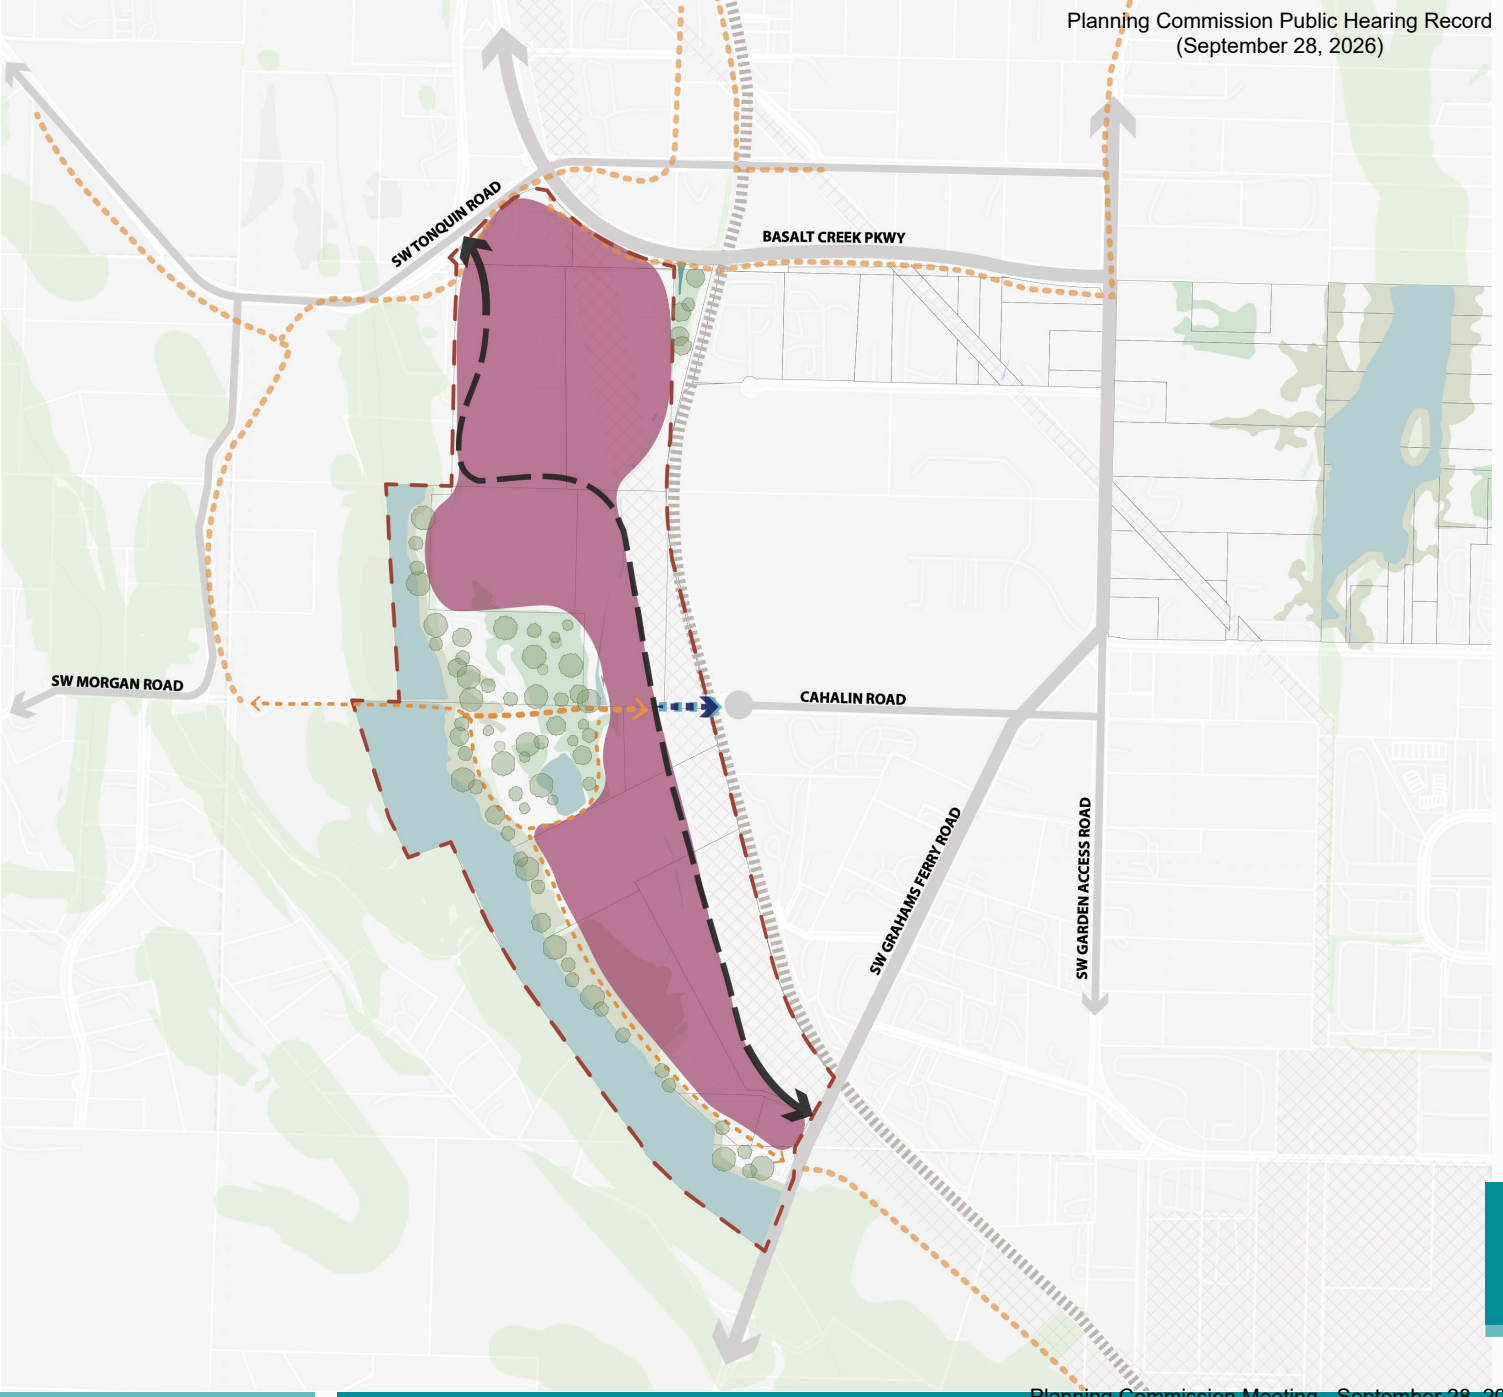
Transportation

Transportation

Transportation



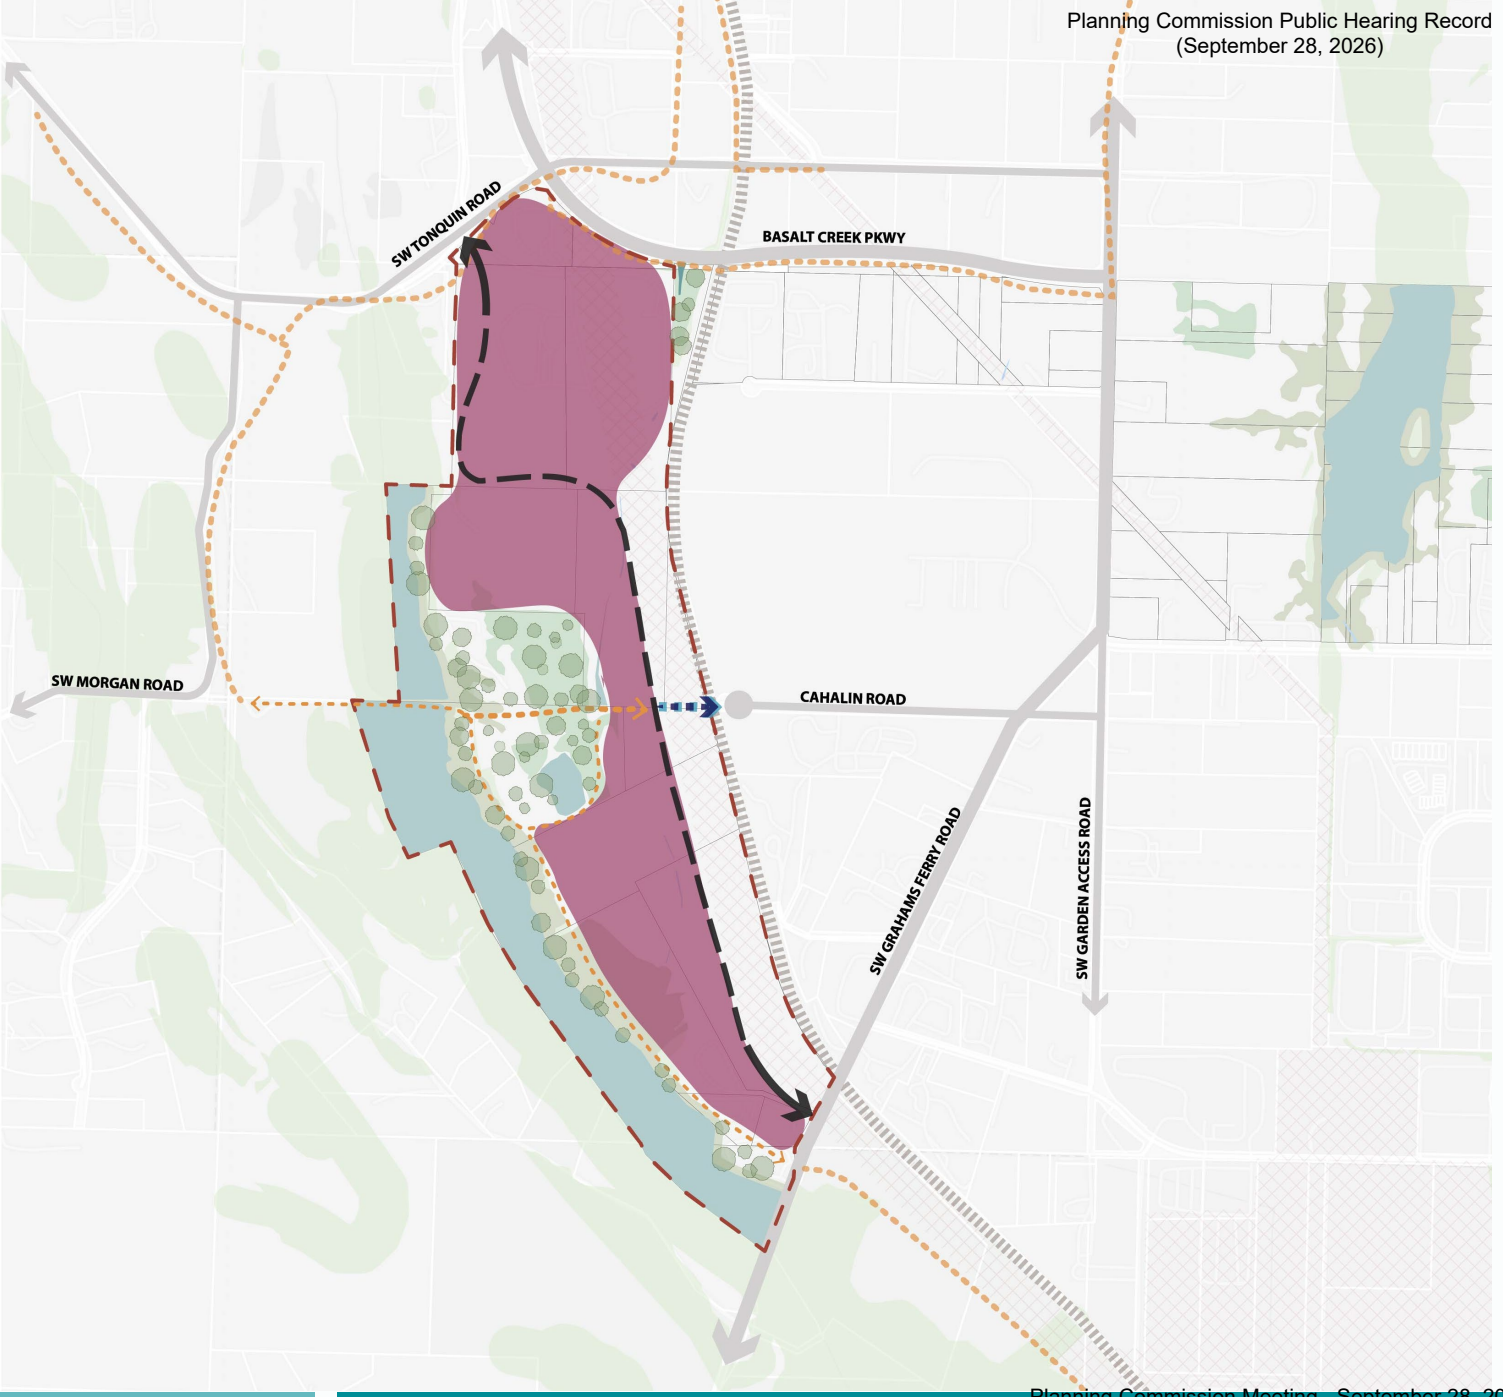
Key Findings



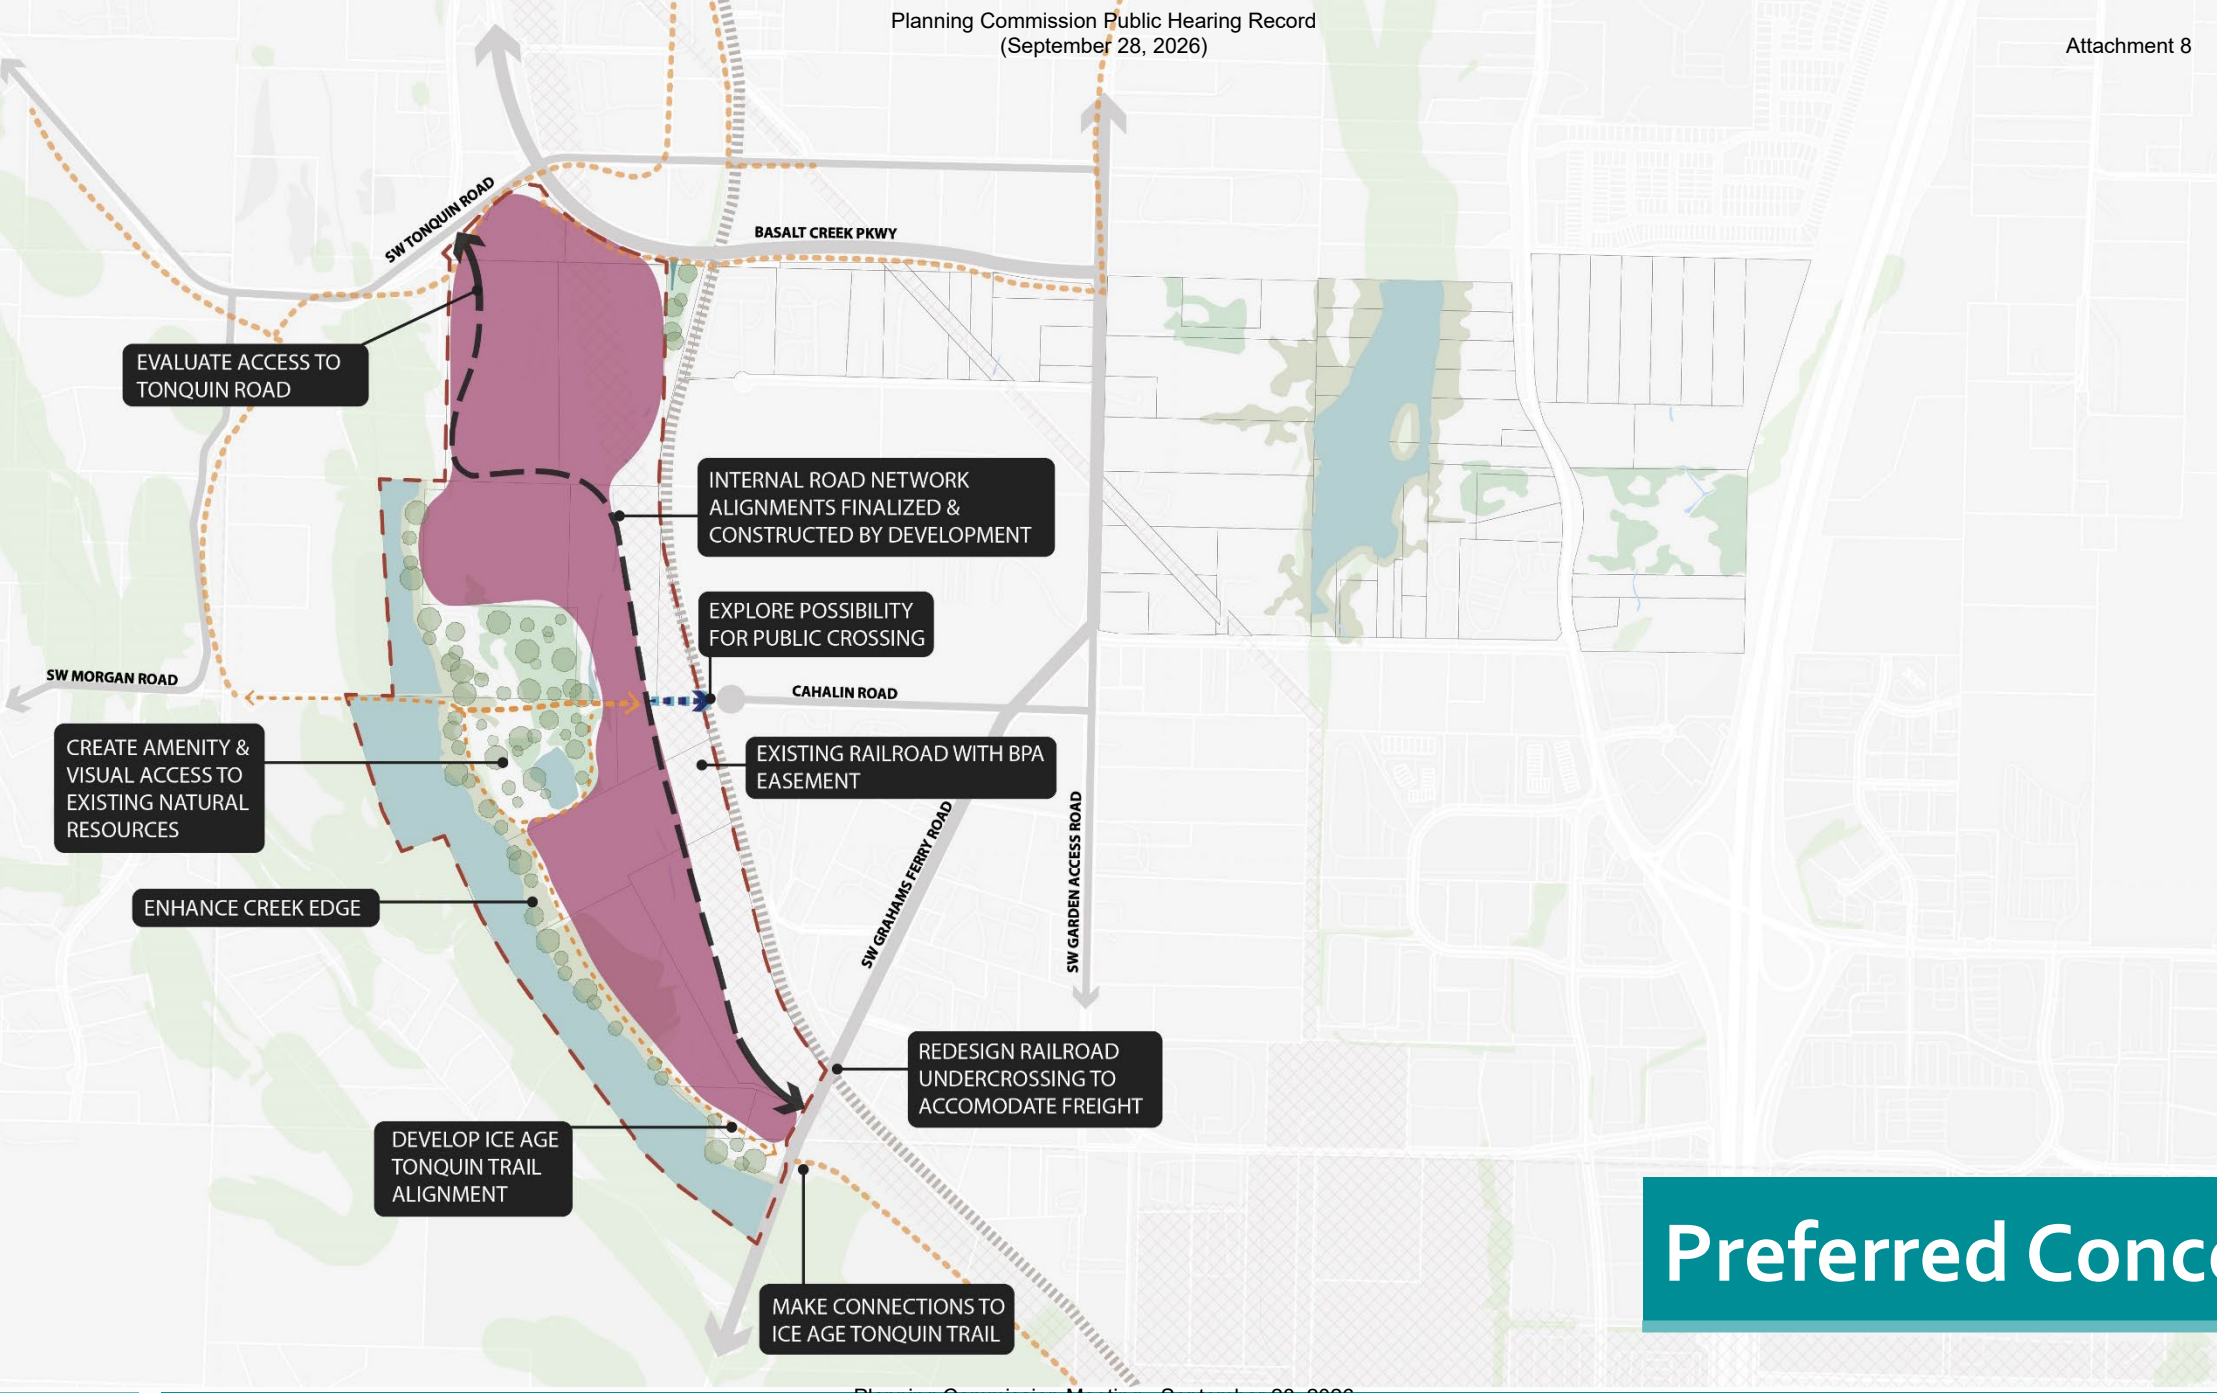
- **No major off-site upgrades needed beyond adopted TSP projects**
- Ice Age Tonquin Trail alignment can be accommodated as currently proposed

Identified Transportation Projects

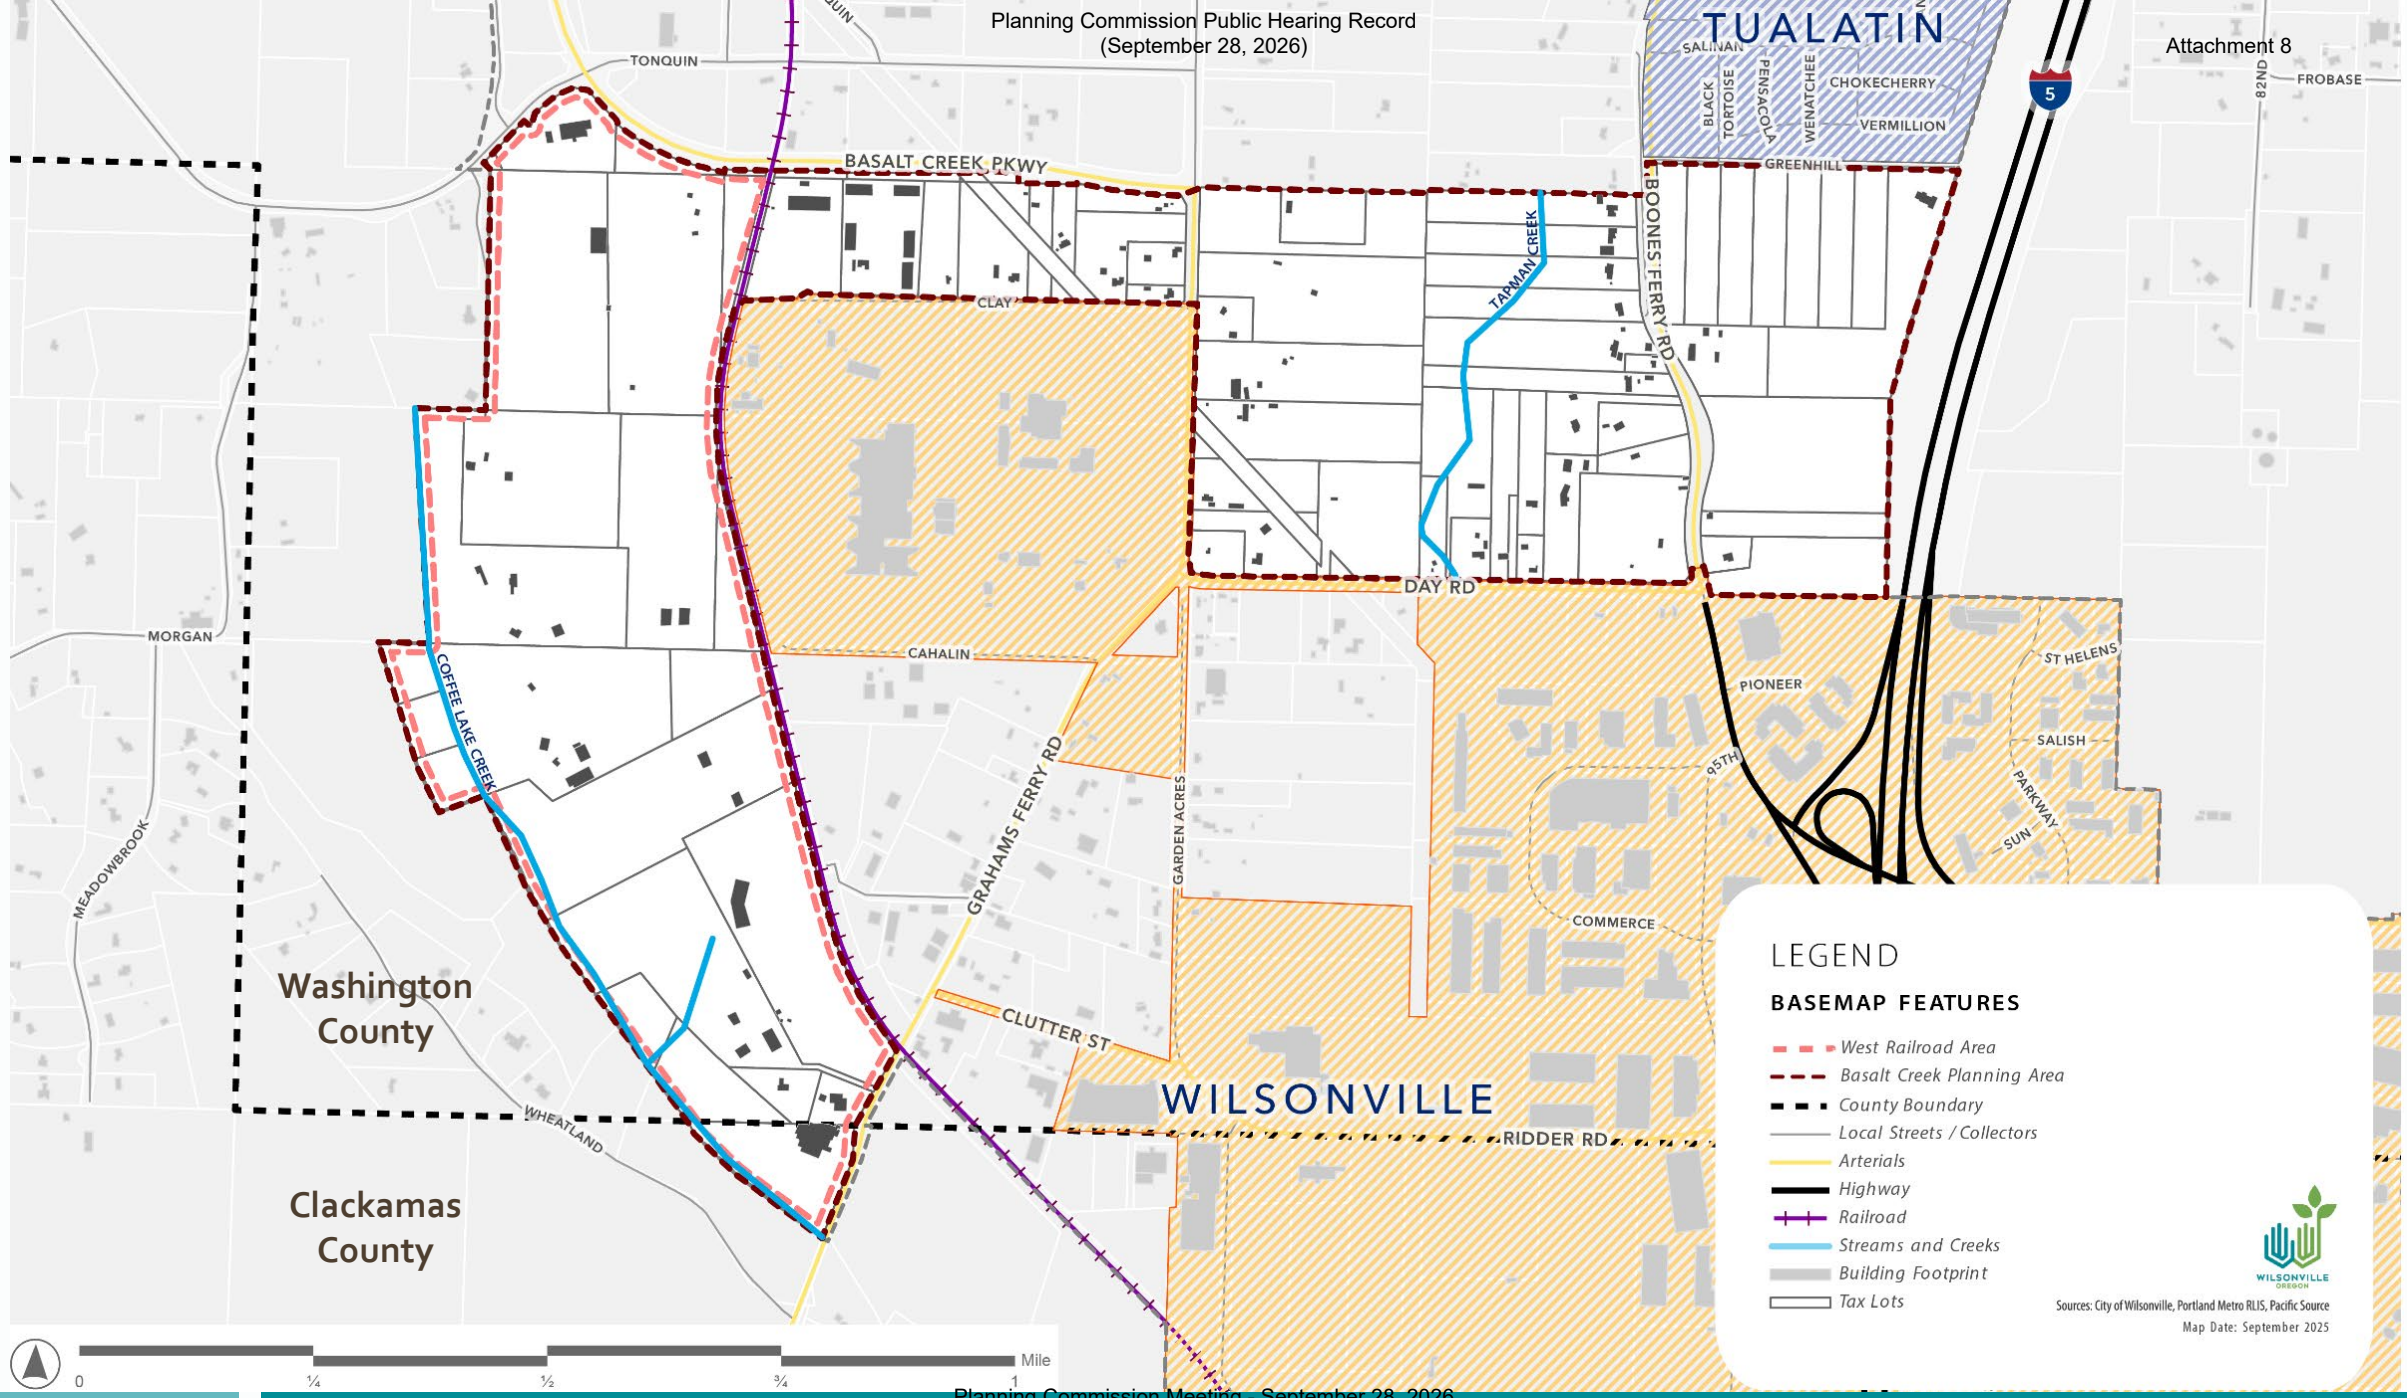
1. New local industrial street
2. Tonquin Rd upgrades for truck access + safety improvements
3. Grahams Ferry Rd access improvements
4. Cahalin Rd rail crossing (optional)
5. Cahalin/Grahams Ferry Rd intersection upgrades (optional)
6. Pedestrian & bicycle trails through site

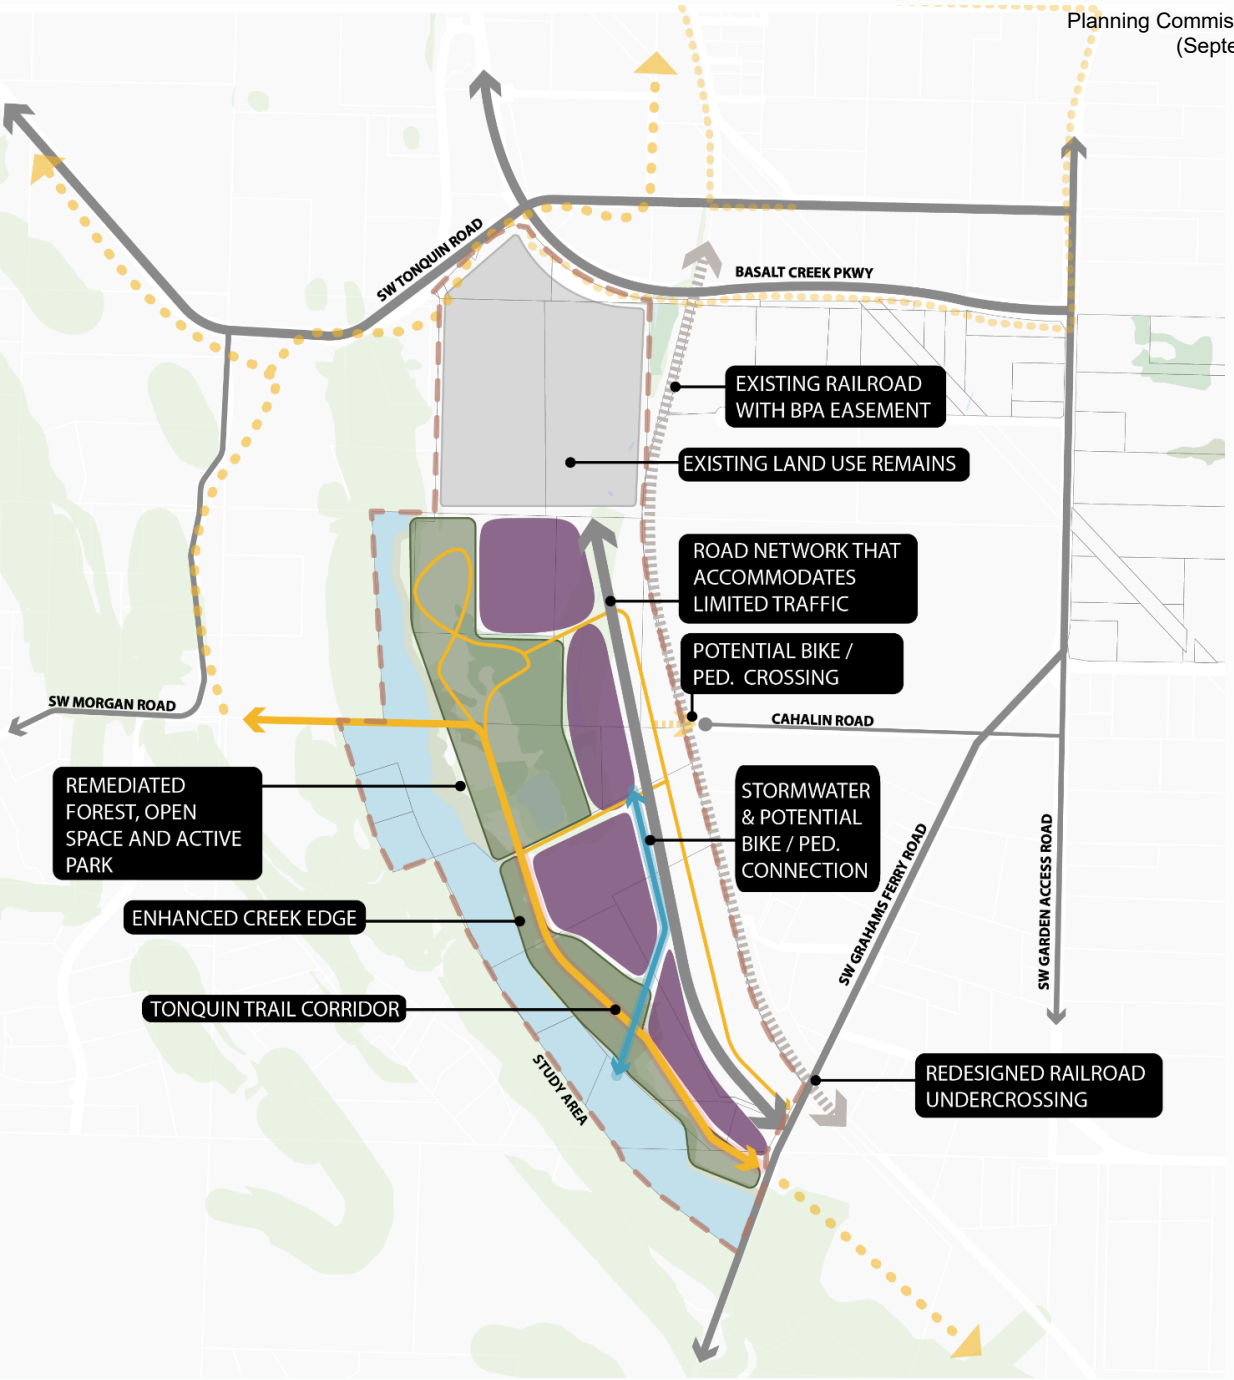


Trails & Natural Resources



Other Elements





Preferred Concept

Is the Preliminary Preferred Concept consistent with the guidance and direction provided by the Planning Commission and City Council?

Are there aspects of the Preliminary Preferred Concept that need clarification?

Miranda Bateschell, Planning Director
Steve Rymer, Interim Assistant City Manager
Zach Weigel, City Engineer

WORK SESSION [5:00 PM]

REVIEW OF AGENDA AND ITEMS ON CONSENT

There was none.

COUNCILORS' CONCERNS

There was none.

PRE-COUNCIL WORK SESSION

1. Wilsonville Industrial Land Readiness – West Railroad Area – Basalt Creek Master Plan

Staff sought the Council's feedback to refine the preferred design concept for the West Railroad Area within the Basalt Creek Planning Area.

2. Emergency Declaration Process

Public Works staff detailed the City's processes if/when it may become necessary to declare a local state of emergency.

3. Peer Support Services Review

The City Attorney detailed the establishment of a pilot program that funds a peer support specialist to aid community members experiencing or recovering from addition or mental health challenges.

ADJOURN [6:24 PM]

Break to clear the room for Executive Session.

EXECUTIVE SESSION [6:30 PM]

- ORS 192.660(2)(f) Exempt Public Records
    - To consider information or records that are exempt by law from public inspection.

ADJOURN [6:50 PM]

CITY COUNCIL MEETING [7:01 PM]

CALL TO ORDER

1. Roll Call

2. Pledge of Allegiance

3. Motion to approve the following order of the agenda.

Motion carried 5-0.

MAYOR'S BUSINESS

4. State of the City Address

The Mayor presented the 2026 State of the City Address.

RECESS [7:35 PM]

There was a brief recess for refreshments and entertainment.

RECONVENED [8:00 PM]

COMMUNICATIONS

There was none.

CITIZEN INPUT AND COMMUNITY ANNOUNCEMENTS

This is an opportunity for visitors to address the City Council on any matter concerning City's Business or any matter over which the Council has control. It is also the time to address items not on the agenda. It is also the time to address items that are on the agenda but not scheduled for a public hearing. Staff and the City Council will make every effort to respond to questions raised during citizen input before tonight's meeting ends or as quickly as possible thereafter. Please limit your comments to three minutes.

COUNCILOR COMMENTS, LIAISON REPORTS AND MEETING ANNOUNCEMENTS

Councilors provided comments, announced prior and anticipated meetings and events.

CONSENT AGENDA

5. **Resolution No. 3231**
   A Resolution Of The City Of Wilsonville Authorizing The City Manager To Execute A Third Amendment To The Professional Services Agreement With Brown & Caldwell, Inc. For Construction Administration Services For The Boeckman Creek Flow Mitigation Project (Capital Improvement Project No. 7068).

6. **Resolution No. 3240**
   A Resolution Of The City Of Wilsonville Authorizing The City Manager To Execute A Construction Contract With Knife River Corporation – Northwest For Construction Of The Brown Road Improvements Project (Capital Improvement Project No. 4216).

7. **Resolution No. 3257**
   A Resolution Of The City Of Wilsonville Authorizing The Sole Source Procurement of Manual Meter Reading Services by Metereaders LLC.

The City Council moved to approve the Consent Agenda as read. Motion carried 5-0.

NEW BUSINESS

8. City Attorney Employment Agreement Extension

The City Council moved to approve the City Attorney Employment Agreement Extension as proposed. Motion carried 5-0.

CONTINUING BUSINESS

There was none.

PUBLIC HEARING

9. **Resolution No. 3256**
   A Resolution Of The City Of Wilsonville Authorizing A Supplemental Budget Adjustment For Fiscal Year 2025-26.

After a public hearing Resolution No. 3256 was adopted 5-0.

10. **Ordinance No. 902** - 1st Reading (Legislative, Non-Land Use Public Hearing)
    An Ordinance Of The City Of Wilsonville Amending Sections 5.035, 5.200, 5.210, And 5.405 Of The Wilsonville Code To Revise The Definition Of Abandoned Vehicles And To Reduce The Duration Allowed For Parking On Public Streets.

After a public hearing and first reading Ordinance No. 902 was adopted 5-0.

CITY MANAGER'S BUSINESS

City Manager Jeanna Troha addressed off-leash dogs in Memorial Park following emails received by council and public testimony.

LEGAL BUSINESS

Council was updated on the Town Center building height waiver task force.

ADJOURN [9:44 PM]

URBAN RENEWAL AGENCY [9:45 PM]

CALL TO ORDER

1. Roll Call

2. Motion to approve the following order of the agenda.

Motion carried 5-0.

CITIZEN INPUT

This is an opportunity for visitors to address the Urban Renewal Agency on any matter concerning City's Business or any matter over which the Agency has control. It is also the time to address items not on the agenda. It is also the time to address items that are on the agenda but not scheduled for a public hearing. Staff and the Urban Renewal Agency will make every effort to respond to questions raised during citizen input before tonight's meeting ends or as quickly as possible thereafter. Please limit your comments to three minutes.

There was none.

CONSENT AGENDA

3. **URA Resolution No. 358**
   A Resolution Of The City Of Wilsonville Urban Renewal Agency Authorizing The City Manager To Execute A Construction Contract With Knife River Corporation – Northwest For Construction Of The Brown Road Improvements Project (Capital Improvement Project No. 4216).

4. Minutes of February 2, 2026, Urban Renewal Agency Meeting.

The Urban Renewal Agency moved to approve the Consent Agenda as read. Motion carried 5-0.

NEW BUSINESS

There was none.

CONTINUING BUSINESS

There was none.

PUBLIC HEARING

There was none.

ADJOURN [9:46 PM]

PLANNING COMMISSION

WEDNESDAY, APRIL 8, 2026

WORK SESSION

1. Wilsonville Industrial Land Readiness (West Railroad, Basalt Creek Master Plan) (Myers/Lorenzen)(60 Minutes)

PLANNING COMMISSION MEETING
STAFF REPORT

Meeting Date: April 8, 2026	**Subject: Wilsonville Industrial Land Readiness – Basalt Creek Master Plan** **Staff Members:** Chris Myers, Senior Planner; Matt Lorenzen, Economic Development Manager **Department:** Community Development
Action Required	**Advisory Board/Commission Recommendation**
☐ Motion ☐ Public Hearing Date: ☐ Ordinance 1st Reading Date: ☐ Ordinance 2nd Reading Date: ☐ Resolution ☒ Information or Direction ☐ Information Only ☐ Council Direction ☐ Consent Agenda	☐ Approval ☐ Denial ☐ None Forwarded ☒ Not Applicable **Comments:**
Staff Recommendation: Provide feedback on the Preliminary Preferred Concept for the West Railroad Area and provide direction on potential policy considerations.	
Recommended Language for Motion: N/A	
Project / Issue Relates To:	

☒Council Goals/Priorities: Attract high-quality industry and support economic opportunity for all in Wilsonville	☒Adopted Master Plan(s): Wilsonville Economic Development Strategy; Wilsonville Comprehensive Plan; Basalt Creek Concept Plan	☐Not Applicable

ISSUE BEFORE COMMISSION:
Staff seeks feedback from the Planning Commission regarding the Preliminary Preferred Concept for the West Railroad Area, including land use, transportation access, natural resource

integration, and potential zoning approaches. This discussion will help guide further refinement of the concept for the Basalt Creek Master Plan and Development Code updates.

BACKGROUND

The West Railroad Area lies within the broader Basalt Creek planning area, which was originally identified as a strategic employment area to accommodate long-term regional job growth. The Basalt Creek Concept Plan established a series of guiding principles intended to shape future development of the area. These guiding principles emphasize:

- Market-driven development
- Meeting regional responsibilities for employment growth
- Maximizing assessed property value
- Creating balanced development that integrates jobs, housing, and natural resources
- Designing cohesive transportation and utility systems
- Maintaining Wilsonville's identity as an attractive and innovative employment center

In October 2025, the Planning Commission and City Council participated in a joint work session to review existing conditions and evaluate three potential development concepts for the West Railroad Area. These concepts explored different approaches to development intensity, transportation connectivity, and environmental integration:

Concept 1 – Tonquin Environment
Focused on leveraging natural resources and trail connectivity to create an employment and innovation district.

Concept 2 – Manufacturing & Industry
Maximized employment potential through improved transportation access and higher intensity industrial development.

Concept 3 – Limited Connectivity / Market Driven Development
Relied largely on existing infrastructure and incremental development with minimal City intervention.

Feedback from the joint work session emphasized the importance of balancing economic development opportunities with environmental stewardship while ensuring the area remains accessible for employment uses.

EXECUTIVE SUMMARY:

The West Railroad Area represents a key opportunity within the Basalt Creek planning area to support employment growth and economic development while integrating natural resources and transportation infrastructure. Following the joint work session and additional technical analysis, staff and the consultant team developed a Preliminary Preferred Concept that combines elements of the previously presented concepts to balance economic development potential with environmental preservation and infrastructure feasibility.

The preferred concept focuses on maximizing developable employment land while preserving key natural resource areas and integrating recreational amenities such as the Ice Age Tonquin

Trail. The concept also identifies transportation improvements needed to support long-term employment development and freight access in the area.

Staff is seeking Planning Commission feedback on the preferred concept and related policy considerations.

DISCUSSION QUESTIONS:
Staff is seeking Planning Commission feedback on the following questions:

1. Is the Preliminary Preferred Concept consistent with the previously provided feedback?
2. Are there elements of the Concept that require additional refinement or clarification?

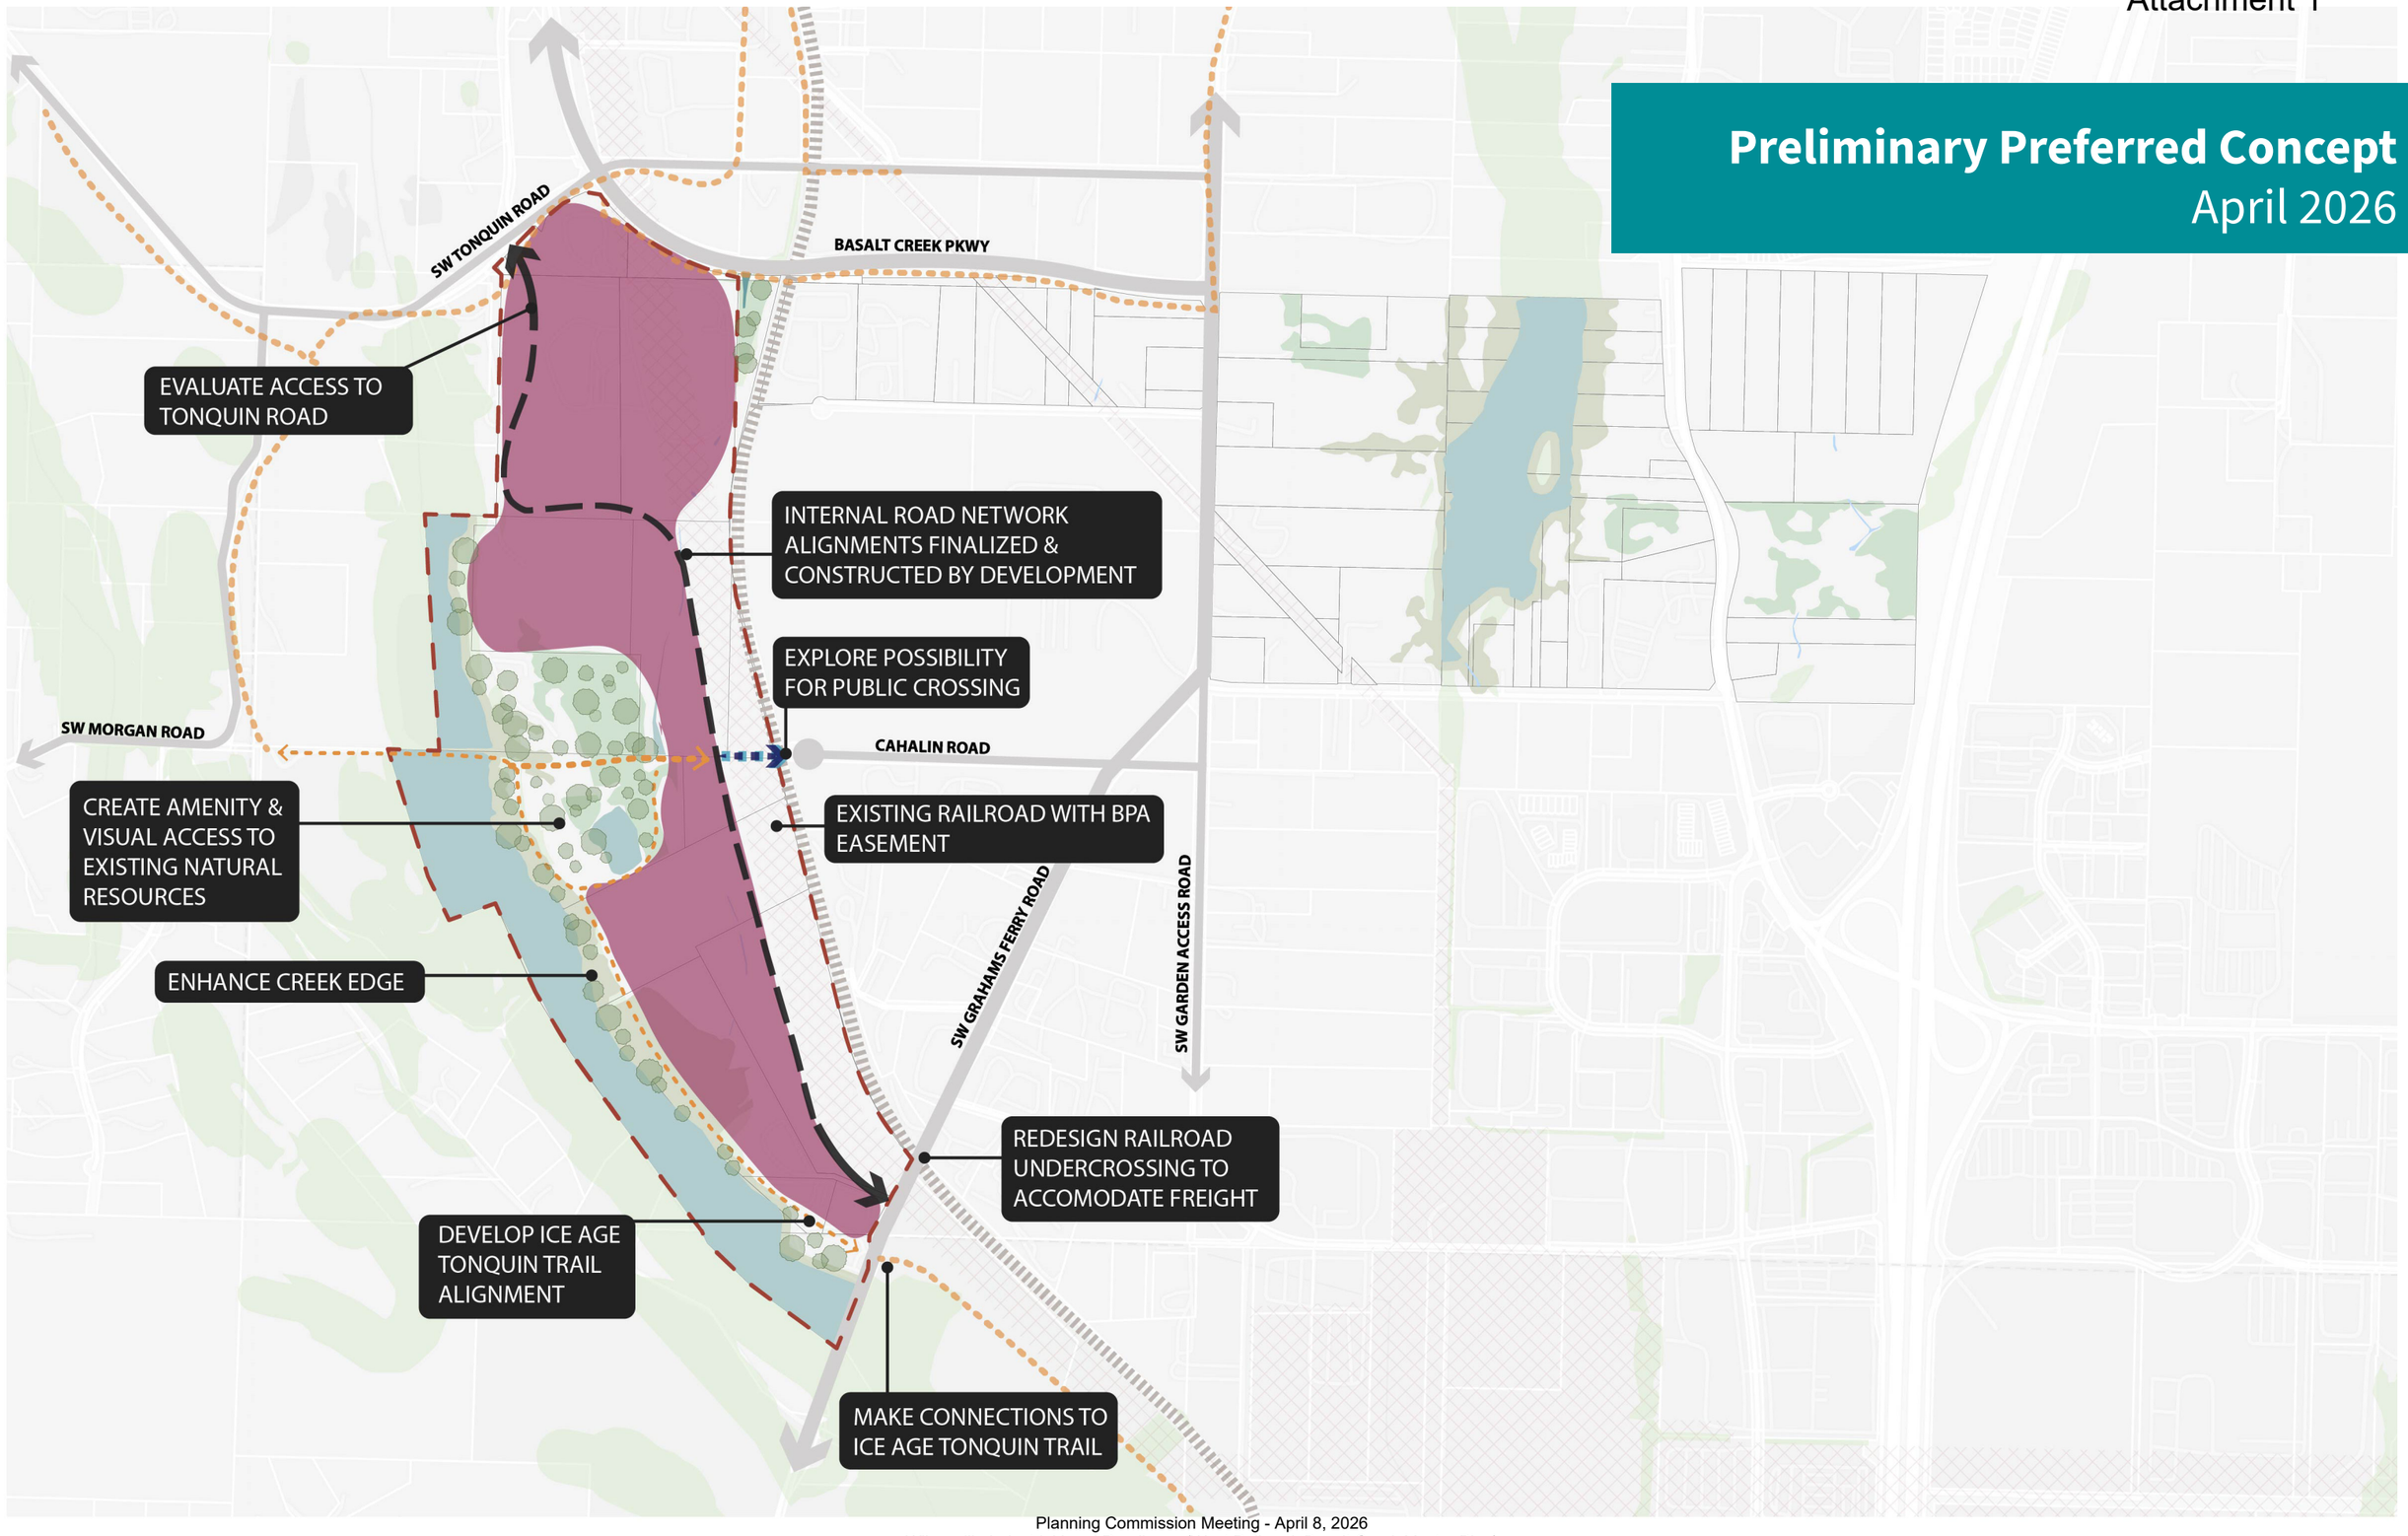
EXPECTED RESULTS:
Feedback from the Planning Commission during this work session will help guide refinement of the preferred concept, the draft Basalt Creek Master Plan, and Development Code updates.

TIMELINE:
Next steps in the project include sessions with the Planning Commission and City Council during Spring and Summer 2026 to review the draft Basalt Creek Master Plan and related Development Code amendments, followed by formal hearings for adoption of the Basalt Creek Master Plan and related Development Code amendments in Fall 2026

CURRENT YEAR BUDGET IMPACTS:
Work on the Basalt Creek Master Plan is funded through a Community Planning and Development Grant from Metro and the Planning Division budget's previously authorized project funding. Additional analysis related to water and stormwater infrastructure will be conducted using the City's on-call consultants.

COMMUNITY INVOLVEMENT PROCESS:
City staff mailed notification letters to the eleven (11) property owners within the Basalt Creek Planning Area to inform them of the ongoing planning process. At the time this staff report was prepared, staff had received one comment from a property owner expressing support for the planning effort and one request for a site visit with City staff. Matt Lorenzen, Economic Development Manager for the City of Wilsonville, met with the property owner to discuss the project. The property owner's feedback was generally positive and supportive of the Basalt Creek Master Plan.

Feedback received through these engagement activities has helped inform refinement of the preferred concept and will continue to guide the development of future policies and code amendments associated with the Basalt Creek planning effort.



POTENTIAL IMPACTS OR BENEFIT TO THE COMMUNITY:
Planning for the West Railroad Area supports Wilsonville's long-term economic development strategy by creating opportunities for employment growth while preserving natural resources and improving transportation connectivity. Successful implementation of the preferred concept

will support family-wage job creation, strengthen Wilsonville's economic base, and reinforce the City's reputation as a forward-thinking employment center.

ALTERNATIVES:
As the concept is refined, alternative approaches to land use configuration, transportation access, zoning, and infrastructure planning may be considered in collaboration with the Planning Commission and City Council.

ATTACHMENTS:
1. Preliminary Preferred Concept Map (March 2026)
2. Preliminary WRR Preferred Concept and Policy Considerations (April 2026)
3. Joint Work Session Summary (October 2025)
4. Joint Work Session Mural Board Notes (October 2025)

Preliminary Preferred Concept
April 2026

memo portland

to Chris Myers and Miranda Bateschell, City of Wilsonville

from Alex Dupey and Lauren Scott, MIG

re West Railroad Area Preliminary Preferred Concept: Implementation and Policy Considerations

date 4/01/2026

Introduction

This memorandum describes the conceptual development framework and implementation considerations for the emerging *Preliminary Preferred Concept* for the West Railroad area within the Basalt Creek Concept Plan. The intent is to establish a visionary direction to guide future technical work and City planning.

It is anticipated that this list will continue to be refined during and following discussions with the Planning Commission, City Council, and staff as the West Railroad Preferred Concept is defined and integrated into the Basalt Creek Concept Plan.

Implementation Considerations

The following sections identify potential opportunities and issues that could impact future development as envisioned for the West Railroad area.

A. Land Use Considerations for Implementation

The West Railroad area today is primarily occupied by contractor yards and outdoor storage uses that are profitable for existing property owners and require little reinvestment. This presents a challenge for advancing more intensive, higher-value development in the near term. At the same time, Wilsonville is recognized for its visionary and forward-thinking planning that delivers economic growth, high-quality jobs, and attractive development.

Given these dualities, the City's land use approach should strike a balance between aspiration and adaptability (two Guiding Principles): maintaining flexibility to accommodate a variety of employment uses today, while positioning the area for more sophisticated, high-quality employment in the long term.

1. Establish a Clear Long-Term Vision

- Define the area as a premier employment destination that leverages its natural setting and multimodal pathways, roadways, and trails to attract modern industrial, manufacturing, and innovation-oriented users.
- Integrate existing open space corridors, wetlands, and potential trail connections into the development identity—creating an employment district that feels both productive and environmentally connected.
- Emphasize design excellence and site organization over rigid land use restrictions to elevate development quality.

2. Recognize Current Market Realities

- Acknowledge that existing contractor and yard uses are economically viable and likely to remain for some time; focus policy efforts on incremental improvement rather than immediate transformation.
- Identify opportunity sites or willing owners where redevelopment could feasibly occur first, setting the stage for future transitions.
- Allow interim or evolving use patterns that enable property owners to remain active participants in the area's evolution.

3. Promote Flexibility through Zoning and Policy

- Apply the Planned Development Industrial (PDI) or Northwest Industrial (NWI) Zone to West Railroad to better reflect the area's unique mix of rail adjacency, environmental context, and long-term vision.
- Consider a performance or form-based code that defines desired outcomes—such as design quality, environmental integration, and circulation standards—without limiting allowable uses too narrowly.
- Maintain broad use allowances to avoid turning away potential investment, even if near-term uses differ from the City's long-range aspirations.

4. Encourage High-Quality Design and Place Identity

- Develop design standards or guidelines for landscaping, building form, and site layout that create a cohesive and marketable identity for the area.
- Use natural amenities and trail connections as a distinguishing feature — positioning West Railroad as an attractive and sustainable employment area within the region.
- Explore opportunities for public realm investments (e.g., gateway features or greenways) that signal the City's commitment to quality development.

B. Transportation Considerations for Implementation

Transportation access is a defining challenge for the West Railroad area. The site's limited connections, physical barriers, and infrastructure deficiencies create significant uncertainty around how future development can effectively move goods, workers, and services. Despite these constraints, it will be important to explore all potential access opportunities to ensure the area's long-term viability as an employment district.

The City has engaged a consultant firm (DKS Associates) to conduct a preliminary transportation analysis to further evaluate the concept plan. Key assumptions and findings from that analysis are presented below and incorporated into the transportation considerations that follow.

» The analysis assumes development consistent with an industrial park setting, including a mix of smaller service businesses, larger manufacturers, and supporting commercial uses.

» The analysis assumes implementation of key regional Transportation System Plan projects, including the Basalt Creek Parkway extension and improvements to the Grahams Ferry Road/Day Road intersection, but does not assume a future I-5 overcrossing.

- » The analysis identifies a north–south local industrial street connecting Tonquin Road to SW Grahams Ferry Road as the primary internal circulation route.
- » The analysis identifies a potential eastward connection across the railroad at Cahalin Road as a long-term improvement.
- » The analysis indicates that no major off-site transportation improvements are required beyond those already identified in City and County Transportation System Plans.

1. Address Access and Connectivity Constraints

- **Tonquin Road (North Access):** Local street access to Tonquin Road may be feasible based on preliminary coordination with Washington County, but will need to meet County access, safety, and operational standards upon redevelopment.
- **Cahalin Road (Potential East Access):** A potential extension of Cahalin Road across the railroad could offer a strong central connection into the area, but would require crossing the rail line, a significant coordination challenge with Portland and Western Railroad and ODOT Rail (owner of the railroad ROW). The City has been in contact with railroad representatives who are open to the idea of a public crossing in the area, preferably by upgrading the existing Cahalin Road crossing with additional protections, while noting that improvements at another crossing may be required as mitigation. While not assumed in the baseline analysis, this connection could reduce reliance on other access points and provide long-term system benefits. Conceptual planning should continue to evaluate its feasibility, including estimated costs (approximately $500,000 in 2026 planning level costs) and permitting requirements.
- **Grahams Ferry Road Undercrossing (South Access):** The existing undercrossing is a critical freight linkage but currently undersized and in need of modernization. A site evaluation of this undercrossing was conducted in February 2025 and revealed that upgrading this facility could significantly improve freight mobility and overall connectivity at the southern end of the site but it is costly. For more detailed information, refer to the *Graham's Ferry Road: Freight Traffic Accommodation Evaluation (2025)*.

2. Prioritize Regional and Freight Mobility

- Focus on ensuring efficient and safe connections to regional corridors such as I-5, Tonquin Road, and Basalt Creek Parkway.
- Recognize that freight traffic will define the area's transportation needs, and future design solutions should prioritize large-vehicle maneuverability and industrial circulation.

3. Incorporate Multimodal and Complete Network Principles

- While freight access is the primary need, incorporate complete street principles where feasible, particularly along internal corridors, to support safe access for pedestrians, bicycles, and potential transit service in the future.
- Pedestrian and bicycle connectivity has not been fully evaluated; however, the transportation analysis found that the Ice Age Tonquin Trail can be accommodated through the site as currently envisioned in the preferred concept. Further coordination and evaluation of the exact alignment should occur as development occurs in the area.

4. Collaborate with Regional Partners and Consider Phased Implementation

- Work closely with Washington County, ODOT, and regional partners to ensure consistency with functional street classifications, spacing standards, and investment priorities to accommodate anticipated growth and future travel patterns.
- Consider a phased implementation approach for key transportation access points (SW Grahams Ferry Road, SW Tonquin Road, and potentially Cahalin Road) to be improved or added over time as development occurs and funding becomes available.
- Advance conceptual alignment studies and cost evaluations early to clarify feasibility before committing to major infrastructure investments.

C. Infrastructure Considerations for Implementation

The West Railroad area currently lacks basic infrastructure — including sanitary sewer, water, and stormwater systems — and extending these services will require significant public investment and regional coordination. Given these challenges, the City's approach should focus on strategic, scalable infrastructure planning that supports near-term feasibility while laying the groundwork for future buildout.

1. Plan for Scalable Infrastructure Investments

- Develop a phased approach that prioritizes strategic connections and essential services first, allowing incremental expansion as development demand materializes.
- Focus initial efforts on alignment within key streets and corridors (e.g., Basalt Creek Parkway, SW Tonquin Road, or Cahalin Road) to establish service entry points for both water and sewer infrastructure.

2. Coordinate Regional Partnerships

- Pursue state and regional funding sources (e.g., Business Oregon, Metro) to offset infrastructure costs for employment lands.

3. Integrate Green and Resilient Systems

- Use green infrastructure and low-impact development practices to manage stormwater.
- Preserve open space along the Coffee Lake Creek and natural drainage corridors as part of the stormwater system and long-term habitat strategy.
- Design infrastructure with climate resilience and adaptability in mind, recognizing the area's long buildout horizon.
- Consider including restoration or mitigation standards as a requirement of development, where feasible and appropriate, considering the significant tree and habitat loss already experienced in this area.

4. Maintain Long-Term Flexibility

- Avoid locking in costly infrastructure alignments before market direction becomes clearer; instead, establish conceptual utility corridors that identify key service entry points and trajectory of infrastructure, without committing to investments before the land is purchased by a developer.

- Ensure infrastructure design standards accommodate a range of development intensities, from lower-density industrial and logistics uses to potential future manufacturing or mixed employment.
- Continue to coordinate infrastructure planning with land use policy and economic development strategies, ensuring the City can respond to changing opportunities over time.

D. Economic Development Considerations for Implementation

The West Railroad area presents a significant opportunity but also notable development challenges, including fragmented ownership, limited access, and the need for major infrastructure investments.

Given these constraints, in order to achieve the type of high-quality development and return on investment envisioned, the City will need to take a leading role in shaping conditions for successful, market-ready employment growth.

The focus should be on creating a foundation of certainty, coordination, and readiness that can attract private investment over time. Strategies that should be considered include:

1. Facilitate Land Coordination and Aggregation

- Facilitate land assembly through public acquisition, land swaps, or partnerships with property owners to create larger, development-ready sites.
- Establish a redevelopment or land bank entity (e.g., urban renewal agency, development commission) to manage and prepare sites strategically.
- Use development agreements or master planning to coordinate multiple owners under a unified infrastructure and design framework.

2. Invest in Infrastructure Readiness

- Invest early in critical infrastructure (water, sewer, stormwater, road access) to clear a path for private developers.
- Pursue cost-sharing, reimbursement, or horizontal development agreements to spread infrastructure costs over multiple benefiting properties.
- Seek state and regional funding sources such as Business Oregon's Industrial Site Readiness Program or Metro's planning and development grants that help cities create master plans for industrially zoned land within the UGB.

3. Support Regulatory Efficiency

- Complete environmental impact and infrastructure studies in advance to remove additional steps developers have to take and to make site development more attractive.

4. Explore Incentives and Investment Tools

- Explore creative funding tools such as grants, earmarks, forgivable loans, tax increment financing (TIF), Local Improvement District, etc., to fund infrastructure and site preparation.
- Utilize the WIN (Wilsonville Investment Now) program or other tax incentive programs to attract high-value employers.
- Consider public-private partnerships for catalytic projects (e.g., shared logistics facilities, innovation centers).

5. Establish Branding and Market Positioning

- When the path to urbanization of this area becomes clear, establish a clear identity/brand for the area.
- Market the area regionally as a strategic employment hub with multimodal freight access and sustainable design potential.
- Coordinate branding and recruitment with regional economic development partners such as Greater Portland Inc. and local Chambers of Commerce.

Next Steps

The list of considerations will continue to be refined through and following discussions with the Planning Commission and City Council during their April and May meetings, as well as through ongoing coordination with City staff, as the West Railroad Preferred Concept is further developed and integrated into the Basalt Creek Concept Plan. Additional meetings with the Planning Commission and City Council regarding the larger update to the Basalt Creek Concept Plan will occur in early summer. In addition to the transportation analysis completed in early 2026, the City is conducting additional site infrastructure planning (i.e., water and sewer) to better understand potential opportunities and constraints. The findings from that work will also be incorporated into the evaluation and refinement of the preferred concept and Basalt Creek Concept Plan update.

Wilsonville Industrial Land Readiness (WILR)

JOINT PLANNING COMMISSION (PC) AND CITY COUNCIL (CC) WORK SESSION SUMMARY | OCTOBER 6, 2025

Meeting Format

The joint Planning Commission and City Council work session was held on October 6, from 5:00 – 6:40 p.m., in the Wilsonville City Council Chambers. Alex Dupey and Lauren Scott from the MIG Consultant Team attended in person to present while Meg Grzybowski hosted the virtual discussion on Mural Board. The team briefly reviewed the existing conditions within the West Railroad project area and then presented the three potential urban design concepts for the area for feedback and discussion. The team also hosted a discussion regarding the preferred design elements and components from the concepts presented to the Planning Commission and City Council.

Existing Conditions Presentation

During the presentation, the Team reviewed existing conditions for the West Railroad area of the Basalt Creek Concept Plan. Recent site analysis indicates that the area now contains significantly less habitat than it did in the 1990s. Still, only slightly more than half of the land is considered "unconstrained" for development. Natural resource constraints are primarily concentrated along the western edge near Coffee Lake Creek.

The area's large parcel sizes make it attractive for potential development, but existing land is largely dominated by contractor establishments and a mining operation. Currently, the West Railroad area lacks sewer, water, and stormwater infrastructure. However, it is well positioned relative to the regional transportation network, with close proximity to I-5. The site is separated from the rest of the Basalt Creek Planning Area by the Portland and Western Railroad line and a large BPA easement running parallel to it. A key infrastructure element for improving future connectivity will be the Grahams Ferry Road railroad undercrossing, which currently has too low of a clearance to accommodate freight traffic.

Draft Urban Design Concepts

The following draft concepts were presented to the City Council and Planning Commission as starting points for discussion.

C1: Tonquin Environment

This concept emphasizes natural resource enhancement and ecological integration. It envisions an improved creek edge, an extended Tonquin Trail corridor, and interconnected open space and forest areas. Employment areas would support campus-style development, craft industrial uses, and small-scale office or manufacturing spaces. The concept centers on creating a unique employment and innovation district where economic development is closely tied to environmental stewardship and access to high-quality natural and recreational amenities.

C2: Manufacturing & Industry

Focused on regional connectivity and employment generation, this concept envisions upgrades to key transportation infrastructure such as the Grahams Ferry Road railroad undercrossing and the Cahalin Road railroad crossing. The land use mix emphasizes large-scale industrial and office development to attract high-density employment opportunities. Overall, this concept positions the area as a hub for manufacturing and logistics supported by improved access and circulation.

C3: Limited Connectivity and Flexible Land Use

This market-driven concept allows for a broad mix of land uses not typically found elsewhere in Wilsonville. It emphasizes flexibility and responsiveness to market demand, potentially supporting commercial recreation, outdoor retail, storage, and low-intensity small businesses. Rather than a predetermined vision, this concept encourages organic growth and adaptation based on evolving economic conditions.

DISCUSSION

Guiding Principles

Of the market-driven, balanced, and aspirational Guiding Principles from the Basalt Creek Master Plan, a discussion was held to identify what principles felt the most relevant to West Railroad, what the opportunities were, and what would be more challenging in the area.

The discussion highlighted both opportunities and challenges in shaping guiding principles for the West Railroad area. Commissioners and Councilors noted that Wilsonville is well positioned to leverage its natural resources as an economic and community asset, with the potential for nature to support a broader business ecosystem. Large parcel sizes were recognized as unique advantages that could allow site aggregation and coordinated development without direct City intervention. There was also interest in fostering employment opportunities that complement nearby Tualatin, supporting a more regionally balanced mix of uses.

Key challenges include limited infrastructure, connectivity, and access—particularly across the railroad at Cahalin Road—and concerns about flood risk in areas near the wetlands. While preserving natural features like the Ice Age Tonquin Trail corridor remains a priority, participants acknowledged the need to balance conservation with job creation. Additional considerations include the difficulty of assembling properties and the limitations imposed by the railroad's proximity, which may restrict certain sensitive land uses.

Throughout the discussion, Commissioners and Councilors emphasized Wilsonville's history as a forward-thinking city, setting the stage for creative, sustainable, and strategic approaches to future planning in the West Railroad area.

Urban Design Concepts

The discussion of urban design concepts led to the group leaning towards a preferred concept that was a balance of C1 and C2. However, there were pros and cons to each concept that were taken into consideration, as summarized below:

C1: Tonquin Environment

Pros / Opportunities:
This concept presents a strong opportunity to capitalize on the Ice Age Tonquin Trail corridor and establish a continuous greenway along Coffee Lake Creek, enhancing connectivity and recreation while highlighting the area's natural assets.

Cons / Constraints:
Participants expressed concern that the significant environmental emphasis may come at the expense of job creation. The large share of land dedicated to natural areas could overly limit employment and economic potential.

C2: Manufacturing & Industry

Pros / Opportunities:
C2 offers the strongest job creation potential, with opportunities to integrate vocational or higher education components. It is seen as providing the most long-term revenue and property value, while also maintaining flexibility to incorporate natural areas—such as extending the Coffee Lake Creek greenway into the development design.

Cons / Constraints:
The concept's success depends heavily on infrastructure feasibility. Both the Grahams Ferry Road undercrossing and the Cahalin Road crossing are critical elements, and participants questioned whether these improvements would be achievable or cost-effective.

C3: Limited Connectivity and Flexible Land Use

Pros / Opportunities:
This approach keeps future options open, allowing for a mix of uses and natural features that could include elements like commercial recreation or a multi-use complex. It provides flexibility for the community to respond to evolving market conditions.

Cons / Constraints:
Some felt the concept lacks the intentionality and forward-thinking approach that typically guides Wilsonville's planning efforts. Without a clearer direction, it may appear more reactive than strategic.

Preferred Elements

As previously mentioned, the Planning Commission and City Council expressed an affinity for the combination of C1 and C2. When asked what the preferred elements or pieces were from their ideal concept, several key elements came to the forefront:

- Balance between the natural and built environment
- Property values and job creation
- Creating a core space
- Intentional planning and intervention; though opportunity for flexibility
- A linear greenway
- Ability to align land uses with Tualatin

Strategies

A final piece of the discussion had the Commissioners and Councilors brainstorming how Wilsonville could achieve these concepts (or elements of the concepts); what the City's role was, and what tools or strategies could be considered when advancing the vision for West Railroad. Some suggestions included:

- Form-based regulations
- Incentives
- Partnership and legislative support

Defining Phrases

When asked to provide defining phrases or unique characteristics that would define the future of West Railroad, these phrases were presented as top of mind:

- Attractive
- Active
- High-use
- Jobs and industry
- Flexibility

Additional Questions

There were additional questions posed by the Planning Commission and City Council that will be included in the considerations for the preferred Concept.

Q: What was the initiator for the large levels of development over the last 15 years?

Q: Construction costs for Graham's Ferry Road railroad undercrossing improvements – are they in today's dollars or future estimates?

Q: Over time have we seen a change in gravel activity at the quarry and what do we know for the future?

> A: We don't really know what their plans are. One of the landowners said they had acquired another firm, so they would be shifting to the Tualatin facility, but no plans in the immediate future for this part of their properties in West Railroad.

Q: Trail system and wetlands – is that integrated into the plan or is it separate?

> A: Assuming trail / regional system and wetlands would remain.

Q. Has the city heard from developers/investors interested in the area? Could we use those conversations to tailor the approach?

> A. Unlimited interest in industrial land in Wilsonville, though the land has to be served by infrastructure and there has to be a reasonable path forward to aggregating a site

Q. What prevents trucks from coming up to Graham's Ferry Road from the south?

> A. That is a long way around – want access to the I-5 interchange – desirable for access
> A. Haven't completed traffic study to analyze

Q. What top sectors can we attract if sensitive sectors (to noise and vibration) cannot come in?

GUIDING PRINCIPLES

Which principles feel most relevant here?

Are there any that will be more challenging to meet in West Railroad?

MARKET-DRIVEN:

- MEET REGIONAL RESPONSIBILITY FOR JOBS.
- MAXIMIZE ASSESSED PROPERTY VALUE.

BALANCED:

- CAPITALIZE ON THE AREA'S UNIQUE ASSETS AND NATURAL LOCATION.
- EXPLORE CREATIVE APPROACHES TO INTEGRATE JOBS AND HOUSING IN THE CRAFT INDUSTRIAL LAND USE TYPE.
- ENSURE APPROPRIATE TRANSITIONS BETWEEN LAND USES.
- DESIGN COHESIVE AND EFFICIENT TRANSPORTATION AND UTILITY SYSTEMS.

ASPIRATIONAL:

- MAINTAIN AND COMPLEMENT WILSONVILLE'S UNIQUE IDENTITY.
- CREATE A UNIQUELY ATTRACTIVE BUSINESS COMMUNITY UNMATCHED IN THE METROPOLITAN REGION.
- INCORPORATE NATURAL RESOURCE AREAS AND PROVIDE RECREATIONAL OPPORTUNITIES AS COMMUNITY AMENITIES AND ASSETS.

THE OPPORTUNITIES

Ripe to maximize natural resources	Nature could feed into a broader business community	Large parcels are unique assets to the area
Jobs - key emphasis	Opportunity for West Railroad to aggregate sites without city intervention vs Coffee Creek/Basalt Creek	To blend with land uses in Tualatin - north of West Railroad

THE CHALLENGES

Infrastructure and access	Natural resources may have a limiting impact for what we can envision	Keep Tonquin and natural areas, but not at expense of jobs	Getting access across Cahalin
Site aggregation	Connectivity and transportation access	Sensitive uses could locate/site next to railroad	
Access spacing requirements and slope	Flood risk for roadways	Parkway is a barrier for connections to Tualatin	

WILSONVILLE FACTOR / UNIQUE IDENTITY

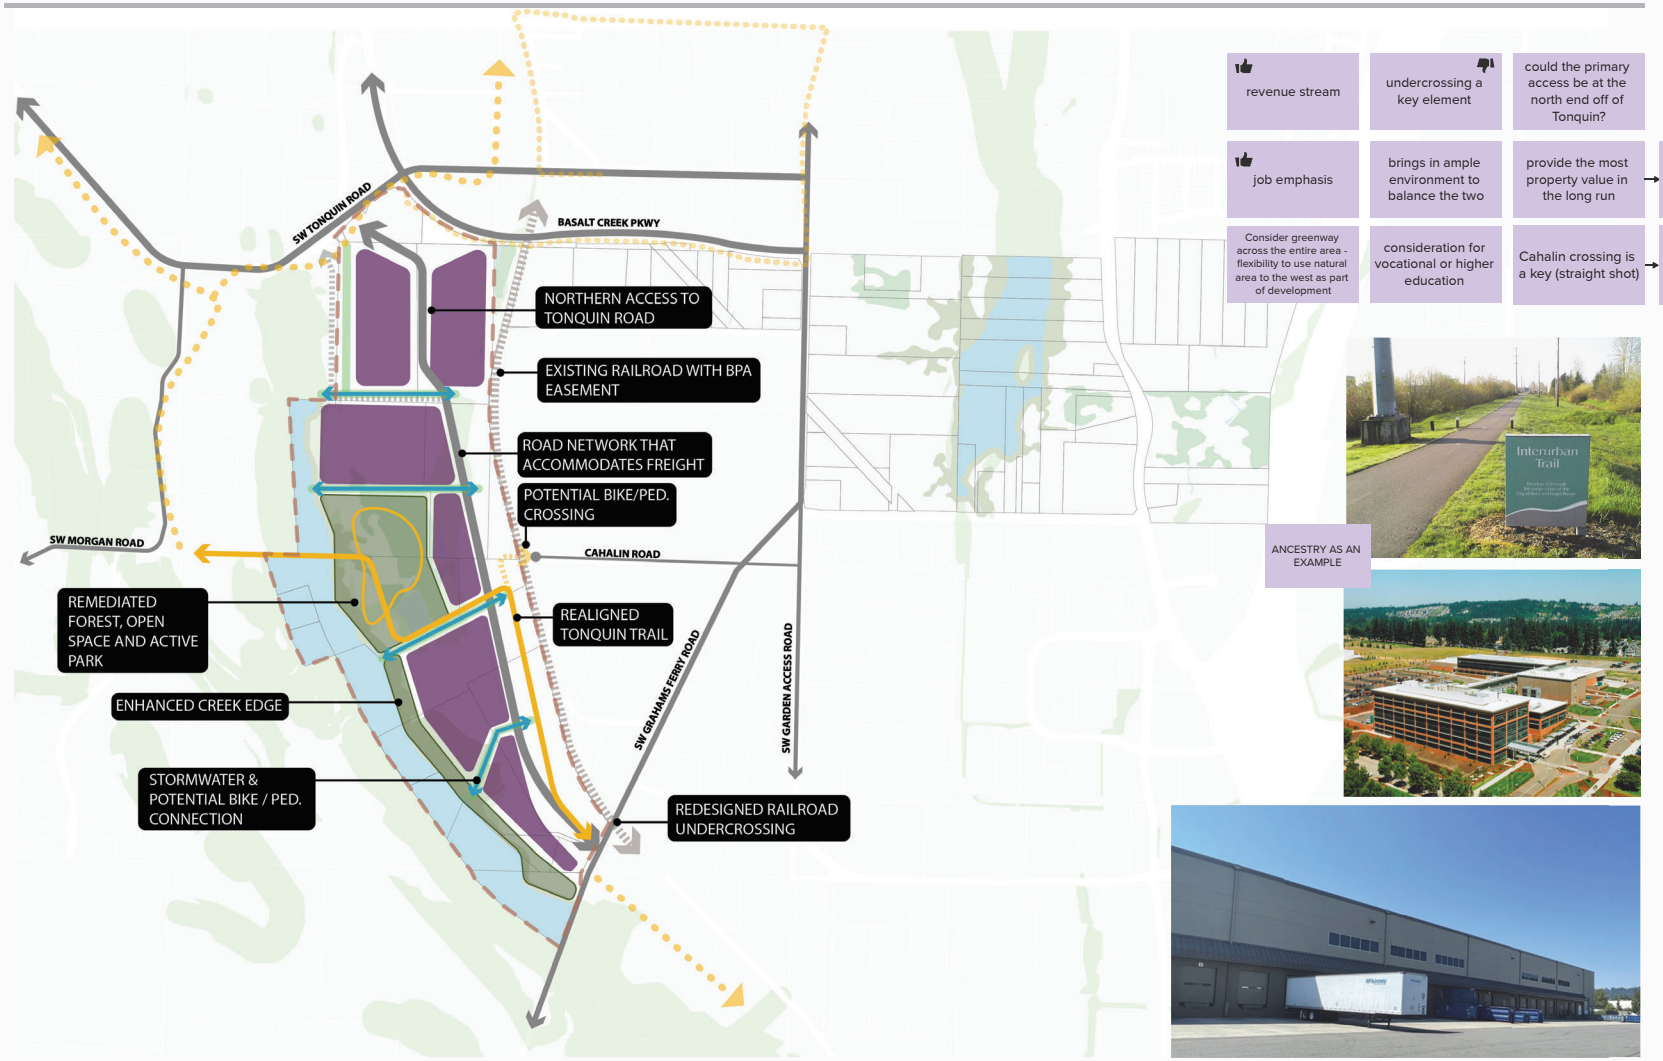
Forward thinking as a City			
			without the City driving development (owning the land), likely to see spec development

C1: TONQUIN ENVIRONMENT

capitalizing on Tonquin Trail

greenway across the entire Coffee Lake Creek

large environmental component may limit jobs too much



may not bring enough job creation

C2: MANUFACTURING & INDUSTRY

revenue stream

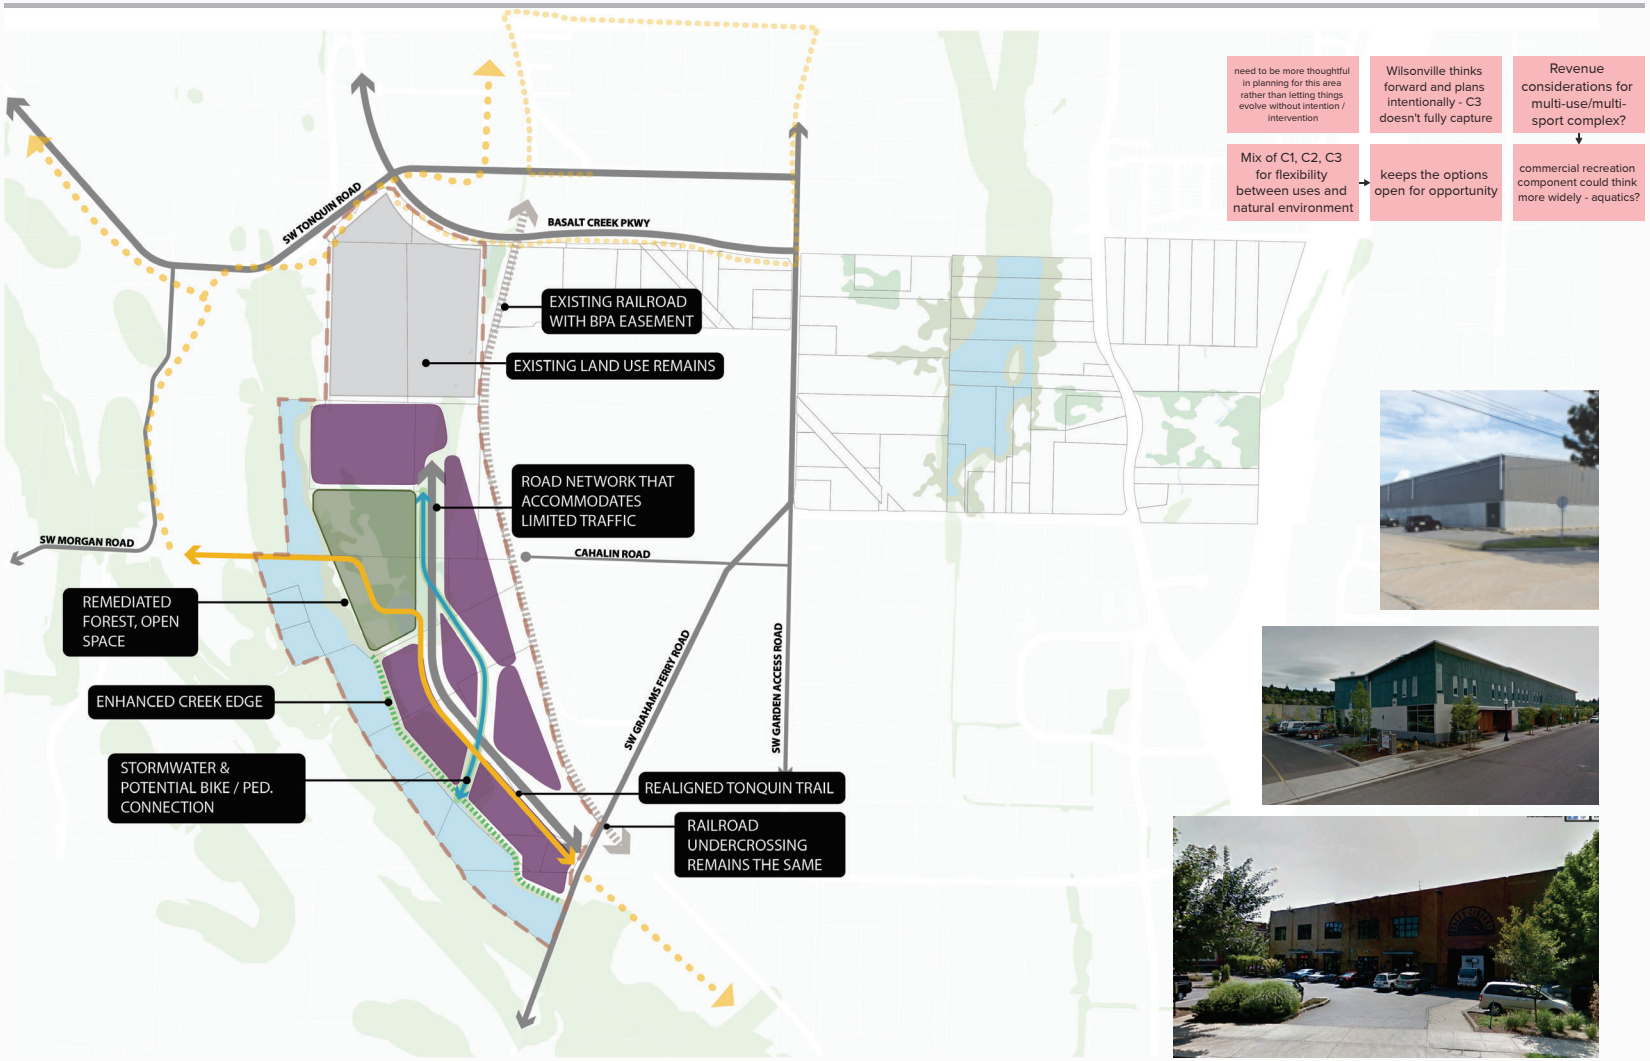
undercrossing a key element

could the primary access be at the north end off of Tonquin?

job emphasis

brings in ample environment to balance the two

provide the most property value in the long run → most flexibility in what can be located here



Consider greenway across the entire area - flexibility to use natural area to the west as part of development

consideration for vocational or higher education

Cahalin crossing is a key (straight shot) → can the State encourage the Cahalin crossing? → Challenging (private crossing) to get approved with the RR

ANCESTRY AS AN EXAMPLE

C3: LIMITED CONNECTIVITY WITH FLEXIBLE LAND USES

PREFERRED ELEMENTS

What are the pieces/elements we want in a preferred concept?

Is there a starting point?

BALANCE BETWEEN NATURAL AND BUILT ENVIRONMENT	ADDRESS THE UNDERCROSSING	PROPERTY VALUE & JOB CREATION	CREATE A CORE SPACE
ALIGN LAND USES WITH TUALATIN?	**MONETARY & FEASIBILITY STANDPOINT: CAHALIN VEHICLE CROSSING**	INTENTIONAL PLANNING & INTERVENTION	
LINEAR GREENWAY	WRITING IN A PLAN B FOR LIMITING ACCESS POINTS	LEAVE OPTIONS OPEN	

DEFINING PHRASES

ATTRACTIVE	ACTIVE	HIGH USE
JOBS & INDUSTRY	FLEXIBILITY	

HOW DO WE GET THERE?

What do we need to make this happen?

What is the City's role?

What tools, incentives, and strategies should be considered?

FORM BASED REGULATION	INCENTIVES	PARTNERSHIPS OR LEGISLATIVE SUPPORT

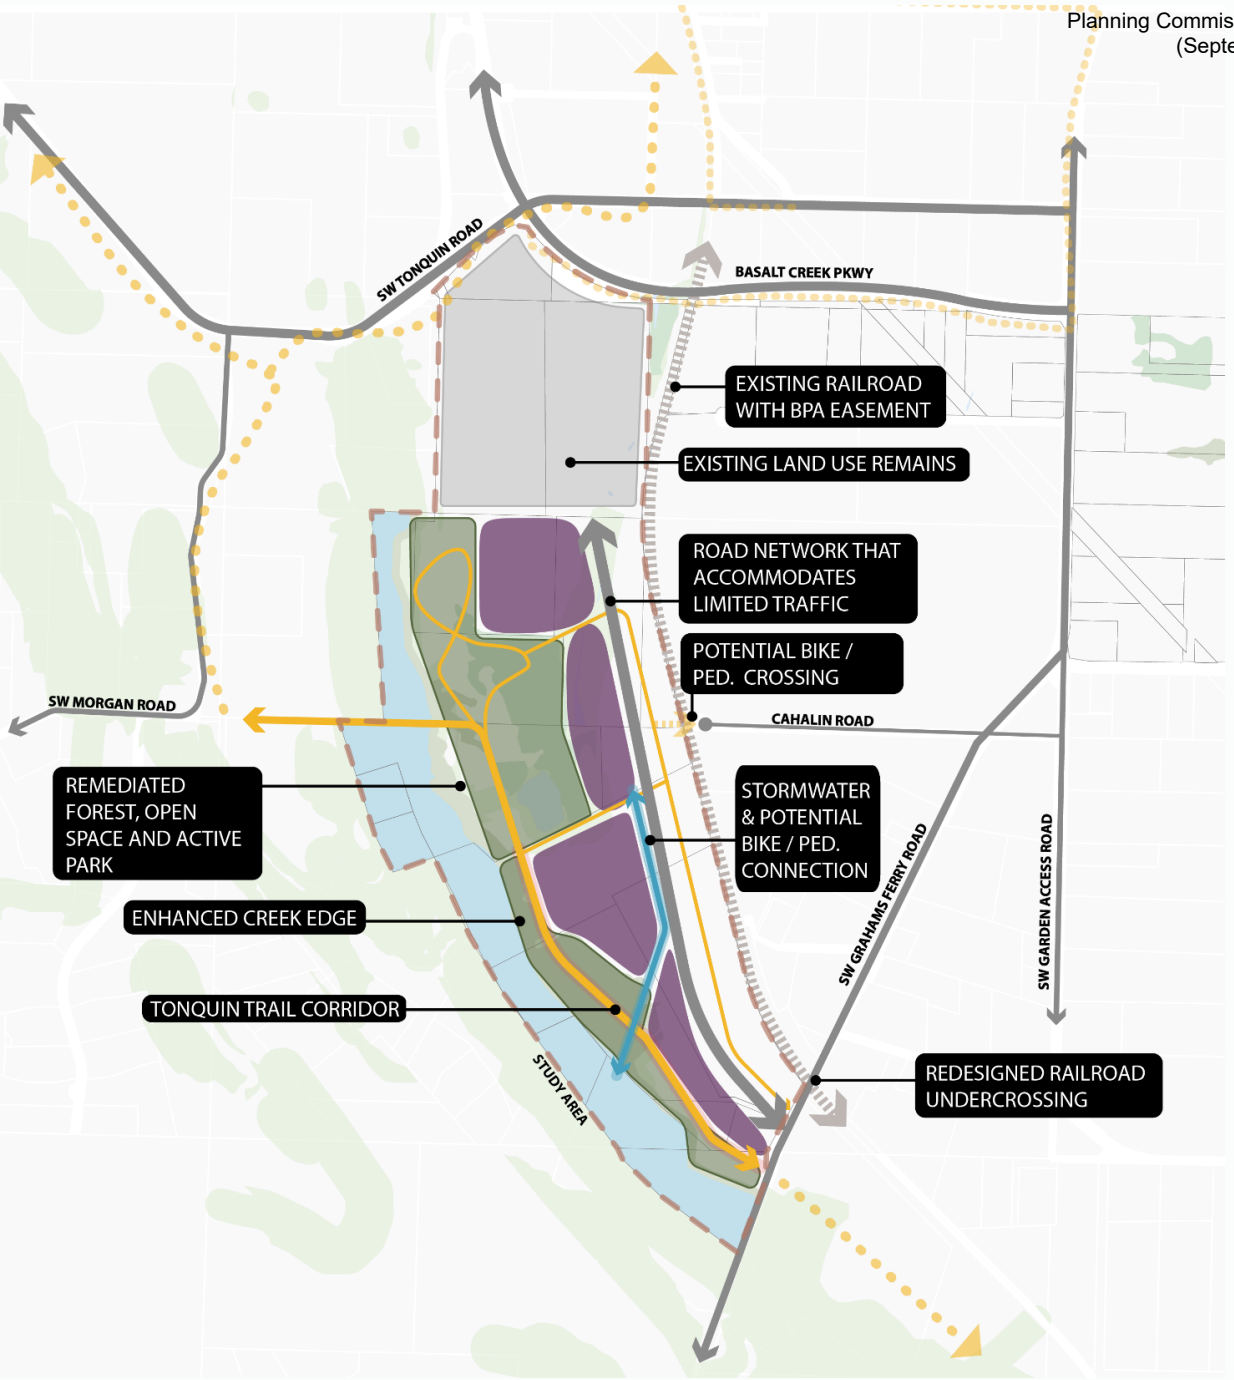
THE GUIDING PRINCIPLES

Basalt Creek Concept Plan Guiding Principles

Market-driven

- *Meet regional responsibility for jobs and housing*
- *Maximize assessed property value*

Balanced



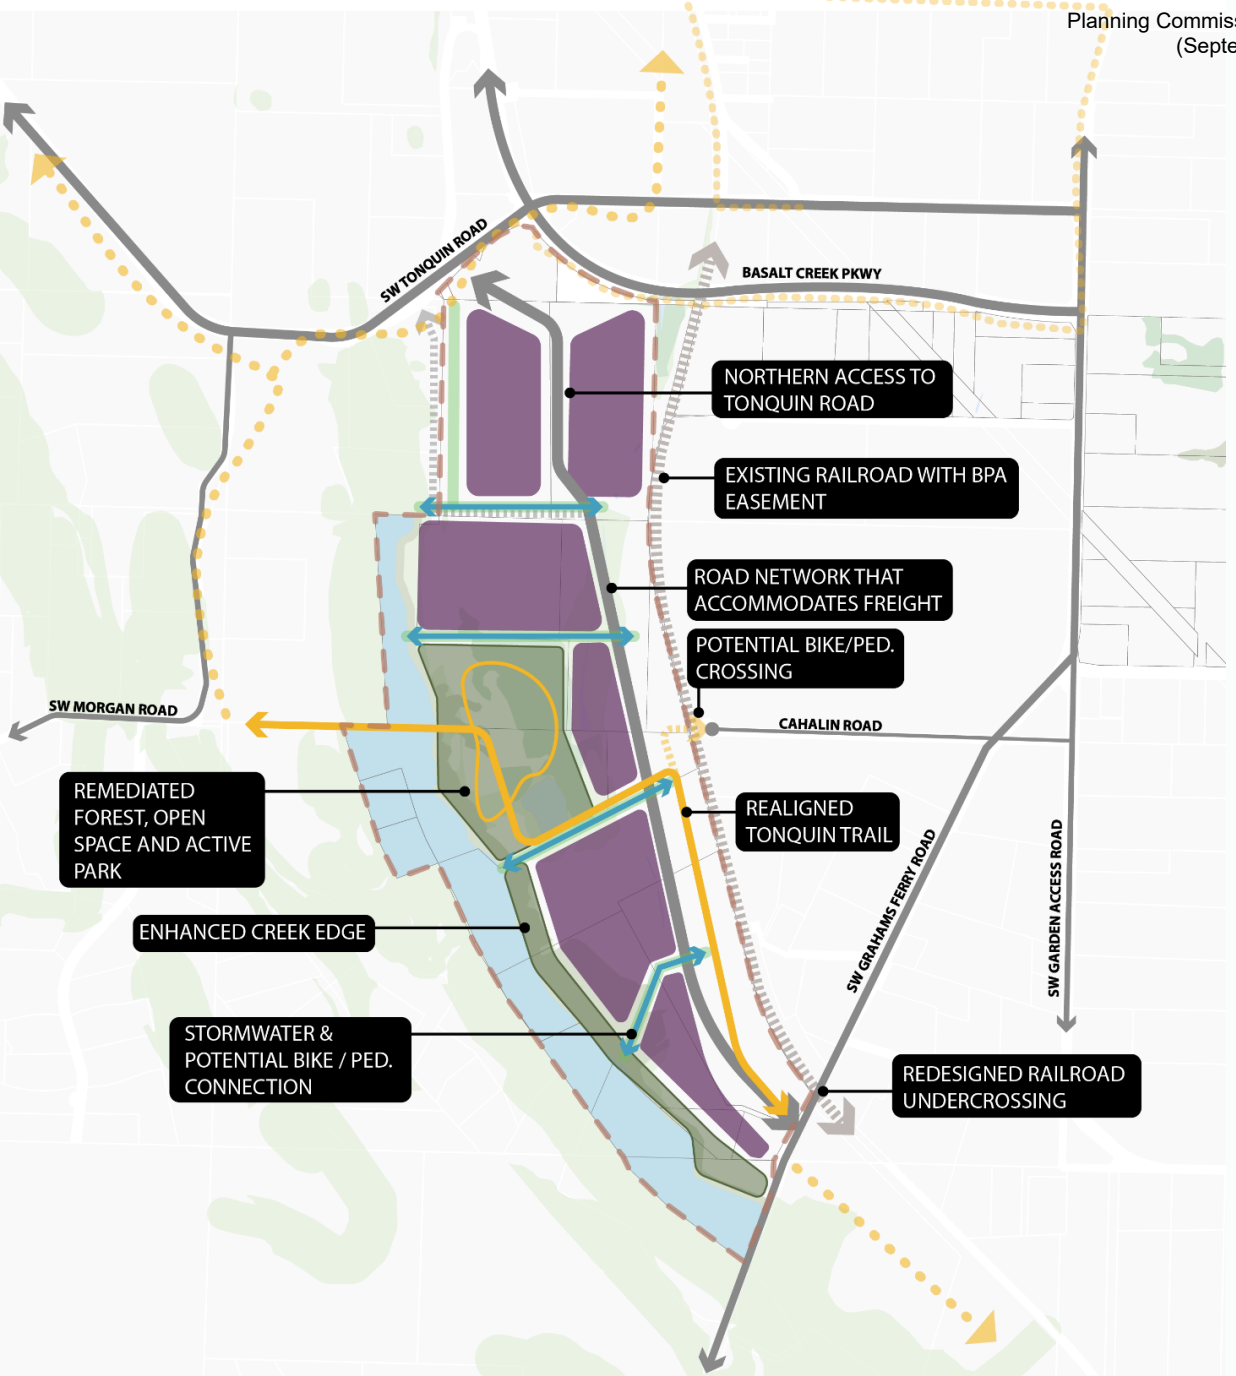
- *Capitalize on the area's unique assets and natural location*
- *Explore creative approaches to integrate jobs and housing in the Craft Industrial land use type*
- *Ensure appropriate transitions between land uses*
- *Design cohesive and efficient transportation and utility systems*

Basalt Creek Concept Plan Guiding Principles

Aspirational

- *Maintain and complement Wilsonville's unique identity*
- *Create a uniquely attractive business community unmatched in the metropolitan region*
- *Incorporate natural resource areas and provide recreational opportunities as community amenities and assets*

THE DRAFT CONCEPTS

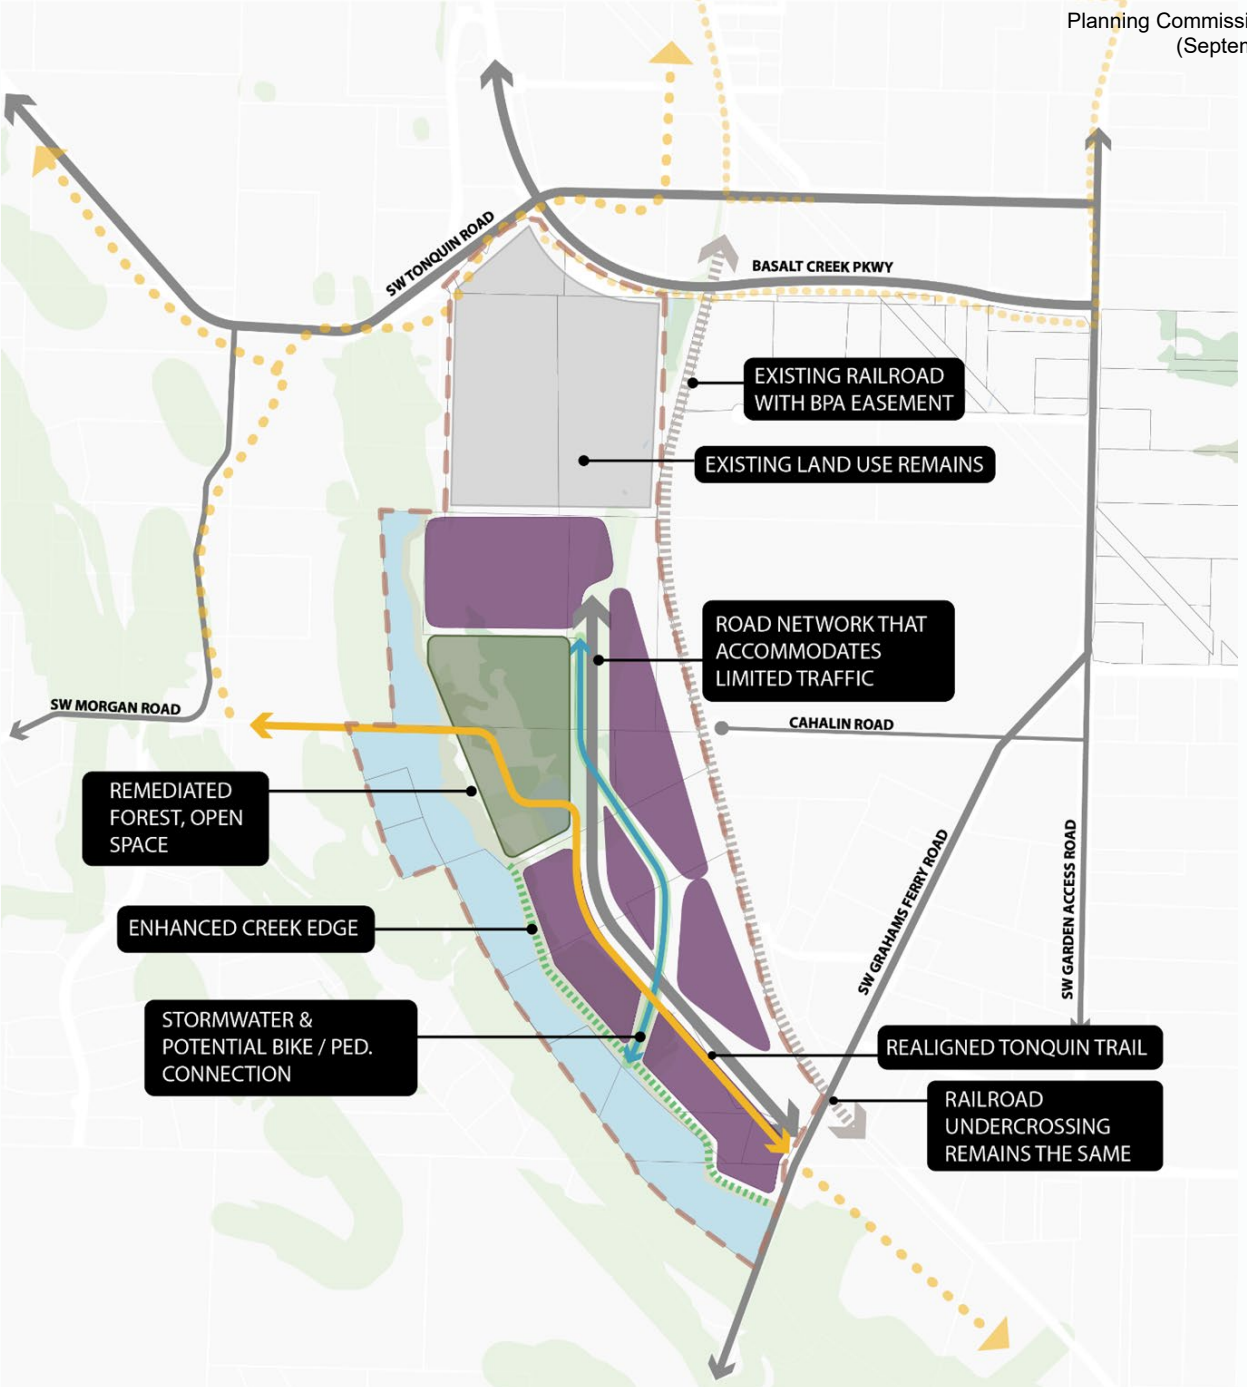


District centered on **natural resources and trails**

Strong **connections to Basalt Creek Parkway**

Positioned as a **unique employment & innovation district**

C1: Tonquin Environment



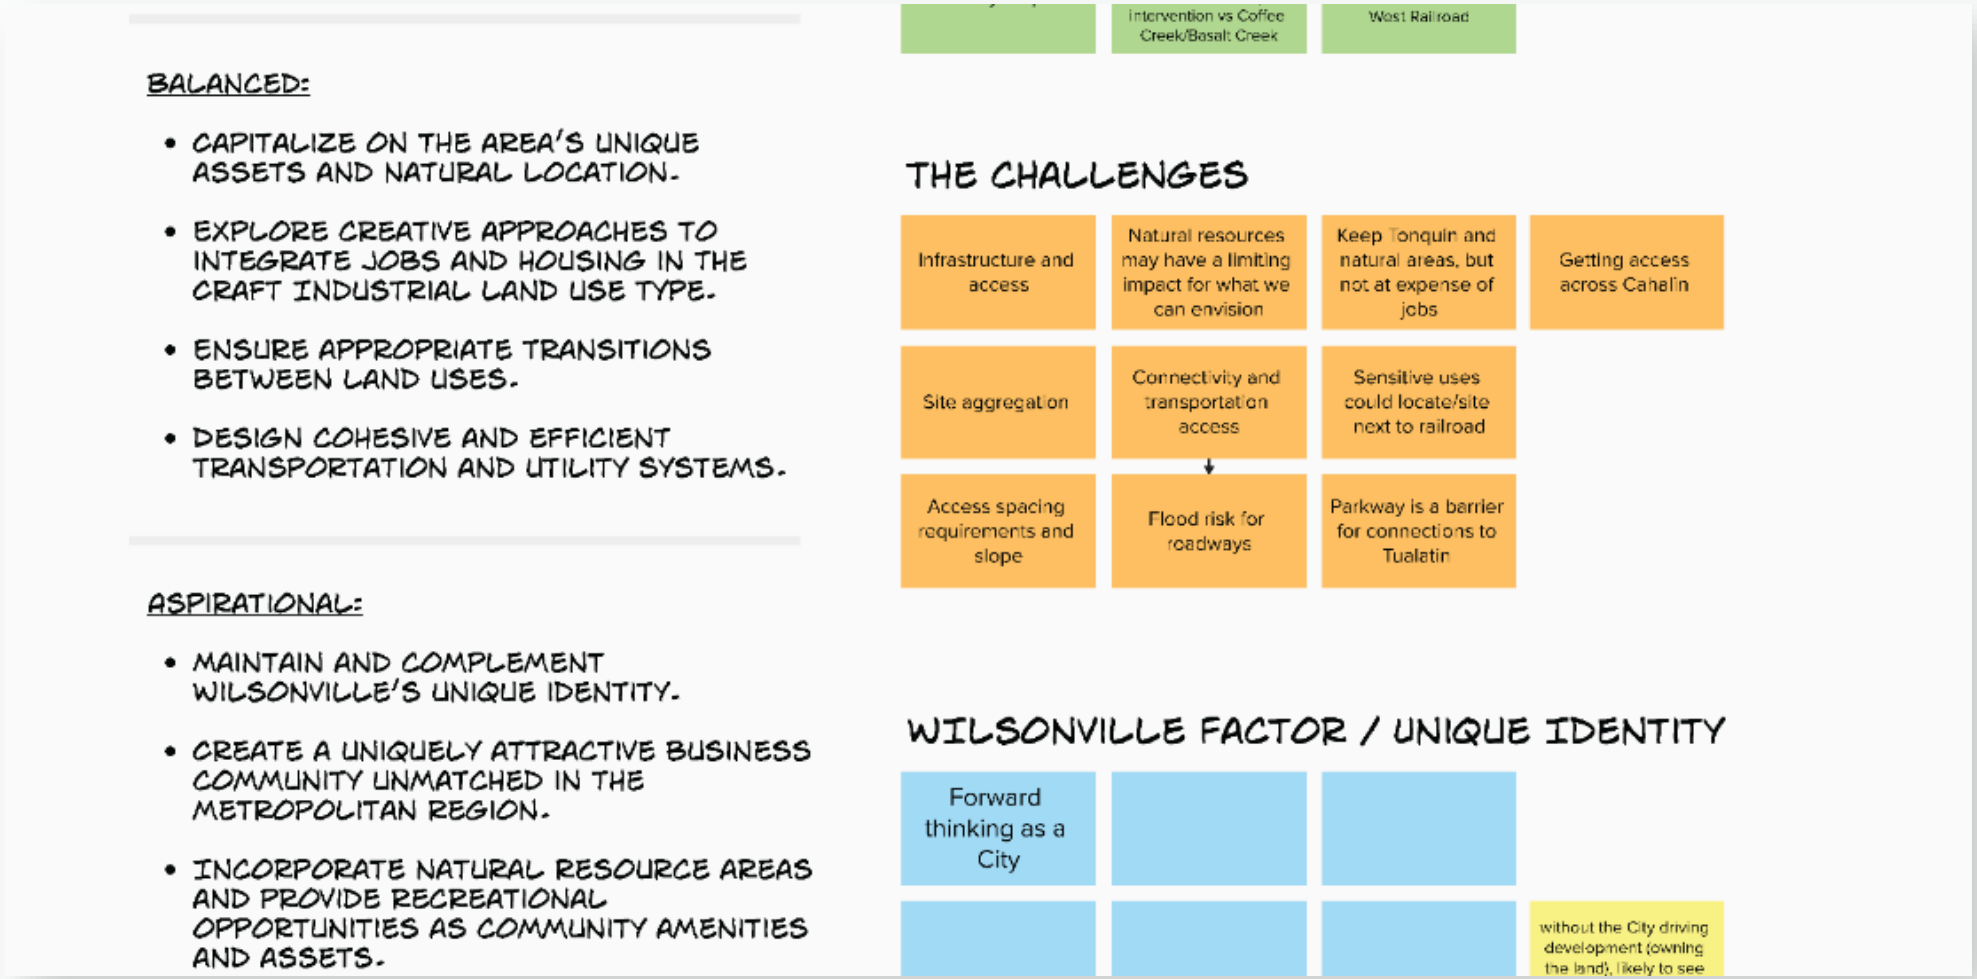
Maximizes employment potential through full access to transportation network

Encourages **high-density employment development**

City strategies would include **incentives for parcel assembly** and **targeted infrastructure investments**

C2: Manufacturing & Industry

Incremental, market-driven approach with limited City intervention

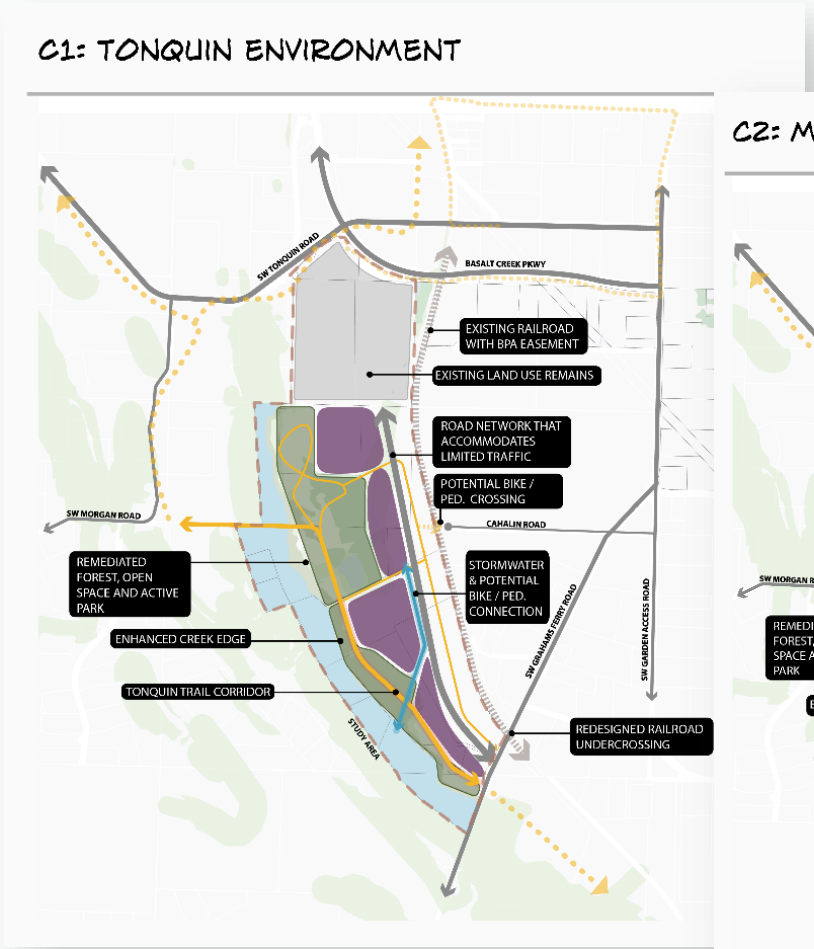


No freight upgrade to the railroad undercrossing

Street network largely as built today with some internal connections

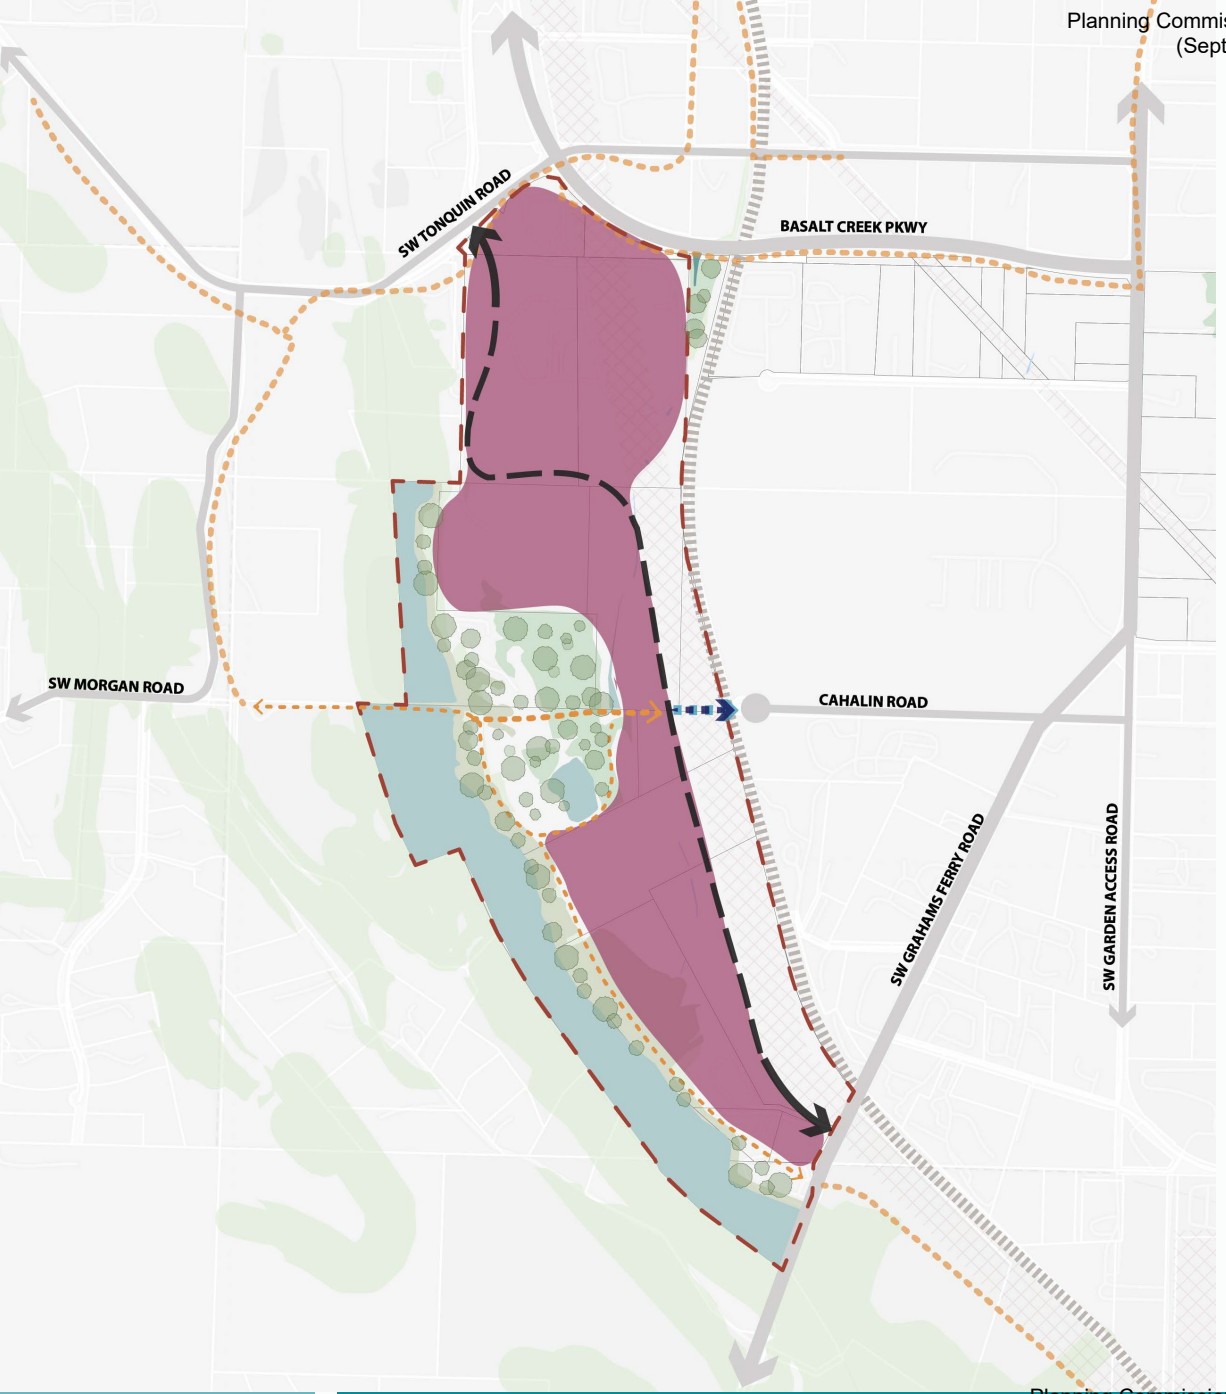
C3: Limited Connectivity with Flexible Land Use

WHAT WE HEARD

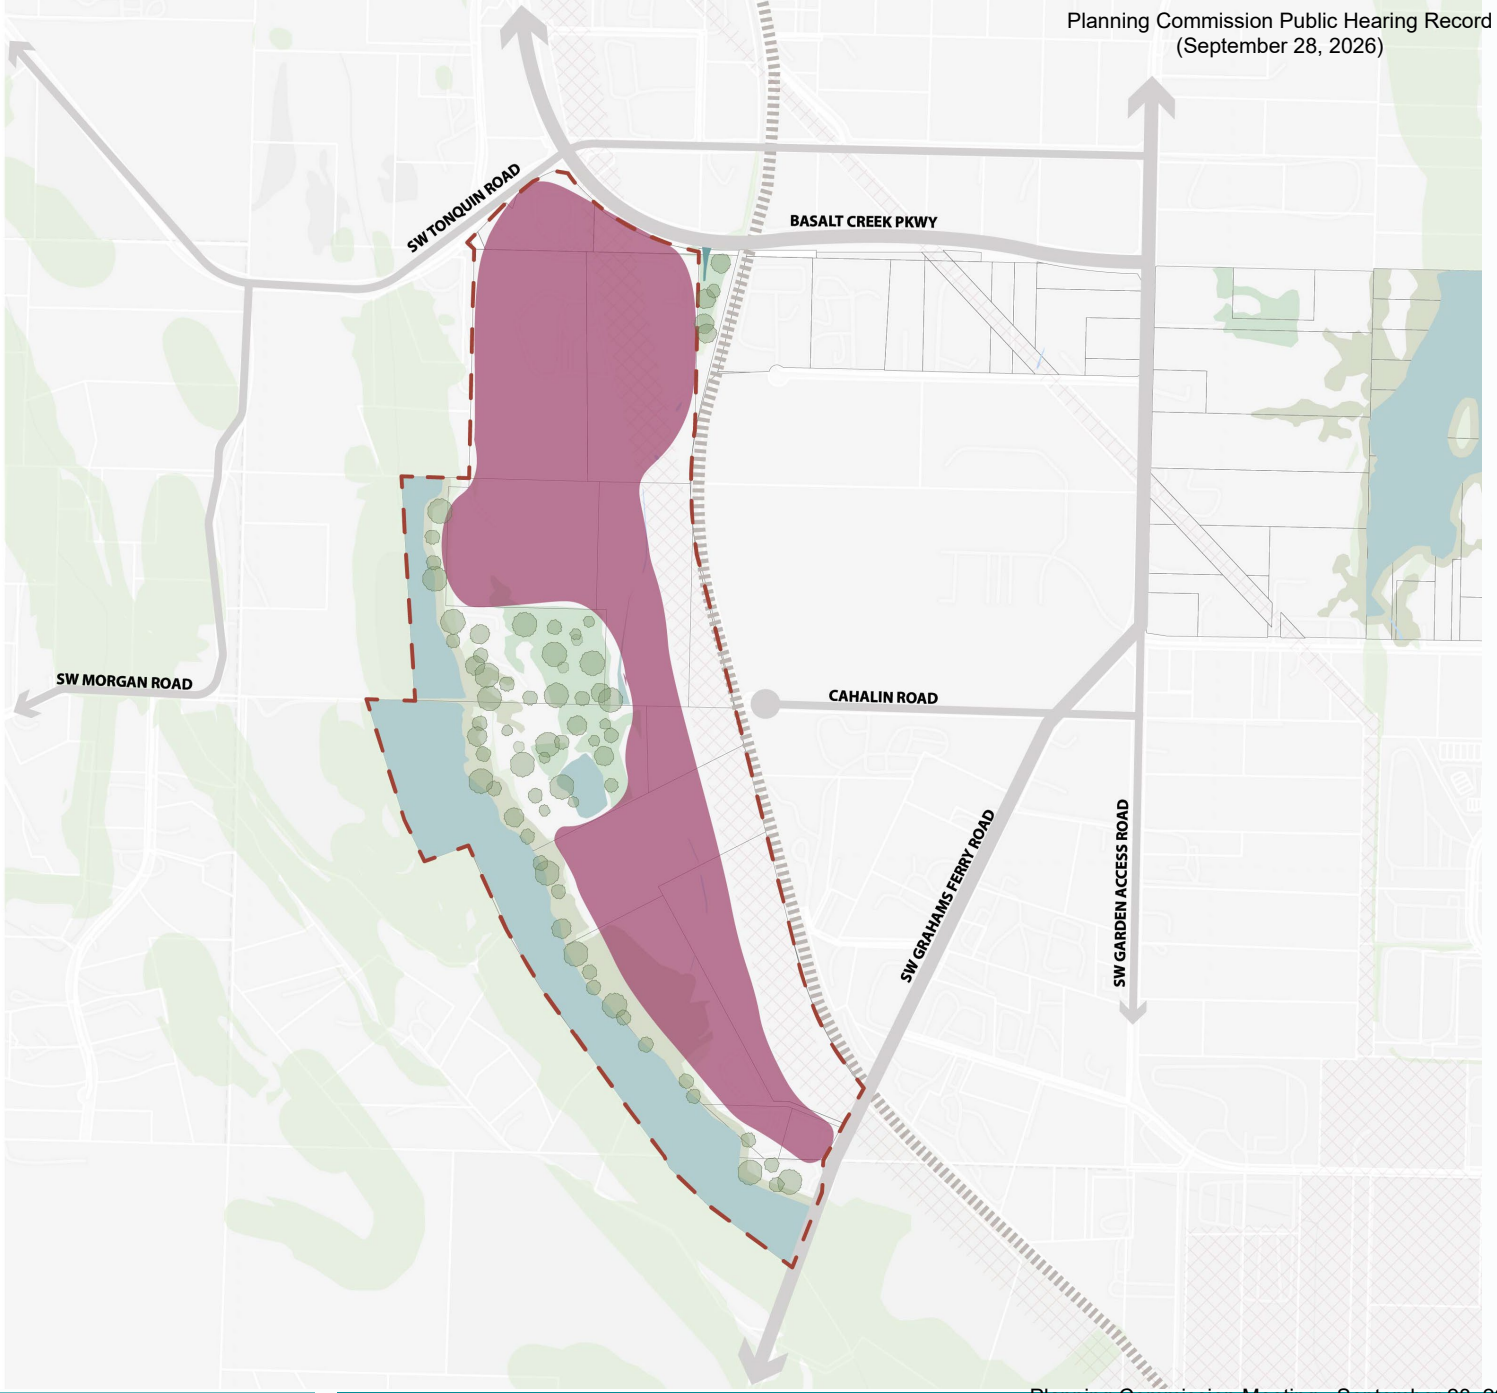


Guiding Principles Takeaways

Preferred Elements and Approach



Urban Design Concepts Takeaways



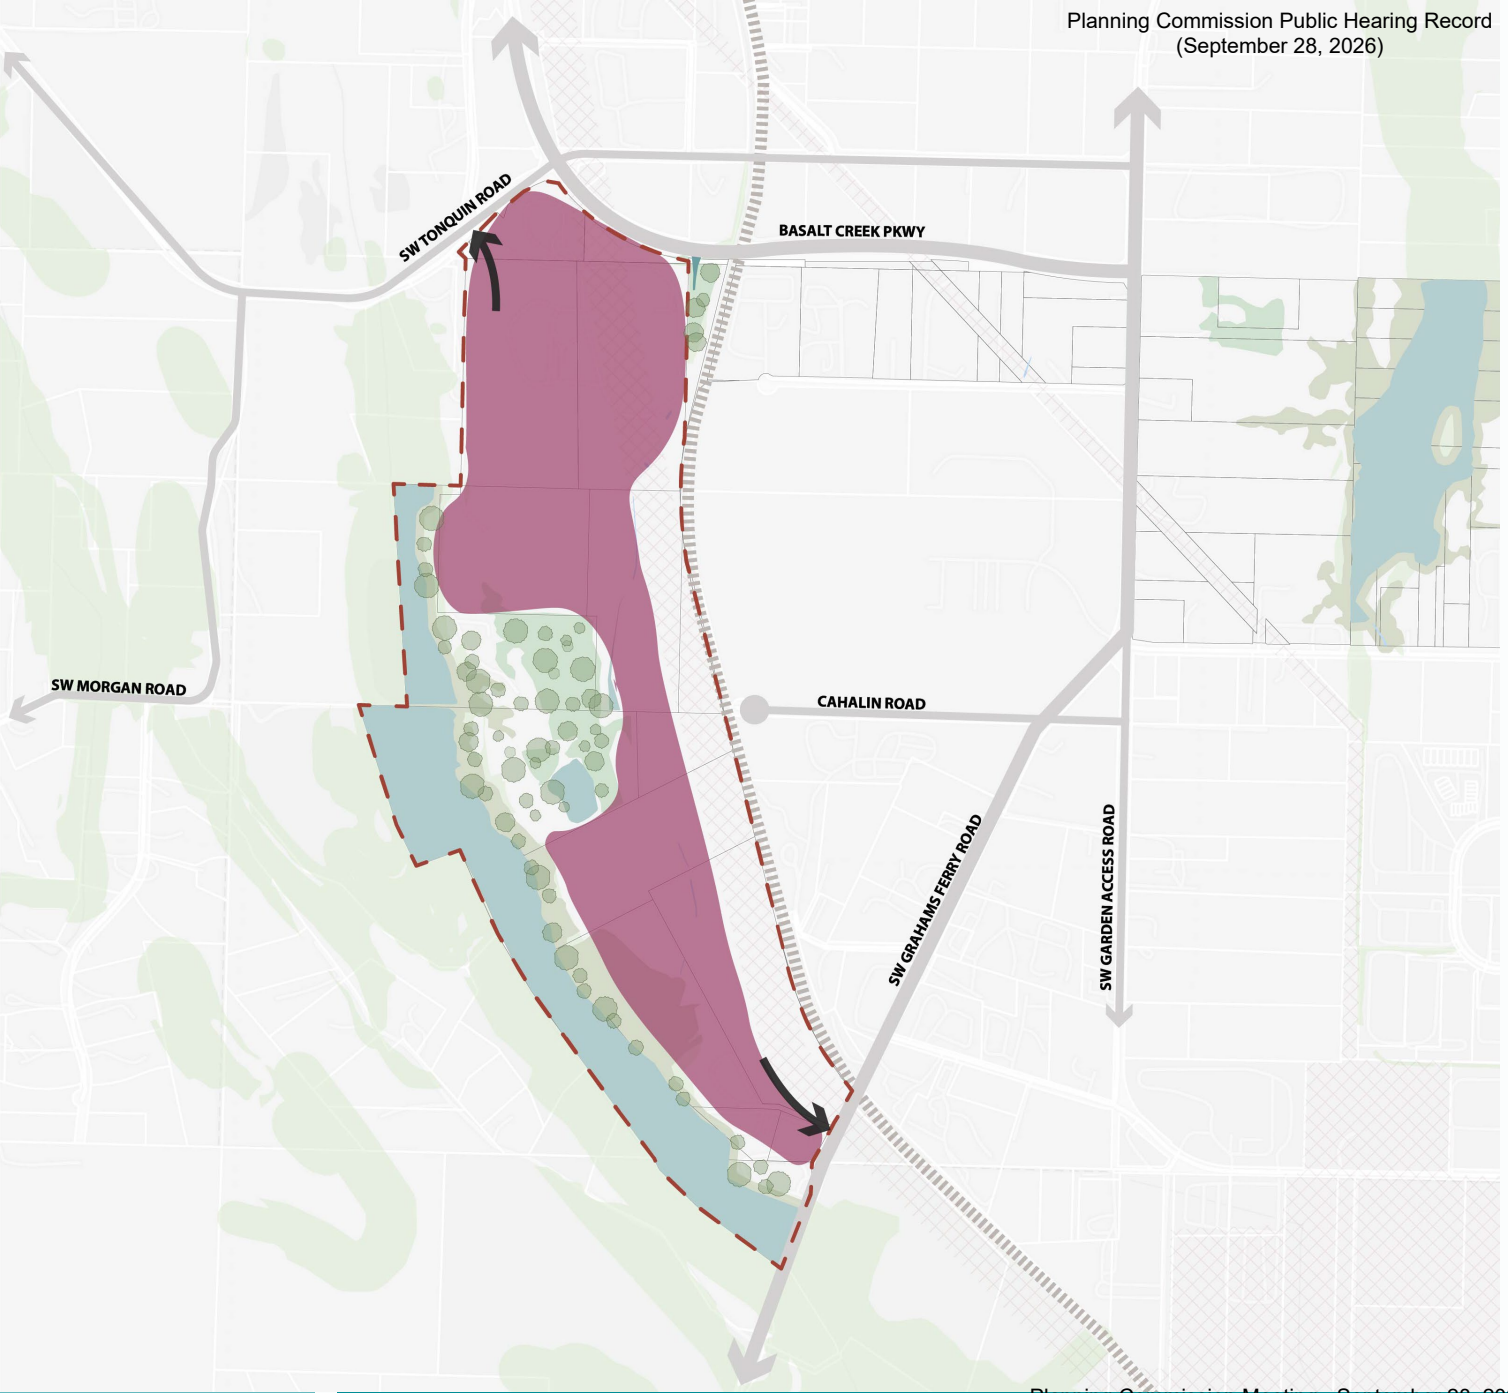
Preliminary Preferred Concept

- **Maximizes developable land**
- **Preserves remaining habitat**, and restores creek edge
- Considers **additional road connections**
- **Links Ice Age Tonquin Trail** with internal circulation

Preferred Concept

SW TONQUIN ROAD
BASALT CREEK PKWY
SW MORGAN ROAD
CAHALIN ROAD
SW GRAHAMS FERRY ROAD
SW GARDEN ACCESS ROAD

Land Use

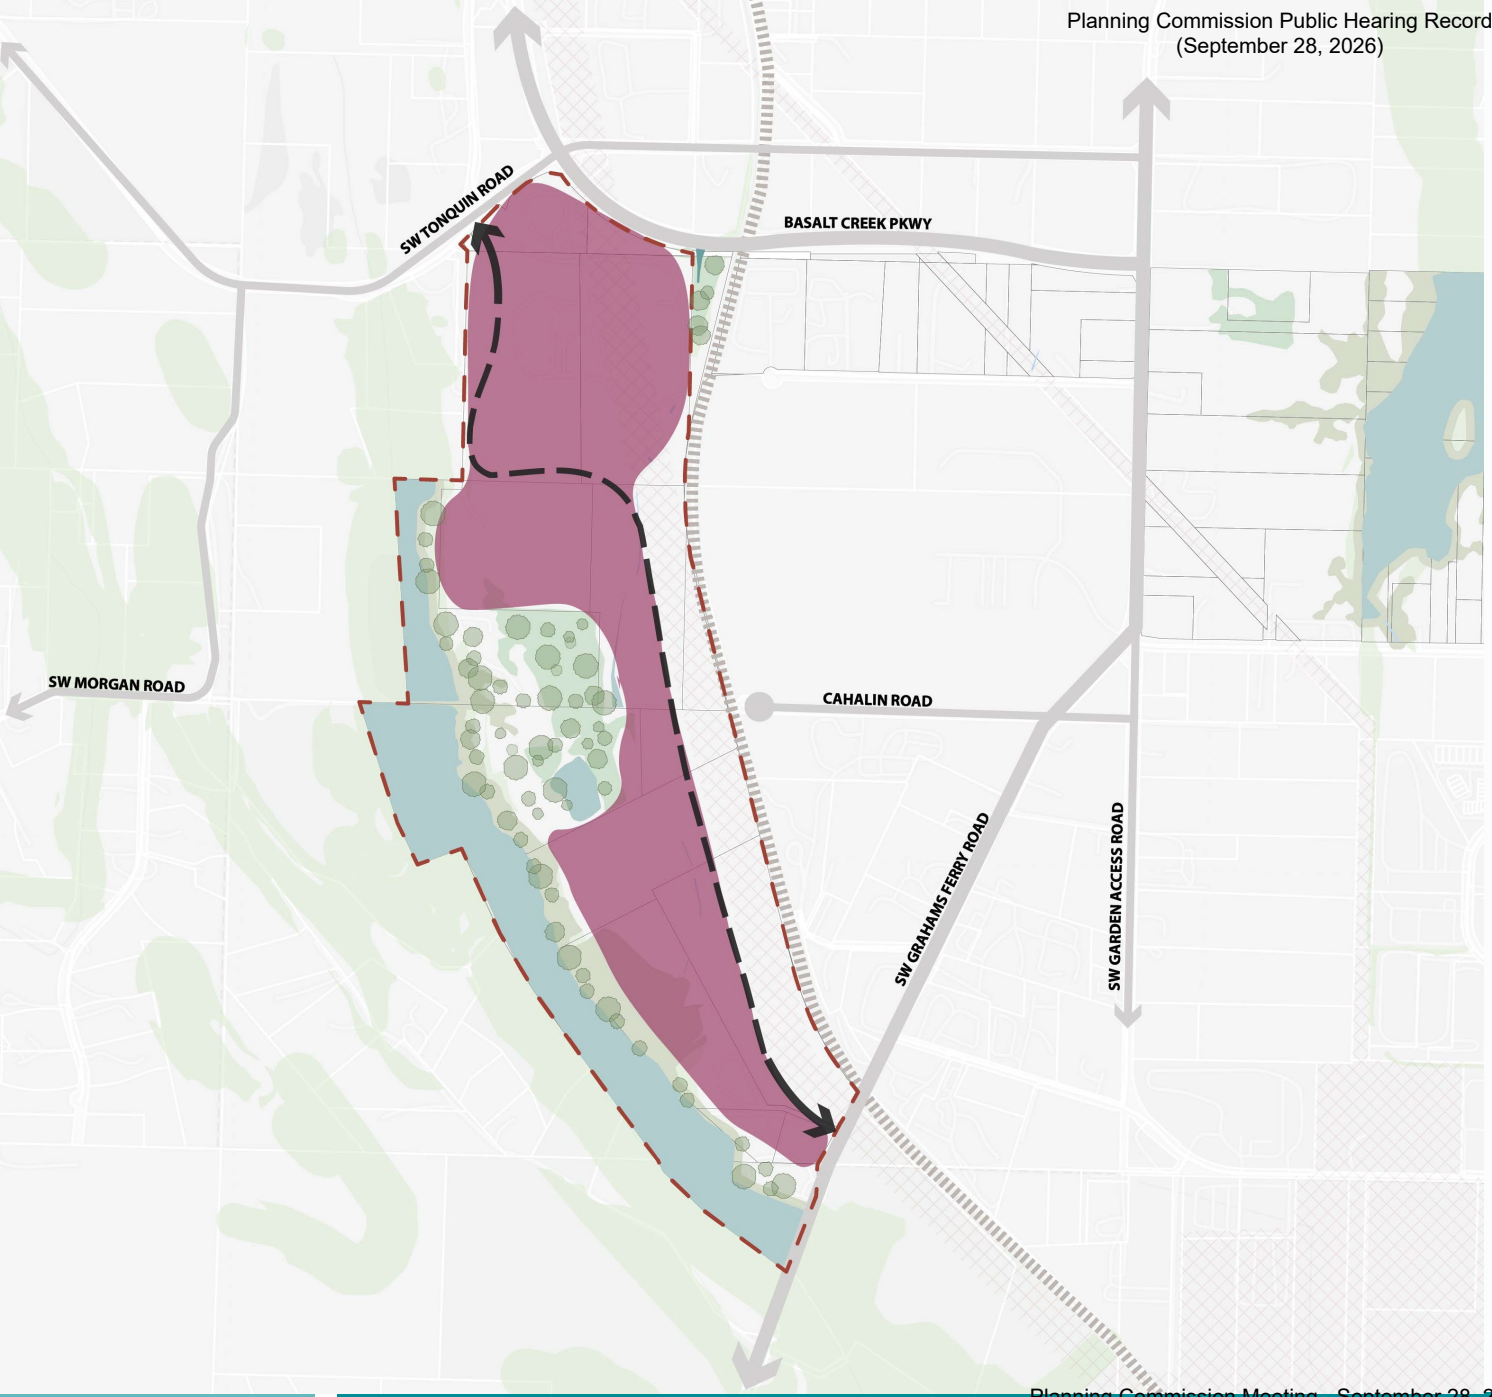


TRANSPORTATION ANALYSIS

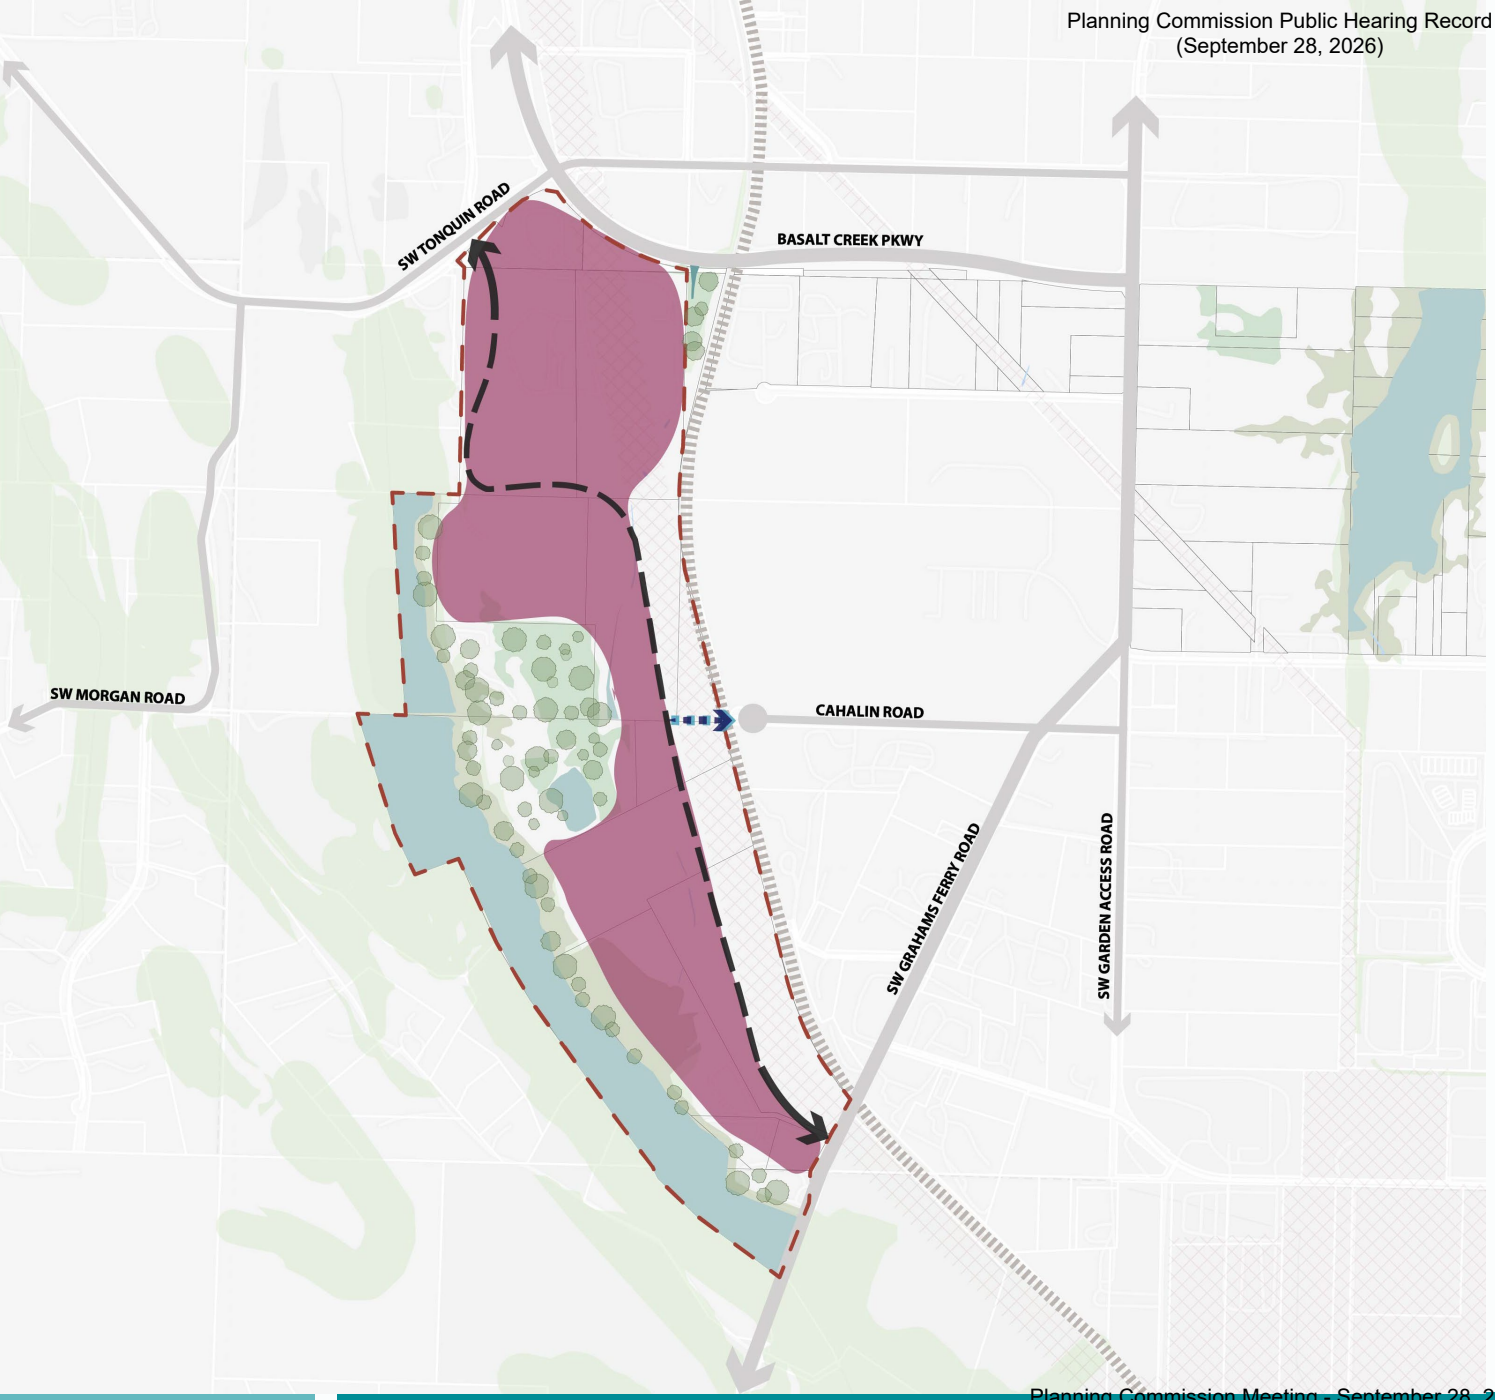
Methodology & Approach

- Evaluated a 20-year horizon based on planned network improvements
- Applied preferred land use scenario for development intensity
- Assessed multimodal access at a planning level
- Coordinated with jurisdictional partners and railroad operator

Key Assumptions



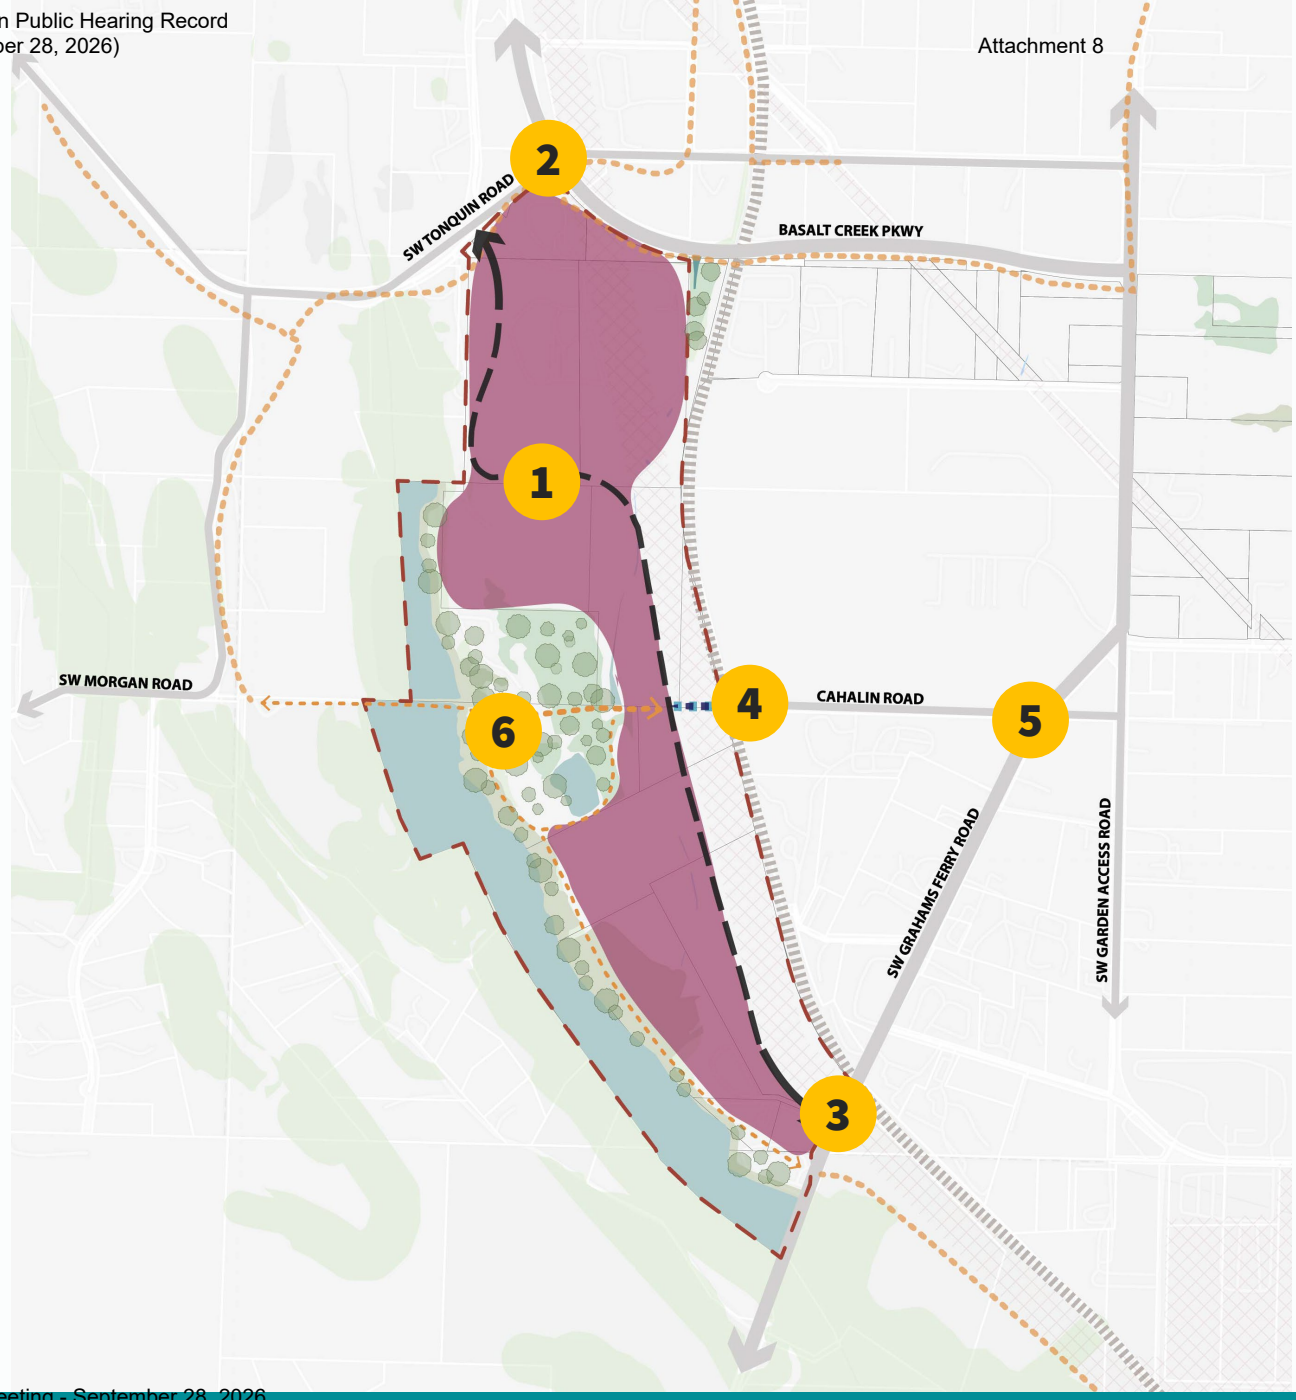
- Land use mix of a typical Industrial Park
- Previously identified projects move forward
- No I-5 overcrossings or rail crossing
- Internal circulation via north-south street



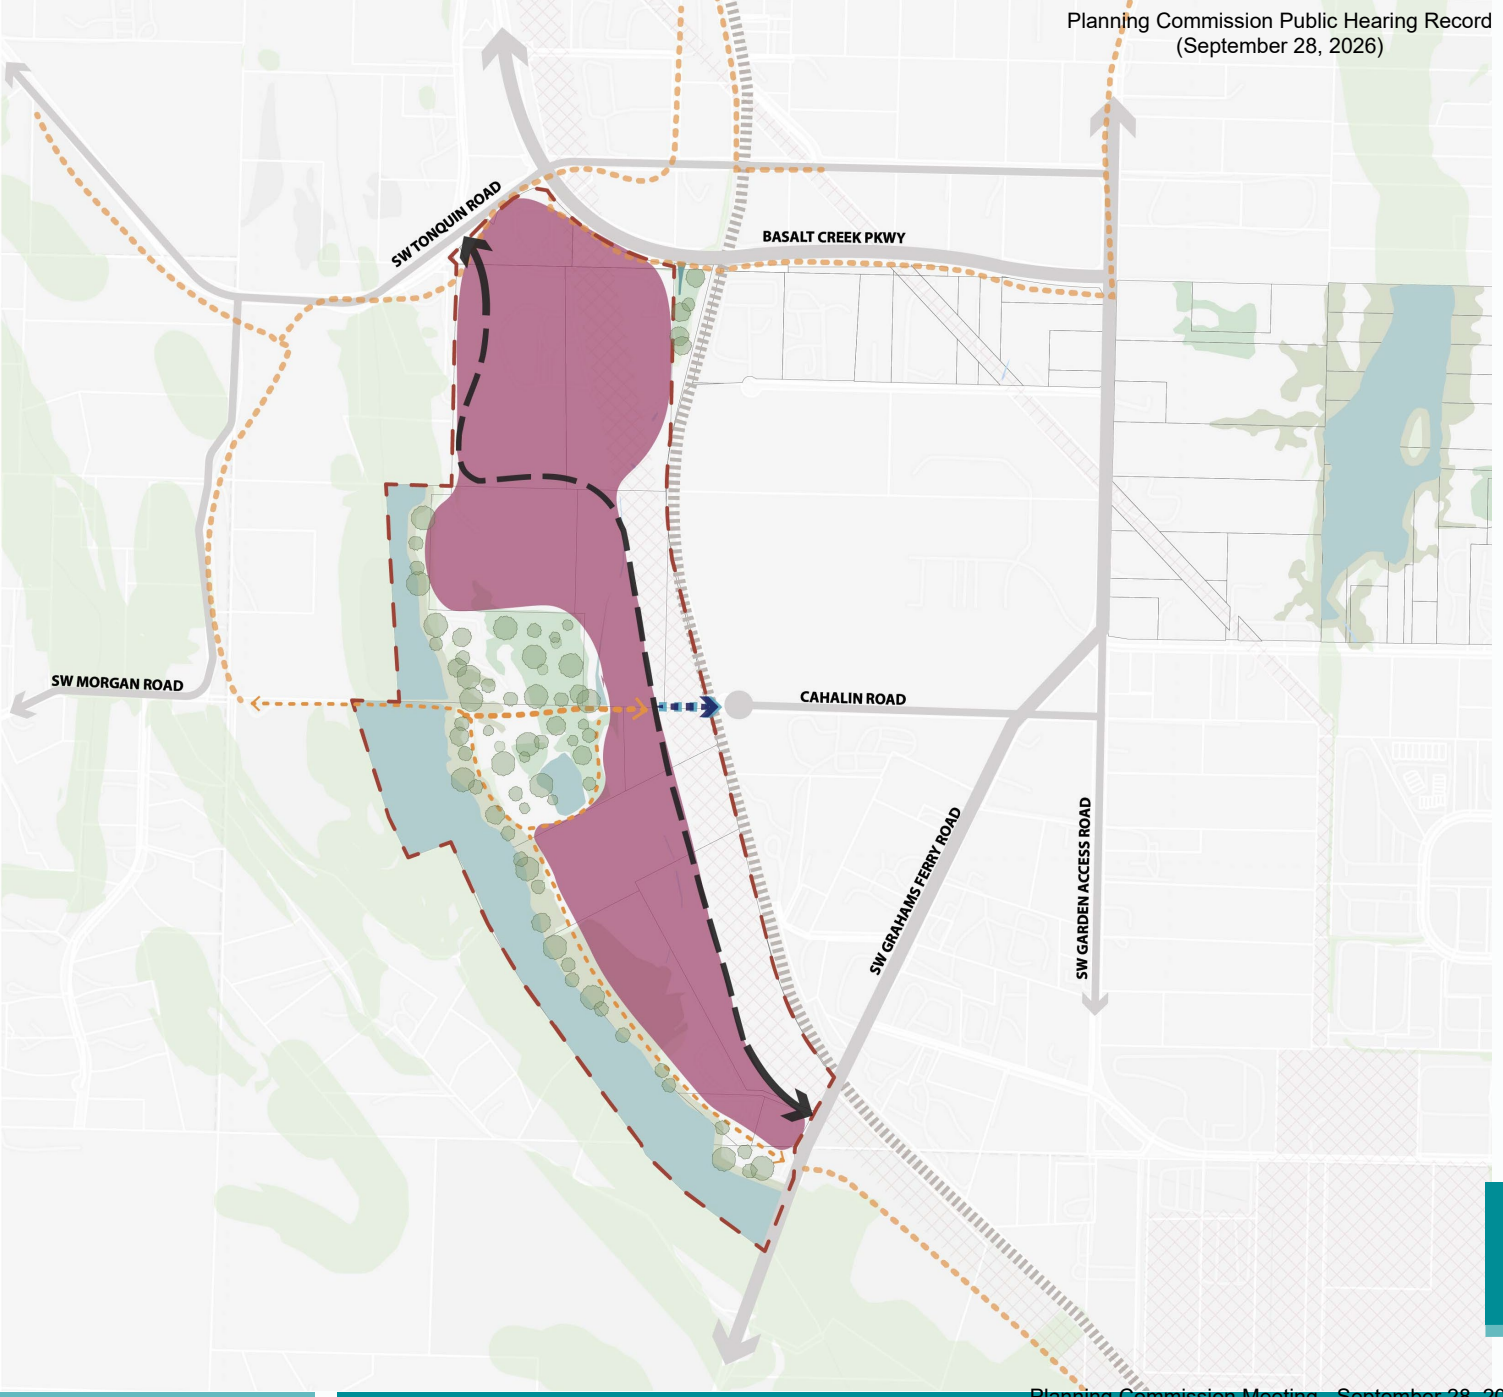
Transportation

Transportation

Transportation



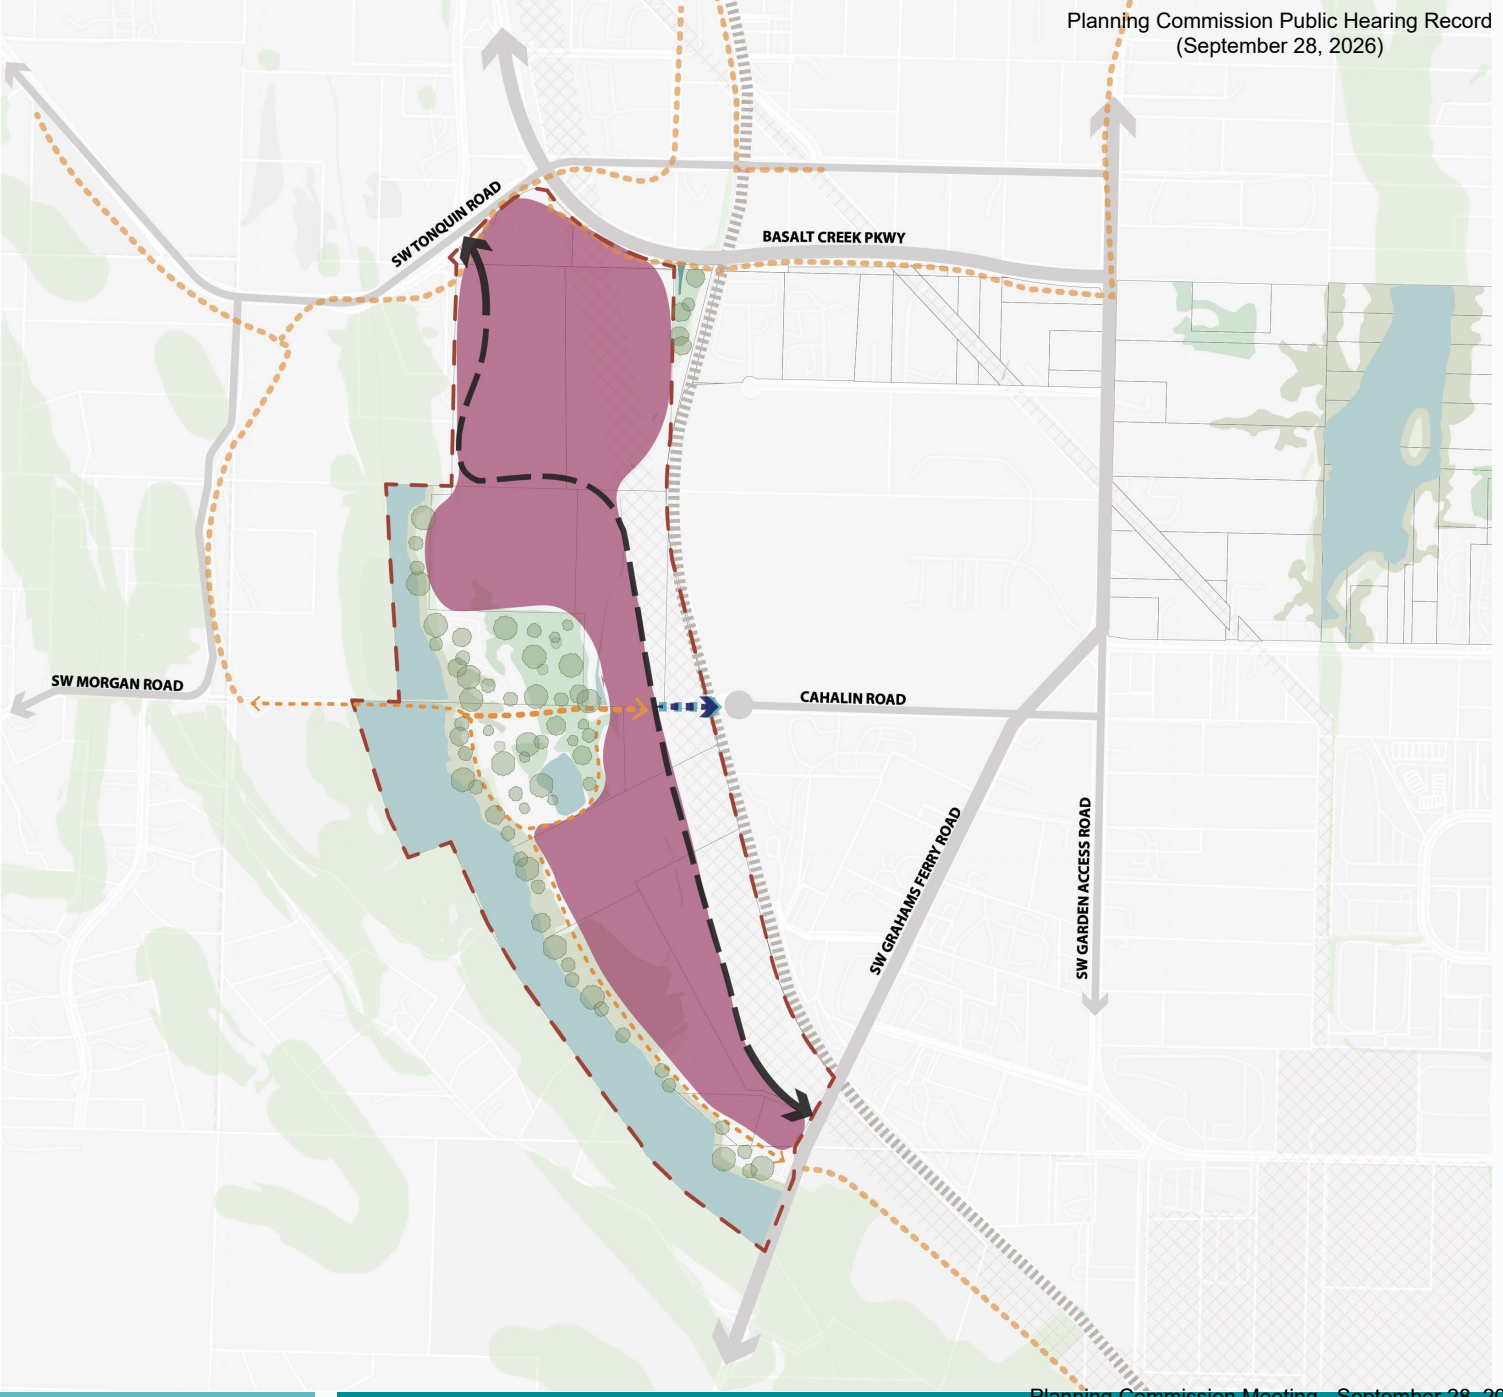
Key Findings



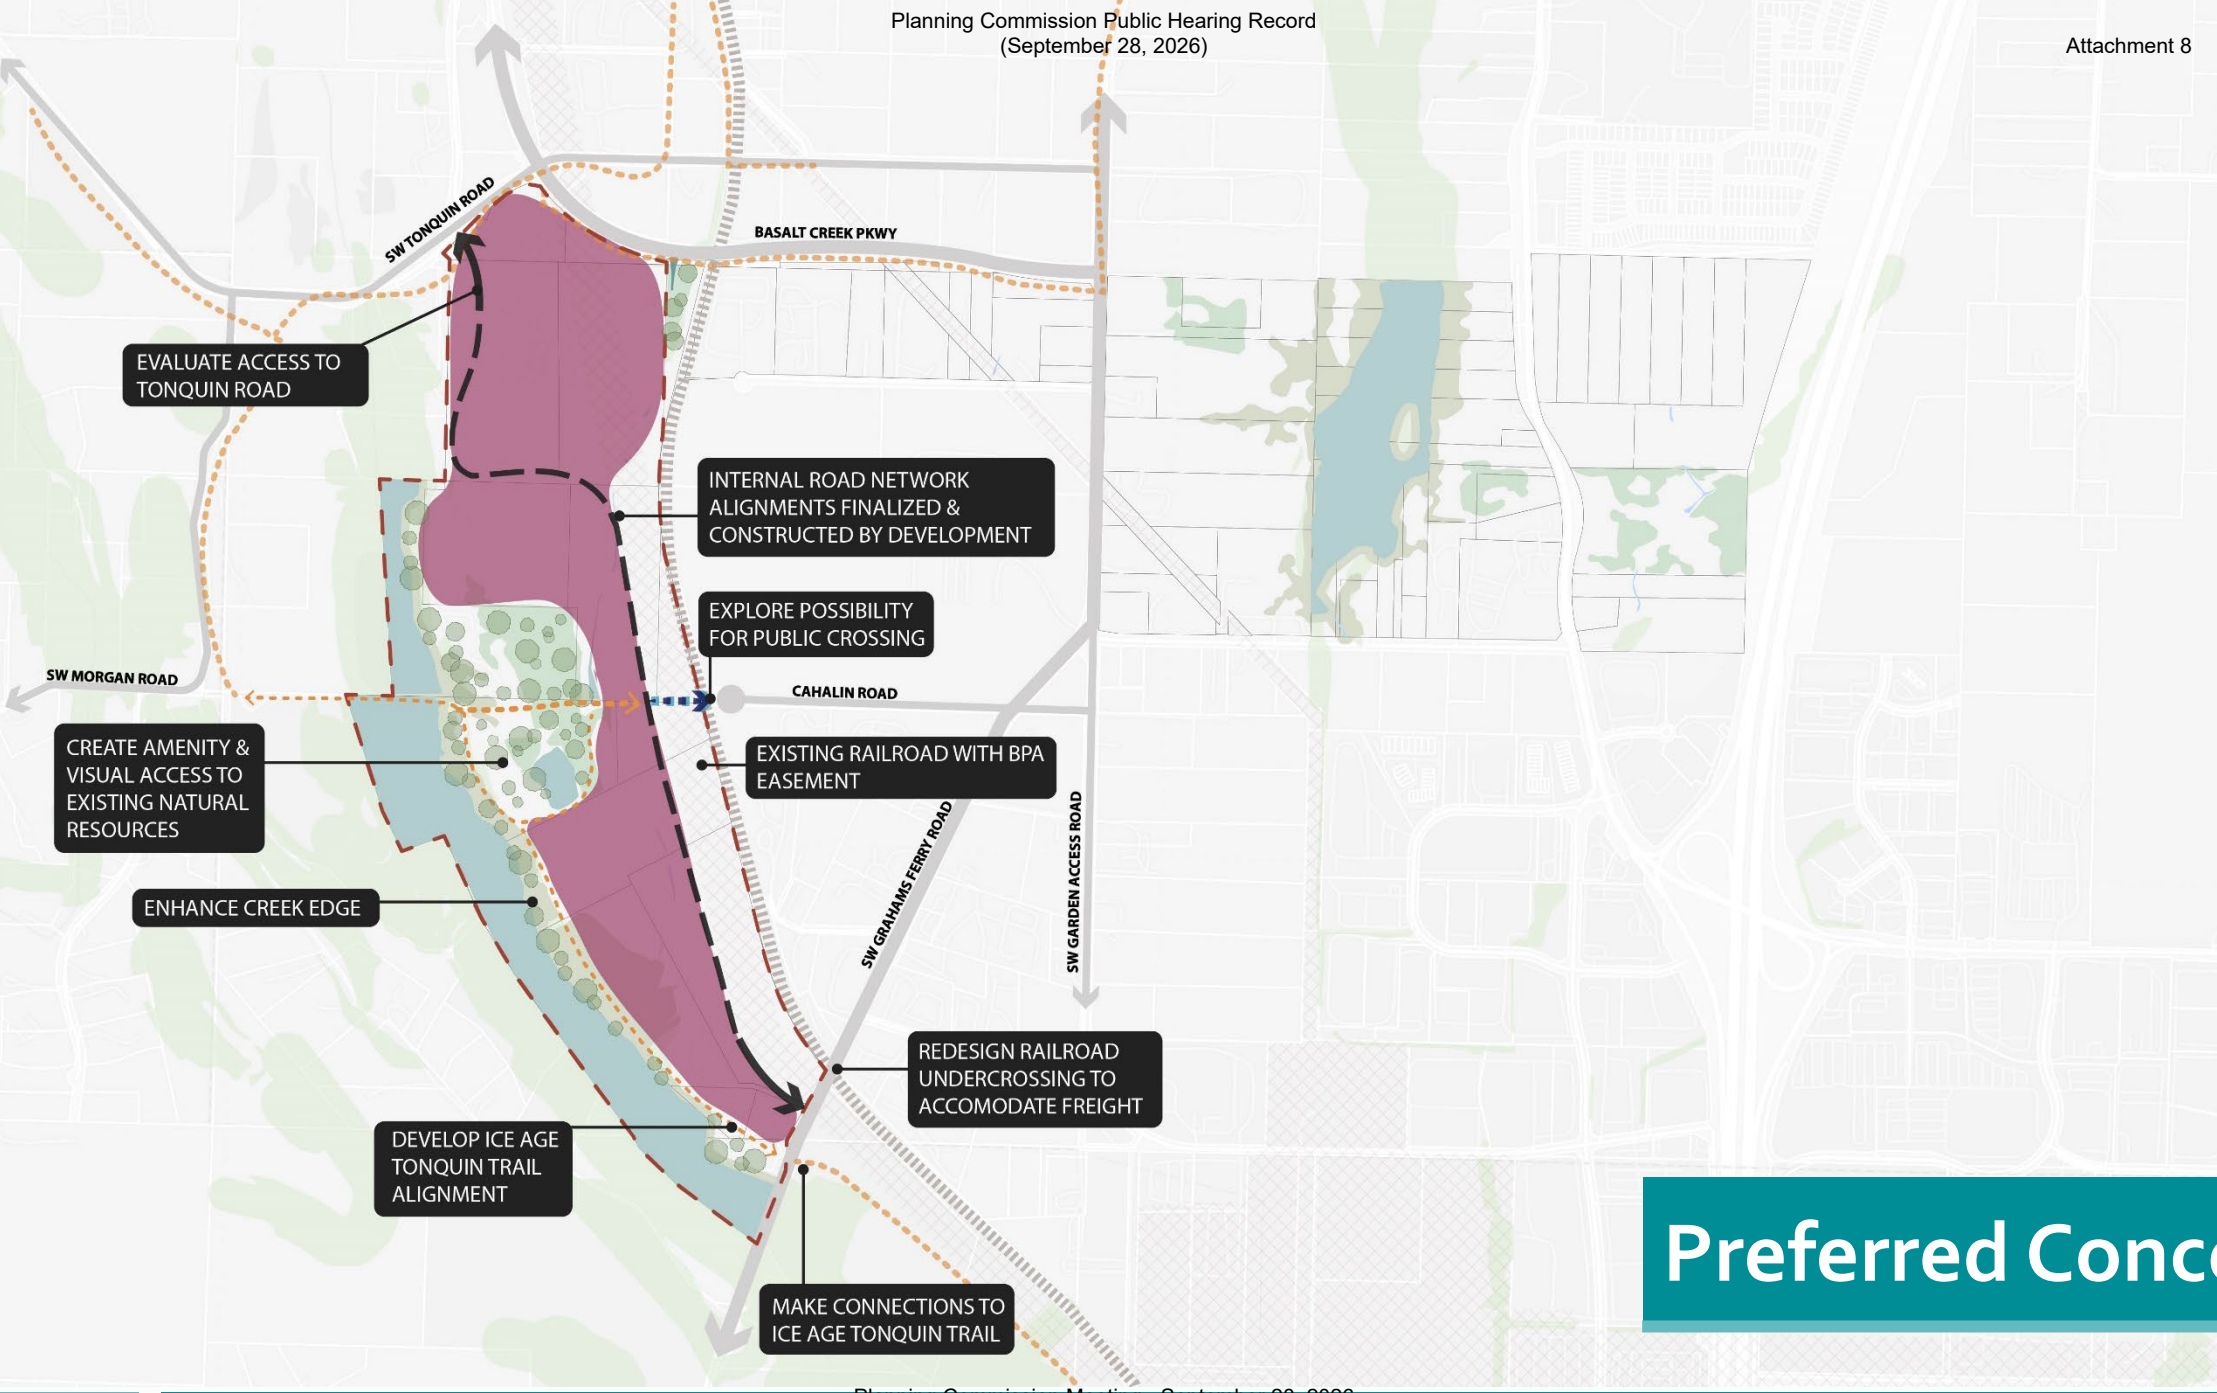
- **No major off-site upgrades needed beyond adopted TSP projects**
- Ice Age Tonquin Trail alignment can be accommodated as currently proposed

Identified Transportation Projects

1. New local industrial street
2. Tonquin Rd upgrades for truck access + safety improvements
3. Grahams Ferry Rd access improvements
4. Cahalin Rd rail crossing (optional)
5. Cahalin/Grahams Ferry Rd intersection upgrades (optional)
6. Pedestrian & bicycle trails through site



Trails & Natural Resources

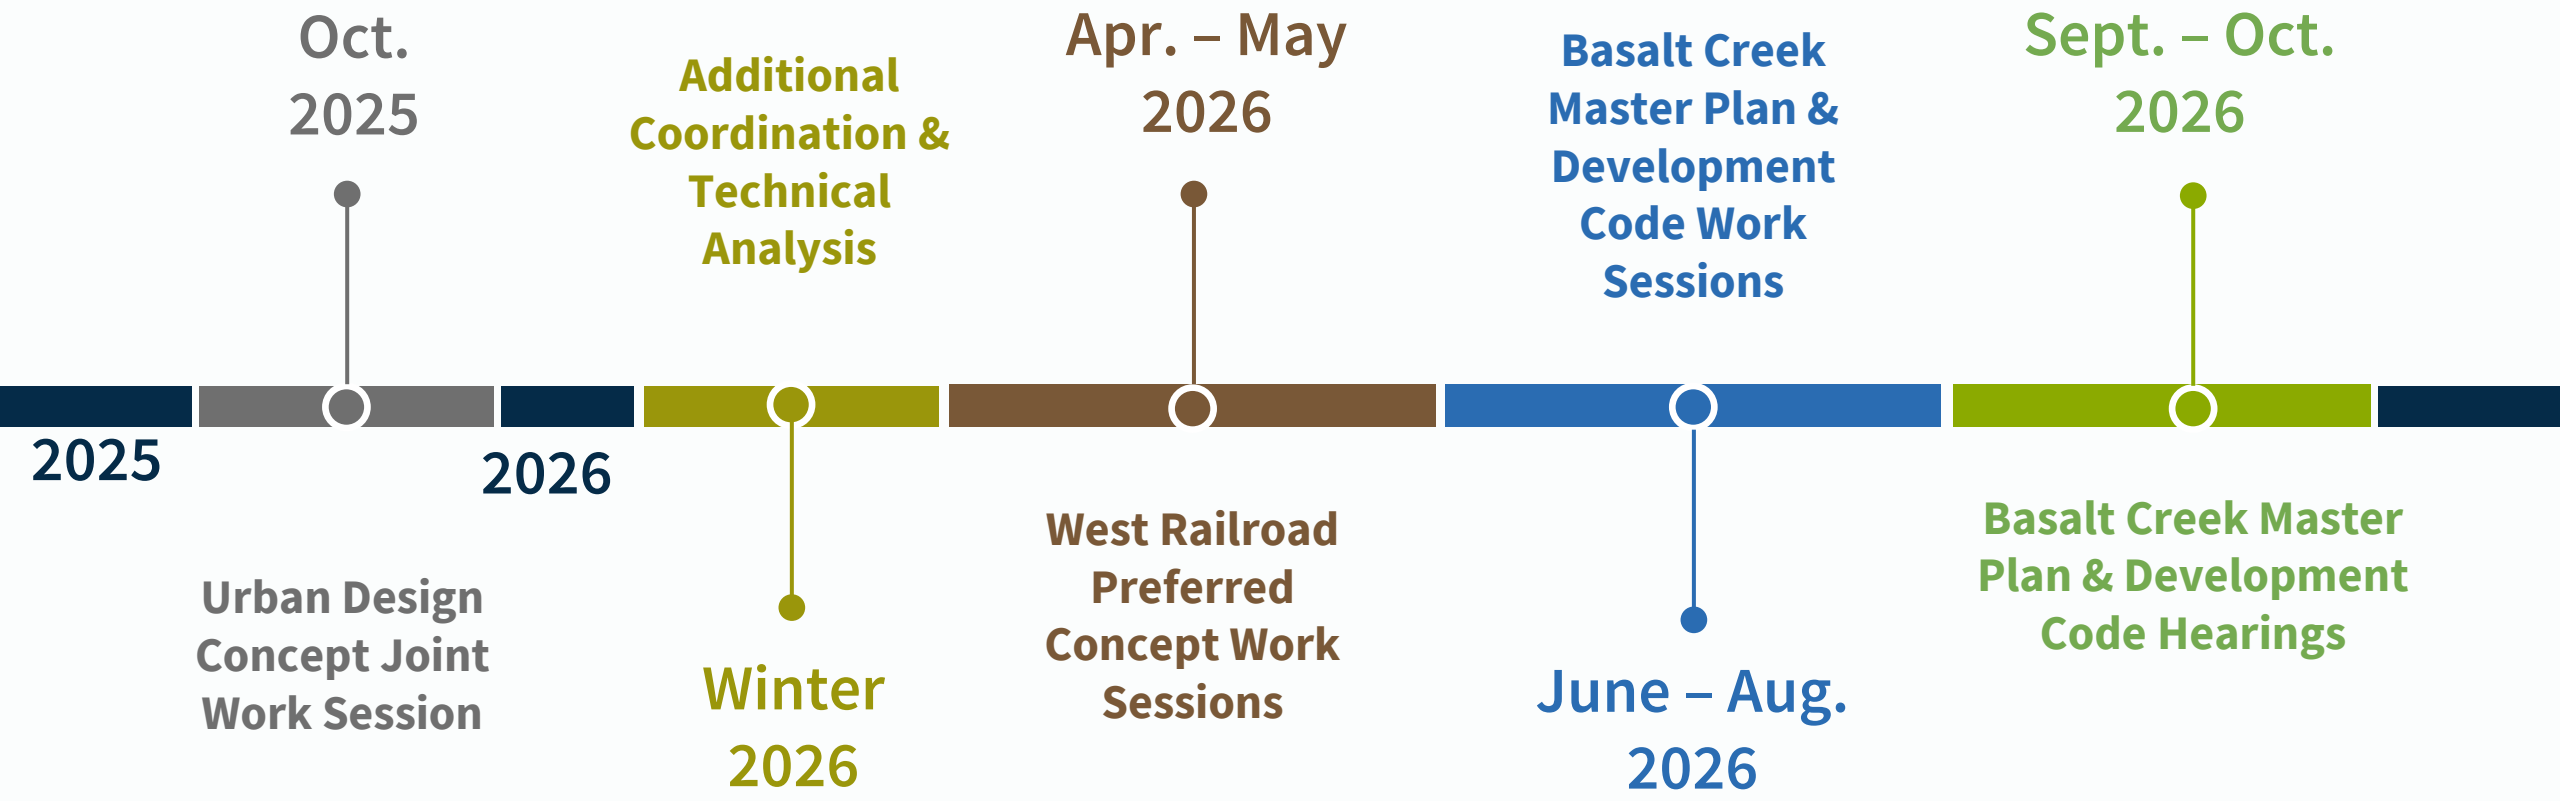


Other Elements

Preferred Concept

Is the Preliminary Preferred Concept consistent with the guidance and direction provided by the Planning Commission and City Council?

Are there aspects of the Preliminary Preferred Concept that need clarification?



Next Steps

Policies, Standards, and Plans

- Comprehensive Plan Elements
- Zoning, Development Code, and Design Standards
- Transportation System Plan (TSP) and Bicycle and Pedestrian Master Plan
- Identity with Citywide Signage and Wayfinding Plan
- Infrastructure Master Plans
- Economic Development Strategy

CALL TO ORDER - ROLL CALL
Chair Semenova called the meeting to order at 6:00 pm.

Present:	Yana Semenova, Matt Constantine, Nicole Hendrix, Andrew Karr, Rob Candrian, Jeff Zundel, and Tabi Traughber
Excused:	None
Staff Present:	Miranda Bateschell, Delora Kerber, Chris Meyers, Matt Lorenzen, and Mandi Simmons.

PLEDGE OF ALLEGIANCE
The Pledge of Allegiance was recited.

CITIZEN INPUT
There was none.

WORK SESSION
1. Wilsonville Industrial Land Readiness (West Railroad, Basalt Creek Master Plan) (Myers/Lorenzen)

Chris Myers, Senior Planner, introduced the preliminary Preferred Concept for the West Railroad area within the Basalt Creek planning area. The presentation served as a follow-up to the October 2025 joint session with the City Council, aiming to finalize a direction that balances economic development with environmental stewardship. Feedback from the Commission would be integrated into the project team's presentation to City Council on April 20th.

Lauren Scott, MIG, reviewed via PowerPoint the project timeline, the Basalt Creek Concept Plan guiding principles, as well as the existing conditions, the three draft concept plans presented at the October 2025 joint work session with Council. Based on the feedback received on those plans, the project team developed a Preliminary Preferred Concept that blends elements of Concept 1: Tonquin Environment and Concept 2: Manufacturing & Industry. (Slides 10-11) The Preferred Concept maximizes developable industrial land, primarily Industrial Park and Craft Industrial, while preserving the creek edge and habitat. (Slide 18) Key features of the Preferred Concept were reviewed, including a new internal north/south local street to serve as the primary route for traffic; integrating the Ice Age Tonquin Trail along the western edge with a potential loop around the

existing wetland; stormwater infrastructure; new east/west connections and internal circulation; and landscaping.

- The 20-year horizon traffic analysis conducted by DKS and Associates identified six transportation projects, assumed no new I-5 overcrossings, and prioritized the following: A northern connection to Tonquin Road requiring Washington County coordination, a southern connection to Grahams Ferry Road, and a potential, optional public rail crossing at Cahalin Road, pending ongoing discussions with the railroad operator . The findings indicated that no major off-site upgrades are required beyond those already identified in the City's Transportation System Plan (TSP) During the presentation, the project team addressed clarifying questions and concluded by requesting feedback about the Preliminary Preferred Concept.

Commissioner comments were as follows with the project team addressing questions as noted:

- **Ms. Scott** and **Staff** responded to comments regarding the Grahams Ferry Road railroad undercrossing, specifically concerning the high cost and logistical difficulty of modifying the structure and clarified that while the project is technically challenging and requires significant funding as well as coordination with the railroad operator, it remains a viable part of the long-term vision in the Preferred Concept.
  - Regardless of whether development moves forward in West Railroad, the Grahams Ferry Rd access improvements are necessary. (Slide 27) Both the Engineering and Public Works Departments also confirmed that improving the undercrossing would be necessary for future development and traffic flow citywide, particularly given the increased traffic with the full build out of Villebois, and if land north of Villebois develops. The upgrades are costly and involve a lot of considerations, including the wetlands, which present geotechnical challenges.
    - The undercrossing project is within the Coffee Creek Urban Renewal Area. Urban renewal funding could be spent on the undercrossing without West Railroad development; however, the Coffee Creek Plan does not anticipate that urban renewal funding to be sufficient to build out the undercrossing project, only to do planning and design work, so additional funding strategies will be required for physical construction.
  - Where development begins is where infrastructure improvements get built first. Having the Basalt Creek Master Plan establish the critical points of access and improvements ensures that future development can be approved in conjunction with, or preceded by, critical infrastructure improvements.
    - The timeline for West Railroad development is likely at least a decade or two, and by then the City is expected to have a plan in place for funding construction of the undercrossing.
- In response to comments regarding the balance between preserving natural spaces and maximizing developable industrial land to meet the City's economic opportunity goals, **Ms. Scott** explained that the Preferred Concept focuses building out development on the purple areas while intentionally preserving the upland tree habitat and enhancing the Coffee Lake Creek edge. (Slide 18) The industrial developments require large sites to accommodate

internal freight circulation, off-street parking, and stormwater management, and the current concept aims to maximize these areas while respecting environmental constraints.

- **Planning Director Bateschell** confirmed that a specific wildlife strike analysis has not yet been conducted considering the potential for increased wildlife impacts due to higher industrial traffic on Grahams Ferry Road; however, Wilsonville maintains a robust wildlife crossing program, and Staff will coordinate with the Natural Resources Program manager to evaluate potential mitigations or infrastructure improvements that could be integrated as the plan moves forward.
- **Planning Director Bateschell** clarified that while the Bonneville Power Administration (BPA) strictly prohibits permanent structures and trees in its easements due to height and access requirements, the City has successfully negotiated for paths and parking in other BPA easements. Such agreements typically involve a negotiation where the City or developer assumes the risk of removal and replacement if the BPA must access the easement for powerline work. The City has not initiated any negotiations about West Railroad easements.
  - **Alex Dupey, MIG,** added that while there was flexibility to allocate parking there, MIG assumed no development anywhere near the BPA easement areas when doing the broader transportation infrastructure analysis for West Railroad late last year.
- The goal for West Railroad was to be industrial land, although currently many contractor yards existed, which were contrary to the City's plan. Comments regarding Zoning noted having flexibility in the market-driven arena versus aspirational job growth targets even if near-term use is different from the City's long-range aspirations. Land uses like contractor yards should not be easy to continue, and too much building should not be allowed without understanding the City's long-term aspirations.
- Did "explore opportunities for public realm investment" mean the area would be specifically named West Railroad Area or be renamed with an entry sign? Was the goal to let people know they were driving into a special industrial area or district?
- **Economic Development Manager Lorenzen** clarified that the West Railroad Area was not currently covered by an urban renewal district. The Coffee Creek Urban Renewal Area was on the other side of the tracks. An infrastructure funding analysis was done for the greater Basalt Creek area, but West Railroad was not included in the analysis. Because much of the West Railroad land is already aggregated under a few owners, development could occur on a larger scale and with less need for the City to facilitate development through infrastructure investments, so there was a question about whether urban renewal would be needed. Regional projects, like the undercrossing, would be needed, but private development would hopefully cover many improvement projects within the area, such as local roads.
  - He clarified that the Cahalin Rd improvements/rail crossing is not contemplated in the Coffee Creek Urban Renewal Plan, but the Grahams Ferry Rd undercrossing was named as a project in the Coffee Creek Urban Renewal Plan.
- Having the draft Basalt Creek Funding Analysis was helpful to see how that part was supposed to pencil out.
- **Economic Development Manager Lorenzen** explained that while the City does consider market realities and development feasibility, approaching specific developers about developing West Railroad is generally outside the City's current purview, especially given the

timeline for development in the area. As part of the greater Basalt Creek effort and the Wilsonville Industrial Land Readiness (WILR) project generally, Staff has been talking with and getting input from the development community.

- Larger employers also plan 10 to 20 years out, so it would be good for them to have Wilsonville's plan in mind as they moved forward. It would be interesting to supplement this material to understand what uses or companies might be a good fit for the area.
    - **Economic Development Manager Lorenzen** replied he understood the intent; however, tech-related companies would probably struggle in West Railroad due to their sensitivity to vibration. Additionally, no large-scale employer has self-developed in the Portland Metro area since the late 1990s. With Intel's Ronler Acres, the City of Hillsboro aggregated that property through urban renewal to orchestrate a specific outcome. As in Coffee Creek, Basalt Creek and the West Railroad area was more likely to see demand for speculative development, where private capital risks building speculatively, without tenants in place, banking that their build is marketable and attractive to companies wanting to move in.
    - Supplementing the West Railroad analysis with information on the companies and industries the City has talked to along with their forecasted growth would make it easier for the City to show increases in property values and other benefits if a new urban renewal zone is created or the Coffee Creek Urban Renewal Zone expands versus the uncertainty of speculative development, relying on the developers to bring in tenants which could take longer to see those benefits.
- **Planning Director Bateschell** clarified that a wide variety of commercial uses are allowed in industrial areas, including restaurants, though the Development Code currently limits retail in industrial areas to 5,000 square feet, which would accommodate most standard restaurants serving the area. For businesses such as breweries, the City categorizes the manufacturing portion of the facility separately from the retail or tasting room area, allowing for larger overall footprints while staying within Code-defined retail caps.
    - Basalt Creek included High-Tech, Light Industrial, and Craft Industrial designations, resulting in some differences between allowed uses, some limitations on certain uses and certain subdistricts.
    - Staff would consider what limitations seem most appropriate for West Railroad given its additional constraints and the Commission would review the revised draft Code, first presented last year, during a work session in June. The draft Code applies the form-based overlay used in Coffee Creek to the NW Industrial District and the City's PDI and PDI-RSIA (Planned Development Industrial - Regionally Significant Industrial Area) land uses to the West Railroad area.
- Because the water in the Coffee Creek Wetland flowed very slowly, concerns were expressed about mosquitos being an issue for restaurants and retail spaces.
- **Senior Planner Meyers** addressed concerns about potential cut-through traffic between Tonquin Road and Grahams Ferry Road, noting that the proposed road must accommodate heavy industrial traffic and large freight vehicles. From an engineering perspective, differentiating mitigation to allow trucks to flow freely while slowing cars might be

challenging. Traditional traffic-calming measures, such as speed humps, are problematic for tractor-trailers, but signalization or specific controls at intersections could be explored.

- **Mr. Dupey** added that the current traffic analysis was conducted at a coarse planning level to ensure the general system functionality. As specific parcels develop, each project will be required to conduct detailed traffic impact studies to evaluate local demand and intersection performance based on the conditions at that time**.** Given the timeline for West Railroad development, traffic demand could be completely different than today.
- **Economic Development Manager Lorenzen** noted that Grahams Ferry Road would be improved and widened in the future, which would enable traffic from Tualatin, for instance, to travel more efficiently than winding through an industrial park, so theoretically, the problem should take care of itself.
- **Planning Director Bateschell** noted other projects associated with the Basalt Creek Transportation Refinement Plan, including expanding Basalt Creek Parkway to five lanes and improving and widening Day Road, would improve the large arterial and collector streets that would serve as the primary freight avenues through the area. The proposed north/south road is designed as a local industrial street, not an arterial or collector, and not as a City project. As development begins, developers would identify the alignment that works best for them, ensuring the alignment allows access to the next parcel of development, and eventually the connection could happen at Tonquin Rd. This local north/south road would not likely see the same level of traffic as that seen on arterials like Basalt Creek Parkway or Day Road in the future.

During the discussion, the Commissioners agreed that the Preliminary Preferred Concept reflected previous conversations, including the regional Ice Age Tonquin Trail connection and retaining the green space, while also providing enough density to achieve the West Railroad's employment offerings. The Preferred Concept was a nice combination of Concepts 1 and 2, reflecting that the project team had heard the Commission's feedback.

Chair Semenova confirmed there was no public comment.

WORK SESSION

Wilsonville Industrial Land Readiness (Basalt Creek Master Plan) (Luxhoj)(Pauly)

WILSONVILLE
OREGON

CITY COUNCIL MEETING
STAFF REPORT

Meeting Date: October 6, 2025	**Subject:** Joint City Council / Planning Commission Work Session – Wilsonville Industrial Land Readiness – West Railroad Area of Basalt Creek **Staff Members:** Cindy Luxhoj AICP, Associate Planner, and Dan Pauly AICP, Planning Manager **Department:** Community Development
Action Required	**Advisory Board/Commission Recommendation**
☐ Motion ☐ Public Hearing Date: ☐ Ordinance 1st Reading Date: ☐ Ordinance 2nd Reading Date: ☐ Resolution ☒ Information or Direction ☐ Information Only ☐ Council Direction ☐ Consent Agenda	☐ Approval ☐ Denial ☐ None Forwarded ☒ Not Applicable **Comments:** N/A
Staff Recommendation: Provide direction on public realm and land use concepts to inform master planning for the West Railroad area of Basalt Creek.	
Recommended Language for Motion: N/A	
Project / Issue Relates To:	

☒Council Goals/Priorities: 2023-25 Council Goal: Attract high-quality industry and support economic opportunity for all in Wilsonville	☒Adopted Master Plan(s): Basalt Creek Concept Plan	☐Not Applicable

ISSUE BEFORE COUNCIL: Review public realm and land use concepts for the West Railroad area of Basalt Creek. City Council and Planning Commission guidance will inform development of a preferred plan to be included in the Basalt Creek Master Plan, scheduled for adoption in early 2026. This Master Plan will also serve as the foundation of Development Code standards specific for the area.

EXECUTIVE SUMMARY:

The City is actively advancing the policy framework outlined in the Basalt Creek Concept Plan to make the Basalt Creek planning area "development ready" from a land use policy perspective. In parallel, staff are working on infrastructure financing and other key actions to support future development.

Land use policy development for a new area of the City follows a three-step process. The first step is a concept plan, which establishes general policy guidance and intent but does not carry legal authority for land use decisions, such as development applications and rezoning. The second steps is a master plan, adopted as part of the City's Comprehensive Plan. This document provides more detailed policy guidance and serves as a legally binding basis for future zoning and land use decisions. However, the master plan does not include detailed development standards for implementing the plan. The final step is the adoption of Development Code standards, which translate the master plan into specific, enforceable requirements to guide development consistent with the City's vision.

The Basalt Creek focused portion of the Wilsonville Industrial Land Readiness (WILR) project aims to adopt both a Master Plan and Development Code standards for the area. As discussed at previous work sessions, planning for the West Railroad area was deferred when the Basalt Creek Concept Plan was adopted in 2018 due to natural resource constraints, limited access, fragmented property ownership, and lack of infrastructure. The West Railroad area lies west of the Portland and Western Railroad, along the Coffee Lake wetlands, extending from SW Grahams Ferry Road to Basalt Creek Parkway/Tonquin Road (see Attachment 1).

While the rest of the Basalt Creek area has assigned land use types and supporting details in the Concept Plan that provide a strong basis for development of a Master Plan and Development Code standards, the West Railroad area still requires this level of planning. Advancing this work will ensure the entire Basalt Creek planning area is ready for future development.

Two key goals and policies to establish in a master plan include those pertaining to the public realm, including streets, parks, open spaces and pathways, and land use, which defines allowed uses along with siting and design requirements to support a desired character of the area. This joint work session provides an opportunity for the City Council and Planning Commission to explore different approaches to these elements for the West Railroad area and offer direction to the project team. That guidance will inform a preferred alternative to be incorporated into the Master Plan and implemented through Development Code standards.

Staff and the consultant team will return to the Planning Commission and City Council in separate work sessions in November to present the preferred alternative.

What to Expect at the Joint Work Session

A consultant team from MIG will lead an interactive joint work session with the City Council and Planning Commission to explore public realm and land use concepts for the West Railroad area. Unlike typical work sessions where participants arrive having reviewed detailed materials, this session is designed as a shared real-time learning and collaboration experience.

MIG will introduce key site-specific constraints such as infrastructure capacity, access limitations, environmental factors, and policy considerations to frame the discussion (see Attachment 2 for contextual maps). The team will facilitate dialogue around how these constraints affect the feasibility and suitability of potential land uses. In addition to exploring physical design concepts, the session will outline the tools needed to implement each idea. These include regulatory mechanisms like zoning and Development Code updates, as well as incentive strategies such as public-private partnerships, infrastructure investments, and development incentives to help achieve the City's goals for the area.

West Railroad Concepts

Following an internal work session with City staff, MIG is developing initial draft concepts for public realm and land use planning in the West Railroad area. These concepts will be discussed in detail during the joint work session and will serve as the foundation for identifying a preferred alternative to carry forward. While the City Council and Planning Commission may choose one concept as the basis for the preferred alternative, it is common in planning processes to combine elements from multiple concepts into a hybrid approach.

In way of introduction, the following provides a brief overview of each concept or approach.

Concept 1: Tonquin Environment

This concept envisions a district that emphasizes the Coffee Creek Wetlands, Coffee Lake Creek, the future Ice Age Tonquin Trail, and connections to the adjacent Basalt Creek Parkway. Public and private investments would focus on environmental restoration and habitat rehabilitation to create a setting that attracts campus style development, craft industrial uses, small-scale office or manufacturing uses, and other specialized employers. The area's primary draw is its immediate access to high-quality natural and recreational amenities, positioning it as a unique employment and innovation district where economic activity and ecological stewardship could intersect.

Concept 2: Manufacturing and Industry

This concept relies on maximizing the area's employment potential by pursuing full access to the region's transportation network for freight and other large-scale uses. Key elements of providing a full transportation network to support large-scale industrial uses would include upgrading the SW Grahams Ferry Road railroad undercrossing for freight movement, enabling the SW Cahalin Road railroad crossing, and enhancing northern and western connections to the area. The City could consider incentives and targeted interventions to encourage parcel assembly and infrastructure investment. This concept

would encourage high-density employment development capable of supporting large-scale industrial and office development, maximizing long-term job growth.

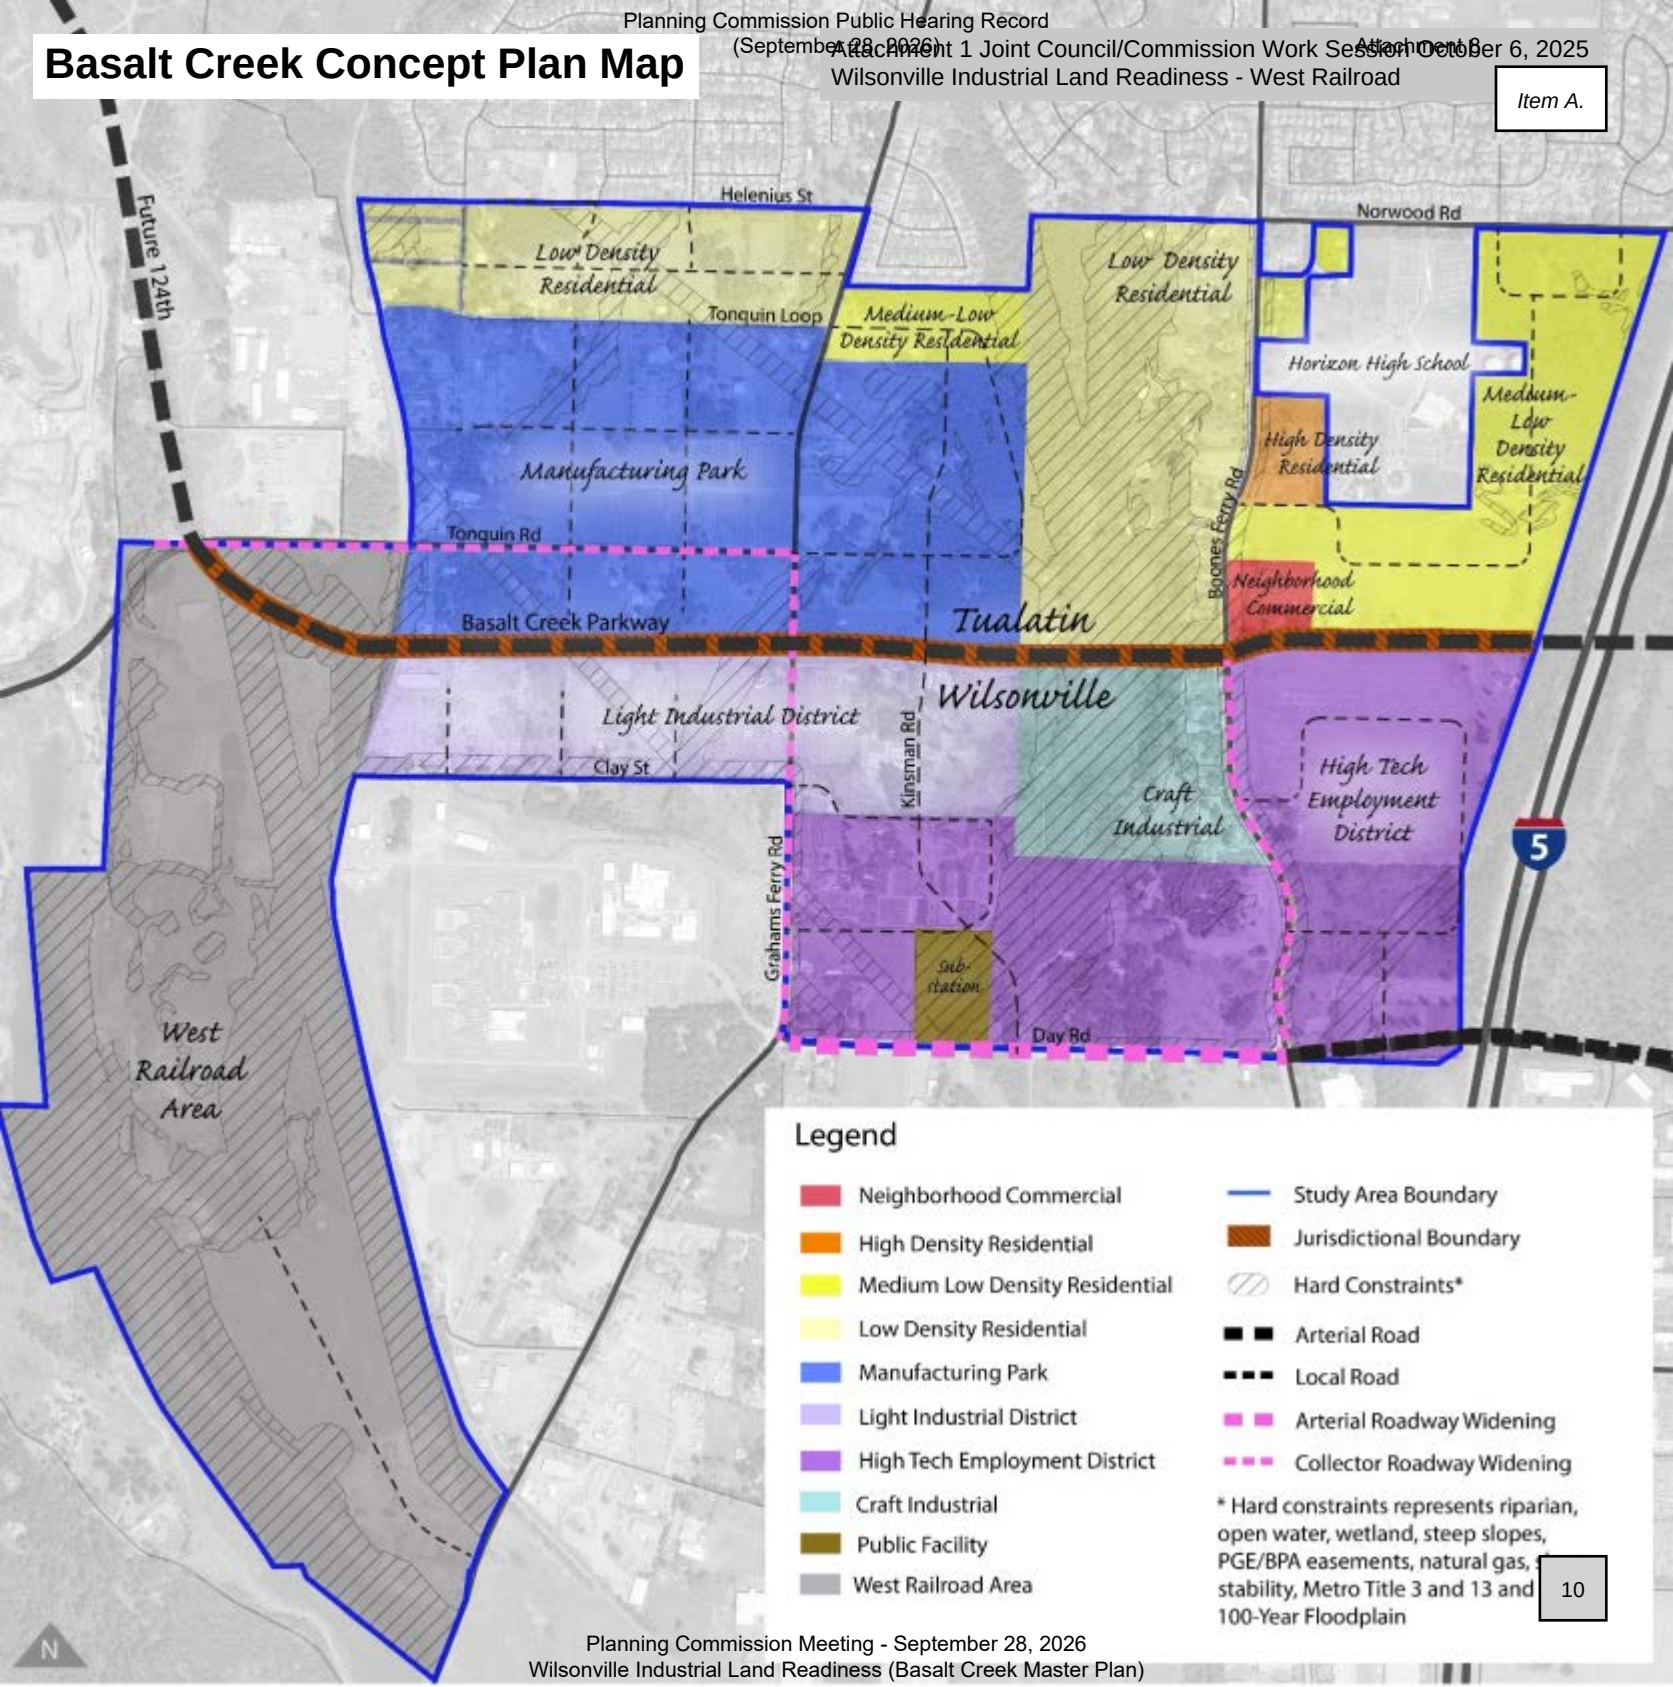
Concept 3: Limited Connectivity with Flexible Land Use
This concept considers a more incremental approach, allowing development and redevelopment to proceed largely through market forces with limited City intervention. Parcel sizes would remain with no incentives for aggregation, and the street network would be limited generally to what is built today with some internal access provided through an internal circulation system. The SW Grahams Ferry Road railroad undercrossing would not be upgraded for freight. This concept would allow a variety of uses generally not found in other parts of Wilsonville, which could include commercial recreation, outdoor retail sales and storage, and other low intensity uses that are generally geared towards a mix of smaller businesses and niche activities within a more modest infrastructure framework.

EXPECTED RESULTS:
City Council and Planning Commission feedback on the three scenarios will guide the development of a preferred concept for land use and the public realm in the West Railroad area. Staff will incorporate this input into the Basalt Creek Master Plan and use it to shape Development Code amendments, including appropriate zoning, to support future development in the area.

TIMELINE:
Staff will hold additional work sessions with the City Council and Planning Commission in the coming months to continue refining the preferred concepts. Public hearings on the Basalt Creek Master Plan and related Development Code amendments are anticipated in early 2026.

CURRENT YEAR BUDGET IMPACTS:
Funding for the WILR project is allocated in the fiscal year (FY) 2025-26 budget from a $290,000 Metro grant.

COMMUNITY INVOLVEMENT PROCESS:
The Basalt Creek Concept Plan review process included comprehensive community involvement. The WILR project has solicited input from Business Oregon, Greater Portland Inc., property owners, and developers to understand the demand for industrial land in Wilsonville and property owners' current and future plans. This input informed preparation of studies and reports and will guide the master plan and related Development Code amendments.



POTENTIAL IMPACTS OR BENEFIT TO THE COMMUNITY:
When developed, Basalt Creek, including West Railroad, will generate jobs, contributing to the income and property tax base, supporting economic mobility through family-wage employment, and enhancing Wilsonville's livability. This will allow the industrial area to reach its full economic potential, positively impacting the greater Wilsonville community.

ALTERNATIVES:
A number of alternatives to public realm and land use planning will be presented at the work session.

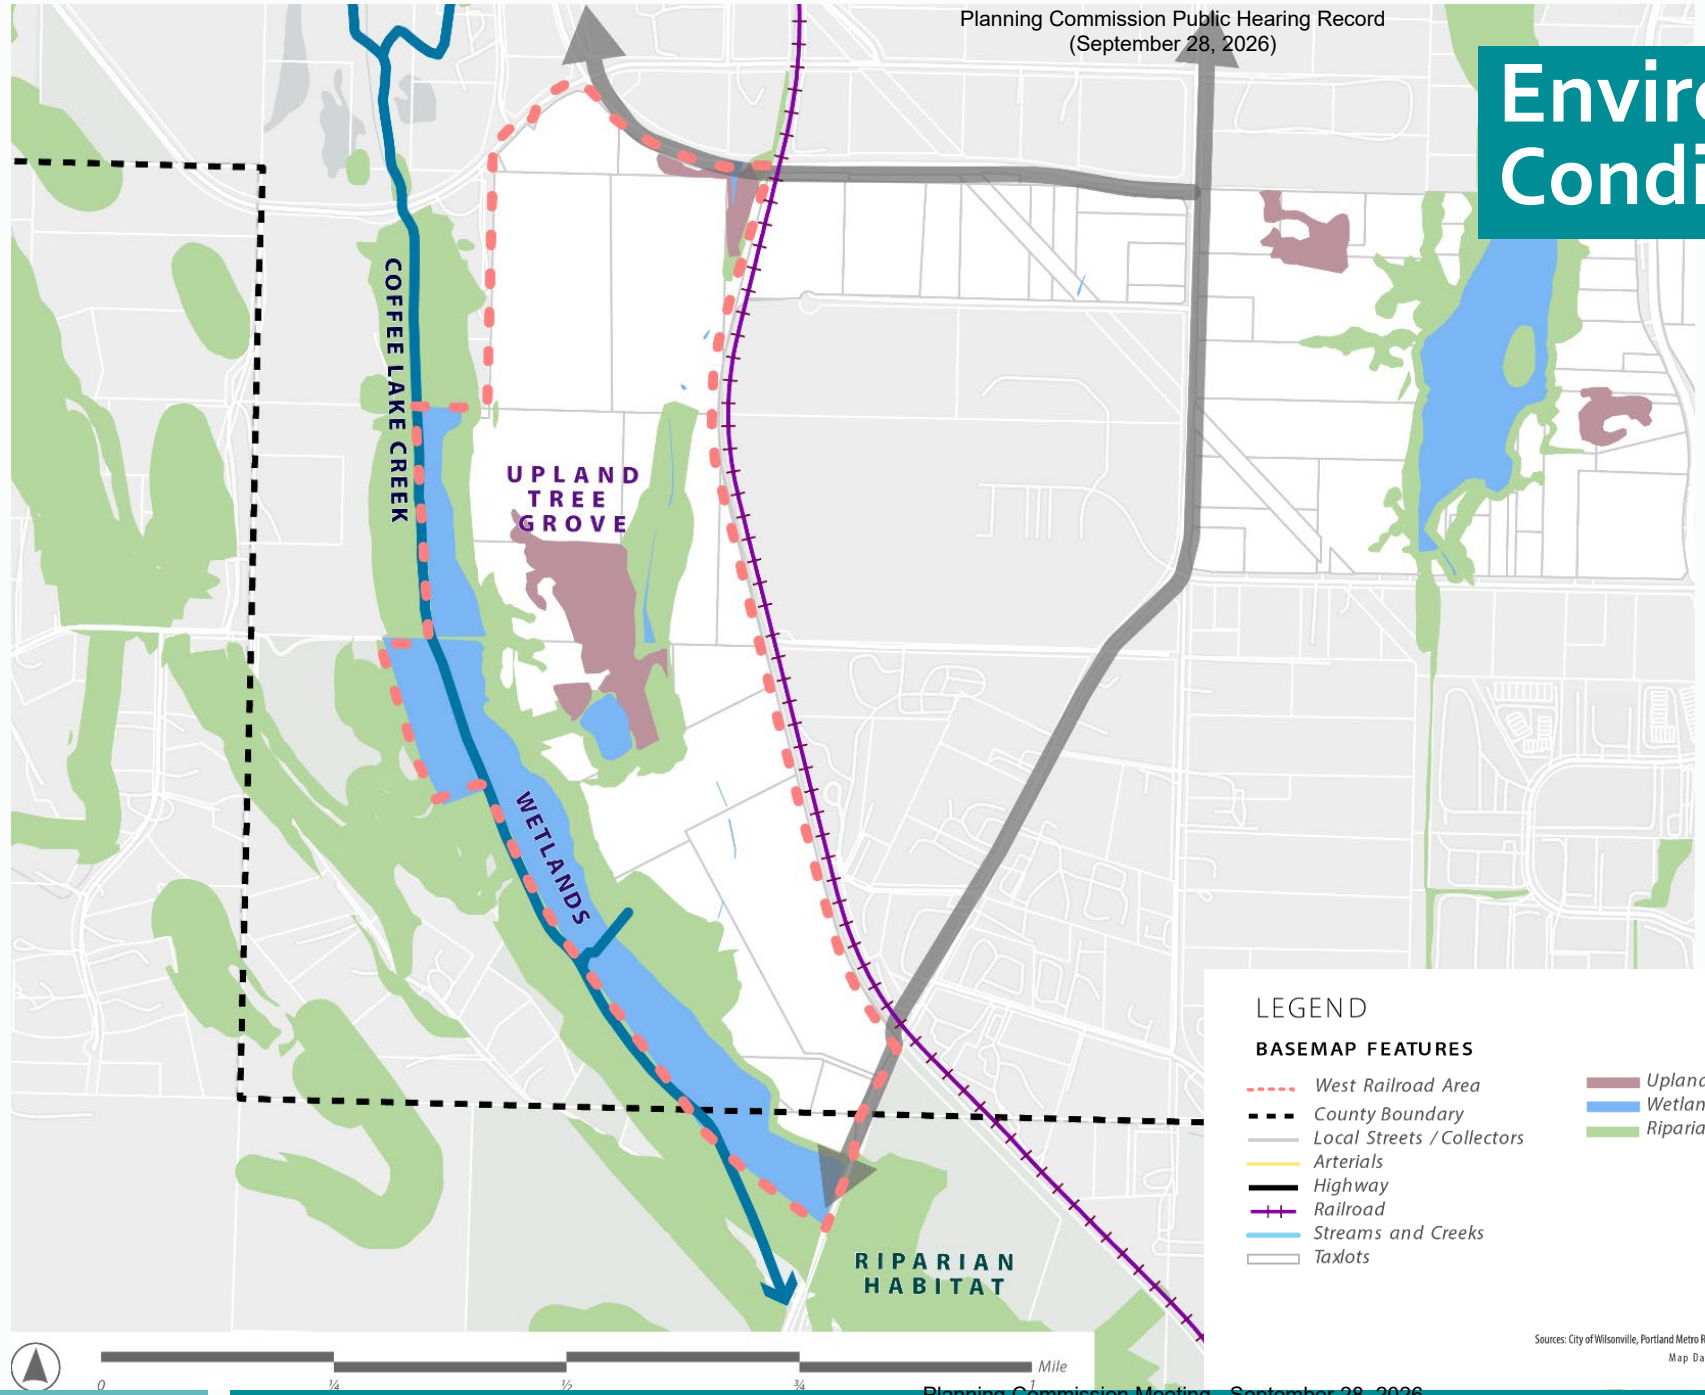
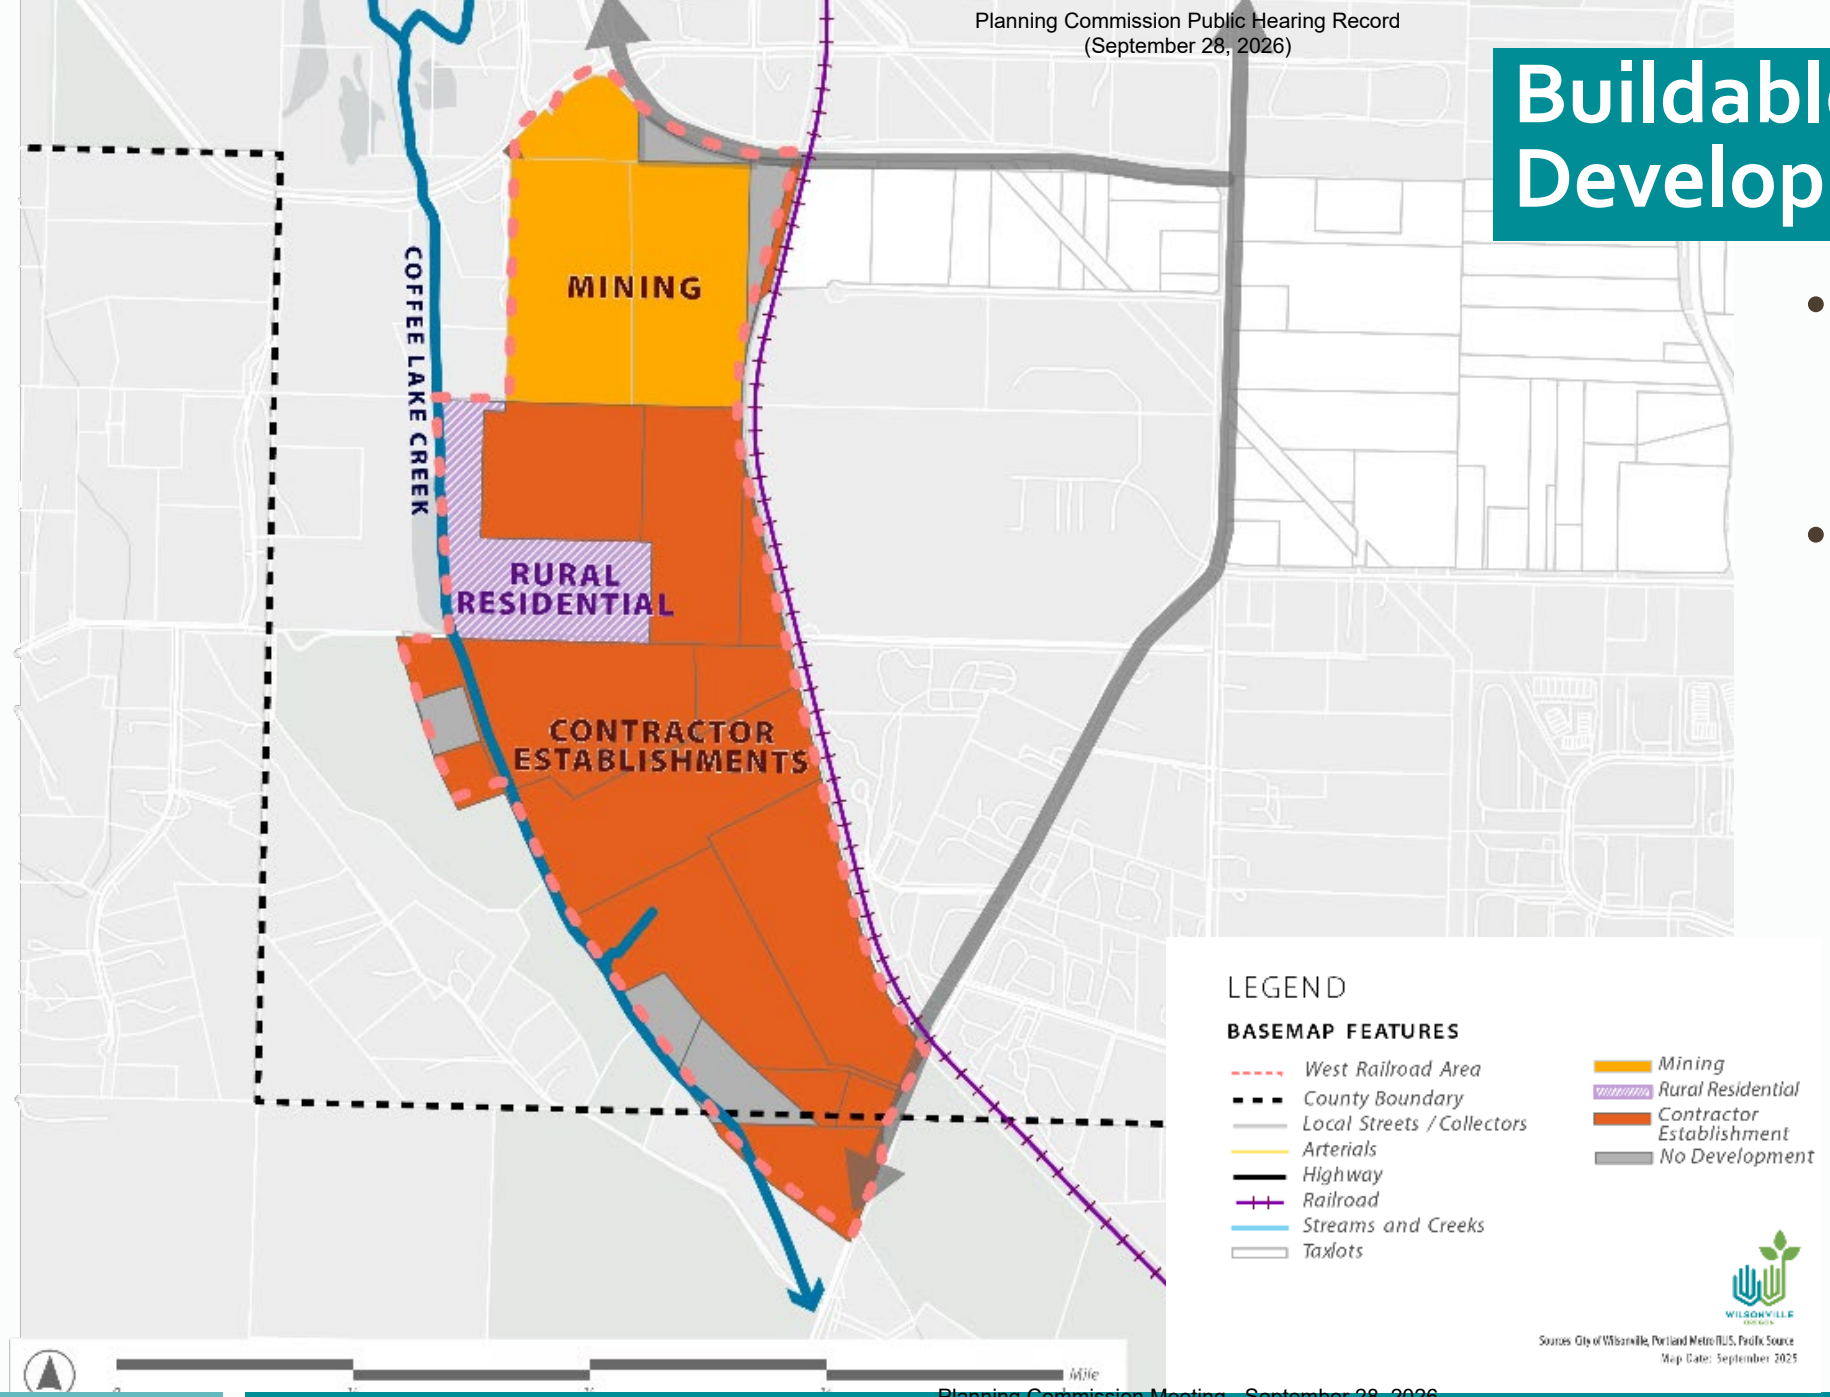
Existing Conditions



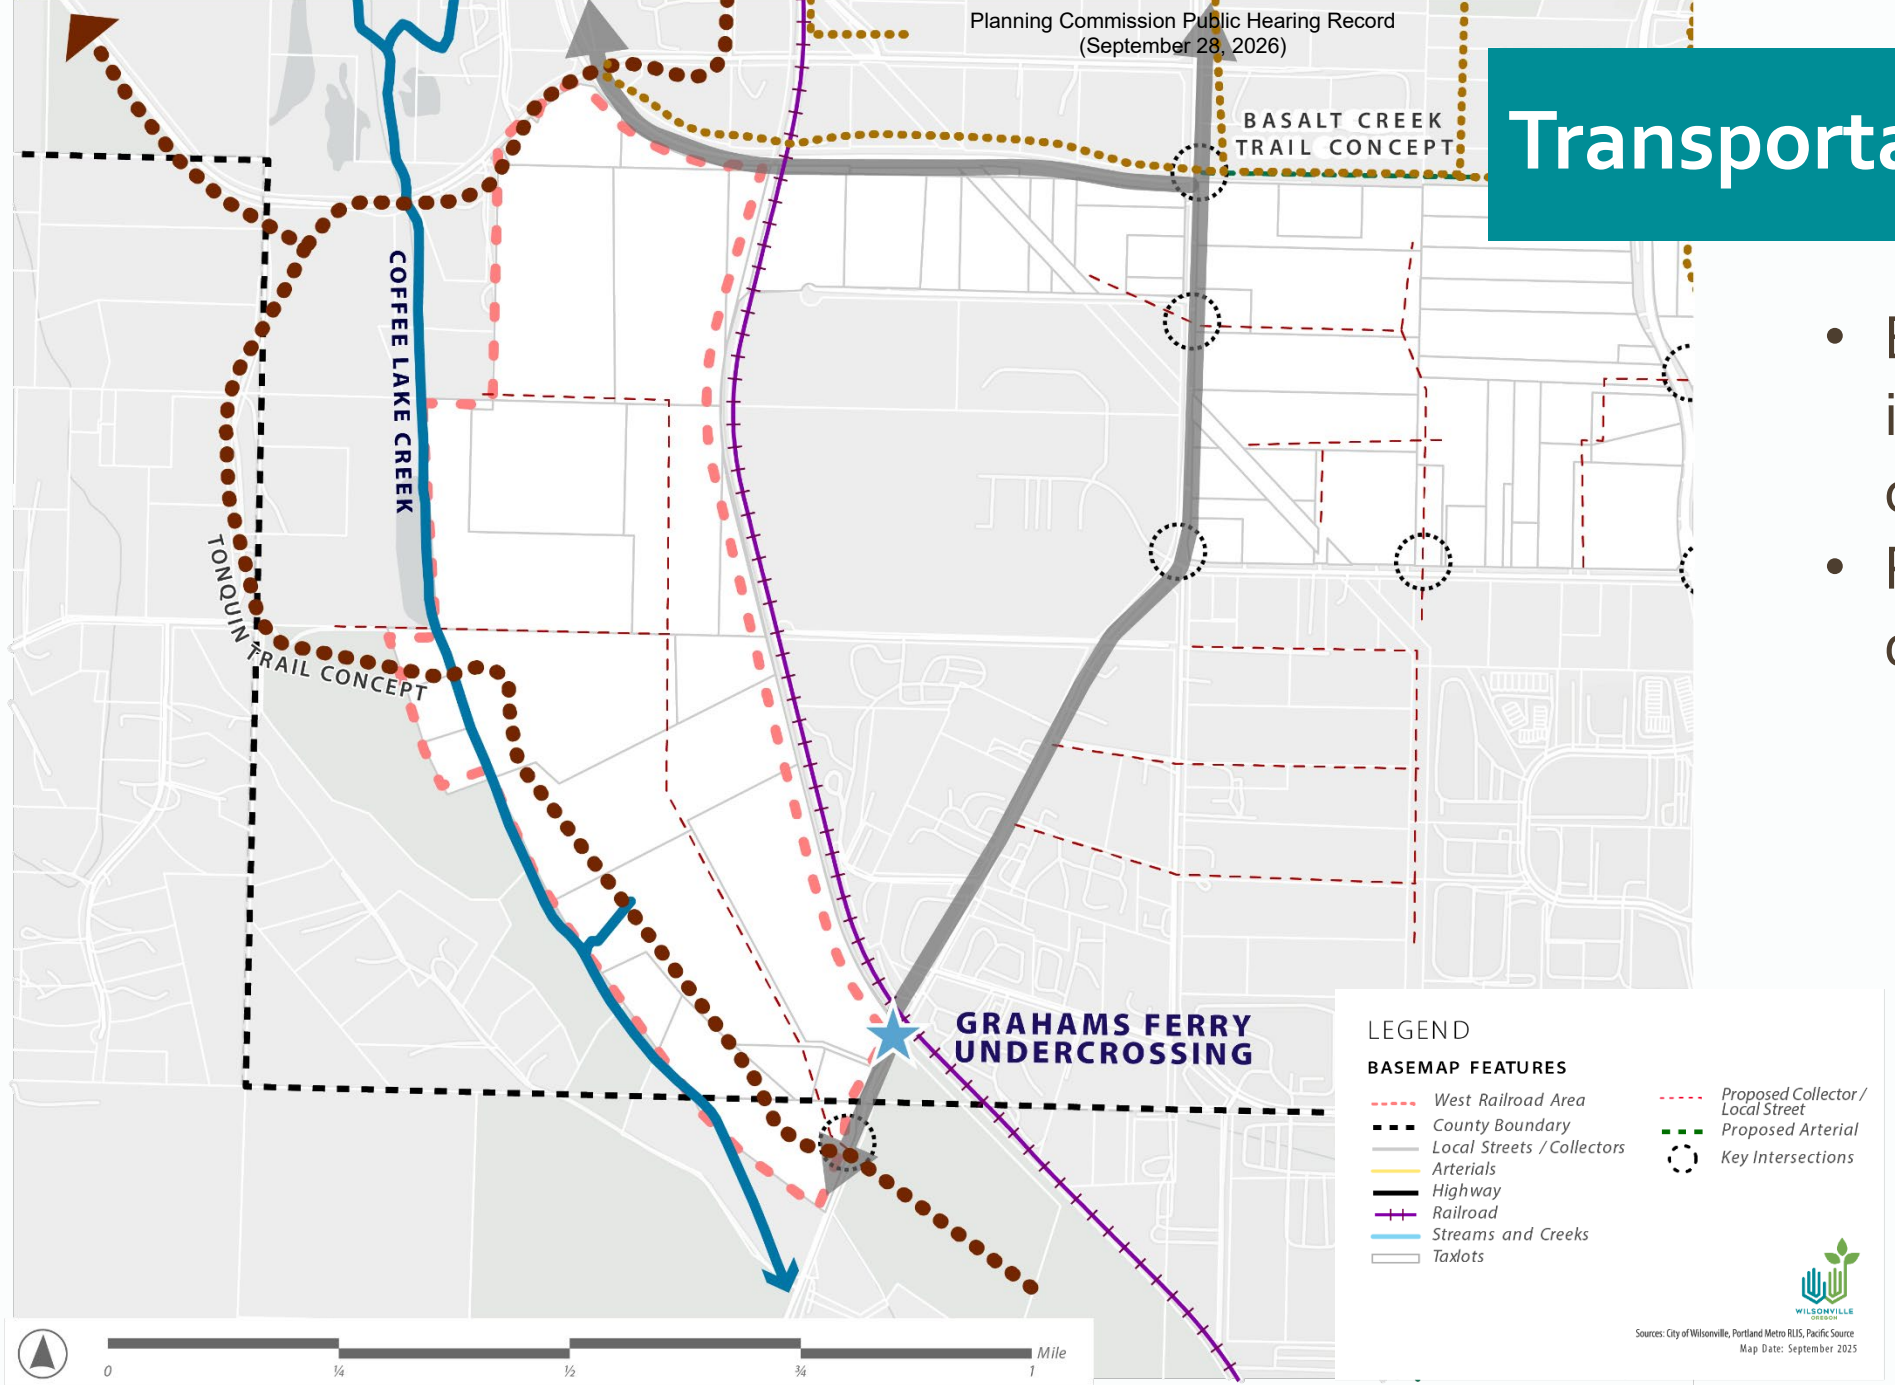
Baseline Maps

- The following basemaps have been consolidated to highlight constraints, opportunities, and to create conceptual frameworks
  - Natural Areas and Constraints
  - Land Ownership
  - Land Use Types
  - Development Status of Tax Lots
  - Infrastructure
  - Connectivity



Environmental Conditions

- Slopes greater than 10% cover 20% of the site area
- 92 acres were considered "unconstrained," about half of the site area



Buildable Lands & Development

- Unconstrained sites are larger in size
- 8 owners in West Railroad, 1 owns 65 acres

Transportation & Access

- Entirety of BCPA is within 5 miles of I-5 and I-205
- Railroad is a divider
  - One ingress / egress at Grahams Ferry Road

Grahams Ferry Road: Freight Traffic Accommodation Evaluation (2025)

- Planning level costs for improvements to Grahams Ferry Road
- Undercrossing of Portland & Western Railroad
  - Too low for freight trucks
- Estimated $33.0 M - $37.5 M in construction costs

Opportunities & Challenges

Opportunities & Strengths

- Location and proximity to Metro, distributors, and other manufacturers
- Large parcels and regional transportation suitable for manufacturing, food processing, warehousing and distribution
- Development-ready sites and interested stakeholders

Limitations & Weaknesses

- Entrances to the area
- Fragmented land ownership and contractor establishments
- Limited utility infrastructure
- Balancing development goals with market realities
- Restrictive zoning in certain areas

Guiding Development in the BCPA

Basalt Creek Concept Plan Guiding Principles

Market-driven

- *Meet regional responsibility for jobs and housing*
- *Maximize assessed property value*

Balanced

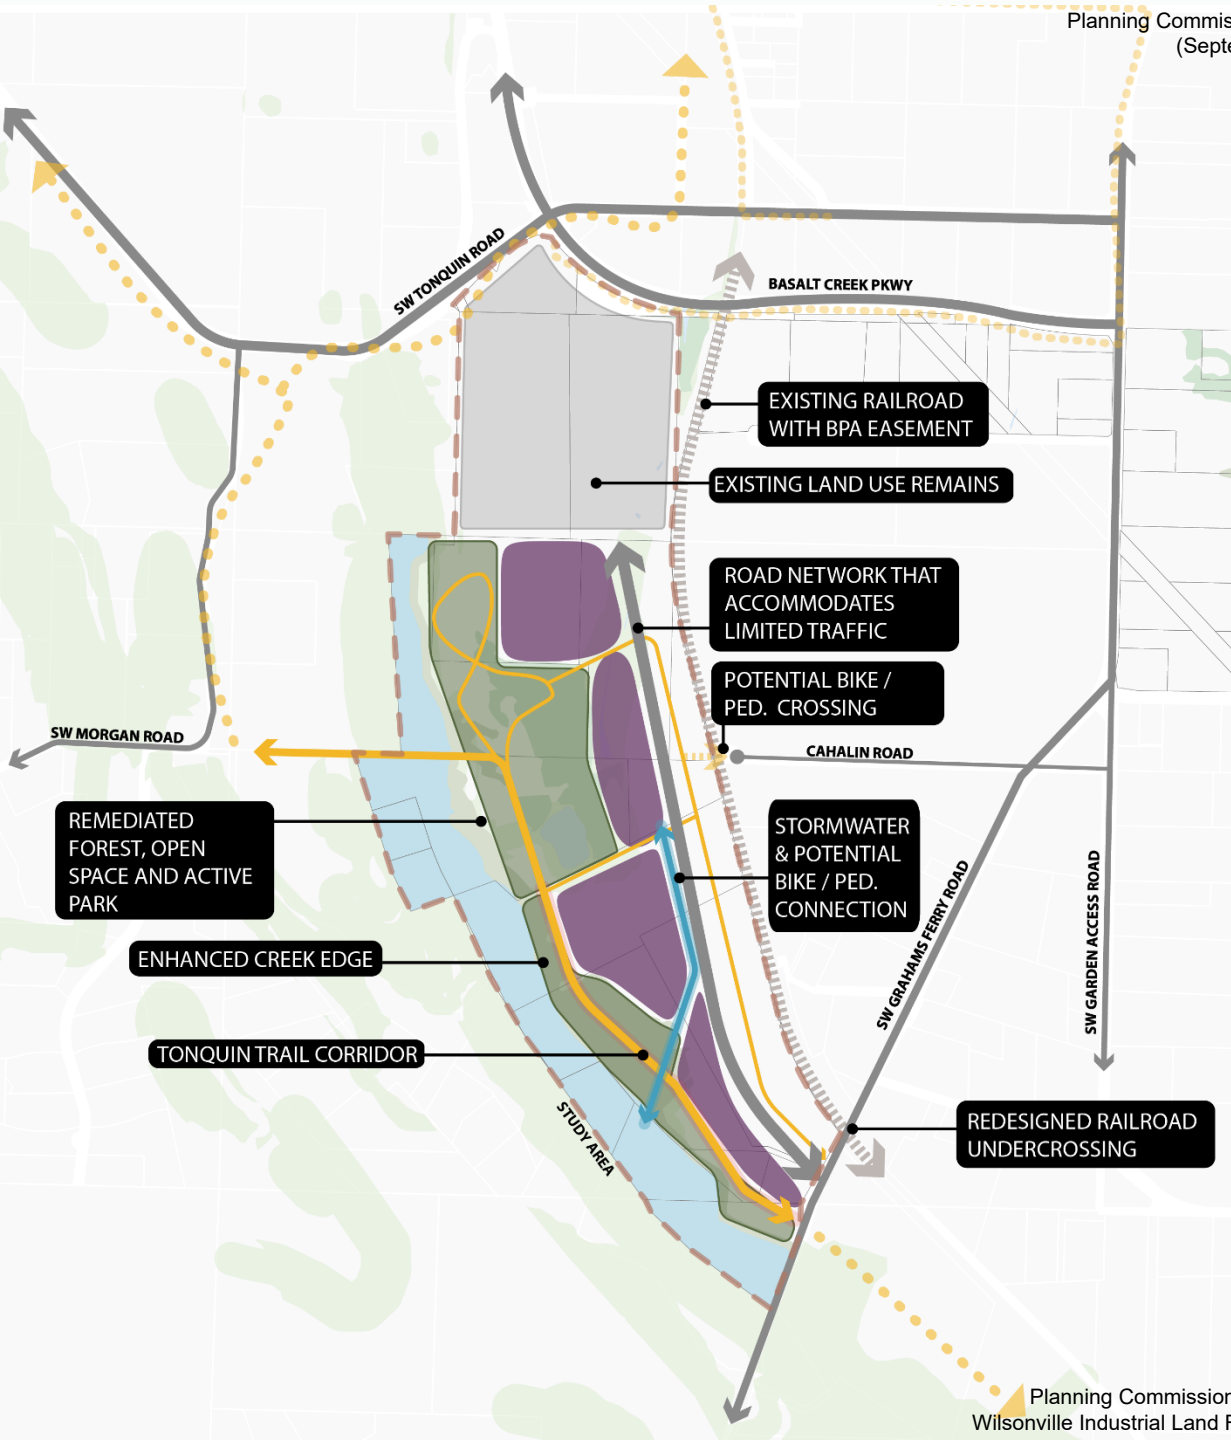
- *Capitalize on the area's unique assets and natural location*
- *Explore creative approaches to integrate jobs and housing in the Craft Industrial land use type*
- *Ensure appropriate transitions between land uses*
- *Design cohesive and efficient transportation and utility systems*

Basalt Creek Concept Plan Guiding Principles

Aspirational

- *Maintain and complement Wilsonville's unique identity*
- *Create a uniquely attractive business community unmatched in the metropolitan region*
- *Incorporate natural resource areas and provide recreational opportunities as community amenities and assets*

Urban Design Concepts



How We Got Here

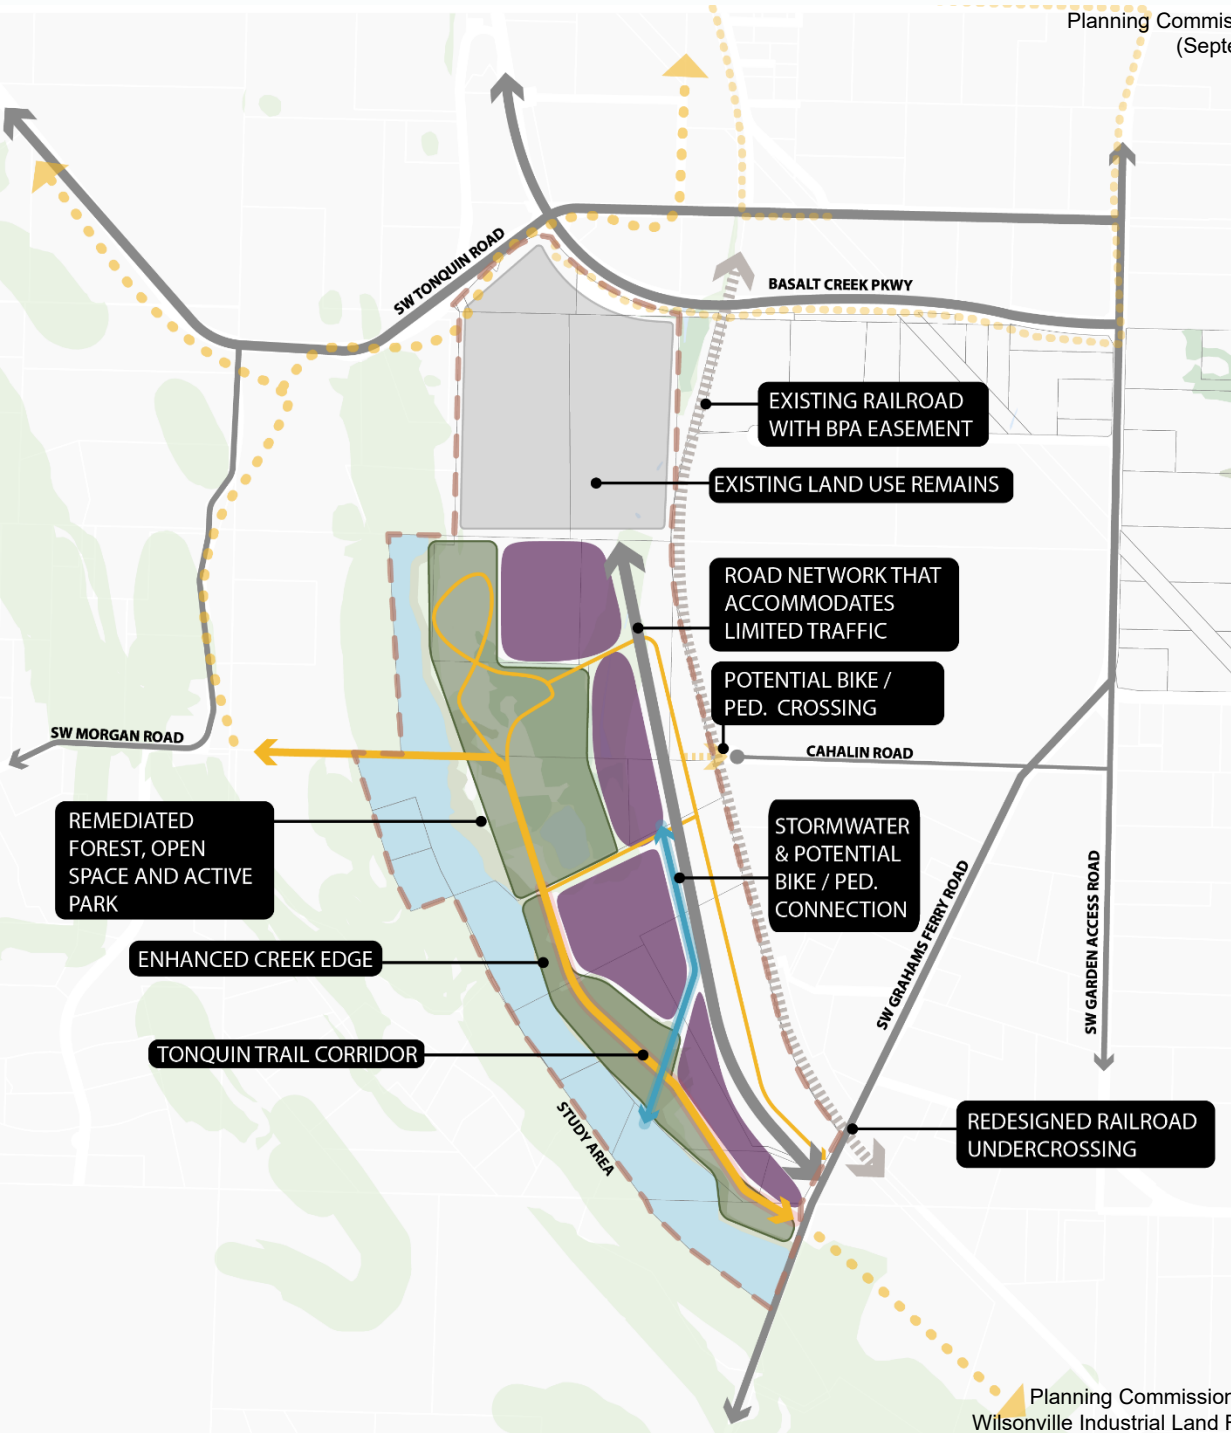
- Collaborative work session with staff
- Asking 'What if' questions:
  - What if we started with nature first?
  - What if we had full access to the regional transportation network?
- **Outcome: three preliminary concepts for feedback, discussion, and refinement**

Universal Implementation Needs

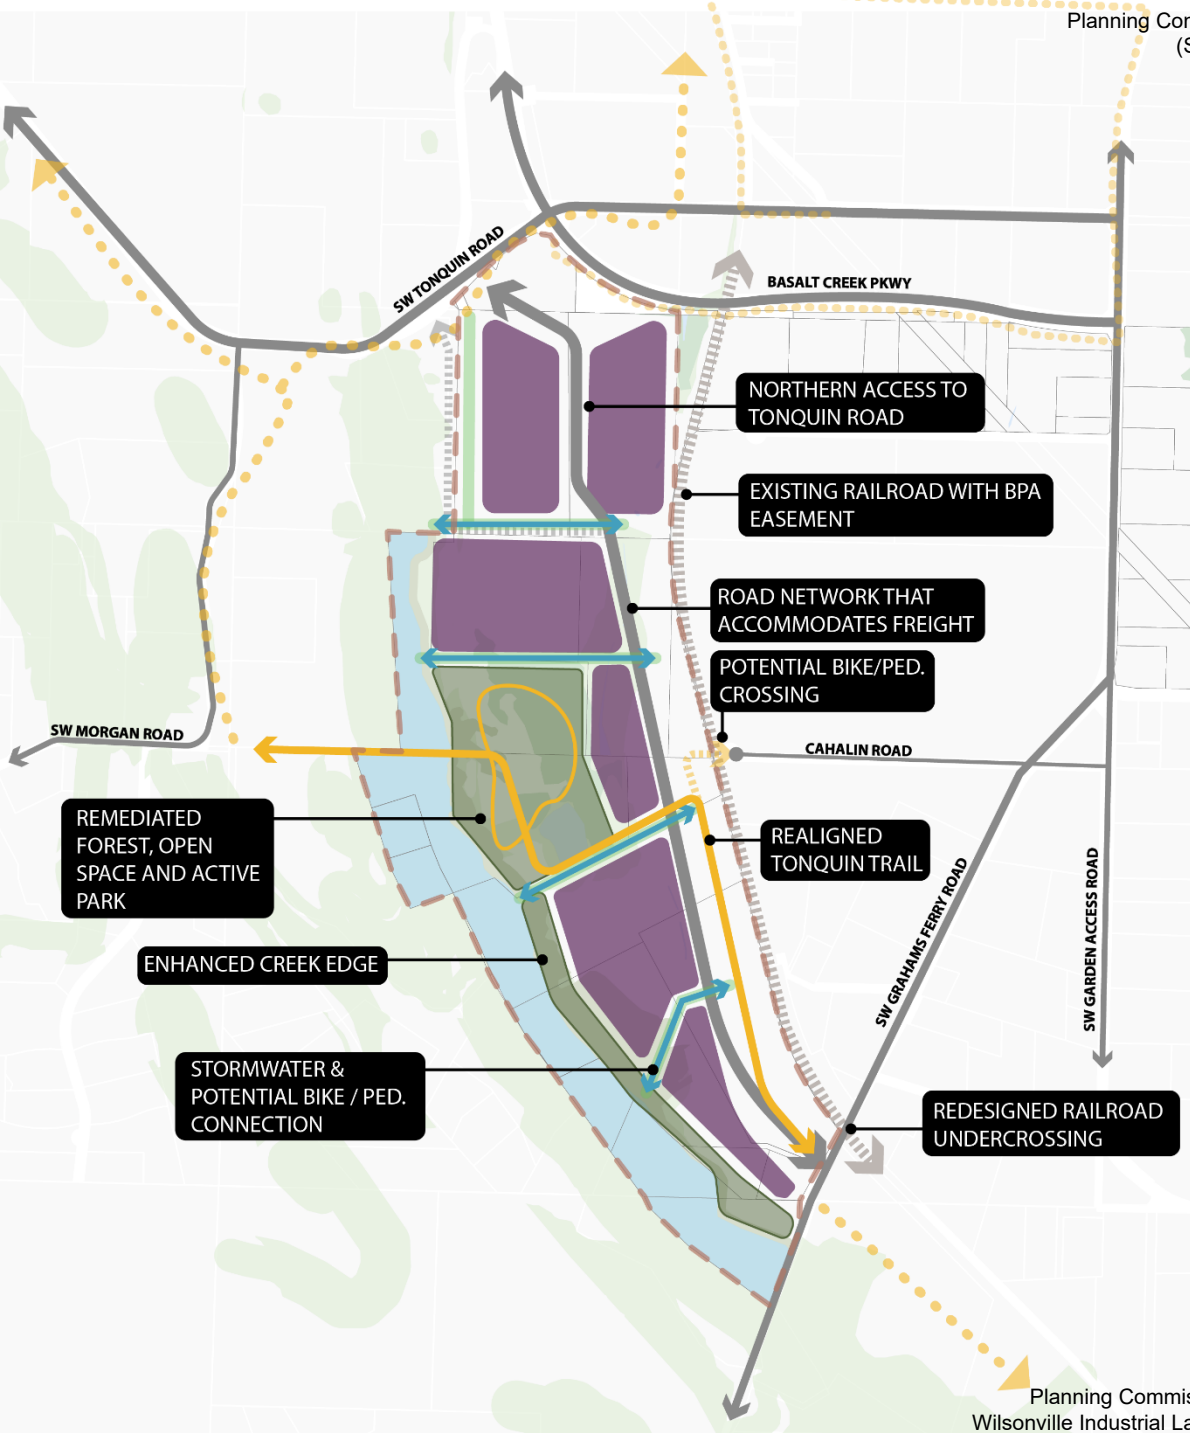
- Annexation and City zoning
- Building infrastructure and improving connectivity
- Applying City standards
- Interagency coordination

- District centered on **Coffee Creek Wetlands, Coffee Lake Creek, and Tonquin Ice Age Trail**
- Strong **connections to Basalt Creek Parkway**

C1: Tonquin Environment

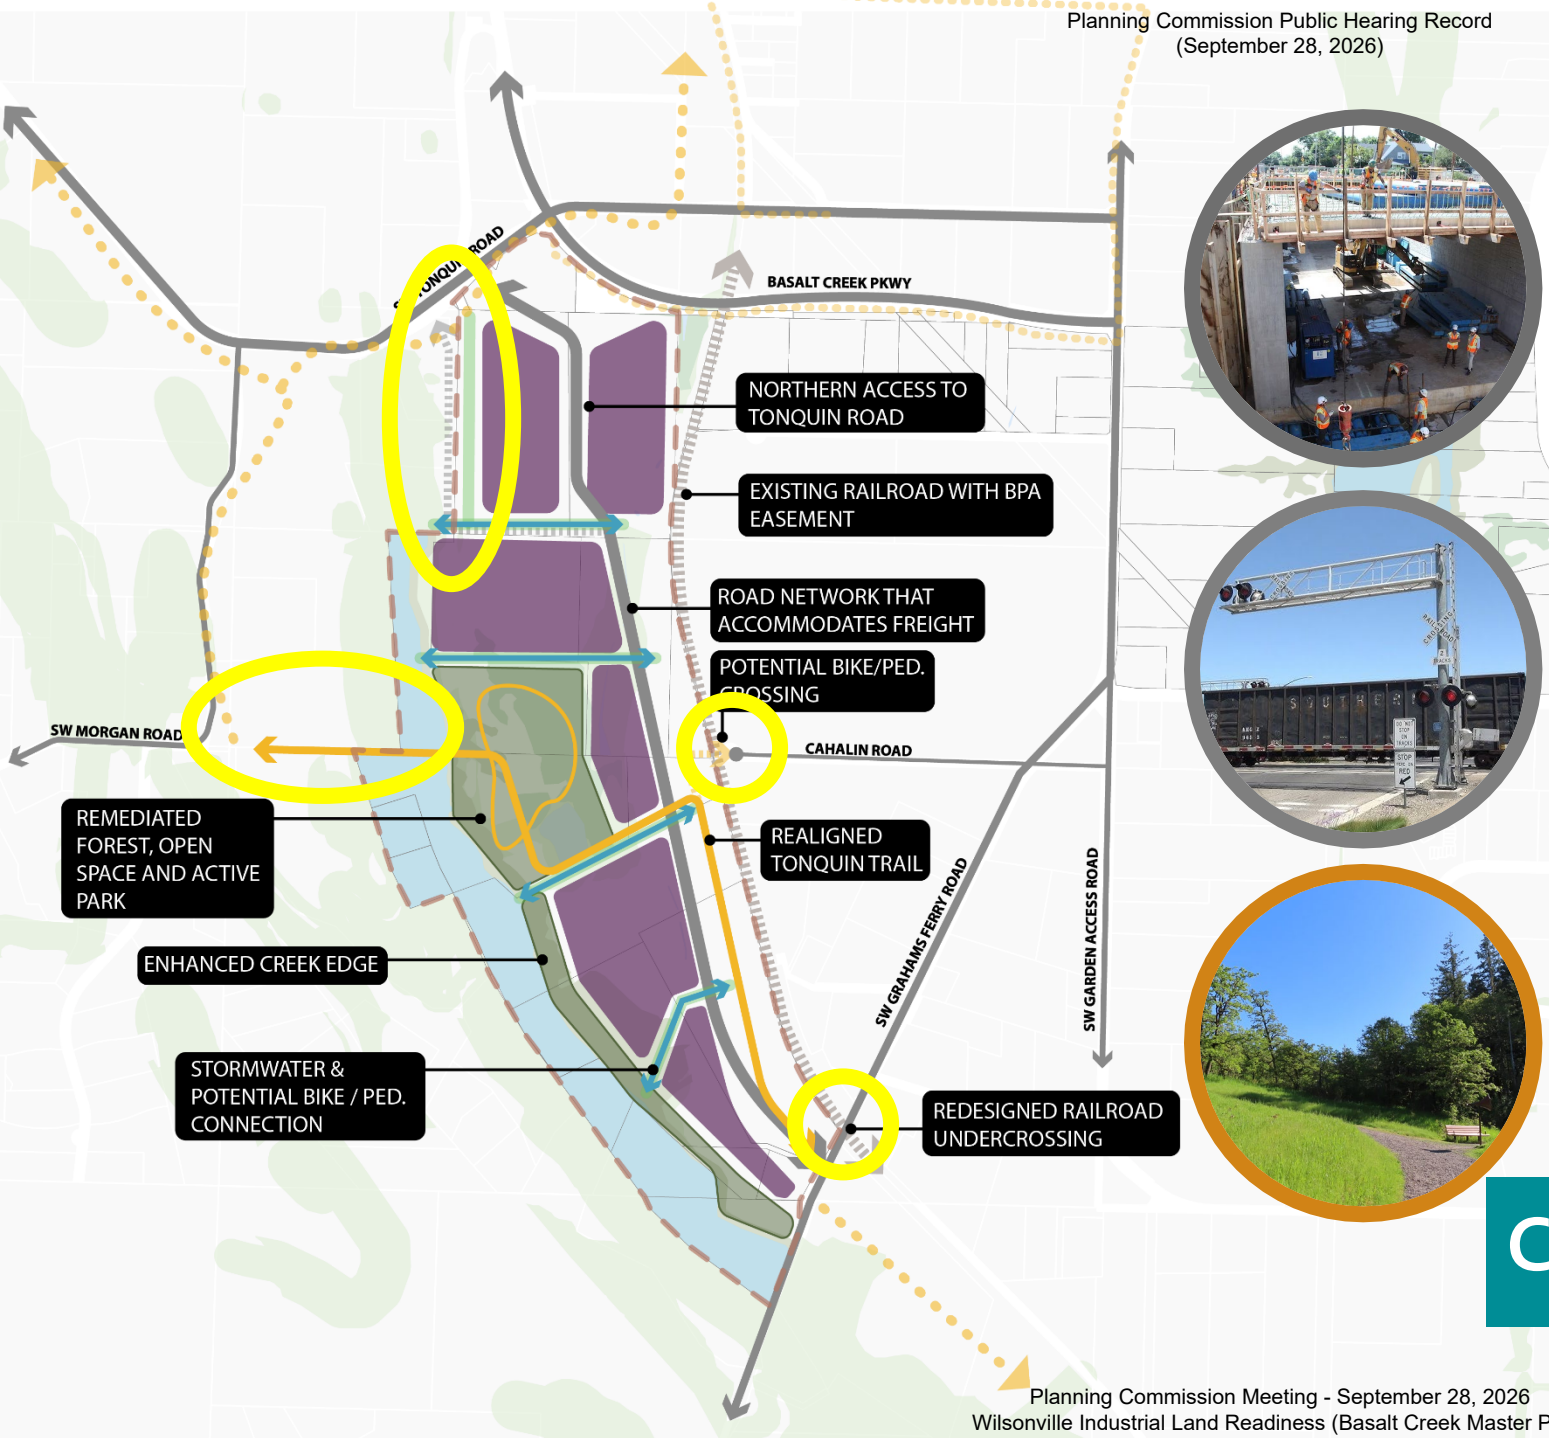


C1: Tonquin Environment



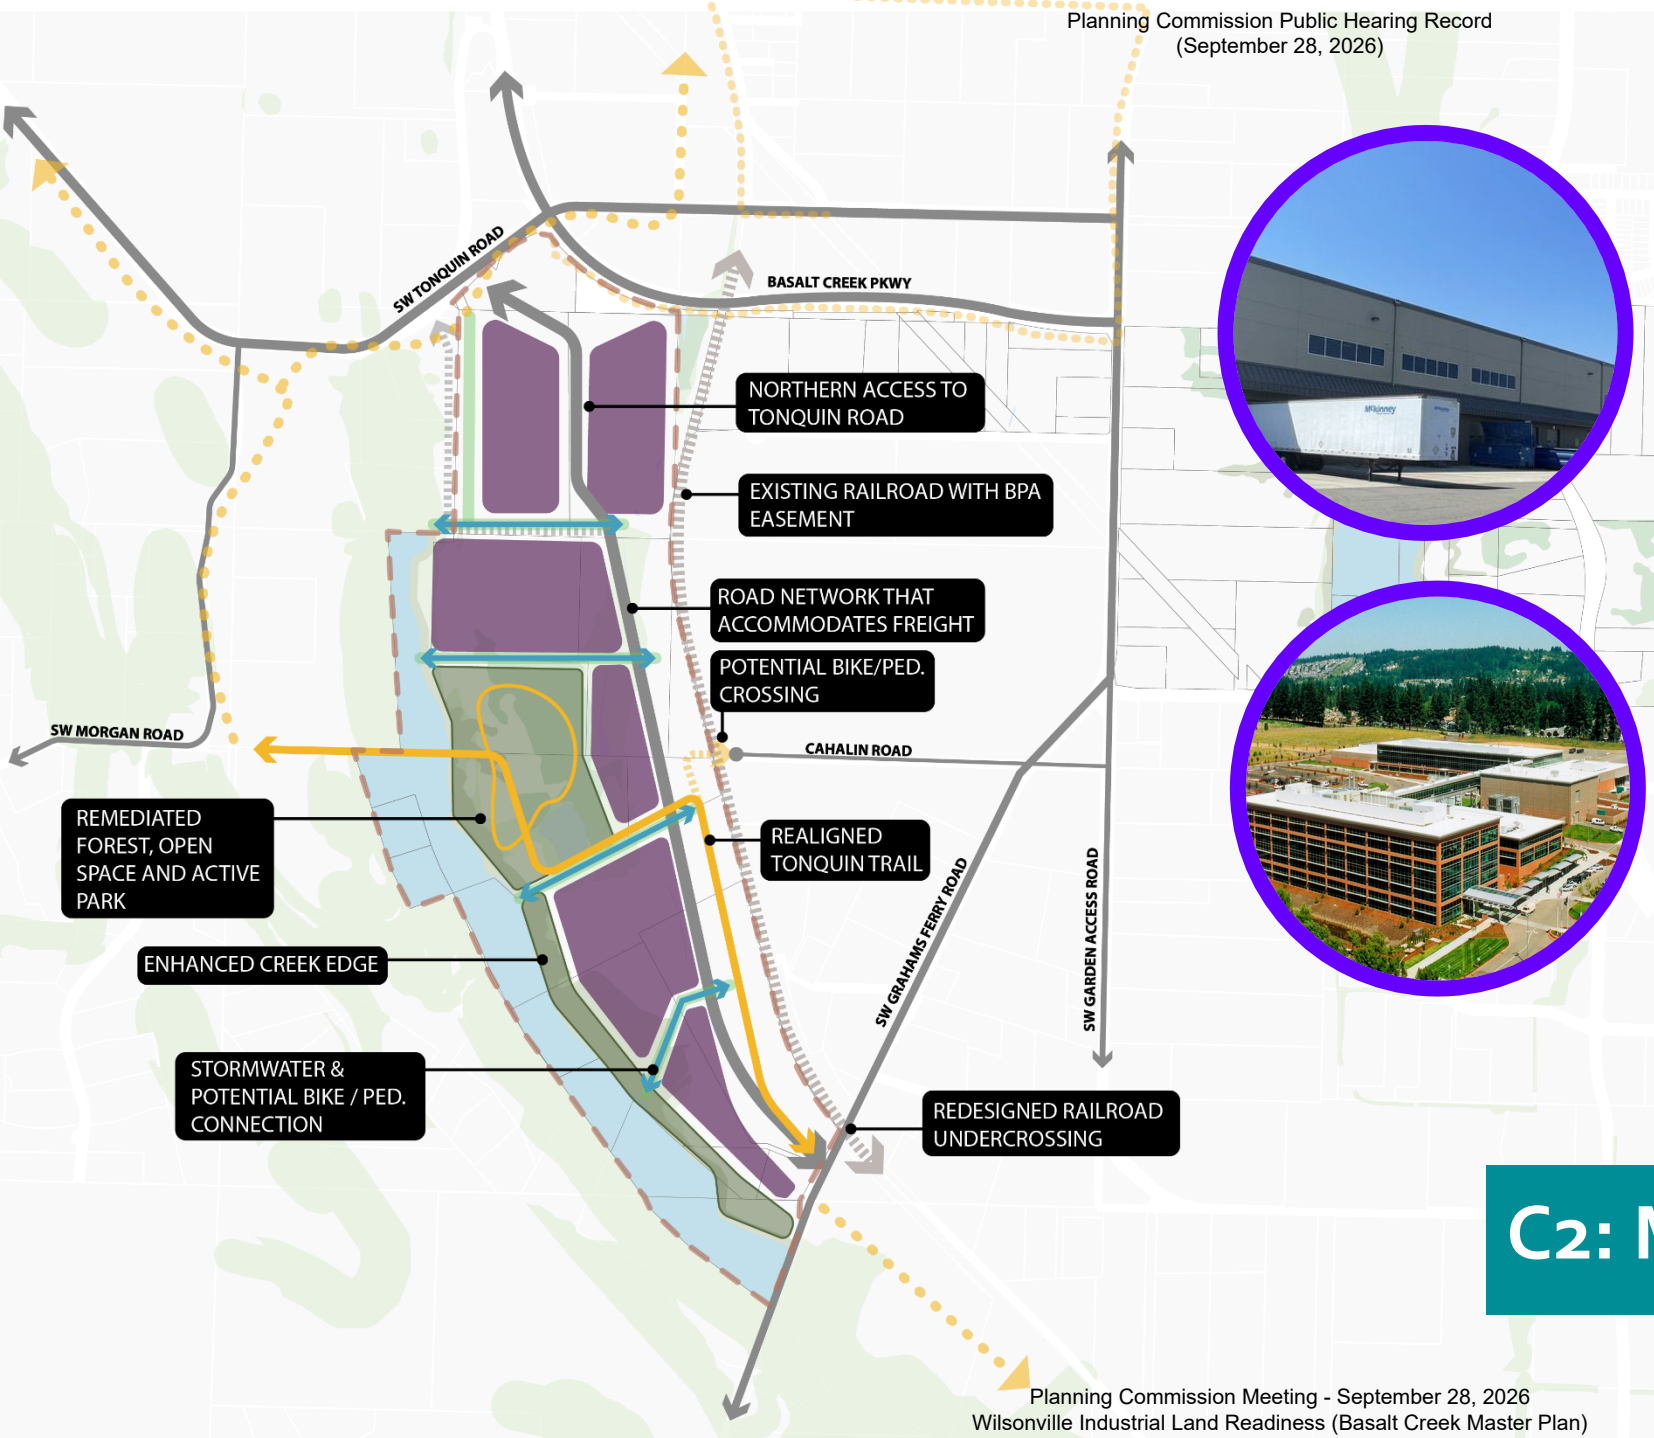
- Campus-style development
- Craft industrial uses
- Small-scale office & manufacturing
- Specialized employers

C1: Tonquin Environment



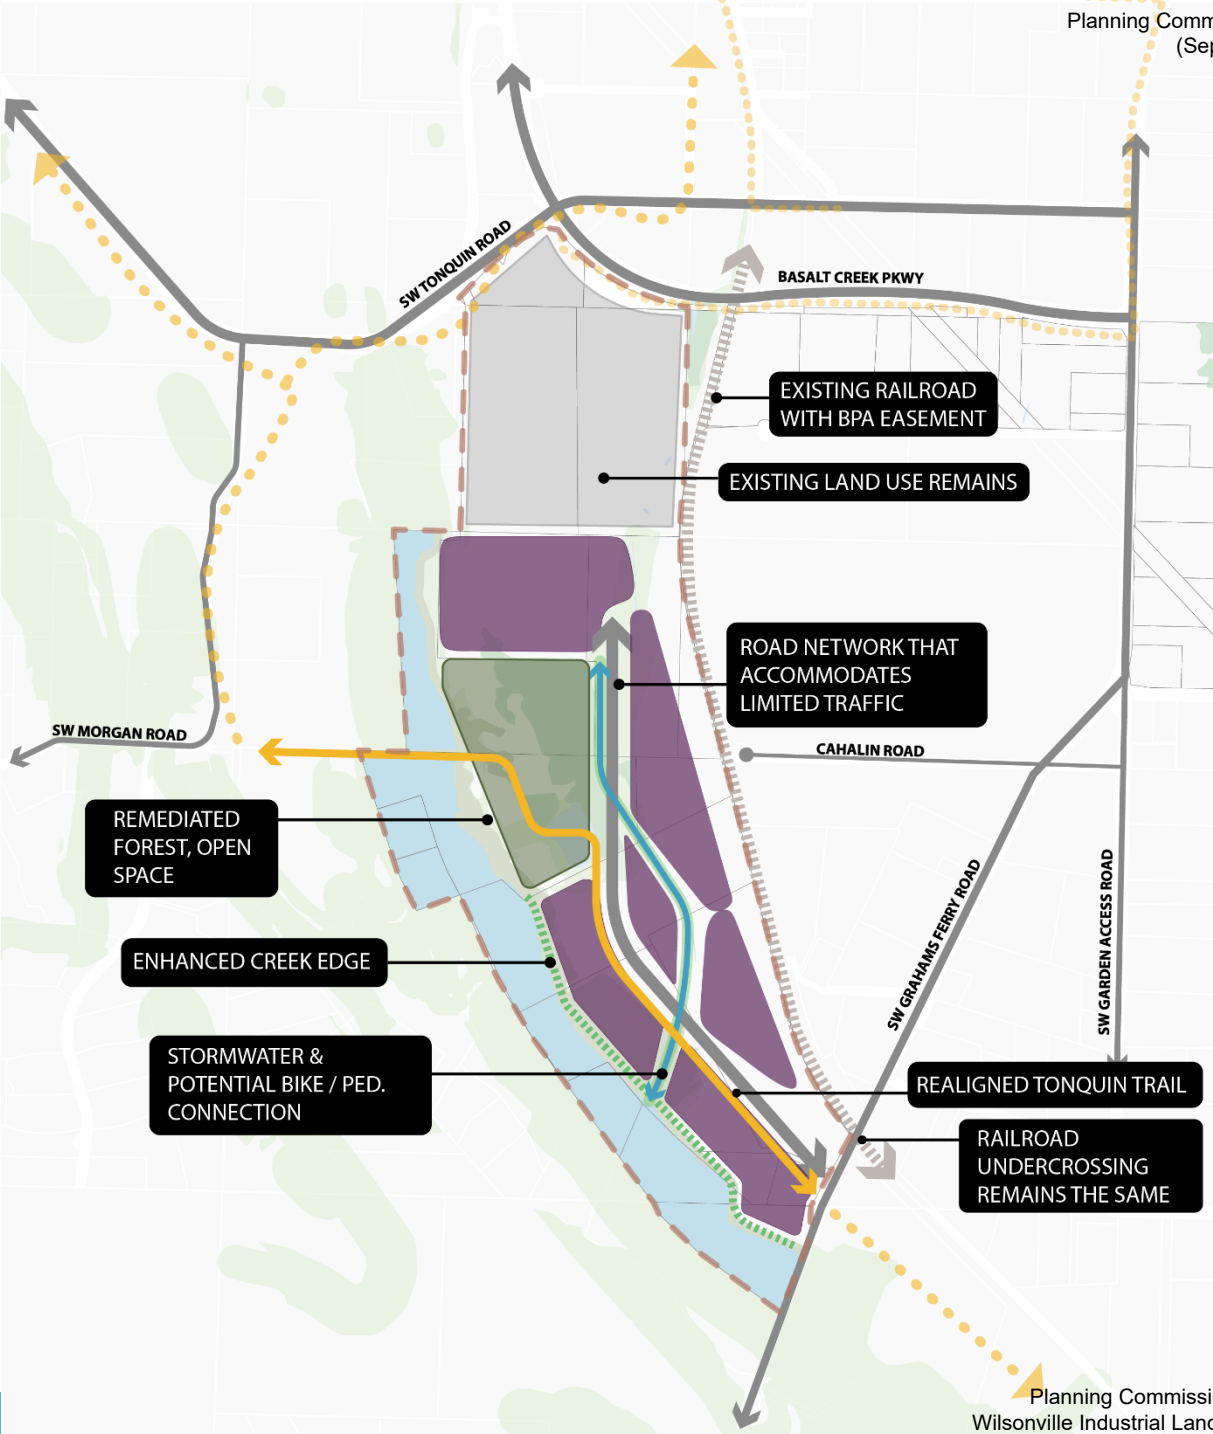
- **Primary draw:** access to high-quality **natural & recreational amenities**
- Positioned as a **unique employment & innovation district**
- **Economic activity** intersects with **ecological stewardship**

C1: Tonquin Environment



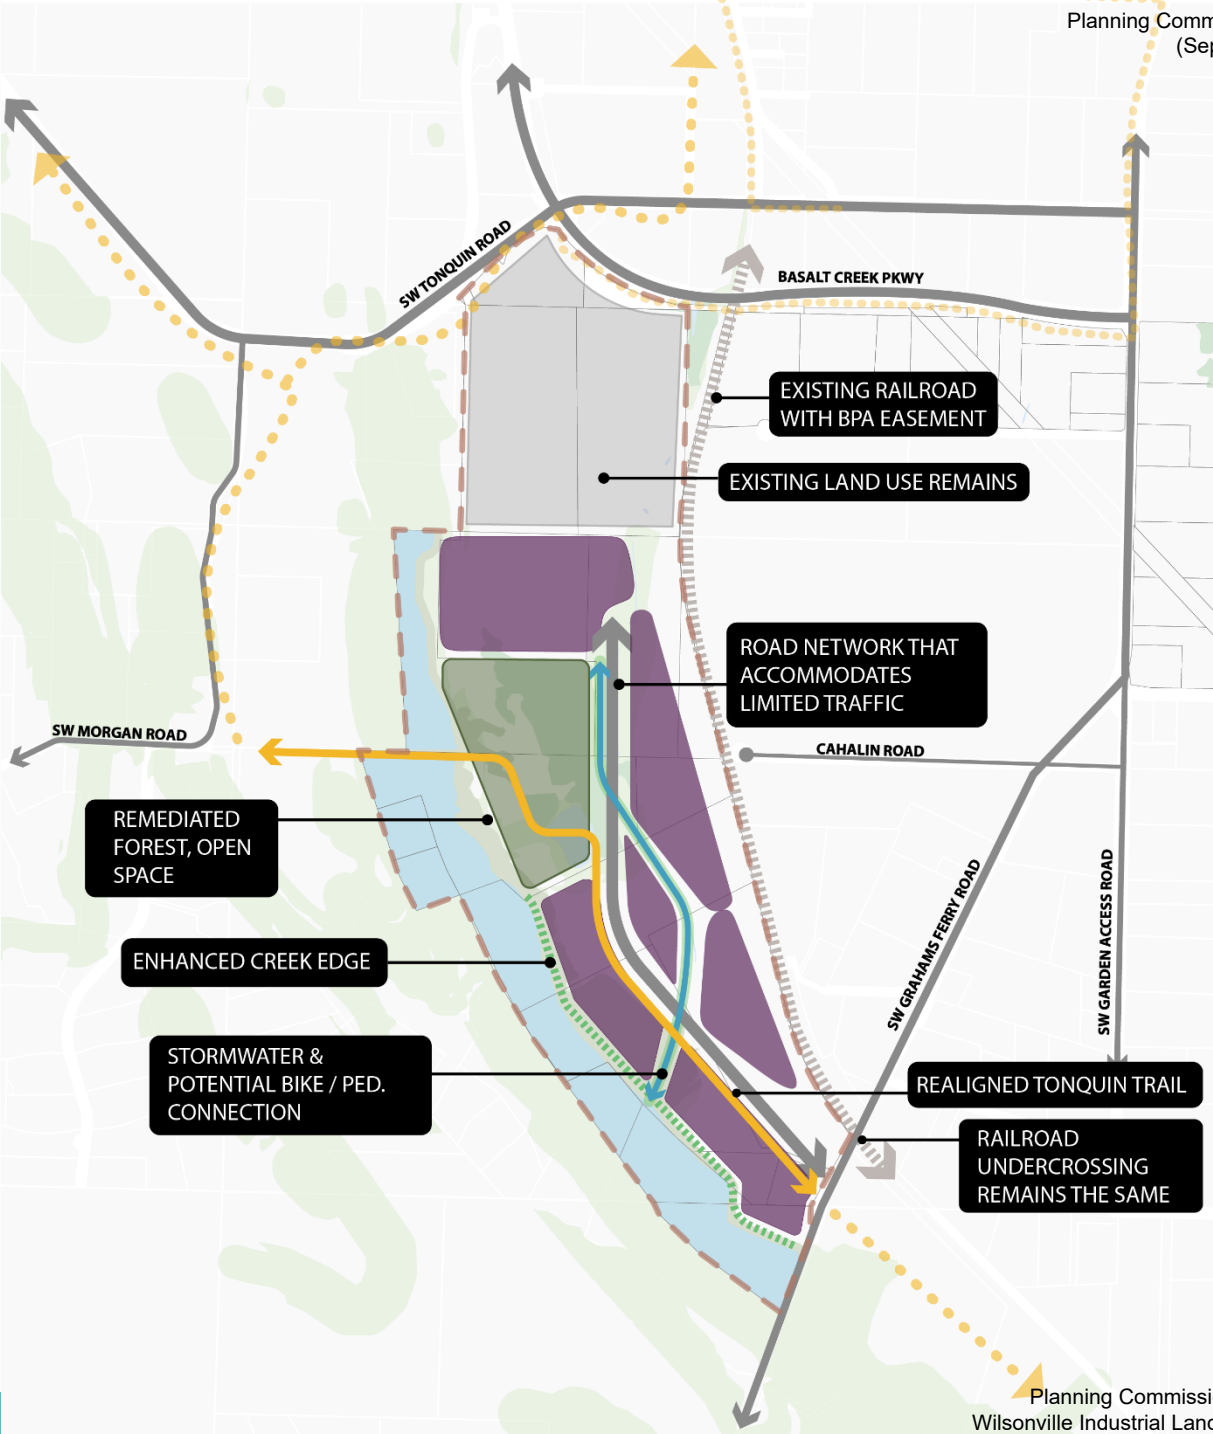
- **Maximizes employment potential** through full access to regional transportation network
- **City strategies:**
  - Incentives for parcel assembly
  - Targeted infrastructure investments

C2: Manufacturing & Industry



- Upgrade Graham's Ferry Road railroad undercrossing (freight movement)
- Enable Cahalin railroad crossing
- Enhance northern & western connections

C2: Manufacturing & Industry



- Encourages **high-density employment development:**
  - Large-scale industrial
  - Office development

C2: Manufacturing & Industry

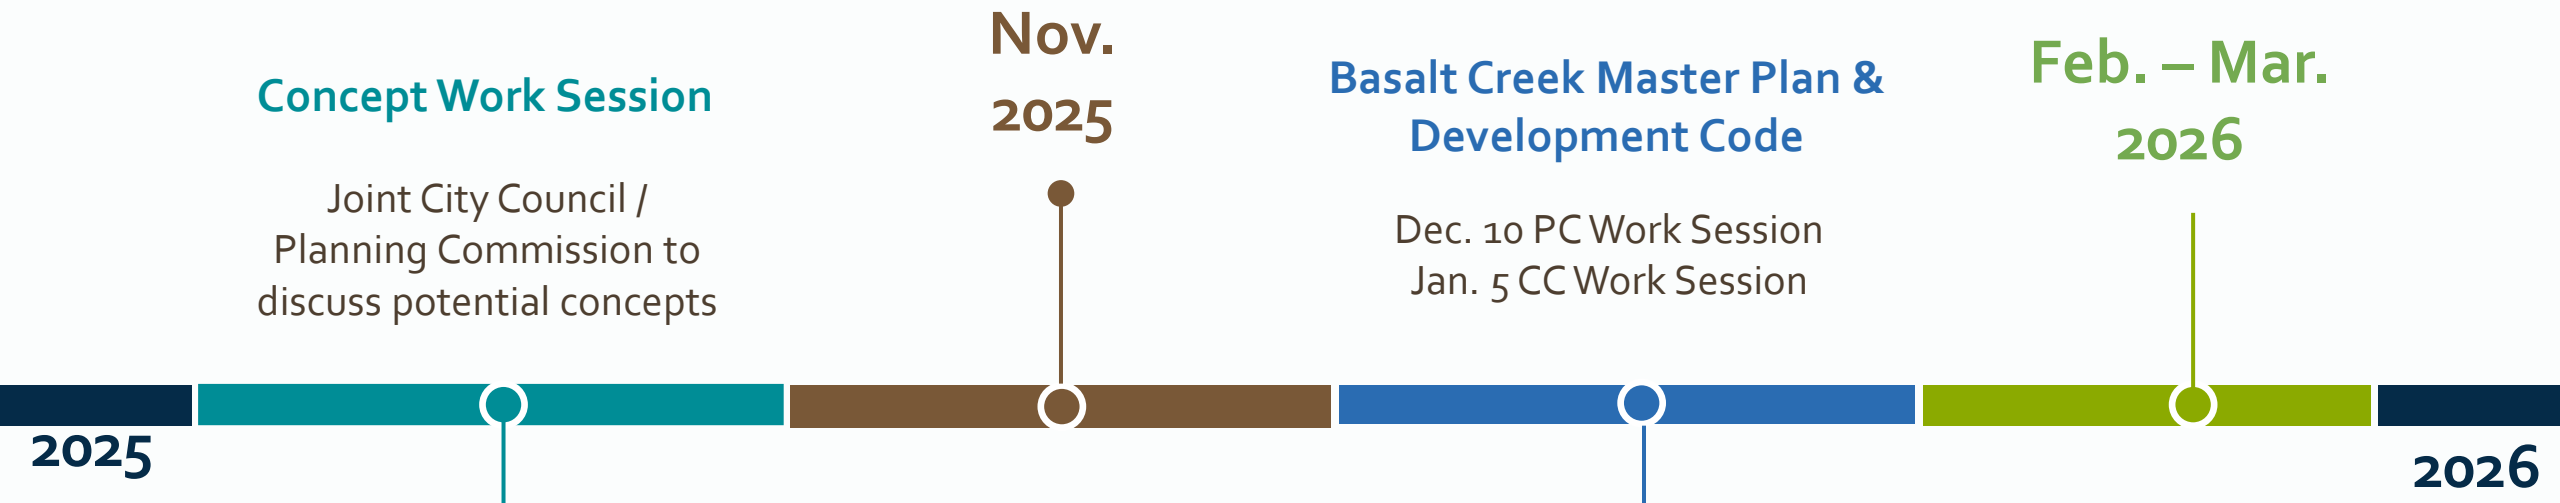
- **Incremental, market-driven approach** with limited City intervention
- **No freight upgrade** to the railroad undercrossing
- Allows **variety of unique uses** not typical elsewhere in Wilsonville

C3: Limited Connectivity with Flexible Land Use

- **Street network largely as built today**
  - Some internal circulation added
  - Supported by **modest infrastructure** network

C3: Limited Connectivity with Flexible Land Use

- Commercial recreation
- Outdoor retail sales & storage
- Low-intensity, small business uses
- Other niche activities



C3: Limited Connectivity with Flexible Land Use

JOINT CITY COUNCIL AND PLANNING COMMISSION WORK SESSION [5:00 PM]

REVIEW OF AGENDA AND ITEMS ON CONSENT

There was none.

COUNCILOR'S CONCERNS

There was none.

JOINT CITY COUNCIL & PLANNING COMMISSION WORK SESSION

1. Wilsonville Industrial Land Readiness (Basalt Creek - West Railroad)

The City Council and Planning Commission held a joint meeting to hear and discuss framework that was being established to guide future development of land located west of the railroad tracks within the Basalt Creek Planning Area. The goal of the Wilsonville Industrial Land Readiness Plan was to define land use policy to make the area development ready as staff worked concurrently on infrastructure financing and to take actions over time to support commercial/industrial growth and trail connections within the area.

ADJOURN [6:34 PM]

EXECUTIVE SESSION [6:48 PM]

MAYOR'S BUSINESS

4. Upcoming Meetings *(Link to City Calendar: https://www.wilsonvilleoregon.gov/calendar)*

The Mayor made announcements.

COMMUNICATIONS

5. Community Enhancement Project Update: Book Bike

It was announced that this presentation would be rescheduled for a future date.

6. Building Tomorrow Today award from the Oregon Chapter of the American Planning Association for the Vuela Project.

Staff shared that the Oregon Chapter of the American Planning Association (OAPA) had awarded the City its Building Tomorrow Today Award. This honor acknowledged the City's work to vision, plan, leverage partnerships, and constructed Vuela, a 121-unit multi-family dwelling located at the Wilsonville Transit Center that was to provide housing opportunities for residents making less than 80% of the Area Median Income (AMI).

Prior to the presentation staff and Council recognized a few of the many contributions of long-time Planning Manager Dan Pauly, who was concluding his 17-year employment with the City and moving out of state at the end of the month.

CITIZEN INPUT AND COMMUNITY ANNOUNCEMENTS

This is an opportunity for visitors to address the City Council on any matter concerning City's Business or any matter over which the Council has control. It is also the time to address items not on the agenda. It is also the time to address items that are on the agenda but not scheduled for a public hearing. Staff and the City Council will make every effort to respond to questions raised during citizen input before tonight's meeting ends or as quickly as possible thereafter. Please limit your comments to three minutes.

COUNCILOR COMMENTS, LIAISON REPORTS AND MEETING ANNOUNCEMENTS

Councilors announced prior and upcoming meetings and events.

CONSENT AGENDA

7. **Resolution No. 3214**
   A Resolution Of The City Of Wilsonville Authorizing An Intergovernmental Agreement With The City Of Wilsonville Urban Renewal Agency Pertaining To A Short Term Urban Renewal Debt For The Coffee Creek Plan District For The Purpose Of Funding The Construction Of Capital Improvement Project By The Agency.

8. **Resolution No. 3216**
   A Resolution Of The City Of Wilsonville Authorizing The City Manager To Execute A Construction Contract With Northstar Electrical Contractors, Inc. To Construct Street Lighting Led Conversion – Phase 4 Project (CIP #4722).

9. Minutes of September 4, 2025, City Council Meeting.

The Consent Agenda was approved 4-0.

NEW BUSINESS

There was none.

CONTINUING BUSINESS

There was none.

PUBLIC HEARING

10. **Resolution No. 3211**
    A Resolution Of The City Of Wilsonville Authorizing A Supplemental Budget Adjustment For Fiscal Year 2025-26.

After a public hearing Resolution No. 3211 was adopted 4-0.

11. **Resolution No. 3213**
    A Resolution Of The City Of Wilsonville Adopting The Natural Areas Management Plan.

After a public hearing Resolution No. 3213 was adopted 4-0.

CITY MANAGER'S BUSINESS

The City Manager informed the Council that community focus groups were scheduled to take place October 23, 2025, and October 25, 2025, to gather input from randomly selected community members on the Town Center Plan and the use of Urban Renewal to fund local infrastructure. The City Manager said that other opportunities for input are still to be developed to gather feedback from a larger cross-section of the community.

LEGAL BUSINESS

There was none.

WEDNESDAY, SEPTEMBER 10, 2025

WORK SESSION

2. Wilsonville Industrial Land Readiness (Code-Basalt Creek) (Luxhoj)(60 Minutes)

PLANNING COMMISSION MEETING
STAFF REPORT

Meeting Date: September 10, 2025	**Subject: Wilsonville Industrial Land Readiness – Basalt Creek** **Staff Member:** Cindy Luxhoj AICP, Associate Planner, and Dan Pauly AICP, Planning Manager **Department:** Community Development
Action Required	**Advisory Board/Commission Recommendation**
☐ Motion ☐ Public Hearing Date: ☐ Ordinance 1st Reading Date: ☐ Ordinance 2nd Reading Date: ☐ Resolution ☒ Information or Direction ☐ Information Only ☐ Council Direction ☐ Consent Agenda	☐ Approval ☐ Denial ☐ None Forwarded ☒ Not Applicable **Comments:** N/A
Staff Recommendation: Provide feedback on draft Development Code updates.	
Recommended Language for Motion: N/A	
Project / Issue Relates To: Basalt Creek Concept Plan area	

☒Council Goals/Priorities: Attract high-quality industry and support economic opportunity for all in Wilsonville	☒Adopted Master Plan(s): Basalt Creek Concept Plan	☐Not Applicable

ISSUE BEFORE COMMISSION

Staff is seeking Planning Commission input on proposed Development Code amendments for the Basalt Creek planning area. Key aspects include merging the Coffee Creek Industrial Design Overlay District (DOD) with elements of the Planned Development Industrial (PDI) and PDI-RSIA Zones to create a new Northwest Industrial (NWI) Zone.

EXECUTIVE SUMMARY:

The Basalt Creek planning area, including the West Railroad area, was the focus of the Basalt Creek Concept Plan (BCCP), jointly developed with the City of Tualatin and adopted by Wilsonville in 2018. Located north and west of the Coffee Creek Industrial Area and adjacent to Tualatin's city limits, the Basalt Creek area represents a significant opportunity for employment growth in Wilsonville. As the Commission is aware, a central objective of the Wilsonville Industrial Land Readiness (WILR) project is to make the BCCP area development ready. Once the project is complete, the City will be positioned to accept industrial development applications, advancing the area's economic development potential.

Two key elements of the BCCP's Implementation and Phasing Strategy are to: (1) ensure zoning supports desired future land use, and (2) identify capital improvements needed to spur development. The Planning Commission has previously reviewed foundational components of the WILR project, including the economic inventory, market analysis, and infrastructure planning.

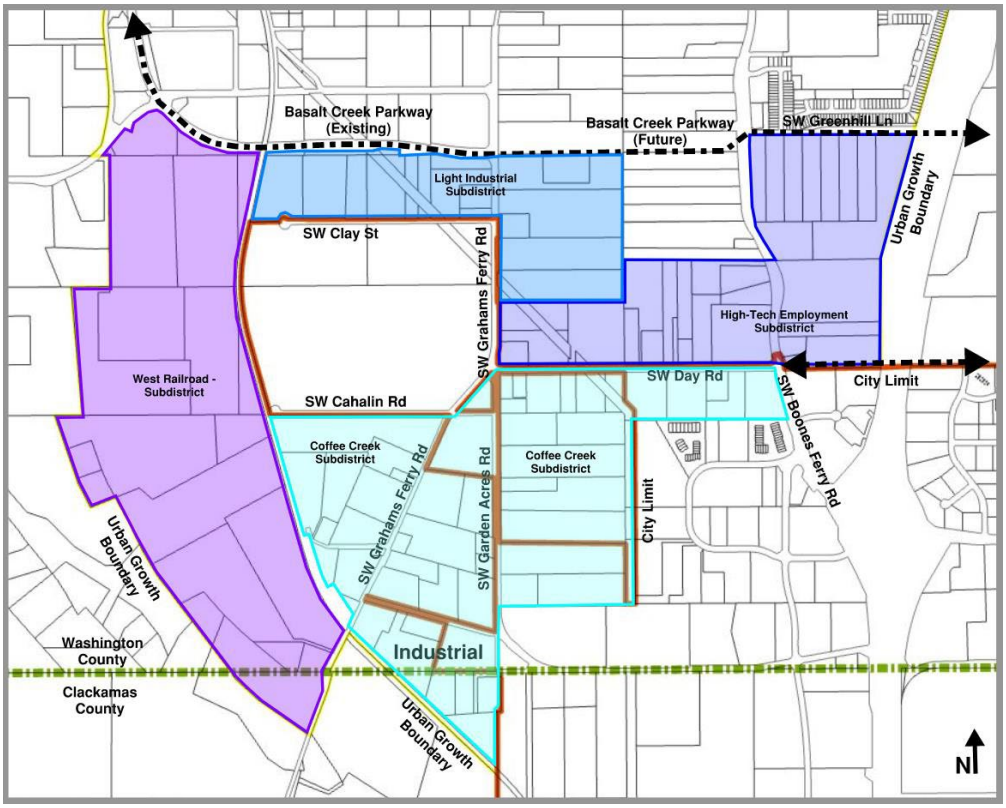
Craft Industrial (CI) Zone

In May, the Commission provided direction about the purpose and uses proposed for a new Craft Industrial (CI) Zone, developed to address the distinct characteristics of properties along SW Boones Ferry Road in the north-central portion of the Basalt Creek planning area. Since the May meeting, staff drafted proposed Development Code text for the CI Zone for Commission review (Attachment 1).

Northwest Industrial (NWI) Zone

This work session will also present the proposed zoning concept for the remaining portions of the Basalt Creek planning area, with a focus on the High-Tech Employment and Light Industrial subdistricts. The zoning framework for these areas is also expected to apply to the West Railroad area once the Commission and City Council provide direction on future employment uses desired for that area.

The proposed zoning for the High-Tech Employment and Light Industrial areas builds on the existing Coffee Creek Industrial Design Overlay District (DOD, form-based code) and PDI-RSIA zoning for the Coffee Creek Master Plan area. It introduces a new Northwest Industrial (NWI) Zone (Attachment 2), which integrates the design elements of the Industrial DOD–expanded geographically to include Basalt Creek–with a list of allowed uses and development standards drawn from both the PDI and PDI-RSIA Zones, updated to reduce redundancy and reflect more current uses.



A key component of the proposed NWI Zone is the use of a table that categorizes allowed use by subdistrict, with slight differences between the subdistricts intended to reflect and the desired outcomes of the different land use types identified in the Plan (Attachment 3). The design and other requirements of the zone are then applied throughout regardless of use. The proposed subdistricts and their unique requirements related to use are described and illustrated below:

- **Coffee Creek:** The area within the Coffee Creek Master Plan, which is the land within the proposed NWI Zone south of SW Day Road and SW Cahalin Road and east of the Portland and Western railroad tracks. This area is designated as Regionally Significant Industrial Area (RSIA)–a specific designation in the Comprehensive Plan–that leads to additional size restrictions for commercial uses beyond those for industrial land not so designated. No substantive changes are proposed for this subdistrict.

- **High-Tech Employment:** The area within Basalt Creek north of SW Day Road south of the Light Industrial subdistrict and CI Zone, and east of SW Boones Ferry Road. This subdistrict will have use restrictions to help preserve the available land for higher-density employment and focus industries.

- **Light Industrial:** The area within Basalt Creek north of SW Clay Street west of SW Grahams Ferry Road, and north of the High-Tech Employment subdistrict east of SW Grahams Ferry Road. This subdistrict is most like the current PDI zone in terms of allowed uses.

- **West Railroad:** The area within Basalt Creek west of the Portland and Western Railroad. Uses in this area are still under consideration, as noted in Attachment 3. After a work session with City Council and Planning Commission, the draft code will be updated for this subdistrict.

For each subdistrict the extent of allowance of each listed use is established by one of the following labels:

- A-Allowed. The use is allowed in the subdistrict without additional restrictions subject to the ability to meet siting and design standards, similar to “allowed” or “typically allowed” uses in other zones.

- R-Allowed with Restrictions. The use is allowed so long as specific restrictions or limitations are met as enumerated or referenced in the table. This is most often used when there is a size limitation for a use within a subdistrict.

- C-Conditional. The use can only be approved through a Conditional Use Permit.

- P-Prohibited. The use is prohibited. The table is not intended to list every prohibited or otherwise disallowed use, but this label is used when a use may be allowed in one subdistrict but not in others.

The project team reviewed the allowed uses in the PDI and PDI-RSIA Zones and updated the use table to reduce redundancy and reflect more current uses, as well as to add uses that are not well addressed in the City’s existing zoning code. Staff recommends these uses as potentially compatible with the zone–in terms of built form, operations, and/or employment density–or compatible with restrictions. An overview of these proposed uses new to PDI and PDI-RSIA, where they would be allowed, and the rationale for including them are outlined in the following table:

NEW USE	WHERE ALLOWED	RATIONALE
Hospitals	Allowed in all subdistricts; West Railroad to be determined (TBD)	Allowing hospitals in all areas of the zone helps to address the City's shortage of land for large-scale medical uses. Such facilities generate high-wage jobs with minimal traffic, unlike clinics or commercial uses. Any retail sales or medical office/clinic space dedicated to outpatient care is limited in the same manner as other retail and office uses in the zone.
Direct-to-Consumer (DTC) E-commerce Fulfillment or Logistics	Allowed with restrictions in all subdistricts; West Railroad TBD	E-commerce fulfillment and logistics has become a major industrial land use, driven by technology and changing consumer habits. To manage land use and avoid displacing other industrial users, a maximum building size of 200,000 square feet is proposed. This would support a regional hub for a large company or a primary center for a small to mid-sized business, typically requiring about 10 acres for operations, including truck courts, parking, circulation, and landscaping. On-site customers are limited to 5% of trips.

Specialty Automotive Services	Allowed in Light Industrial; Prohibited in other subdistricts; West Railroad TBD	This use does not fit neatly into existing zoning categories. Unlike typical auto repair shops, these facilities involve multi-day vehicle work and require screened outdoor storage for parts and vehicles. They operate more like light industrial manufacturing uses than retail services. Examples include auto body repair and vehicle customization shops. The use excludes general auto repair, oil changes, tire services, and dealership-based service operations.
Data Center	Allowed in Light Industrial; Allowed with restrictions in other subdistricts; West Railroad TBD	Data centers, like e-commerce facilities, reflect recent technological shifts. While they have low employment density, they demand significant energy and infrastructure. To prevent large data centers from outcompeting other industrial uses for limited land, water, and power, staff recommends a maximum building size of 25,000 square feet—adequate for local or regional needs. As precedent, the Siemens data center on SW Parkway Avenue is approximately 20,000 square feet.
Commercial Recreation	Allowed in Light Industrial; Prohibited in other subdistricts; West Railroad TBD	Commercial recreation uses—such as specialized gyms and indoor sports facilities—are not well supported by Wilsonville's current zoning. These businesses need larger spaces and higher ceilings, which most PDC-zoned properties do not offer. They also struggle to compete with higher-paying retail tenants. While not intended for prime employment land, certain industrial parcels with physical constraints—such as small lot size or limited truck access—may be suited for these uses.
Contractor Establishment	Allowed in Light Industrial; Prohibited in other subdistricts; West Railroad TBD	Allowing contractor establishments in suitable areas of Basalt Creek supports prior discussions about their role in serving nearby construction activity. Once annexed, these uses would be subject to the NWI Zone's development standards and design guidelines.

Discussion Questions

Feedback on the following questions will be incorporated into the draft Development Code amendments and be brought back to the Commission for further review:

- Craft Industrial (CI) Zone: What additional input, if any, does the Planning Commission have about the proposed CI Zone language?
- Northwest Industrial (NWI) Zone:

- What guidance does the Planning Commission have on creating a new NWI Zone that combines the Coffee Creek Industrial DOD with existing PDI and PDI-RSIA standards into a single zone for industrial lands in both the Coffee Creek and Basalt Creek planning areas?
- What input does the Planning Commission have on the proposed use of a table to clearly distinguish allowed uses across different subdistricts within the new NWI Zone?
- What feedback does the Planning Commission have on the proposed list of uses and the extent they are allowed within the different subdistricts?

EXPECTED RESULTS:
Feedback from Planning Commission will guide further updates to the Development Code for the proposed NWI Zone.

TIMELINE:
Additional work sessions with the Planning Commission and City Council are planned in the coming months. A public hearing on the Development Code amendments is planned for this winter.

CURRENT YEAR BUDGET IMPACTS:
Funding for the WILR project is allocated in the FY2025-26 budget, primarily through a $290,000 Metro grant.

COMMUNITY INVOLVEMENT PROCESS:
The BCCP review process included broad community engagement to gather input. For the WILR project, outreach has focused on Business Oregon, Greater Portland Inc., property owners, and developers to better understand industrial land demand in Wilsonville and property owners' current and future plans for their property. This input has informed technical analysis and along with policy input from the Commission and Council is helping shape appropriate zoning standards and necessary Code amendments.

POTENTIAL IMPACTS OR BENEFIT TO THE COMMUNITY:
The proposed NWI Zone reflects the distinct characteristics and planning visions for Coffee Creek and Basalt Creek. Establishing the NWI Zone in the Development Code will support job creation and economic growth in Basalt Creek by providing a clear framework for future development.

ALTERNATIVES:
Alternatives to the proposed NWI Zone include applying the existing PDI Zone, applying a modified PDI Zone, or taking no action addressing zoning for this area at this time.

ATTACHMENTS:
1. Draft Craft Industrial (CI) Zone Development Code Text (September 3, 2025)
2. Draft Northwest Industrial (NWI) Zone Development Code Text (September 3, 2025)
3. Draft NWI Zone Use Table (September 3, 2025)

Section 4.137. CI—Craft Industrial Zone.

(.01) *Purpose.* The purpose of the Craft Industrial (CI) Zone is to support a diverse range of small-scale industrial and creative enterprises such as incubators, craft and artisan studios, innovation hubs, and maker spaces. It may also include limited residential and commercial uses accessory to the typically permitted uses that serve as a transition to and support more intense urban uses nearby.

(.02) The CI Zone is a Planned Development Zone, subject to applicable Planned Development regulations (see Sections 4.118 and 4.140). Where conflicts occur between these standards and other Development Code regulations or other ordinances, the provisions of this Chapter shall apply.

(.03) *Uses that are typically permitted:*

A. Home Businesses that include any of the uses listed below.

B. Business-Integrated Dwelling Units (BIDU) and Live-Work Dwelling Units (LWDU).

C. Studios and Creative Workspaces.

D. Artisan Food and Beverage Production and Food-Related Micro-Businesses, with or without accessory on-site tasting rooms or eateries subject to the limitations for Retail and Service Commercial Uses of Subsection 4.137(.03)K.

E. Craft and Specialty Manufacturing, including the processing, packaging, and/or assembly of artisan goods and handcrafted items.

F. Custom Fabrication and Printing Services, including sign fabrication.

G. Light Manufacturing and Assembly of small machinery and appliances, micro-mobility vehicles, precision tools, or other electrical or mechanical items.

H. Industrial Office and Laboratory Uses, including research, development, testing, or product training and support.

I. Repair, Finishing, and Testing Services of products manufactured or assembled within the zone.

J. Professional Services, which may cater to daily customers, limited to 5,000 square feet of floor area in a single building, or 20,000 square feet of combined floor area within a multi-building development.

K. Retail and Service Commercial Uses, limited to 5,000 square feet of indoor and outdoor sales, service or inventory storage area.

L. Accessory Uses, including buildings and structures customarily incidental and subordinate to any permitted use.

M. Other Similar Uses, as determined by the Planning Director to be consistent with the purpose of the CI Zone.

(.04) *Performance Standards.* The performance standards of Section 4.117(.01) apply to all industrial properties and sites within the CI Zone, and are intended to minimize the potential adverse impacts of industrial activities on the general public and on other land uses or activities. They are not intended to prevent conflicts between different uses or activities that may occur on the same property or site.

(.05) *Design and Development Standards:*

A. The standards of Section 4.134(.10), *Development Standards Table*, excepting the front yard setback provisions, for properties with frontage on SW Boones Ferry Road located north of SW Day Road, where the setback standards of Section 4.137(08) shall apply; or

B. The standards of the PDC zone, Section 4.131(.03), for all other properties.

DRAFT

(.06) *Performance Standards.* The performance standards of Section 4.117(.01) apply to all industrial properties and sites within the CI Zone and are intended to minimize the potential adverse impacts of industrial activities on the general public and on other land uses or activities. They are not intended to prevent conflicts between different uses or activities that may occur on the same property or site.

(.07) *Block and access standards.* The CI zone shall be subject to:

C. The block and access standards of Section 4.134(.10), *Development Standards Table*, for properties with frontage on SW Boones Ferry Road located north of SW Day Road; or

D. The block and access standards of the PDC zone, Section 4.131(.03), for all other properties.

(.08) *Other Standards:*

A. *Minimum Individual Lot Size.* No limit save and except as shall be consistent with the other provisions of this Code (e.g., landscaping, parking, etc.).

B. *Maximum Lot Coverage.* No limit save and except as shall be consistent with the other provisions of this Code (e.g., landscaping, parking, etc.).

C. Minimum *Front Yard Setback.* None required except when front yard abuts a more restrictive district, in which case setbacks shall be the same as the abutting district. Except as otherwise provided for properties with frontage on SW Boones Ferry Road located north of SW Day Road, structures on corner or through lots shall observe the minimum front yard setback on both streets. Setbacks shall also be maintained from the planned rights-of-way shown on any adopted City Transportation System Plan (TSP).

D. Minimum *Rear and Side Yard Setback.* None required except when rear and side yards abut a more restrictive district, in which case setbacks shall be the same as the abutting district.. Except as otherwise provided for properties with frontage on SW Boones Ferry Road located north of SW Day Road, structures on corner or through lots shall observe the minimum rear and side yard setbacks on both streets. Setbacks shall also be maintained from the planned rights-of-way shown on any adopted City TSP.

E. No setback is required when side or rear yards abut a railroad siding.

F. *Corner Vision*. Corner lots shall have no sight obstruction to exceed the vision clearance standards of Section 4.177.

DRAFT

Section 4.134. Northwest Industrial (NWI) Zone.

(.01) *Purpose.* The purpose of the Northwest Industrial (NWI) Zone is to implement the Coffee Creek Industrial Area Master Plan (2007) and Basalt Creek Master Plan (2025) by establishing standards for allowed uses, street design and connectivity, site design and circulation, building form, and building architecture and landscape for all development located within the master plan areas. These standards are intended to result in:

A. An industrial district featuring cohesive and high-quality site, landscape, and building design that is well integrated with adjacent streetscapes and other public spaces.

B. A multi-modal transportation network accommodating pedestrians, bicyclists, transit riders, motorists, and freight in the context of a modern industrial district.

C. Preservation of trees and natural features.

D. Minimization of adverse impacts to adjacent properties from development that detracts from the character and appearance of the area.

E. Minimization of the off-site visibility of vehicular parking, circulation and loading areas.

F. Creation of a pleasant and functional industrial district for employees and visitors.

G. A predictable and timely process for reviewing industrial development applications.

(.02) *Applicability.* The NWI Zone shall apply to all properties within the Coffee Creek Master Plan and Basalt Creek Master Plan areas as shown in the Regulating Plan (Figure NWI-2).

A. *Subdistricts.* The NWI Zone includes four subdistricts (Figure NWI-1):

1. *Coffee Creek.* Properties in the Coffee Creek Master Plan area located south of SW Day Road.

2. *High-Tech Employment.* Properties located in the Basalt Creek Master Plan area north of SW Day Road south of the Light Industrial subdistrict, and east of SW Boones Ferry Road.

3. *Light Industrial.* Properties located in the Basalt Creek Master Plan area north of SW Clay Street west of SW Grahams Ferry Road, and north of the High-Tech Employment subdistrict east of SW Grahams Ferry Road to the western boundary of Craft Industrial (CI) Zone.

4. *West Railroad.* Properties located in the Basalt Creek Master Plan area west of the Portland and Western Railroad tracks.

B. The provisions of this section shall apply to:

1. All new building construction.

2. Any exterior modifications to existing, non-residential buildings, subject to Section 4.134(.03).

3. All development of site improvements, including but not limited to, new paved parking lots, outdoor storage, display areas, signs, and landscaping.

4. All building expansions greater than 1,250 square feet.

DRAFT

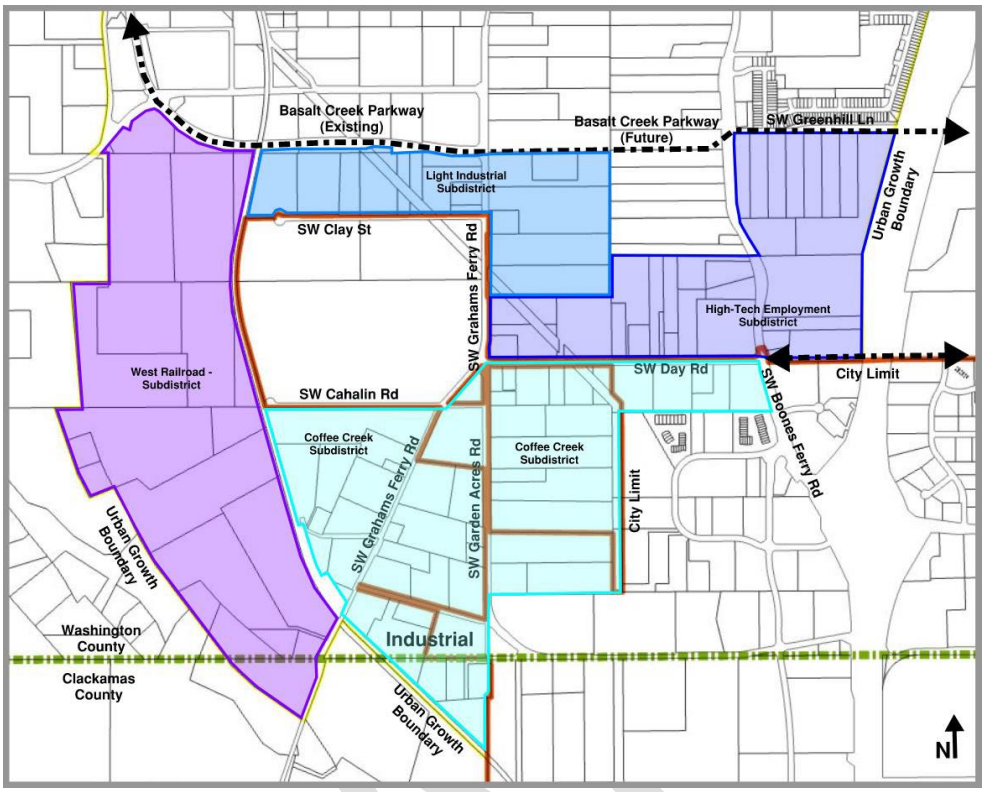


Figure NWI-1. NWI Zone Subdistricts

(.03) *Exceptions.* This section does not apply to the following:

A. Maintenance of the exterior of an existing industrial/employment structure, such as painting to an approved color palette, reroofing, or residing with the same or similar materials.

B. Interior remodeling.

C. Maintenance of existing dwellings and accessory buildings.

D. Maintenance of agricultural buildings.

(.04) *Uses that are Typically Permitted:*

[Insert Use Table – example below]

Table NWI-1. Typically Permitted Uses		

(.05) *Overview of Northwest Industrial Zone Standards:*

A. *Section 4.134(.08) Regulating Plan.* The Regulating Plan organizes all existing and future streets, drives, and shared-use paths within the NWI Zone into a hierarchy of Addressing Streets, Supporting Streets and Through Connections.

B. *Section 4.134(.09) Connectivity Standards:*

1. New Supporting Streets and Through Connections are required within the NWI Zone to meet Connectivity Requirements as shown on Figure NWI-5.

2. The Street Types specify the cross sections for each of the street and shared-use path types within the Regulating Plan. These cross section specifications apply to both existing and proposed new streets. A range of cross sections for Supporting Streets and Through Connections is permitted and detailed in Figures NWI-3 and NWI-4.

C. *Section 4.134(.10) Development Standards Table:*

1. The Development Standards Table provides an overview of all applicable development standards. The development standards for any given parcel are determined by the existing or future street or shared-use path type on which the parcel fronts, as detailed in Table NWI-2.

2. Areas bounded by new Supporting Streets and Through Connections are designated as Parcels and are required to comply with Development Standards governing site design, building orientation and frontage. The development standards for site design, building façade and landscape design are intended to work in tandem with the street types to create a cohesive and unified public realm.

3. Adjustments to Development Standards may be granted by the Planning Director for quantifiable provisions, as noted in Tables NWI-2 through NWI-5, if the Planning Director finds that the adjusted Development Standard will perform as well as the Development Standard.

D. *NWI Zone Pattern Book.* The NWI Zone Pattern Book provides supplemental design guidelines, which are intended to allow more flexibility in design than the Development Standards while satisfying the purpose of the NWI Zone.

(.06) *Review Process.* Development applications shall follow the application review process described in:

A. Section 4.197 Zone Changes and Amendments.

B. Section 4.198 Comprehensive Plan Changes.

C. Section 4.700 Annexation and Urban Growth Boundary Amendments.

D. Section 4.140 Planned Development Regulations.

(.07) *Waivers.* The Development Review Board may waive standards as listed in Section 4.134(.10), consistent with the provisions of Section 4.118(.03).

A. The following standards shall not be waived, unless there is substantial evidence in the whole record to support a finding that the intent and purpose of the standards will be met in alternative ways:

1. Required minimum building height as provided in Section 4.134(.10) Table NWI-5;

2. Parking location and design along Addressing Streets in Section 4.134(.10) Table NWI-4; and

3. Parcel pedestrian access as listed in Section 4.134(.10) Table NWI-4.

B. In addition to meeting the purposes and objectives of Section 4.140, any waivers granted in the NWI Zone must be found to be consistent with the intent of the NWI Zone Pattern Book.

(.08) *NWI Zone Regulating Plan, Figure NWI-2:*

A. *Components of the Regulating Plan Map:*

1. *Addressing Streets.* Existing and planned streets within the Regulating Plan Area are called Addressing Streets and include Boones Ferry Road, Cahalin Road, Clay Street, Clutter Street, Day Road, Garden Acres Road, and Grahams Ferry Road, and "Future" Street. For the purposes of this Subsection, the Basalt Creek Parkway and SW Greenhill Lane are existing or planned streets, but not Addressing Streets as referred to in Tables NWI-2 through NWI-5.

2. *Regulating Plan Area.* Land area identified within the NWI Zone on Figure NWI-2 is subject to additional Connectivity Standards as detailed in Figure NWI-5 and Table NWI-2.

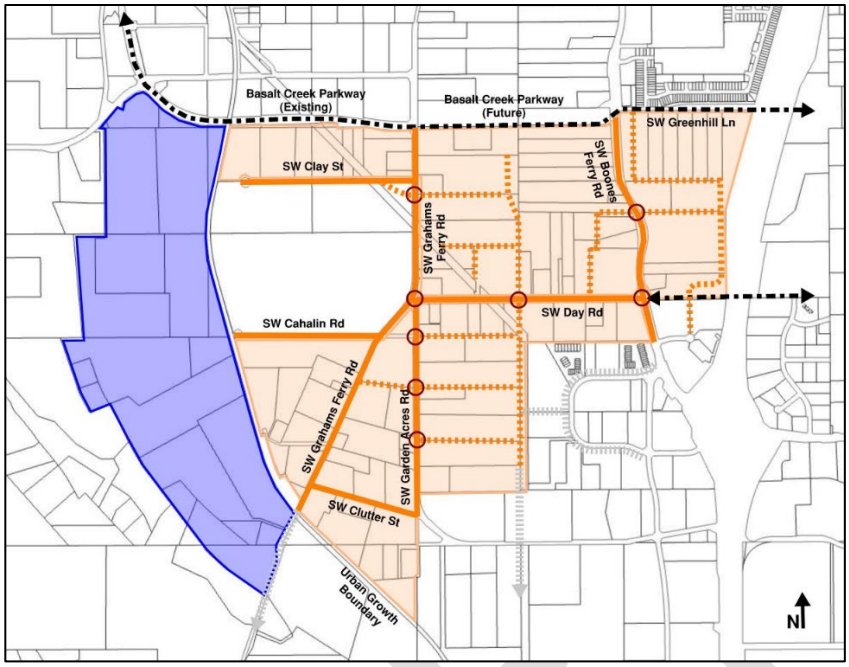

Figure NWI-2. Regulating Plan

(.09) *NWI Zone Connectivity Standards:*

A. *Street Types, Figure NWI-2.* Within the land area bounded by Addressing Streets, connectivity shall be provided through new streets or private drives and shared use paths. The location, alignment, and cross-section of required streets or private drives and shared-use paths is flexible, as long as they comply with spacing and minimum cross-section standards. New connections may be one of the following types:

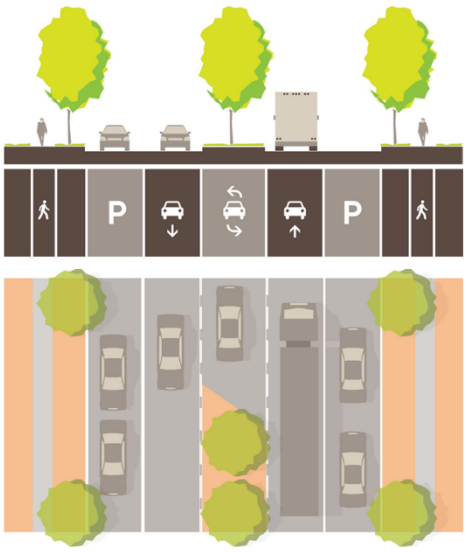
1. *Supporting Streets.* Supporting Streets are new public streets or private streets in public easements. They shall meet the development standards set out in Figure NWI-3.

   a. A Required Supporting Street is one that intersects with an Addressing Street as shown on Figure NWI-2. The exact location and design of these connections will be determined at the time of development review.

   b. Planned Intersections are locations where Existing and Planned Addressing Streets intersect with required Supporting Streets and Planned Pathways, as generally shown in Figure NWI-2.

2. *Through Connections.* Through Connections are new public streets or private streets in public easements with multi-use paths, or streets or public easements that combine characteristics of streets and multi-use paths. They shall meet the Development Standards set out in Figure NWI-4.

B. Planned Pathways are multi-use paths or pedestrian connections that are planned in the Transportation Systems Plan to occur in the location generally shown in Figure NWI-2. A Planned Pathway may be employed to meet required connectivity, if it complies with Through Connection Standards for Connection Spacing and Connection Type, see Figure NWI-7.



C. *Maximum Connection Spacing:*

1. Addressing Streets. When intersecting with an Addressing Street, new Supporting Streets and Through Connections shall meet maximum spacing standards as set out in Table NWI-2.

2. Internal Supporting Streets and Through Connections. See Figure NWI-5 and Table NWI-2.

D. *Required Connectivity Master Plan.* Connectivity Master Plans are required for all development within the NWI Zone. Development proposals shall show conceptually how the Connectivity Requirements will be met. In addition, the Connectivity Master Plan should generally indicate how parking, driveways, walkways, waysides, etc., will relate or connect to adjacent parcels.

Specifications for Supporting Streets	
Type	Multimodal Connection*
Aesthetic Character / Identity	Minor Addressing Street
Role in Network	Bike, Pedestrian and Local Vehicular Connectivity
Design Speed	under 20 mph
Right-of-Way / Easement	Varies
Curb-to-Curb Width	24-54 feet
Travel Lanes (number)	2
Travel Lane Width	10-12 feet
Center Turn Lane Width	14 feet, max. (optional)
Parking Lane Width	8 feet (optional)
Bike Facilities	Shared Street
Sidewalk Width	6 feet (minimum)
Planting Strip Width	6 feet (minimum)
Planted Median Width	14 (minimum, optional)

*The Regulating Plan (Figure CC-1) illustrates the general location of planned multimodal connections. These are labeled as *Required Supporting Streets*. Within 300 feet of an Addressing Street, the exact location and design of these connections will be determined at the time of development review.

Figure NWI-3 - Supporting Streets Standards

Specifications for Through Connections	
Type	Local Street
Aesthetic Character / Identity	
Role in Network	Bike, Pedestrian, Local Vehicular Connectivity
Design Speed	under 20 mph
Right-of-Way / Ease-ment	Varies
Curb-to-Curb Width	Varies
Travel Lanes (number)	Optional
Travel Lane Width	12 feet (maximum)
Center Turn Lane Width	NA
Parking Lane Width	8-30 feet (optional; head-in, diagonal or parallel parking, or a combination, permit-ted,)
Bike Facilities	Shared Street or Shared-Use Path
Sidewalk Width	5 feet (minimum) each side or 10 feet (minimum) one side or 10 feet (minimum) no travel lane
Planting Strip Width	6 feet (minimum)
Planted Median Width	NA

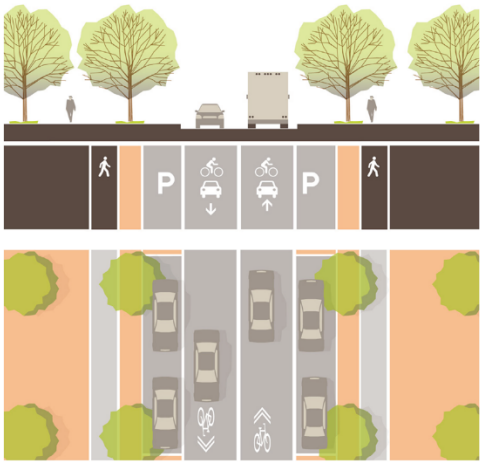


Figure NWI-4 - Through Connections Standards

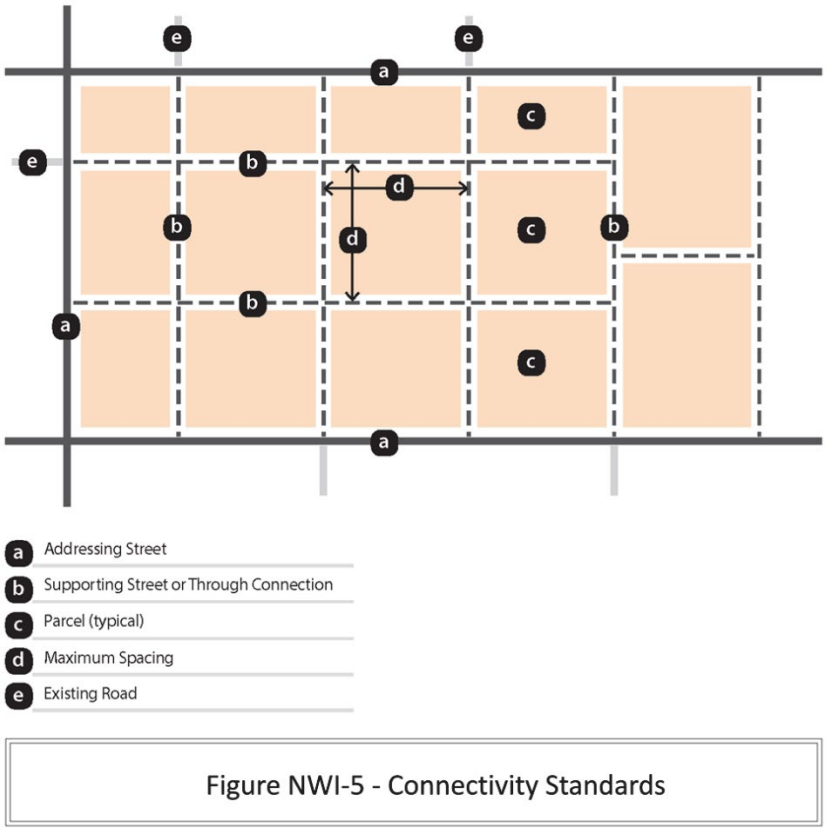

Figure NWI-5 - Connectivity Standards

(.10) *Development Standards Table.* Areas bounded by Addressing Streets, Supporting Streets and Through Connections shall be designated as a Parcel and subject to the Development Standards in Tables NWI-2 through NWI-5.

Table NWI-2: Street Design and Connectivity			
	Addressing Streets	**Supporting Streets**	**Through Connections**
General	Development Standards within this table are not adjustable.		
Connection Spacing	Not applicable, Addressing Streets exist or are planned	600 feet, maximum, centerline to centerline. Supporting Streets and Through Connections shall intersect with Addressing Streets; or if the Addressing Street is Boones Ferry Road, Garden Acres Road, or Grahams Ferry Road, as shown on Figure NWI-2, Regulating Plan; or if the Addressing Street is Day Road, no less than 1,000 feet apart, centerline to centerline.	
Connection Type	Addressing Streets are Boones Ferry Road, Cahalin Road, Clay Street, Clutter Street, Day Road, Garden Acres Road, Grahams Ferry Road, and "Future" Street.	Supporting Streets are those meeting Specifications, Figure NWI-3. A Required Supporting Street is one that intersects with an Addressing Street. The exact location and design of these connections will be determined at the time of development review.	Through Connections are those meeting Specifications, Figure NWI-4. Through Connections may be multimodal or used exclusively for bicycle and pedestrian access.
Connection Hierarchy and Primary Frontage	If one of the streets or connections bounding a parcel is an Addressing Street, the Addressing Street shall be the Primary Frontage. If none of the bounding streets or connections is an Addressing Street, a Supporting Street shall be the Primary Frontage. See Figure NWI-6.		

DRAFT

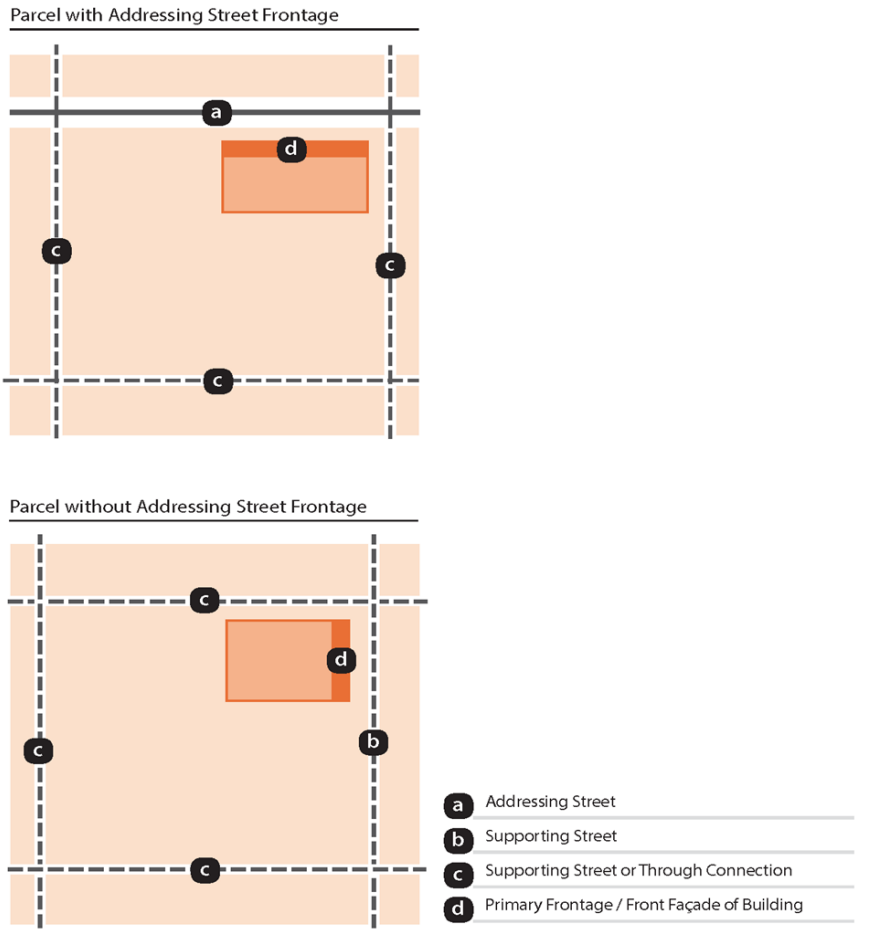

Figure NWI-6 - Connection Heriarchy and Primary Frontage

Table NWI-3: Planning and Landscaping			
	Addressing Streets	**Supporting Streets**	**Through Connections**
General	The following provisions apply: • Section 4.176 for landscaping standards • Section 4.610.10 for tree removal, relocation or replacement. • Section 4.610.10(.01)C. for consideration of development alternatives to preserve wooded areas & trees.		

Table NWI-4: Site Design			
	Addressing Streets	**Supporting Streets**	**Through Connections**
1. Parcel Access			
General	Unless noted otherwise below, the following provisions apply: • Section 4.177(.02) for street design; • Section 4.177(.03) to (.10) for sidewalks, bike facilities, pathways, transit improvements, access drives and intersection spacing. The following Development Standards are adjustable: • Parcel Driveway Spacing: 20% • Parcel Driveway Width: 10%		
Parcel Driveway Access	Not applicable	Limited by connection spacing standards Parcel Driveway Access may be employed to meet required connectivity, if it complies with Supporting Street Standards for Connection Spacing and Connection Type, see Figure NWI-7. Subject to approval by City Engineer	Limited by connection standards for motorized vehicle access. Parcel Driveway Access may be employed to meet required connectivity, if it complies with Through Connection Standards for Connection Spacing and Connection Type, see Figure NWI-7. Subject to approval by City Engineer
Parcel Driveway Spacing	Not applicable	150 feet, minimum See Figure NWI-7	150 feet, minimum See Figure NWI-7
Parcel Driveway Width	Not applicable	24 feet, maximum or complies with Supporting Street Standards for primary driveway providing access for passenger vehicles, light delivery, etc. 40 feet, maximum for secondary driveway providing access for heavy delivery vehicles, large trucks, etc.	24 feet, maximum or complies with Through Connection Standards for primary driveway providing access for passenger vehicles, light delivery, etc. 40 feet, maximum for secondary driveway providing access for heavy delivery vehicles, large trucks, etc.
2. Parcel Pedestrian Access			
General	Unless noted otherwise below, the following provisions apply: • Section 4.154 (.01) for separated and direct pedestrian connections between		

	parking, entrances, street right-of-way and open space • Section 4.167 (.01) for points of access		
Parcel Pedestrian Access Spacing	No restriction		
Parcel Pedestrian Access Width	8 feet wide, minimum for pedestrian connections between the primary street frontage and Primary Building Entrance(s).		
Parcel Pedestrian Access to Transit	Provide separated and direct pedestrian connections between transit stops and parking, entrances, street right-of-way and open space.		
3. Parcel Frontage			
Parcel Frontage, Defined	Parcel Frontage shall be defined by the linear distance between centerlines of the perpendicular Supporting Streets and Through-Parcel Connections. Where Parcel Frontage occurs on a curved segment of a street, Parcel Frontage shall be defined as the linear dimension of the Chord.		
Primary Frontage, Defined	The Primary Frontage is the Parcel Frontage on an Addressing Street. If the parcel is not bounded by Addressing Streets, it is the Parcel Frontage on a Supporting Street. See Figure NWI-6.		
Parcel Frontage Occupied by a Building	A minimum of 100 feet of the Primary Frontage shall be occupied by a building. The maximum Primary Frontage occupied by a building shall be limited only by required side yard setbacks.	No minimum	
4. Parking Location and Design			
General	Unless noted otherwise below, the following provisions apply: • Section 4.155 (03) Minimum and Maximum Off-Street Parking Requirements • Section 4.155 (04) Bicycle Parking • Section 4.155 (06) Carpool and Vanpool Parking Requirements • Section 4.176 for Parking Perimeter Screening and Landscaping—permits the parking landscaping and screening standards as multiple options The following Development Standards are adjustable: • Parking Location and Extent: up to 20 spaces permitted on an Addressing Street		
Parking Location and Extent	Limited to 16 spaces, maximum. 50% of spaces designated for short-term (1 hour or less), visitor, and disabled parking only between right-of-way of Addressing Street and building.	Parking is permitted between right-of-way of Supporting Street and building.	Parking is permitted between right-of-way of Through Connection and building.
Parking Setback	20 feet minimum from the right-of-way of an Addressing Street.	15 feet minimum from the right-of-way of a Supporting Street.	10 feet minimum from the right-of-way of a Through Connection.
Parking Lot Sidewalks	Where off-street parking areas are designed for motor vehicles to overhang beyond curbs, sidewalks adjacent to the	Where off-street parking areas are designed for motor vehicles to overhang beyond curbs, planted areas adjacent to the curbs shall be increased to a minimum of nine (9) feet in depth.	

	curbs shall be increased to a minimum of seven (7) feet in depth.		
Parking Perimeter Screening and Landscaping	Screen parking area from view from Addressing Streets and Supporting Streets by means of one or more of the following: a. General Landscape Standard, Section 4.176 (.02) C. b. Low Berm Standard, Section 4.176 (.02) E., except within 50 feet of a perpendicular Supporting Street or Through Connection as measured from the centerline.		Screen parking area from view from Through Connections by means of a. Low Screen Landscape Standard, Section 4.176(.02) D., or b. High Screen Landscaping Standard, Section 4.176(.02)F., or c. High Wall Standard, Section 4.176(.02)G., or d. Partially Sight-obscuring Fence Standard, Section 4.176(.02)I.
Off-Street Loading Berth	One loading berth is permitted on the front façade of a building facing an Addressing Street. The maximum dimensions for a loading berth are 16 feet wide and 18 feet tall. A clear space 35 feet, minimum is required in front of the loading berth. The floor level of the loading berth shall match the main floor level of the primary building. No elevated loading docks or recessed truck wells are permitted. Access to a loading berth facing an Addressing Street may cross over, but shall not interrupt or alter, a required pedestrian path or sidewalk. All transitions necessary to accommodate changes in grade between access aisles and the loading berth shall be integrated into adjacent site or landscape areas. Architectural design of a loading berth on an	No limitation. Shall meet minimum standards in Section 4.155(.05).	

DRAFT

	Addressing Street shall be visually integrated with the scale, materials, colors, and other design elements of the building.		
Carpool and Vanpool Parking	No limitation		
5. Grading and Retaining Walls			
General	The following Development Standards are adjustable: • Retaining Wall Design: 20%		
Maximum height	Where site topography requires adjustments to natural grades, landscape retaining walls shall be 48 inches tall maximum when visible from adjacent streets and 60 inches tall maximum when visible only to users from within a site. Where the grade differential is greater than 30 inches, retaining walls may be stepped.		
Required Materials	Materials for retaining walls shall be unpainted cast-in-place, exposed-aggregate, or board-formed concrete; brick masonry; stone masonry; or industrial-grade, weathering steel plate.		
Retaining Wall Design	Retaining walls longer than 50 linear feet shall be tiered, introducing a 5-foot, minimum horizontal offset between the lowest part and upper part(s) of the wall to reduce their apparent mass.		
6. Planting			
General	Unless noted otherwise below, the following provisions apply: • Section 4.176 Landscaping and Screening Standards		
Landscaping Standards Permitted	General Landscape Standard, Section 4.176(.02)C. Low Berm Standard, Section 4.176(.02)E., except within 50 feet of a perpendicular Supporting Street or Through Connection as measured from the centerline	General Landscape Standard, Section 4.176(.02)C. Low Screen Landscape Standard, Section 4.176(.02)D. Screen loading areas with High Screen Landscaping Standard, Section 4.176(.02)F., and High Wall Standard, Section 4.176(.02)G.	
7. Location and Screening of Utilities and Services			
General	Unless noted otherwise below, the following provisions apply: • Sections 4.179 and 4.430. Mixed Solid Waste and Recyclables Storage in New Multi-Unit Residential and Non-Residential Buildings		
Location and Visibility	Site and building service, equipment, and outdoor storage of garbage, recycling, or landscape maintenance tools and equipment is not permitted	Site and building service, utility equipment, and outdoor storage of garbage, recycling, or landscape maintenance tools and equipment is not permitted within the setback	No limitation
Required Screening	Not permitted	High Screen Landscaping Standard, Section 4.176(.02)F. and/or High Wall Standard, Section 4.176 (.02) G.	

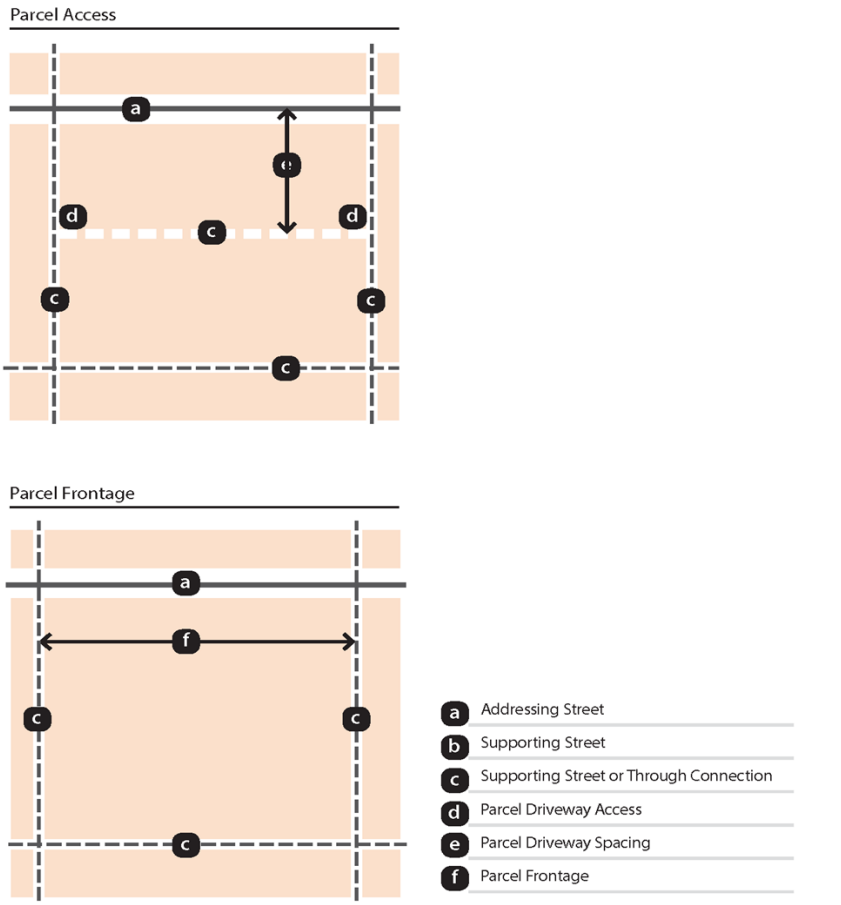

Figure NWI-7 - Site Design - Parcel Access

Table NWI-5: Building Design			
	Addressing Streets	**Supporting Streets**	**Through Connections**
1. Building Orientation			
Front Façade	Buildings shall have one designated front façade and two designated side façades. If one of the streets or connections bounding a parcel is an Addressing Street, the front façade of the building shall face the Addressing Street. If two of the streets or connections bounding a parcel are Addressing Streets, the front façade of the building may face either Addressing Street, except when one of the Addressing Streets is Day Road. In that case, the front façade must face Day Road. If none of the bounding streets or connections is an Addressing Street, the front façade of the building shall face a Supporting Street. See Figure NWI-6.		
Length of Front Façade	A minimum of 100 feet of the Primary Frontage shall be occupied by a building. The maximum Primary Frontage occupied by a building shall be limited only by required side yard setbacks.		
Articulation of Front Façade	Applies to a Front Façade longer than 175 feet that has more than 5,250 square feet of street-facing façade area: At least 10% of the street-facing façade of a building facing an Addressing Street must be divided into façade planes that are offset by at least 2 feet from the rest of the façade. Façade area used to meet this standard may be recessed behind, or project out from, the primary façade plane.		
2. Primary Building Entrance			
General	The following Development Standards are adjustable: • Required Canopy: 20% • Transparency: 20%		
Accessible Entrance*	The Primary Building Entrance shall be visible from, and accessible to, an Addressing Street (or a Supporting Street if there is no Addressing Street frontage). A continuous pedestrian pathway shall connect from the sidewalk of an Addressing Street to the Primary Building Entrance with a safe, direct and convenient path of travel that is free from hazards and provides a reasonably smooth and consistent surface consistent with the requirements of Americans with Disabilities Act (ADA). The Primary Building Entrance shall be 15 feet wide, minimum and 15 feet tall, minimum.		
Location	150 feet, maximum from right-of-way of an Addressing Street, see Figure NWI-8.	150 feet, maximum from right-of-way of a Supporting Street, if there is no Addressing Street Frontage, see Figure NWI-8.	
Visibility	Direct line of sight from an Addressing Street to the Primary Building Entrance.		
Accessibility	Safe, direct, and convenient path from adjacent public sidewalk.		
Required Canopy*	Protect the Primary Building Entrance with a canopy with a minimum vertical clearance of 15 feet and an all-weather protection zone that is 8 feet deep, minimum and 15 feet wide, minimum.		
Transparency	Walls and doors of the Primary Building Entrance shall be a minimum of 65% transparent.		
Lighting	The interior and exterior of the Primary Building Entrance shall be illuminated to extend the visual connection between the sidewalk and the building interior from day to night. Pathway lighting connecting the Primary Building Entrance to the adjacent sidewalk on an Addressing Street shall be scaled to the needs of the pedestrian. Comply with Outdoor Lighting, Section 4.199		

3. Overall Building Massing			
General	The following Development Standards are adjustable: • Required Minimum Height: 10% • Ground Floor Height: 10% • Base, Body, and Top Dimensions: 10% • Base Design: 10% • Top Design: 10%		
Front Setback	30 feet, minimum, except as provided below	30 feet maximum	30 feet maximum
Allowance of Primary Building Entrance*	Where the Primary Building Entrance is located on an Addressing Street it may extend into the required front yard setback by 15 feet maximum provided that: a. It has a two-story massing with a minimum height of 24 feet; b. The Parcel Frontage on the Addressing Street is limited to 100 feet; c. The building extension is 65% transparent, minimum; d. The entrance is protected with a weather-protecting canopy with a minimum vertical clearance of 15 feet; and e. The standards for site design and accessibility are met.	Not applicable	Not applicable
Required Minimum Height	30 feet minimum.		
Ground Floor Height*	The Ground Floor height shall measure 15 feet, minimum from finished floor to finished ceiling (or 17.5 feet from finished floor to any exposed structural member).		
Base, Body, and Top Dimensions	Buildings elevations shall be composed of a clearly demarcated base, body and top. a. For Buildings 30 feet in height (unless lower by adjustment): i. The base shall be 30 inches, minimum. ii. The body shall be equal to or greater than 75% of the overall height of the building. iii. The top of the building shall be 18 inches, minimum. b. For Buildings between 30 feet and 5 stories in height: i. The base shall be 30 inches, minimum; 2 stories, maximum. ii. The body shall be equal to or greater than 75% of the overall height of the building. iii. The top of the building shall be 18 inches, minimum. c. For Buildings greater than 6 stories in height: i. The base shall be 1 story, minimum, 3 stories, maximum.		

DRAFT

	ii. The body shall be equal to or greater than 75% of the overall height of the building. iii. The top of the building shall be 18 inches, minimum.
Base Design	The design of the building Base shall: a. Use a material with a distinctive appearance, easily distinguished from the building Body expressed by a change in material, a change in texture, a change in color or finish; and/or b. Create a change in surface position where the Base projects beyond the Body of the building by 1½ inches, minimum; and/or c. Low Berm Landscape Standard, Section 4.176(.02)E.
Top Design	Building Tops define the skyline. The design of the Building Top shall: a. Use a material with a distinctive appearance, easily distinguished from the building Body expressed by a change in material, a change in texture, a change in color or finish; and/or b. Create a change in surface position where the Top projects beyond, or recesses behind, the Body of the building by 1½ inches, minimum.
Required Screening of Roof-mounted Equipment	Screen roof-mounted equipment with architectural enclosures using the materials and design of the building Body and/ or the building Top. No roof-mounted equipment shall be visible from an Addressing Street or Supporting Street.

* When an applicant elects to use the allowed adjustment to reduce Required Canopy height to less than 15 feet, corresponding reduction in minimum height is allowed for Accessible Entrance, Allowance of Primary Building Entrance, and Ground Floor Height.

DRAFT

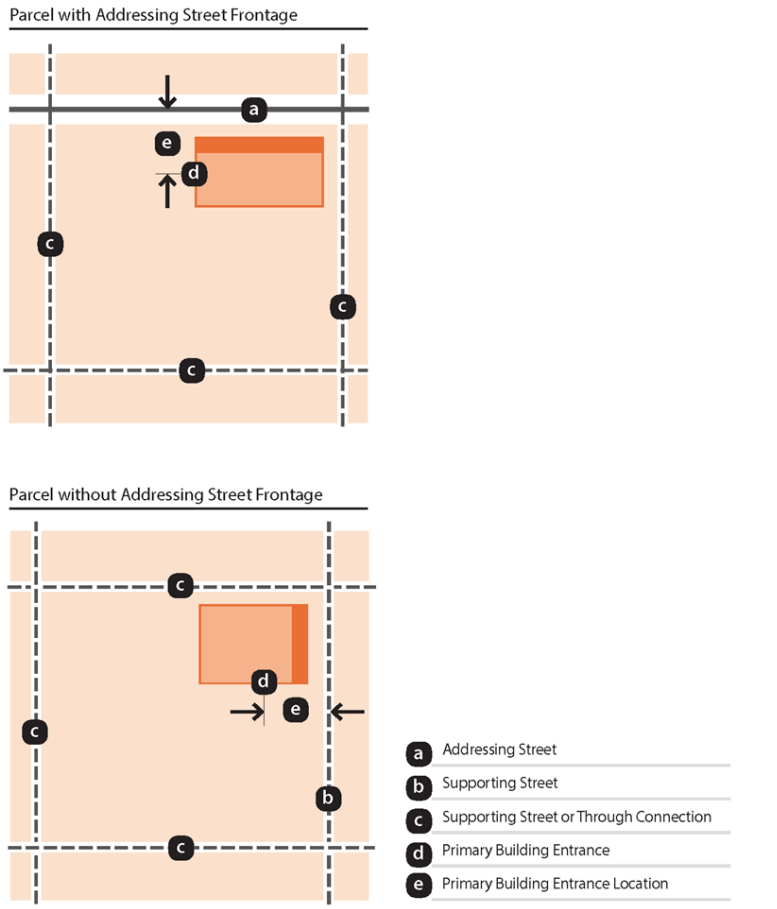

Figure NWI-8 - Building Design - Primary Building Entrance

(.11) *Waysides:*

A. *Purpose.* This section consists of standards and regulations for use throughout the NWI Zone. The regulations address materials, placement, layout, installation, and maintenance of Industrial Waysides. The City recognizes the need to:

1. Provide multiple, distributed destinations for passive and active recreation for the public and employees along a network of streets and trails;

2. Be convenient, usable and accessible. Industrial Waysides should be physically and visually accessible from the adjacent Addressing Street, Supporting Street or Through Connection;

3. Connect Industrial Waysides to transit;

4. Be inviting. Inviting open spaces feature designs that encourage users to explore the Industrial Wayside and design elements that support a sense of the human scale. These elements include landscaping, benches and other seating areas, and pedestrian-scaled lighting;

5. Provide access. Provide access to the employees and the public between the hours of 6:00 a.m. and 8:00 p.m.;

6. Be safe. Safe open spaces incorporate principles of natural surveillance, lighting, and prominent entrances;

7. Provide facilities appropriate for the scale of the proposed development; and

8. Be easy to maintain. Industrial Waysides should be constructed of commercial grade materials that will endure and are readily maintainable.

B. *Applicability.* All projects in the NWI Zone shall provide Waysides according to the standards in Table NWI-6.

C. *General.* The following development standards apply to all Waysides:

1. Required Wayside Area is exclusive of required landscape screening.

2. Required Minimum Dimension of 20 feet (either width or depth).

D. *Criteria.* Waysides shall meet the following criteria:

1. *Perimeter Landscaping.* In addition to the minimum size and dimensions, landscape three sides of the Industrial Wayside to a depth of 20 feet, minimum according to Section 4.176(.02). Permitted screening includes: Section 4.176(.02)D. Low Screen Landscaping Standard; Section 4.176(.02)E. Low Berm Standard; or Section 4.176(.02)F. High Screen Landscaping Standard. Perimeter landscaping shall not obscure visual access to the Industrial Wayside. Unscreened surface parking lots, chain link fencing, or service yards are prohibited adjacent to Industrial Waysides.

2. *Visibility.* Industrial Waysides shall be visible from and accessible to Addressing Streets.

3. *Accessible Pathway.* A paved walking surface, width: five feet, minimum, meeting ADA standards is required to connect Industrial Wayside with Addressing Street.

4. *Accessible Surface.* Industrial Waysides shall have an accessible surface, 100 square feet, minimum; dimensions ten feet, minimum meeting ADA standards.

5. *Required Amenities:*

a. *Seating.* Outdoor seating shall be provided. Publicly accessible plazas, courtyards, and pocket parks shall include at least one linear foot of seating per each 40 square feet of plaza, courtyard or pocket park space on site. Outdoor seating shall be in the form of:

i. Free standing outdoor benches consistent with the standards; or

ii. Seating incorporated into low walls, berms, or raised planters.

b. *Landscaping.* The landscaping must be planted and maintained according to Section 4.176(.02)C.

c. *Lighting.*

d. *Recycling/ Waste Receptacle.* Locate waste and recycling stations nearest to the accessible path and away from stormwater facilities.

6. *Installation and Maintenance.* Industrial Waysides shall be programmed, planned, constructed, and maintained at the expense of the applicant. The landscaping must be planted and maintained according to Section 4.176(.07). Recycling, waste receptacles, and pet waste stations shall be serviced at an acceptable professional interval to prevent being over filled or creating unsanitary or visually messy appearances.

7. *Solar Access.* Exposure to sunlight. Southern exposure is encouraged. Design facilities to permit direct sunlight to enter the Industrial Wayside and strike the required accessible surface between the hours of 10:00 a.m. and 2:00 p.m. local time.

8. *Lighting.* Lighting for Industrial Waysides is required to permit reasonable use, utility, security, and nighttime safety. Lighting installed in Industrial Waysides shall conform to the requirements of Section 4.199. All outside lighting shall be arranged and shielded so as not to shine into

adjacent areas and to prevent any undue glare or reflection and any nuisance, inconvenience, and hazardous interference of any kind on adjoining streets or property.

E. *Optional Amenities include the following:*

1. Picnic tables and benches. Locate picnic tables and benches on the Accessible Surface;
2. Arbors or trellises;
3. Drinking Fountains. Locate drinking fountains and benches on the Accessible Surface;
4. Sculpture and other works of art;
5. Bicycle repair stations;
6. Exercise stations; or
7. Pet waste stations. Locate pet waste stations nearest to the accessible path and away from stormwater facilities.

Table NWI-6: Waysides

Parcel Area	Required Wayside Area	Number of Waysides	Enhanced Transit Plaza ‡
Less than or equal to 5.0 acres	Not required	n/a	n/a
Greater than 5.0 acres, less than or equal to 8.0 acres	400 square feet, minimum	One	Not permitted
Greater than 8.0 acres, less than or equal to 13.0 acres	600 square feet, minimum	One	Not permitted
Greater than 13.0 acres, less than or equal to 23.0 acres	800 square feet, minimum	One, minimum	Permitted*. Up to 400 square feet.
Greater than 23.0 acres, less than or equal to 36.0 acres	1,600 square feet, minimum	One, minimum	Permitted*. Up to 400 square feet.
Greater than 36.0 acres, less than or equal to 51.0 acres	3,200 square feet, minimum	Two, minimum	Permitted*. Up to 400 square feet.
*** Greater than 51.0 acres, less than or equal to 70.0 acres	6,400 square feet, minimum	Two, minimum	Permitted**. Up to 800 square feet.
*** Greater than 70.0 acres, less than or equal to 92.0 acres	12,800 square feet, minimum	Two, minimum	Permitted**. Up to 800 square feet.

‡ In the future when SMART serves parcels in the NWI Zone, Industrial Waysides may comply with the standards for Enhanced Transit Plazas, as follows:

*Up to 400 square feet of the space requirement for Industrial Waysides may be satisfied by installation of an enhanced transit stop. An enhanced transit stop must provide weather protection, paved surface, and seating, as approved by SMART Transit.

**Up to 800 square feet of the space requirement for Industrial Waysides may be satisfied by installation of an enhanced transit stop, provided parcel fronts on two or more Addressing Streets. An enhanced transit stop must provide weather protection, paved surface, and seating, as approved by SMART Transit.

***For Parcel Frontage greater than 1,500 feet, and area greater than 51.0 acres, up to 50 percent of the space requirement for Industrial Waysides may be satisfied by restoration of wetlands, riparian zones, or other habitat because of the significant passive recreation opportunities provided.

(.12) *Performance and Other Standards:*

A. *Performance Standards.* The performance standards of Section 4.117(.01) shall apply to all industrial properties and sites within the NWI Zone, as are intended to minimize the potential adverse impacts of industrial activities on the general public and on other land uses or activities. They are not intended to prevent conflicts between different uses or activities that may occur on the same property.

B. *Block and access standards.* The block and access standards of Tables NWI-2 and NWI-4 shall apply.

C. Lot Size. No limit save and except as shall be consistent with the other provisions of this Code (e.g., landscaping, parking, etc.).

D. Maximum Lot Coverage. No limit save and except as shall be consistent with the other provisions of this Code.

E. *Front Yard Setback.* The setback standards of Table NWI-5 shall apply.

F. Rear and Side Yard Setbacks. Thirty feet, except as otherwise provided for properties within this zone.

1. No setback is required when rear or side yards abut a railroad siding.

G. Corner Vision. Corner lots shall have no lot obstruction to exceed the vision clearance standards of Section 4.177.

(.13) *Signs:*

A. *Applicability.* PDI Zone requirements of Section 4.156.01 through 4.156.11 apply to the NWI Zone with the following modifications and adjustments.

B. *General:*

1. Site Frontage as described in Section 4.156.08 is the Primary Frontage.
2. Monument-style signs are required. Pole-style freestanding signs are not permitted.
3. Maximum area for signs on buildings is based on linear length (in feet) of the façade adjacent to the Primary Frontage.
4. Directional and Wayfinding Signs shall be placed at the intersection of Supporting Streets and Through Connections.

(Ord. No. 812, 2-22-2018; Ord. No. 889, § 2(Exh. A), 3-18-2024)

DRAFT

Table NWI-1. Typically Permitted Uses

Abbreviations:

A	Allowed
R	Allowed with Restrictions
C	Conditional
P	Prohibited

Subdistricts:

Coffee Creek	South of SW Day Road
High-Tech Employment	North of SW Day Road south of the Light Industrial subdistrict, and east of SW Boones Ferry Road
Light Industrial	North of SW Clay Street west of SW Grahams Ferry Road, and north of the High-Tech Employment subdistrict east of SW Grahams Ferry Road to the western boundary of Craft Industrial (CI) Zone
West Railroad	West of Portland and Western Railroad tracks

Use	Coffee Creek Subdistrict	High-Tech Employment Subdistrict	Light Industrial Subdistrict	West Railroad Subdistrict	Rationale and Considerations:
Manufacturing, Processing, Assembly, and Packaging of products.	A	A	A	TBD	
Fabrication.	P	A	A	TBD	Prohibit in Coffee Creek Subdistrict: Fabrication is smaller scale (small to medium) than manufacturing. PDI-RSIA is more appropriate for larger-scale uses that would fall into manufacturing.
Repair, Finishing, and Testing of products manufactured or fabricated within the zone.	A	A	A	TBD	Possibly Restrict in Coffee Creek Subdistrict: Use is generally allowed as part of manufacturing. However, if there is a concern about an independent small to medium use that would consume too much land locating in the Coffee Creek Subdistrict, consider making R with a minimum size.
Research and Development.	R Allowed accessory to a primary use or as a separate use. When a separate use, no single biulding on a site may be less than 75,000 square feet in size.	A	A	TBD	Restrict in Coffee Creek Subdistrict: Research and development is not specifically called out in Coffee Creek (PDI-RSIA). Thus, restrict the use in the Coffee Creek Subdistrict to accessory to a primary use or limited in size when a separate use.
Laboratories.	A	A	A	TBD	
Hospitals.	A	A	A	TBD	Allow in all Subdistricts: Allowing hospitals in all areas of the zone helps to address the City's shortage of land for large-scale medical uses. Such facilities generate high-wage jobs with minimal traffic, unlike clinics or commercial uses. Any retail sales or medical office/clinic space dedicated to outpatient care is limited the same as other retail and office uses in the zone.
Warehousing and Distribution, except Direct to Consumer (DTC) E-commerce Fulfillment or Logistics.	A	A	A	TBD	

** Highlighted rows indicate those uses are proposed additions not currently directly listed as permitted in PDI or PDI-RSIA

Use	Coffee Creek Subdistrict	High-Tech Employment Subdistrict	Light Industrial Subdistrict	West Railroad Subdistrict	Rationale and Considerations:
Direct-to-Consumer (DTC) E-commerce Fulfillment or Logistics.	R On-site customers limited to 5% of trips. No single building on a site may exceed 200,000 square feet in size. Any delivery vehicles, including light-duty vehicles, shall be kept in a screened storage area.	R On-site customers limited to 5% of trips. No single building on a site may exceed 200,000 square feet in size. Any delivery vehicles, including light-duty vehicles, shall be kept in a screened storage area.	R Any delivery vehicles, including light-duty vehicles, shall be kept in a screened storage area.	TBD	Restrict in all Subdistricts: E-commerce fulfillment and logistics has become a major industrial land use, driven by technology and changing consumer habits. To manage land use and avoid displacing other industrial users, a maximum building size of 200,000 square feet is proposed. This would support a regional hub for a large company or a primary center for a small to mid-sized business, typically requiring about 10 acres for operations, including truck courts, parking, circulation, and landscaping. On-site customers are limited to 5% of trips. Add a definition to WC Section 4.001?
Industrial Services.	P	P	A	TBD	Prohibit in Coffee Creek and High-Tech Subdistricts: Industrial Services is not specifically called out in Coffee Creek (PDI-RSIA). Thus, prohibit the use in the Coffee Creek Subdistrict. Also prohibit in High-Tech Employment Subdistrict.
Motor Vehicle Services, or other services complementary or incidental to primary uses, and which support the primary uses by allowing more efficient or cost-effective operations.	A	A	A	TBD	
Specialty Automotive Services.	P	P	R Limited to processing that generally takes more than 48 hours and customer interaction area of not more than 5,000 square feet. Does not include typical maintenance or mechanical repair of light-duty vehicles done at quick lube, auto mechanics, or similar commercial service facilities catering to motor vehicles. All equipment or vehicles being processed and waiting for processing or pickup shall be kept inside a building or in screened storage areas.	TBD	Prohibit in Coffee Creek and High-Tech Subdistricts; Restrict in Light Industrial Subdistrict: This use does not fit neatly into existing zoning categories. Unlike typical auto repair shops, these facilities involve multi-day vehicle work and require screened outdoor storage for parts and vehicles. They operate more like light industrial manufacturing uses than retail services. Examples include auto body repair and vehicle customization shops. The use excludes general auto repair, oil changes, tire services, and dealership-based service operations.
Corporate Headquarters.	R Must have more than 20 employees.	A	A	TBD	Restrict in Coffee Creek Subdistrict: Corporate Headquarters is not specifically called out in Coffee Creek (PDI-RSIA). Thus, allow the use in the Coffee Creek Subdistrict but restrict it to more than 20 employees.
Office Complex-Technology, other than Call Center or Data Center.	A	A	A	TBD	
Call Center.	R Must have more than 20 employees.	R Must have more than 20 employees.	A	TBD	Restrict in Coffee Creek and High-Tech Subdistricts: Call Center is not specifically called out in Coffee Creek (PDI-RSIA). Thus, allow the use in the Coffee Creek Subdistrict but restrict it to more than 20 employees. Include same restriction in High-Tech Employment Subdistrict.

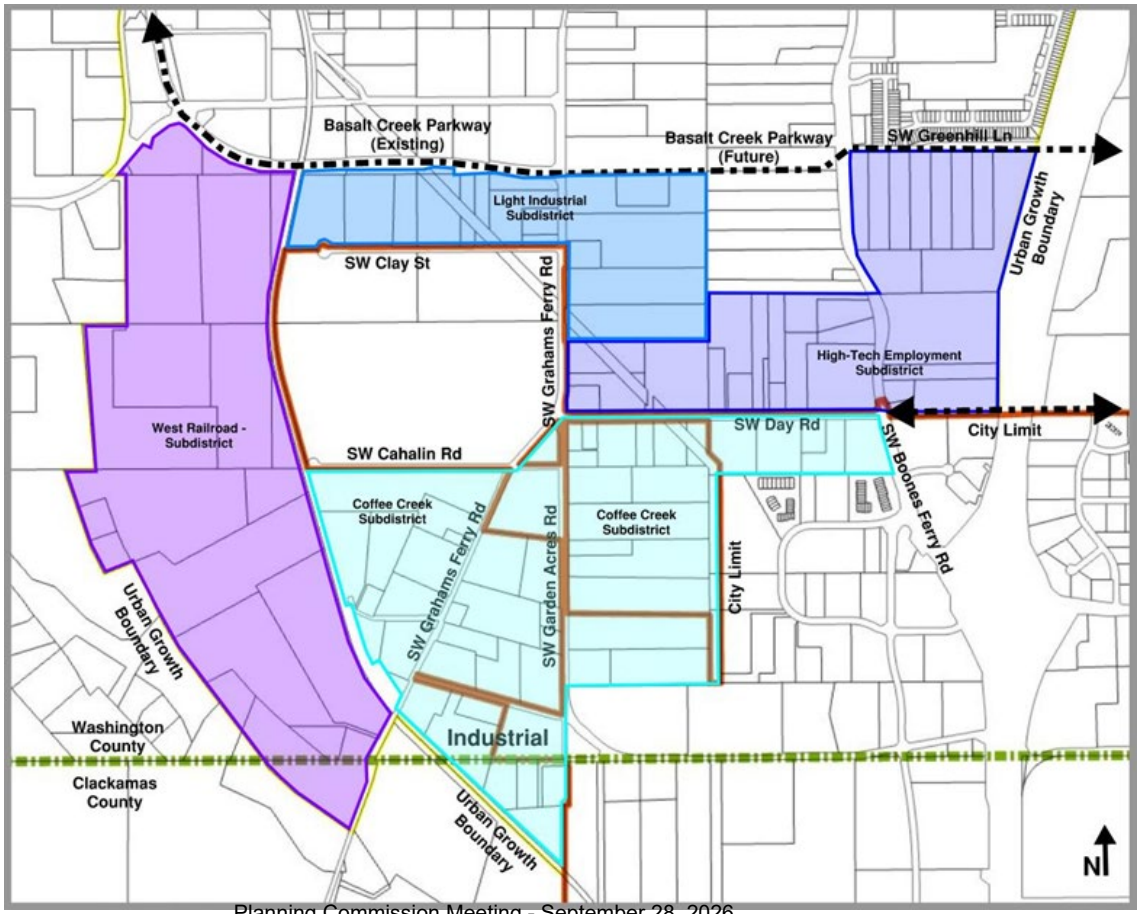
Use	Coffee Creek Subdistrict	High-Tech Employment Subdistrict	Light Industrial Subdistrict	West Railroad Subdistrict	Rationale and Considerations:
Data Center.	R Limited to maximum of 25,000 square feet on a site.	R Limited to maximum of 25,000 square feet on a site	A	TBD	Restrict in Coffee Creek and High-Tech Subdistricts: Data centers, like e-commerce facilities, reflect recent technological shifts. While they have low employment density, they demand significant energy and infrastructure. To prevent large data centers from outcompeting other industrial uses for limited land, water, and power, staff recommends a maximum building size of 25,000 square feet—adequate for local or regional needs. As precedent, the Siemens data center on SW Parkway Avenue is approximately 20,000 square feet. Note: Mentor Graphics/Siemens is about 20K SF.
Any use allowed in the PDC Zone or any other light industrial uses provided that any such use is compatible with industrial use, planned and developed in a manner consistent with the purposes and objectives of Section 4.130 to 4.140, and subject to the follwoing criteria:					Restrict Office, Commercial Service, and Retail in all Subdistricts: These uses are restricted in PDI-RSIA and PDI consistent with Metro Title 4 Industrial and Other Employment Areas. Include same restrictions as PDI-RSIA in Coffee Creek Subdistrict and PDI in High-Tech Employment and Light Industrial Subdistricts.
Professional Office accessory to and occupying a smaller square footage than the primary use.	R Not to exceed 20 percent of total floor area within a site.	R Not to exceed 30 percent of total floor area within a site.	R Not to exceed 30 percent of total floor area within a site.	TBD	See rationale, above.
Professional Office or Commercial Service with regular customers (daily or more than 3 per week) including small medical/dental offices.	R Not to exceed 3,000 square feet of floor area in a single building, or 20,000 square feet of combined floor area within a multi-building development.	R Not to exceed 5,000 square feet of floor area in a single building, or 20,000 square feet of combined floor area within a multi-building development.	R Not to exceed 5,000 square feet of floor area in a single building, or 20,000 square feet of combined floor area within a multi-building development.	TBD	See rationale, above.
Retail use including indoor and outdoor sales, service or inventory storage area	R Not to exceed 3,000 square feet of floor area in a single building, or 20,000 square feet of combined floor area within a multi-building development.	R Not to exceed 5,000 square feet of floor area in a single building, or 20,000 square feet of combined floor area within a multi-building development.	R Not to exceed 5,000 square feet of floor area in a single building, or 20,000 square feet of combined floor area within a multi-building development.	TBD	See rationale, above.
Combined Professional Office, Commercial Service, and Retail use including indoor and outdoor sales, service or inventory storage area	R Not to exceed 3,000 square feet of floor area in a single building, or 20,000 square feet of combined floor area within a multi-building development.	R Not to exceed 5,000 square feet of floor area in a single building, or 20,000 square feet of combined floor area within a multi-building development.	R Not to exceed 5,000 square feet of floor area in a single building, or 20,000 square feet of combined floor area within a multi-building development.	TBD	See rationale, above.
Commercial Recreation.	P	P	A	TBD	Prohibit in Coffee Creek and High-Tech Employment Subdistricts: Commercial recreation uses—such as specialized gyms and indoor sports facilities—are not well supported by Wilsonville's current zoning. These businesses need larger spaces and higher ceilings, which most PDC-zoned properties do not offer. They also struggle to compete with higher-paying retail tenants. While not intended for prime employment land, certain industrial parcels with physical constraints—such as small lot size or limited truck access—may be suited for these uses.
Training Facilities and Vocational Schools providing education to meet industrial workforce needs.	A	A	A	TBD	

Use	Coffee Creek Subdistrict	High-Tech Employment Subdistrict	Light Industrial Subdistrict	West Railroad Subdistrict	Rationale and Considerations:
Self Storage, including retail storage facilities and/or storage/warehousing of containers for use in moving or self-storage.	P	P	P	TBD	Prohibit in all Subdistricts: Self-storage is considered a commercial/retail use that is not appropriate for industrial land. However, it could be appropriate for West Railroad and is, therefore, included in the use table.
Public Facilities.	A	A	A	TBD	
Contractor Establishment.	P	P	A	TBD	Prohibit in Coffee Creek and High-Tech Employment Subdistricts: Allowing contractor establishments in suitable areas of Basalt Creek supports prior discussions about their role in serving nearby construction activity. Once annexed, these uses would be subject to the NWI Zone's development standards and design guidelines. Add definition to Section 4.001?
Residential use.	R Shall not exceed 10 percent of total floor area.	R or C?	P	TBD	Restrict in Coffee Creek and High-Tech Subdistricts; Prohibit in Light Industrial Subdistrict: Residential uses are allowed in Coffee Creek (PDI-RSIA), but limited not to exceed 10 percent of total floor area; therefore, the same limitation is included in the Coffee Creek Subdistrict. Should the same restriction be included, or should the use be conditional in the High-Tech Employment Subdistrict? Residential use is not typically permitted in the PDI Zone; therefore, it is listed as pronibited in the Light Industrial Subdistrict.
Accessory Uses, Buildings and Structures customarily inciental to any permitted use.	A	A	A	TBD	
Temporary Buildings or Structures for uses incidential to construction work.	R Structures shall be removed within 30 days of completion or abandonment of construction work.	R Structures shall be removed within 30 days of completion or abandonment of construction work.	R Structures shall be removed within 30 days of completion or abandonment of construction work.	TBD	Restrict in all Subdistricts: Required removal of temporary buildings associated with construction within a certain number of days is a typical restriction.
Expansion of a Building, Structure or Use approved pior to October 25, 2004 of up to 2-percent additional floor area and/or ten percent additional land area.	A	P	P	TBD	Allow in Coffee Creek Subdistrict; Prohibit in other Subdistricts: This is allowed in Coffee Creek (PDI-RSIA); therefore, the allowance is included for the Coffee Creek Subdistrict. The same use is not typically permitted in the PDI Zone; thus, it is prohibited in other Subdistricts.
Similar Uses to those listed as typically allowed.	R Must be substantially similar as determined by the Planning Director and meet any restrictions of similar uses.	R Must be substantially similar as determined by the Planning Director and meet any restrictions of similar uses.	R Must be substantially similar as determined by the Planning Director and meet any restrictions of similar uses.	TBD	Restrict in all Subdistricts: This restriction is consistent with WC Section 4.164 - General Regulations--Uses Not Listed, authorizing the Planning Director to make the determination of similar use.

Wilsonville Industrial Land Readiness – Basalt Creek

Planning Commission Work Session
September 10, 2025
Presented by: Cindy Luxhoj AICP, Associate Planner
Dan Pauly AICP, Planning Manager

Craft Industrial (CI) Zone



- Limited residential and commercial uses
- Broader and more flexible use descriptions
- Application of NWI Zone design and development standards

Discussion – CI Zone

- What additional input, if any, does the Planning Commission have about the proposed CI Zone language?

Northwest Industrial (NWI) Zone

NWI Zone - Subdistricts

- Coffee Creek
  - Designated RSIA
  - Additional size restrictions for commercial uses
- High-Tech Employment
  - Use restrictions to help preserve available land for higher-density employment and focus industries
- Light Industrial
  - Allowed uses most like the current PDI zone
- West Railroad
  - Uses still under consideration

NWI Zone – Proposed New Uses

- Hospitals
- Direct-to-Consumer (DTC) E-commerce Fulfillment and Logistics
- Specialty Automotive Services
- Data Center
- Commercial Recreation
- Contractor Establishment

NWI Zone – Proposed New Uses

- Hospitals:
  - Allow in all subdistricts
  - Rationale:
    - Generates high-wage jobs at a density similar to high-tech industrial
    - Limit space dedicated to outpatient care same as other retail/office uses

NWI Zone – Proposed New Uses

- Direct-to-Consumer (DTC) E-commerce Fulfillment and Logistics:
  - Restrict in all subdistricts
  - Rationale:
    - Add major industrial land use not addressed in existing zoning
    - Manage to avoid displacing other industrial users
      - Maximum buildings size of 200,000 square feet
      - Limit on-site customers to 5% of trips
      - Keep all delivery vehicles in screened storage area

NWI Zone – Proposed New Uses

- Specialty Automotive Services:
  - Prohibit in Coffee Creek and High-Tech Employment. Restrict in Light Industrial.
  - Rationale:
    - Does not fit neatly into existing zoning categories
    - Operate more like light industrial manufacturing uses than retail services
    - Limit in Light Industrial to processing that takes more than 48 hours and customer interaction area not to exceed 5,000 square feet

NWI Zone – Proposed New Uses

- Data Center:
  - Restrict in Coffee Creek and High-Tech Employment. Allow in Light Industrial.
  - Rationale:
    - Reflect recent technological shifts
    - Limit building size to prevent over competition with other industrial uses for limited resources

NWI Zone – Proposed New Uses

- Commercial Recreation:
  - Prohibit in Coffee Creek and High-Tech Employment. Allow in Light Industrial.
  - Rationale:
    - Not well supported by current zoning
    - Address business need for larger spaces and higher ceilings than offered in PDC-zone properties
    - Limit to parcels in Light Industrial that may be suited for use due to physical constraints – small lot size or limited truck access

NWI Zone – Proposed New Uses

- Contractor Establishment:
  - Prohibit in Coffee Creek and High-Tech Employment. Allow in Light Industrial.
  - Rationale:
    - Supports prior discussions about role of contractor establishments in serving nearby construction activity
    - Once annexed, subject to NWI Zone's development standards and design guidelines

Discussion – NWI Zone

- What guidance does the Planning Commission have on:
  - The proposed new NWI Zone for both Coffee Creek and Basalt Creek?
  - The proposed use of a table to distinguish allowed uses across different subdistricts?
  - The proposed list of uses and the extent they are allowed within the different subdistricts?

Draft PC Minutes were reviewed and approved at the October 8, 2025 PC Meeting.

Wilsonville Planning Commission
Regular Meeting Minutes
September 10, 2025
Wilsonville City Hall & Remote Video Conferencing
https://www.ci.wilsonville.or.us/meetings/pc

CALL TO ORDER - ROLL CALL
Chair Hendrix called the meeting to order at 6:00 pm.

Present:	Nicole Hendrix, Andrew Karr, Ron Heberlein, Sam Scull, Yana Semenova, and Matt Constantine
Excused:	Jennifer Willard
Staff Present:	Daniel Pauly, Miranda Bateschell, Amanda Guile-Hinman, Cindy Luxhoj, and Mandi Simmons

PLEDGE OF ALLEGIANCE
The Pledge of Allegiance was recited.

CITIZEN INPUT
There was none.

ADMINISTRATIVE MATTERS
1. Consideration of the August 13, 2025, Planning Commission Minutes
The August 13, 2025, Planning Commission minutes were accepted as presented.

WORK SESSION
2. Wilsonville Industrial Land Readiness (Code-Basalt Creek) (Luxhoj)

Associate Planner Luxhoj presented the Staff report via PowerPoint, providing a brief review of the Craft Industrial (CI) Zone and highlighting Development Code text proposed in response to prior Commissioner comments. (Attachment 1) She also introduced the new Northwest Industrial (NWI) Zone, reviewing its subdistricts (Slide 5) and the proposed new uses and why they were proposed. (Slides 7-12) The NWI Zone would implement the design elements of the Coffee Creek Industrial Design Overlay District, expand geographically to include Basalt Creek, and include an updated list of allowed uses and revised development standards drawn from both the Planned Development Industrial (PDI) and PDI-RSIA Zones, with the standards updated to reduce redundancy and reflect existing uses. The draft Code language for the NWI Zone was in Attachment 2 and Table NWI-1 Typically Permitted Uses was provided as Attachment 3 of the meeting packet. Staff sought Planning Commission input on the NWI Zone.

Commissioner input on the proposed Development Code amendments and Staff responses to Commissioner questions were as follows:

- Staff confirmed the Planning Commission had no additional input or comments regarding proposed CI Zone language.
- Including a legend with Figure NWI-2 to describe streets and street types would be helpful. (Attachment 2)
- The white area shown between the Light Industrial and High-Tech Subdistricts was the Craft Industrial area. (Slide 4)
- Light Industrial or Industrial uses should be located closer to the freeway so larger trucks would not need to travel through neighborhoods. Switching the locations was suggested to place office areas in the middle and heavier traffic uses along the freeway.
  - Staff explained that the High-Tech Employment and Light Industrial locations reflected the Basalt Creek Concept Plan, with larger freeway-adjacent parcels identified for High-Tech because they were flat, had good visibility, and freeway access.
  - Aside from some access issues with West Railroad, the entire area was relatively close to the I-5 Interchange. Many traffic and land use considerations were part of the concept planning process.
- In Section 4.134(.02)B.2, using "any exterior modifications" seemed too general. Would a minor change to a building's exterior make the new standards applicable? (Attachment 2)
  - Staff explained that much of Section 4.134 came from the Design Overlay District and the exterior modifications language was changed from the Form-Based Code. It could be modified if necessary.
    - The phrase was carried over in a cut/paste scenario, and the proposed language should be considered to see about any redundancy with the General Zoning Standards for nonconforming uses. Even without any development, including exterior modifications, if the use was nonconforming, it would need to meet current standards. The language would be reviewed to confirm it still made sense in this context.
- Similarly, Section 4.134(.02)B.3, included "changing an existing sign" which seemed overly restrictive since even a name change could trigger the new standards to be in effect.
  - Staff noted the Code section language was originally for design standards so whether they were still applicable for General Zoning Standards was a good question.
- Figure NWI-3 Supporting Streets Standards showed no bike lanes planned for supporting streets. Figure NWI-4 showed bicycles sharing the through traffic lanes, but Figure NWI-3 did not. (Attachment 2)
  - Staff clarified the table identified Bike Facilities as shared streets, rather than having dedicated bike lanes. Supporting streets would generally be unmarked, more like residential streets without bike lane striping.
- Staff would confirm how the Addressing Street standards were defined, since they were not shown in the packet, and whether those streets defaulted to the City's street requirements.

- Staff would work with the engineering team and others to clarify the description in Table NWI-2 Street Design and Connectivity regarding the Connection Spacing, the exceptions for some Addressing Streets, and Day Road being separate. (Attachment 2)
- Table NWI-5 Building Design requiring a primary building entrance to be visible from, and accessible to, an Addressing Street might result in long walks from parking areas, which may not be near the Addressing Street. (Attachment 2)
  - Staff clarified some parking was allowed on Addressing Streets in front of buildings, though the number of spaces was limited. ADA spaces would still be located at the primary entrance.
- The use of "safe, direct, and convenient" in the Accessibility section of Table NWI-5 could be a bit subjective; perhaps other language should be used.
  - Staff explained subjectivity was allowed, since this was not for residential development, and mirrored similar language in Code Section 4.154.
- The 30-foot minimum building height requirement in Table NWI-5 was an urban design element carried forward from the Day Road Design Overlay, which became the Coffee Creek Overlay, to create a consistent street presence with buildings that help frame the street. Being form-based design regulations played into it to create an employment district look with clear delineation of the public space edges within the employment area. High facades along Addressing Streets were wanted to create that look and feel. (Attachment 2)
  - Staff confirmed even one-story buildings would need a 30-foot façade as the intent was to provide the desired visual design. The minimum height requirement had an allowed adjustment of 10%, so the facades could be no lower than 27-feet high.
- In Section 4.134(.11) Waysides, and especially Table NWI-6, understanding how waysides would look and how they would connect together was difficult to visualize.
  - Staff described three existing wayside examples at Coffee Creek Logistics, Black Creek, and Precision Countertops, noting a wayside was also planned for Delta Logistics. Waysides were generally concrete areas directly off main sidewalks with benches, trash receptacles, and perhaps artwork, surrounded by trees and landscaping to provide shade.
- Staff clarified that Enhanced Transit Plazas could only be developed as part of a wayside if SMART served the parcel. (Footnote, Table NWI-6) The City and SMART would have to approve the project as SMART would be part of the development review team.
- Data centers and contractor establishments had no size restrictions in the Light Industrial Subdistrict to maintain flexibility and to reflect what is currently allowed in the PDI Zone. Staff received no additional direction about the need to restrict the size. Parcel geometry in the subdistrict would limit both the size and likelihood of such uses. (Table NWI-1, Attachment 3)
  - Including prohibitions and restrictions are only considered if there was a reasonable probability of an issue; however, Staff welcomed Commissioner input, particularly if there was a risk that contractor establishments would become too big and unduly consume land in the Light Industrial Subdistrict.

  - Staff suggested an acreage limitation be explored after a comment that contractor establishments may consume significant land in the future if other land became unavailable.
- Staff clarified that the Connectivity Master Plan requirement for development within the NWI Zone was a direct carry over from the Overlay District.
- To accommodate business uses not listed in the permitted use table, the Code included "similar use" provisions and broader categories to allow flexibility for emerging uses. The business would apply, and Staff determine the applicable use category.
- Staff confirmed no building to acreage ratio was required but recognized that contractor establishments consume land that would probably be better suited for other uses.
- However, the use was an economic cluster in Wilsonville that provided payroll, attracted jobs, and supported other public and private projects. Some contractor establishments had been built within the city limits under urban standards and seemed to function and fit well in industrial areas. Those precedent developments could inform standards such as floor-to-area ratio or square footage-to-yard area distinctions.
- "Hospital/medical building" might be a better term, since medical buildings were more likely than a hospital, which was difficult to imagine being built in the area.
  - Staff clarified the Code's definition of "hospital" was distinct from "medical center", which would not be a permitted use. Though not built, an in-patient mental health hospital was approved in Coffee Creek that would have functioned more like an industrial use in terms of job density, high-wage jobs, and traffic, which was the basis for including the use. Larger medical centers would involve vacant commercial land, rezoning or master planning, while urgent care or medical office uses would be classified as commercial uses. A physical therapy office would be considered a medical office, not a hospital.
  - The concept of allowing in-patient facilities was supported, given the challenges of siting such uses, but the term "hospital" might not be the most accurate as it conjured up larger facilities like Meridian Park, Emmanuel, or Dammasch.
    - Staff welcomed wording ideas, noting earlier drafts titled the use as in-patient medical office, medical research and development, laboratories, which was long. The intent was to capture facilities not serving out-patient consumer uses.
- Overall, the permitted use definitions were broad enough to allow flexibility for future developments and were well done.
- Small-scale versions of commercial food preparation uses, such as centralized school kitchens, were permitted in the CI Zone,. Larger scale operations for commercial food preparation would be categorized under Manufacturing, Processing, Assembly, and Packaging of Products; some warehousing might be associated with the use as well.

Chair Hendrix called for public comment.

Ryan Schera, Schnitzer Properties, a stakeholder and property owner, expressed support for the consolidation of the NWI Zone, noting Staff had identified appropriate uses for the Light Industrial Subdistrict, but raised concerns that several design standards were not appropriate

for the functional needs of industrial sites. His primary concern was the 600-foot connection spacing in Table NWI-2, which could eliminate 12 acres of developable land on Schnitzer's 44-acre property and limit building size below what was typical for large industrial users. He noted additional concerns with parking standards limiting spaces at the front of buildings, building height requirements that were too low for modern industrial facilities, driveway width standards that were too narrow for trucks, and retaining wall standards that would consume significant portions of developable land on Schnitzer's sloped property. Mr. Schera would like to meet with Staff to review the standards and address the realities of light industrial development.

Planning Manager Pauly replied Staff would be happy to meet to discuss Mr. Schera's concerns.

Chair Hendrix confirmed there was no further public testimony.

INFORMATIONAL

3. City Council Action Minutes (August 4, 2025) (No staff presentation)
4. 2025 PC Work Program (No staff presentation)

Commissioner Karr inquired about comments in the minutes about the Civics Academy's interest in rebooting Boones Ferry Days event. **City Attorney Guile-Hinman** clarified that the Civics Academy had been informed that Staff had no resources to assist with the Boones Ferry Days event, but the Academy was welcome to take the event on.

Planning Manager Pauly clarified a joint work session would be held with City Council on October 6th in addition to the Commission's regular meeting. Packet materials would be provided in advance.

ADJOURN

The meeting was adjourned at 7:02 p.m.

CITY COUNCIL

MONDAY, JUNE 2, 2025

WORK SESSION

Wilsonville Industrial Land Readiness (Basalt Creek Master Plan) (Luxhoj)(Pauly)

CITY COUNCIL MEETING
STAFF REPORT

Meeting Date: June 2, 2025	**Subject:** Wilsonville Industrial Land Readiness – Basalt Creek **Staff Members:** Cindy Luxhoj AICP, Associate Planner, and Dan Pauly AICP, Planning Manager **Department:** Community Development
Action Required	**Advisory Board/Commission Recommendation**
☐ Motion ☐ Public Hearing Date: ☐ Ordinance 1st Reading Date: ☐ Ordinance 2nd Reading Date: ☐ Resolution ☒ Information or Direction ☐ Information Only ☐ Council Direction ☐ Consent Agenda	☐ Approval ☐ Denial ☐ None Forwarded ☒ Not Applicable **Comments:** N/A
Staff Recommendation: Provide requested input about planned land uses for the Basalt Creek industrial area.	
Recommended Language for Motion: N/A	
Project / Issue Relates To:	

☒Council Goals/Priorities: Attract high-quality industry and support economic opportunity for all in Wilsonville (2023-2025 Council Goal)	☒Adopted Master Plan(s): Basalt Creek Concept Plan	☐Not Applicable

ISSUE BEFORE COUNCIL:
Staff seeks input on policy direction for the Basalt Creek Planning Area to inform the Master Plan which is expected to be adopted at the end of the year.

EXECUTIVE SUMMARY:

During the May 19 work session, staff provided the Council with background on the Basalt Creek Planning Area—an unincorporated area within the urban growth boundary, located on the northwest edge of the City adjacent to Tualatin. That work session also included a review of the Guiding Principles for the Basalt Creek Planning area (Attachment 1). This work session will build on that background by presenting additional information and seeking the Council's guidance on key aspects of the project.

Since adoption of the Basalt Creek Concept Plan in 2018, prepared jointly with the City of Tualatin, both Cities have individually advanced implementation efforts. However, Wilsonville has yet to complete certain steps, including master planning, amending the Development Code for appropriate zoning, and preparing an infrastructure funding plan. Consequently, in 2023, the City initiated the Wilsonville Industrial Land Readiness (WILR) project, funded by grants from Business Oregon and Metro, to update technical information and calibrate the Basalt Creek Concept Plan's assumptions with current conditions, including market conditions in order to develop a Master Plan and prepare the area for development.

In this work session, staff will present key findings from recent market and land use studies. The discussion will address the continued viability of proposed land uses in today's economic climate and over the 20-year master planning horizon, ensuring alignment with the City's vision of balancing industrial demand with the creation of a distinctive industrial business community that complements Wilsonville's unique identity.

Key findings from recent studies indicate continued strong demand for industrial space, suitability of the Basalt Creek area for development, and challenges posed by parcelization and existing contractor establishments. Based on these findings, the Planning Commission recommends implementing the Concept Plan's land use types for the Basalt Creek area, excluding the West Railroad area, which is still under study and will be discussed at future work sessions. Additional information on the Concept Plan and WILR project findings, to date, is provided below.

Basalt Creek Concept Plan Land Use Types

The Basalt Creek Concept Plan (BCCP) designates properties for High-Tech Employment, Light Industrial, and Craft Industrial as shown in the attached map (Attachment 2). These designations support a mix of employment types, complement adjacent industrial areas, and respond to market demands. A synopsis of the land use types prepared by staff provides background information about scenario planning that shaped the Concept Plan map and land use types and incorporates new information from the recent analyses to inform refinement of land uses in the Master Plan (Attachment 3).

Due to natural resource constraints, fragmented ownership, and inadequate infrastructure, planning for the West Railroad area was postponed during concept planning and it was not assigned a land use type. The project team is still preparing information for West Railroad for Planning Commission and City Council consideration in coming months.

Recent studies, in particular the Economic Inventory and Site Suitability Analysis, confirm the appropriateness of the designated land use types in the Concept Plan. Further study of the West Railroad area is needed to determine the best way to balance industrial development with community priorities and to assign an appropriate land use type for the area. In addition, as recommended in the Concept Plan, northern extension of the Industrial Design Overlay District (form-based Code), adopted in 2018 for the Coffee Creek Industrial Area, to include all or a portion of Basalt Creek should be considered.

Findings of Key Studies and Analyses

Recently completed studies and analyses include:

Study	Purpose
Economic Inventory and Land Use Analysis	Evaluates current market trends and identifies suitable industries for Basalt Creek
Updated Buildable Lands Inventory (BLI)	Reflects recent land developments, adjusted natural resource constraints, and revised capacity estimates
Site Suitability Analysis	Evaluates three key opportunity sites for potential to support target industries based on attributes like size, location, and constraints
Redevelopment Feasibility of Contractor Establishments	Discusses redevelopment potential of contractor establishments given prevailing market conditions
Transportation System Plan (TSP) Evaluation	Reviews City's current list of TSP projects for Basalt Creek to ensure land use assumptions and identified transportation projects are still applicable, and identifies any new transportation improvement projects that might be needed to further support development
Updated Local Street Concept Map	Identifies likely connection points and alignments for future local streets in Basalt Creek
Updated Natural Resources Inventory	Inventories wetlands, upland tree groves, and riparian areas in compliance with Statewide Planning Goal 5 to identify resources to include in City's Significant Resource Overlay Zone (SROZ)

The complete package of economic and land use studies, which will inform the master planning process, is compiled in the Basalt Creek Recommendations Report (Attachment 4) with key findings highlighted below:

- Basalt Creek's vision as an industrial area aligns with current market trends, showing strong demand for industrial space nationally and in the Portland metro region.
- Despite limited development in Wilsonville relative to nearby cities, rising rents and low vacancy rates indicate a robust industrial market, attractive for new development, especially speculative development.

- The City's Planned Development Industrial (PDI) zone, which supports a wide range of industrial and office uses, could be applied to Basalt Creek to facilitate a balance between market forces and prioritizing industrial use aligned with the Concept Plan Guiding Principles. Potential additions to the PDI zoning for this area to maintain the desired balance include:
    - Evaluating zoning limitations on low-intensity uses, such as contractor establishments, that do not meet long-term employment density goals, and determining appropriate regulatory strategies to encourage existing uses to transition to higher intensity urban industrial uses.
    - Considering the creation of a new zoning designation to apply to properties in the Craft Industrial land use type to expand the range of permitted uses consistent with the Concept Plan's intent, while maximizing opportunity for future transition to higher-intensity urban industrial use.
    - Exploring zoning limitations on certain large-scale uses that may consume land in the High-Tech Employment land use type, prematurely precluding use of the properties for other desired employment-generating development.

Conclusion and Questions for City Council

Recent studies, reports, and Planning Commission discussions indicate the Guiding Principles remain valid and the land use types are viable in today's economic conditions as well as over the 20-year master planning horizon, with some caveats as noted. Following Staff's presentation, the City Council's guidance is requested on the following:

- Does the City Council concur with Staff and the Planning Commission that the High-Tech Employment, Light Industrial, and Craft Industrial land use types continue to align with the City's vision for Basalt Creek as reflected in the Guiding Principles and Concept Plan?

- Does the City Council have additional guidance that would help inform Development Code and economic development actions for the different industrial land use types in the Basalt Creek Concept Plan area?

Attachments and How they Can Assist City Council

While references to the various attachments are provided in the narrative above, the information below can help guide the Council in review of each attachment:

Attachment No.	Purpose
1. Basalt Creek Concept Plan Guiding Principles (Adapted for Wilsonville)	Provide Council, for reference, the Guiding Principles adapted for Wilsonville and categorized into market-driven, balanced, and aspirational types.
2. Basalt Creek Concept Plan Map	Refresh Council about the geography of the Basalt Creek area and where the different land use areas are located.

3. Synopsis of Basalt Creek Land Use Types	Provide a summary of each land use type considered in the Concept Plan and how it relates to recent studies.
4. Wilsonville Industrial Land Readiness Phase 1: Basalt Creek Recommendations Report	Provide Council, for reference, the complete package of studies and recommendations from Phase 1 of the Wilsonville Industrial Land Readiness project.

EXPECTED RESULTS:
Feedback from City Council will guide implementation items for the Basalt Creek planning area, including drafting a master plan and package of proposed Development Code amendments, formulating economic development strategies, and preparing an infrastructure funding plan.

TIMELINE:
Additional work sessions with the City Council and Planning Commission are anticipated in coming months. Work on the infrastructure funding plan will occur throughout 2025. Public hearings on related Development Code amendments are expected at the end of this year.

CURRENT YEAR BUDGET IMPACTS:
Funding for the first phase of the Wilsonville Industrial Land Readiness project is allocated in the fiscal year (FY) 2024-25 Planning Division budget and, for the second phase, will be allocated in the FY 2025-26 budget. The first phase was primarily funded by a $100,000 grant from Business Oregon, with additional funding available, if needed, from a $290,000 Metro grant, which is also funding the second project phase.

COMMUNITY INVOLVEMENT PROCESS:
The Basalt Creek Concept Plan review process involved extensive community engagement to gather input. In the first phase of the WILR project, ECOnorthwest collected feedback from Business Oregon, Greater Portland Inc., property owners, and developers, to assess the demand for industrial land in Wilsonville and understand property owners' current and future plans. This information guided preparation of studies and reports and will be considered in determining appropriate zoning standards and preparing necessary Code amendments.

POTENTIAL IMPACTS OR BENEFIT TO THE COMMUNITY:
Adopting appropriate zoning standards, creating an infrastructure funding plan, and pursuing economic development strategies will facilitate implementation of the Basalt Creek Concept Plan. This development will generate jobs, enhance the income and property tax base, support economic mobility through family-wage employment, and enable the industrial area to achieve its full economic potential, benefiting the greater Wilsonville community.

ALTERNATIVES:
As zoning standards, economic strategies, and an infrastructure funding plan are developed, alternatives will be explored and developed with the City Council and Planning Commission.

CITY MANAGER COMMENT:
N/A

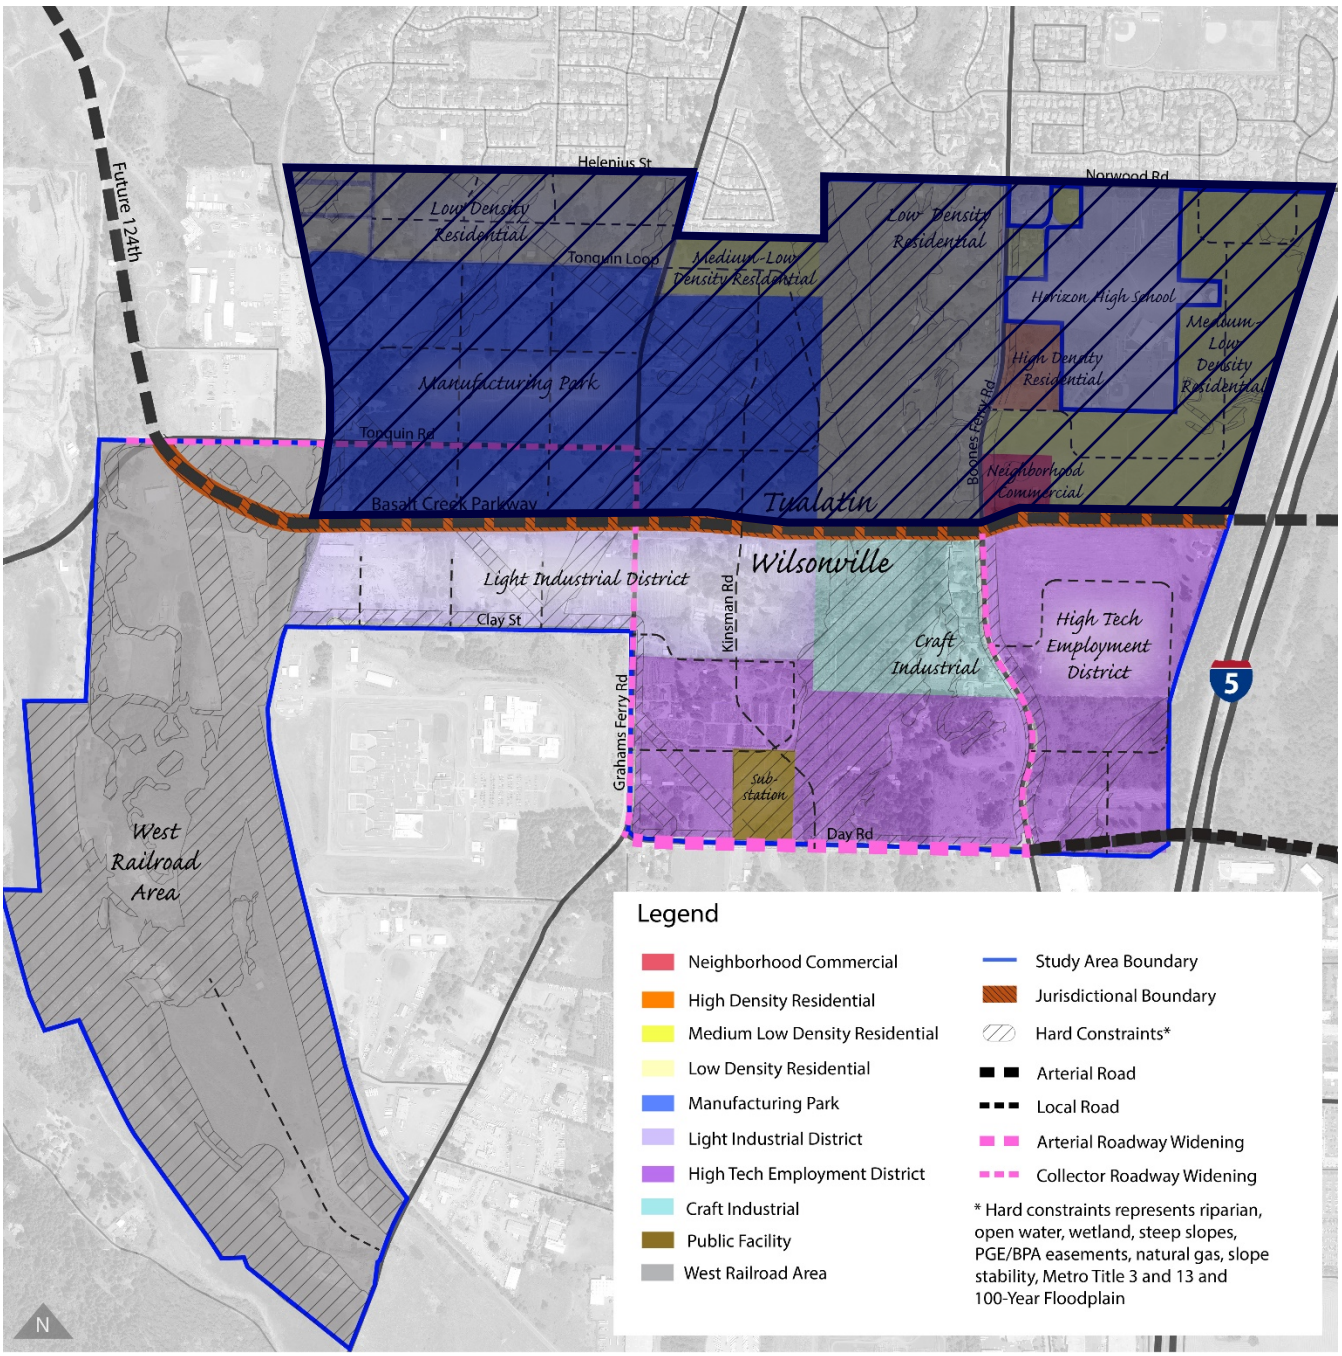
ATTACHMENTS:

1. Basalt Creek Concept Plan Guiding Principles (Adapted for Wilsonville)
2. Basalt Creek Concept Plan Map
3. Synopsis of Basalt Creek Concept Plan Land Use Types
4. Wilsonville Industrial Land Readiness Phase 1: Basalt Creek Recommendations Report
5. Basalt Creek Concept Plan-access at the following link to the City's website: Basalt Creek Concept Plan

Concept Plan Guiding Principles

Market-driven:

- Meet regional responsibility for jobs.
- Maximize assessed property value.



Balanced:

- Capitalize on the area's unique assets and natural location.
- Explore creative approaches to integrate jobs and housing in the Craft Industrial land use type.
- Ensure appropriate transitions between land uses.
- Design cohesive and efficient transportation and utility systems.

Aspirational:

- Maintain and complement Wilsonville's unique identity.
- Create a uniquely attractive business community unmatched in the metropolitan region.
- Incorporate natural resource areas and provide recreational opportunities as community amenities and assets.

Figure 8 Basalt Creek Land Use Concept Map

Synopsis of Basalt Creek Concept Plan Land Use Districts

Introduction

This synopsis provides background information about scenario planning that shaped the Basalt Creek Concept Plan (BCCP) map and land use districts, and details about each land use type. It also incorporates new information from analyses completed as part of the Phase 1 of the Wilsonville Industrial Land Readiness (WILR) project that could influence decision making about refinement of the land use types in response to changes in the Basalt Creek Planning Area (BCPA) since adoption of the Concept Plan.

Analysis of Contractor Establishments

The Analysis of Future Development of Contractor Establishments, one of the key reports prepared for Phase 1 of the WILR project, evaluated the redevelopment potential of contractor establishments in the BCPA under current market conditions. As much of the BCPA including West Railroad, north of SW Clay Street, and the eastern half of the north side of SW Day Road, is occupied by contractor establishments, this creates additional challenges to urban industrial development. The analysis notes that contractor establishments are unlikely to transition to higher intensity uses without City intervention and, if the City seeks to promote urban industrial development in these areas, a more proactive approach will be necessary, including targeted incentives and policies to encourage redevelopment.

Concept Plan Scenario Planning

Scenario planning is a tool used to estimate the likely future effects of growth and development patterns in a specific area. This information helps local governments make decisions about what type of land use, transportation and infrastructure plans and policies will best meet community needs in the future. Scenario planning helps identify challenges and opportunities for desired growth and allows exploration of different approaches to achieve the community vision for an area. Unlike a plan, scenarios are very specific, intending to model likely future land uses. Learning from these, a plan can be developed to allow for several beneficial scenarios.

Final Concept Plan Development

Scenarios were used in the BCCP to understand how different land use decisions, infrastructure investments, other regulations and policies might impact the future outcomes in Basalt Creek – and how well they achieved the guiding principles for the planning process. The scenarios that were designed and tested for the BCPA integrated many different variables (such as different land uses and service areas) and the relationships between those variables. By modifying the scenarios, the impact of different sets of decisions were able to be better understood.

A series of five scenarios were developed in an ongoing iterative process. These scenarios were fully analyzed for transportation, infrastructure, and land use implications, including how land use types and densities were balanced to meet obligations for providing regional employment capacity while limiting negative impacts on congestion and traffic levels. A preferred scenario was developed, which became the basis for the Basalt Creek Concept Plan Map.

Basalt Creek Concept Plan Map and Land Use Types

The BCCP Map, shown below after the summary table, includes three land use types in the area designated as future City of Wilsonville: High-Tech Employment District, Light Industrial District, and Craft Industrial District. Each land use district includes an assumed mix of office, industrial, warehousing and retail as shown in the table below:

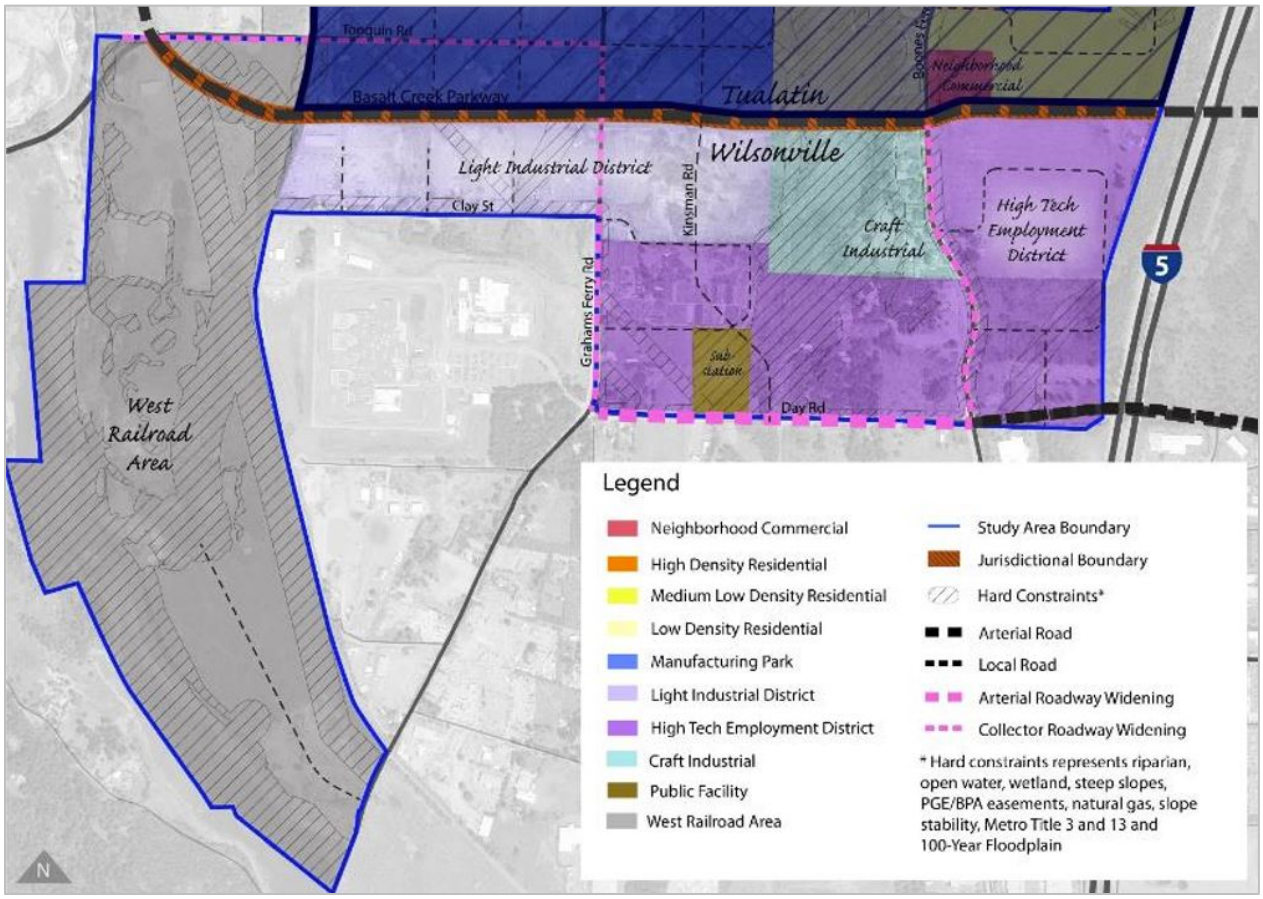


Table 1. Assumed Use Mix for Basalt Creek Concept Plan Land Use Districts.

Land Use District	Use/Share %				Jobs	
	Office	Industrial	Warehousing	Retail	Total	Per Gross Acre
High-Tech Employment	45%	38%	15%	1%	1916	20.28
Light Industrial	19%	69%	11%	1%	581	16.46
Craft Industrial	31%	44%	1%	24%	27	21.70

Because the West Railroad area was considered heavily constrained by natural resources and lack of access to transportation and utility infrastructure, assigning a land use type to this area was deferred until further planning could occur.

The land use types represent a mix of employment development types, include a modest opportunity for live/work housing in the Craft Industrial District, support adjacent and nearby industrial areas such as the Coffee Creek Industrial Area, and provide flexibility to meet a range of market demands. The BCCP considered the land use types and uses to be good candidates for the City's Industrial Form-based Code, adopted in 2018 for the Coffee Creek Industrial Area, should the City decide to extend it north into all or a portion of the BCPA.

Figure 1. Basalt Creek Concept Plan Map with Land Use Designations.

Land Use Districts

As discussed in the previous section, the BCCP Map includes three land use types: High-Tech Employment District, Light Industrial District, and Craft Industrial District. Each is discussed in detail in this section, including new information from analyses completed as part of the Phase 1 of the Wilsonville Industrial Land Readiness (WILR) project that could influence decision making about refinement of the land use types in response to changes in the Basalt Creek Planning Area (BCPA) since adoption of the Concept Plan. In addition, although the West Railroad area was not assigned a land use type in the BCCP, because it was heavily constrained with limited development potential, changes have occurred in the intervening years that warrant planning consideration for designating land use type(s). Hence, West Railroad also is discussed in this section.

High-Tech Employment District

The High-Tech Employment District, shown in purple on the BCCP Map excerpt below, is planned for all land in the BCPA east of SW Boones Ferry Road and most of the land south of SW Clay Street, if extended to the east side of SW Grahams Ferry Road, and extending south to SW Day Road, and bordered to the west by Coffee Creek Correctional Facility.

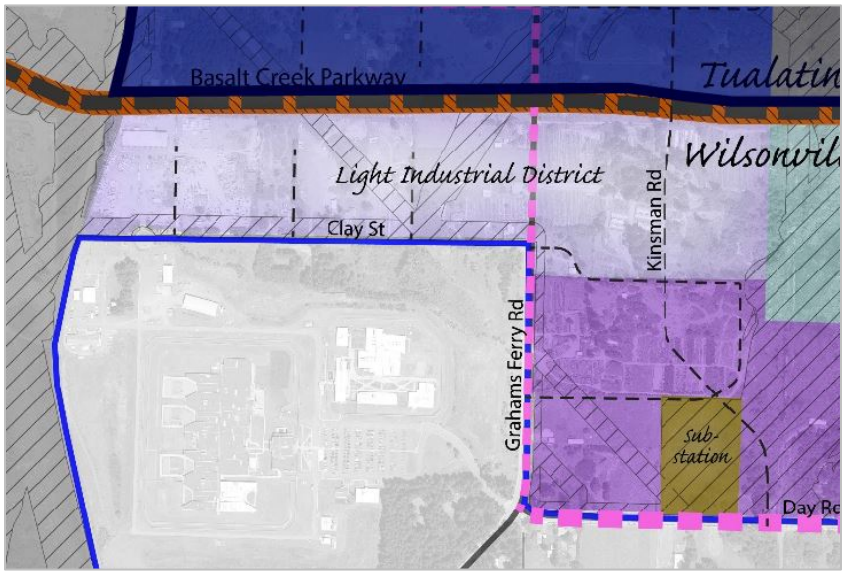
This land use type as modeled in the BCCP is expected to accommodate the largest number of jobs, estimated to be 1,916. Envisioned to include high-tech single-users accompanied by manufacturing and some warehouse space, employment was assumed to be roughly half office and half industrial. Initially modeled as one- and two-story buildings, the City desired to provide opportunities for four- to five-story office buildings as well, particularly near I-5 and along SW Boones Ferry Road.

Another consideration in determining the geographic extent of this High-Tech Employment District is that properties on the south side of SW Day Road are in the Coffee Creek Master Plan area, which is zoned PDI-RSIA with the Coffee Creek Industrial Design Overlay District (form-based code). Thus, assigning this land use type to properties on the north side of SW Day Road would result in consistency

of use and development form along both sides of the roadway, particularly if the Design Overlay District were extended to include all or part of the BCPA.

Some examples that were modeled for the High-Tech Employment District in the BCCP include Eaton on SW Kinsman Road, DW Fritz on SW Boeckman Road, and Rockwell on SW Parkway Avenue. These developments or similar examples are illustrated below:

In many ways, development envisioned for the High-Tech Industrial District is similar to what is anticipated in the Coffee Creek Industrial area – an industrial district appropriate for light manufacturing, flex uses, corporate headquarters and technology campuses, and industrial office, with some ancillary warehousing and distribution, as well as limited retail and service uses. The BCCP originally envisioned office space within each land use type with the highest share in the High-Tech Employment District and anticipated that the office space would be in connection with industrial users. However, the recently prepared Economic Inventory and Land Use Analysis for Phase 1 of the Wilsonville Industrial Land Readiness project, concluded that nationally and regionally demand for office space has been in decline with remote and hybrid work trends continuing to impact the need for office space. Therefore, while office will likely still be a part of the BCPA, it may occupy a smaller share than originally envisioned.



The Site Suitability Analysis prepared as part of Phase 1 of the WILR project includes the SW Greenhill site, which spans 57 acres in the High-Tech Employment land use type east of SW Boones Ferry Road.

This site's high proportion of undeveloped land, consolidated land ownership (two owners), and proximity to existing infrastructure, make it one of the most attractive locations in Basalt Creek for industrial development. Consistent with the vision of the BCCP, the site could be physically suitable for high-tech supply chain, cleantech industries, advanced manufacturing, food processing, warehousing and distribution, and industrial business parks or R&D campuses. Its proximity to transportation networks and regional workforce access further enhances its competitiveness.

There are some challenges posed by the presence of contractor establishments north of SW Day Road, along its eastern half within this land use type, that create additional challenges to urban industrial development. As noted earlier, contractor establishments are unlikely to transition to higher intensity uses without City intervention and, if the City seeks to promote urban industrial development in these areas, a more proactive approach will be necessary, including targeted incentives and policies to encourage redevelopment.

Light Industrial District

The Light Industrial District, shown in light purple on the BCCP Map excerpt below, is planned for land on the southern side of the future Basalt Creek Parkway between it and SW Clay Street, north of Coffee Creek Correctional Facility, and east of SW Grahams Ferry Road to the Basalt Creek Canyon.

This land use type is expected to include primarily manufacturing and warehouse uses in single- or multi-tenant buildings with some office and commercial activities. The Light Industrial is anticipated to accommodate a moderate number of jobs, estimated at 581 in the BCCP.

Some examples that were modeled for the Light Industrial District in the BCCP include Synergy Medical Systems (formerly American Medical Concepts) at 28050 SW Boberg Road, Houston's at 9799 SW Freeman Drive, McKesson at 970 SW Commerce Circle, Rite Aid at 29555 SW Boones Ferry Road, Canyon Creek Business Center and Wilsonville Corporate Center. These developments or similar examples are illustrated below:

The uses and form of development in the Light Industrial District as envisioned in the BCCP is similar to development in existing industrial areas of the City, such as along SW 95th Avenue, SW Commerce Circle, and SW Boberg Road. Although the Site Suitability Analysis prepared as part of Phase 1 of the WILR project does not include a site with this land use type designation, it notes that an approach supporting a wide range of industrial and office uses consistent with the BCCP and the Economic Inventory is desirable. This approach allows the market to determine the most appropriate locations for various business types while still prioritizing industries aligned with the City's employment and wage goals.

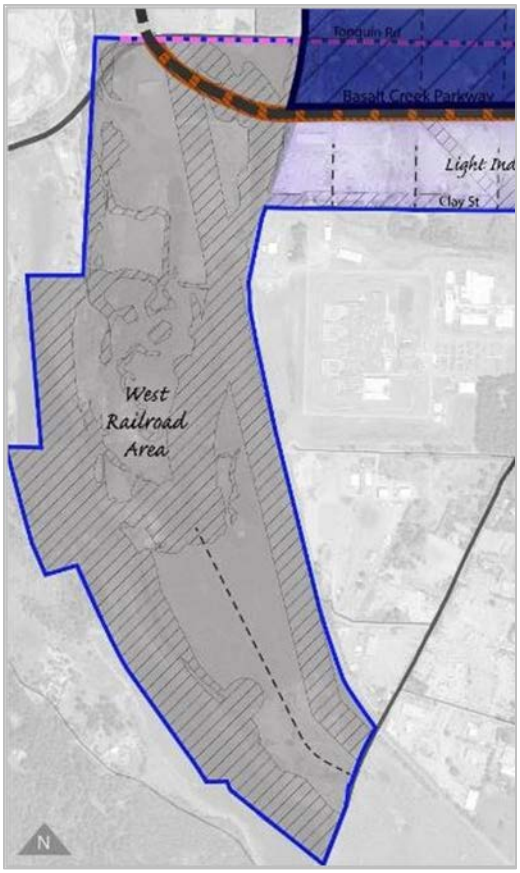
It should be noted that there are some challenges posed by the presence of contractor establishments on the north side of SW Clay Street, west of SW Grahams Ferry Road, that create additional challenges to urban industrial development.

Craft Industrial District

The Craft Industrial District, shown in turquoise on the BCCP Map excerpt below, is planned at the southwest corner of the intersection of SW Boones Ferry Road and the future extension of the Basalt Creek Parkway. This land use type anticipates a mix of small tenant spaces for creative industries and smaller-scale commercial uses and may include some limited residential use.

The Craft Industrial District responds to existing single-family residential development in the area, topography and natural constraints of the Basalt Creek Canyon, and the area's location directly south across the Basalt Creek Parkway from residential land and a neighborhood commercial node in Tualatin. Business development is expected to occur gradually over time, providing a transition to the higher intensity employment uses to the east and south in the High-Tech Employment District. In the long term, the area is anticipated to have two- to three-story buildings with small tenant spaces for light industrial manufacturing and office uses on the ground floor, as well as some retail, and living space above. Industries could include incubator, craft and artisan, innovation, and maker spaces. This land use type as modeled in the BCCP includes less than 20% residential use and is expected to accommodate 27 new jobs and 6 new housing units in the form of live-work or work-live units.

Some examples that were modeled for the Craft Industrial District in the BCCP include the Hood River waterfront and southeast Portland. Hood River, in particular, was considered a good example of development that could occur in the Craft Industrial District with two- and three-story buildings being used by craft industries with live-work spaces adjacent to a park, natural areas, and other industrial uses. Developments in these areas or similar examples are illustrated below:



The BCCP envisioned a mix of uses in the Craft Industrial District that blend well with adjacent neighborhoods. These could include small tenant spaces for creative industries, such as incubator spaces, craft beer, wine, and food spaces, a tasting room, brewery, seamstress, photographer or photography studio, or the newest tech innovations, with some office, retail, and services. This could enable young entrepreneurs to live and work close to industries with which they would want to partner, and could provide supporting services and retail for employees.

The Site Suitability Analysis prepared as part of Phase 1 of the WILR project reviews the potential of this Craft Industrial District. With only 14 acres of unconstrained land available for development and its proximity to residential areas to the north in Tualatin, as well as existing residential development on parcels in this land use type, its suitability for high-intensity industrial uses is limited. The analysis concludes that the area aligns with the BCCP's vision for small-scale or micro-industrial uses, such as live-work spaces or makerspaces.

With site aggregation, as noted in the Site Suitability Analysis, the southeastern portion of the Craft Industrial District could accommodate small-scale industrial or office users on up to five acres. These uses could resemble industrial condo developments like the Commerce Circle Business Park or Riverwood Business Center, which integrate office and small-scale production spaces. The northeastern portion, while it could also redevelop, is likely less appealing due to its irregular shape and nearby high-value residences. The presence of existing residences, including some high-value homes, is likely to delay redevelopment timelines compared to other areas in the BCPA, although it is possible that transitional uses such as home-based businesses or cottage industries in accessory structures, could occur in the interim.

West Railroad

West Railroad, shown grey on the BCCP Map excerpt below, is divided from the rest of the BCPA by the Portland and Western Railroad (PNWR) and the Coffee Creek Correctional Facility. When the BCCP was adopted, this area was heavily constrained by natural resources, fragmented property ownership, and lack of access to adequate water, sewer, and transportation infrastructure. Although the area was considered to have potential for resource conservation and future public access to nature, due to the constraints, a future land use scenario was not created.

The Site Suitability Analysis prepared as part of Phase 1 of the WILR project includes West Railroad as an opportunity site, which spans 165 acres. The large parcels and access to regional transportation networks could make West Railroad physically suitable for uses such as general manufacturing, food processing, and warehousing or distribution. Proximity to Coffee Creek's industrial area further enhances its appeal to businesses providing support services to neighboring industries.

However, significant infrastructure upgrades are required in West Railroad, and access is limited by only one established point of vehicular ingress and egress at SW Grahams Ferry Road. The low railroad undercrossing on SW Grahams Ferry Road further constrains access as it does not currently allow passage by standard-height semi-trucks. The area's proximity to a rail line and a mining operation could make it less attractive to advanced manufacturing or other industries sensitive to vibration. Finally, the proliferation of contractor establishments in West Railroad in recent years creates additional challenges to urban industrial development as discussed in the introductory section of this synopsis.

Wilsonville Industrial Land Readiness Phase 1: Basalt Creek Recommendations Report

City of Wilsonville

Prepared for: City of Wilsonville

ECOnorthwest
222 SW Columbia Street • Suite 1600 • Portland, OR 97201 • 503-222-6060

Acknowledgments

ECOnorthwest prepared this report with support from the guidance and input of several partners, including members, staff, and leadership of the ***City of Wilsonville***. Most notably we are appreciative of the involvement and input of ***Cindy Luxhoj, Daniel Pauly, Miranda Bateschell, and Matt Lorenzen***. This work was financially supported by grants from ***Business Oregon and Metro.***

That assistance notwithstanding, ECOnorthwest is responsible for the content of this report. The staff at ECOnorthwest prepared this report based on their general knowledge of the economics of regional economies. ECOnorthwest staff contributing to this study included ***Bob Parker, Nicole Underwood, Barrett Lewis, and Michelle Anderson.*** ECOnorthwest also relied on information derived from government agencies, private statistical services, the reports of others, interviews of individuals, or other sources believed to be reliable. ECOnorthwest has not independently verified the accuracy of all such information and makes no representation regarding its accuracy or completeness. Any statements nonfactual in nature constitute the authors' current opinions, which may change as more information becomes available.

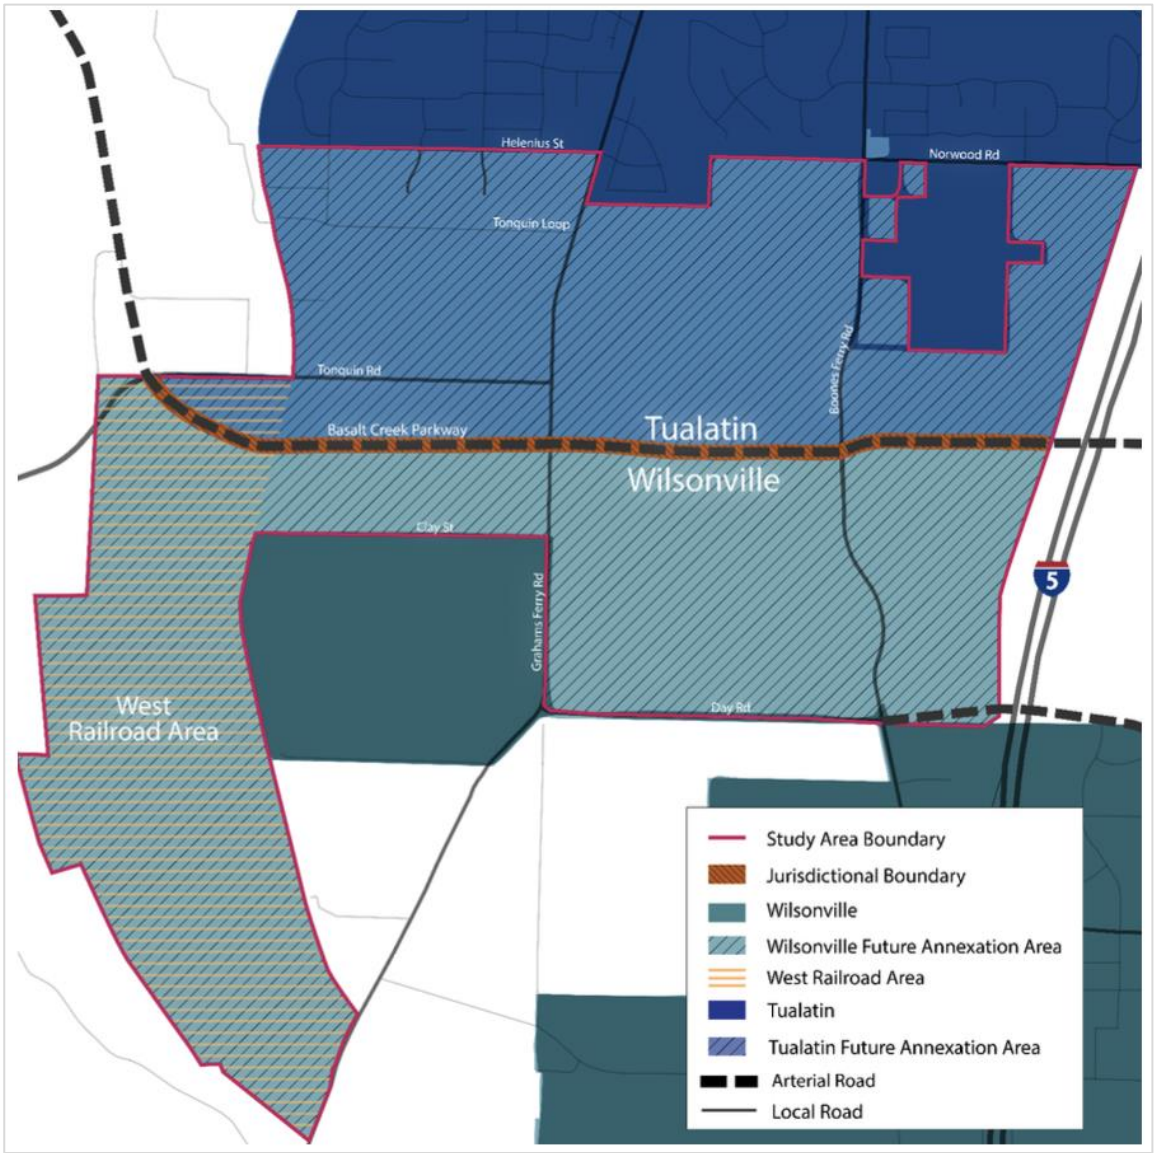
Conclusion and Recommendations..... 11
Appendix A: Economic Inventory and Basalt Creek Concept Plan Land Use Analysis 17
Appendix B: Buildable Lands Inventory and Site Suitability Analysis 60
Appendix C: Redevelopment Feasibility of Contractor Establishments 102

Purpose and Background

The Cities of Tualatin and Wilsonville adopted the Basalt Creek Concept Plan (BCCP) in 2018 after a lengthy joint planning process. Now, in 2024-25, the City of Wilsonville is working to advance the Basalt Creek Planning Area (BCPA) beyond the concept plan to a development-ready status by designating zoning and refining infrastructure plans. However, since adoption of the BCCP, economic conditions at national, state, regional, and local levels have shifted significantly and must now be considered.

To address these evolving conditions, the City hired ECOnorthwest to conduct a market assessment and industrial lands study focused on Wilsonville's portion of the BCPA. This study is comprised of several interconnected tasks:



- An **Economic Inventory** that evaluates current market trends and identifies industries suitable for the area (Appendix A).
- A **Buildable Lands Inventory (BLI)** that reflects recent land developments, adjusted constraints, and revised capacity estimates (Appendix B).
- A **Site Suitability Analysis** that evaluates three key opportunity sites for their potential to support target industries based on attributes like size, location, and constraints (Appendix B).
- An **Analysis of Future Development of Contractor Establishments in the BCPA** given prevailing lease rates and market conditions (Appendix C).

This report summarizes the key findings from each task and outlines recommended policy interventions and strategic actions for the City. By addressing challenges and leveraging opportunities, these efforts aim to establish Basalt Creek as a vital hub for regional job growth and long-term economic vitality.

Basalt Creek Planning Area Overview

The Basalt Creek Planning Area (BCPA) is an 847-acre area located between southern Tualatin and northern Wilsonville. This report focuses on the Wilsonville section, which includes 453 acres in the main portion of the BCPA south of the Basalt Creek Parkway and land west of the railroad known as West Railroad (as depicted in Figure 1*). For the remainder of this report, references to the BCPA specifically refer to the Wilsonville portion.* The BCPA is centrally located in the southern portion of the Portland Metro, adjacent to Interstate-5, and easily accessible and connected to other growing industrial areas (including Sherwood and Tualatin). It has access to the Portland Metro and Mid-Valley labor sheds, making it well positioned to attract various types of industry.

Figure 1: Basalt Creek Planning Area

Source: Basalt Creek Concept Plan, 2018. Note: Wilsonville's portion of the Basalt Creek Planning Area (BCPA) is inclusive of the Wilsonville Future Annexation Area and West Railroad Area.

What is Wilsonville's portion of Basalt Creek Like today?

The Wilsonville portion of the BCPA is currently zoned under Washington County's FD-20 designation (Future Development, 20-acre minimum lot size), which permits low-intensity uses. Since the adoption of the BCCP, Washington County has continued to approve developments consistent with its zoning, resulting in much of the land now being used for contractor establishments. These establishments—used for storing tools, equipment, and vehicles—provide jobs and economic activity. But they fall short of the employment densities and development envisioned in the Concept Plan, and which are typical of land within the Metro urban growth boundary (UGB) and incorporated City limits.

Contractor establishment (above) and railroad crossing near West Railroad.

KEY STATISTICS

The Wilsonville portion of the BCPA spans 453 acres and includes 85 tax lots, with only 10 tax lots hosting covered employment. Some areas in the BCPA have a high degree of parcelization, while others are less fragmented. There are a handful of large contiguous landholdings by single ownership.

From 2012 to 2022, covered employment grew from 194 to 275 employees in the BCPA, with an average wage of $85,863—higher than the tri-county average ($73,995) and City average ($74,252)—indicating well-paying jobs. However, employment density remains low at 4.4 employees per acre (on parcels with covered employment), far below the BCCP vision of 18.5 employees per acre. It is important to note that these figures only account for covered employees.[1]

Some of the land in the BCPA is actively used despite minimal reported employment. The area is primarily used for contractor establishments, including storage yards for various businesses, which typically require fewer employees. It is likely that additional workers are present but not included in the covered employment estimates, such as sole proprietors or other types of uncovered contractors.

[1] Covered employment refers to employees covered by unemployment insurance. It *excludes* sole proprietors, certain contractors ("1099 employees"), and some railroad workers.

Due to the prevalence of storage-focused contractor establishments, many lots have minimal building improvements. The improvement-to-land-value ratio is low and has changed little over the past decade.

- 453 acres
- 85 tax lots
- 275 covered employees
- $86,000 average wage
- 4.4 employees per acre in areas with employment
- Little change in improvement-to-land value since 2012
- Areas of high and low parcelization

Key Components of This Study

Economic Inventory: Basalt Creek's Market Context

The Economic Inventory provides a detailed analysis of market trends and industry opportunities for the BCPA, emphasizing its potential as a regional hub for industrial development (see Appendix A for the full inventory). Since adoption of the BCCP in 2018, economic conditions have been shifting considerably. Nationally, the industrial sector continues to experience robust demand fueled by e-commerce growth, reshoring efforts, and federal investments like the CHIPS Act, which supports semiconductor manufacturing. In the Portland Metro area, industrial trends mirror national patterns, with low vacancy rates and rising rents. While demand for industrial space has slowed from the highs of 2021–2023, it is expected to remain strong in the near term.

Locally, Wilsonville's industrial sector plays a crucial role in the City's economy, with manufacturing, wholesale trade, and construction accounting for 43 percent of employment compared to 22 percent regionally. Despite this strength, industrial growth in neighboring Sherwood and Tualatin has outpaced Wilsonville, primarily due to their supply of large, development-ready parcels. In the Portland Metro area, industrial demand is primarily driven by businesses expanding or upgrading facilities rather than businesses locating from out of state. To remain competitive, Basalt Creek must be prepared to accommodate these businesses' evolving needs.

Originally, the BCCP envisioned a mix of industrial and office uses, with the High-Tech Employment District assuming 45 percent of development in the area would be office. However, the demand for office space has declined regionally and nationally, driven by the rise of remote and hybrid work. While office space will likely remain part of the BCPA, its footprint may be smaller than originally planned.

Wilsonville is well positioned to capture industrial growth, particularly in key sectors such as semiconductor supply chain, cleantech, advanced manufacturing, and logistics. Basalt Creek's proximity to major transportation networks, its skilled labor force, and its location near established industrial clusters enhance its attractiveness. However, several challenges must be addressed to realize this potential. Fragmented land ownership, existing contractor establishments, and rural infrastructure that does not meet urban standards remain key barriers to high-intensity industrial uses.[2] Addressing these obstacles will be vital to unlocking Basalt Creek's capacity to compete for its commensurate share of regional economic growth.

[2] The City is refining its infrastructure plans for the BCPA. While plans exist, the infrastructure has not yet been built and will require funding for improvements.

Buildable Lands Inventory: Measuring Land Capacity and Development Potential

The updated Buildable Lands Inventory (BLI) revises the 2014 inventory from the BCCP, providing an updated assessment of Wilsonville's portion of the BCPA for employment-related growth (see Appendix B). It identifies developable land and highlights areas with existing economic uses that offer redevelopment potential due to low improvement values and/or low employment density.

Of the 453 acres in Wilsonville's portion of the BCPA:[3]

- **173 acres** are currently in active use and considered developed.
- **129 acres** are constrained by physical or environmental factors.
- **150 acres** are considered buildable and available for development.

This buildable land supply is distributed across a range of parcel sizes, from small lots under 5 acres to larger parcels exceeding 25 acres, offering flexibility to meet diverse industrial and employment needs. Given the 150 acres of buildable land and the expectation of employment densities between 10 and 18.5 employees per gross acre, the BCPA is expected to accommodate between 1,500 and 2,780 jobs. The BCCP estimated employment capacity at about 2,500 jobs in Wilsonville's portion of Basalt Creek in 2018.

The updated BLI provides a clearer understanding of the land available to attract industries and support future employment growth. It emphasizes the BCPA's potential to support a variety of industrial and employment uses aligned with Wilsonville's economic development goals. However, it also reveals an increase in land used for contractor establishments since the previous BLI, highlighting the decreasing supply of land for urban industrial development. This trend is likely to continue if the area remains outside the city and unprepared for urban growth.

CHANGES FROM THE 2014 BLI

Buildable Acres

The BCCP identified 130 buildable acres whereas the updated BLI shows 150 buildable acres. This 20-acre increase is primarily due to a revised assessment of constraints in West Railroad. The 2014 BLI classified much of West Railroad as constrained, but updated constraints data show more development capacity. However, this gain was partially offset by land now occupied by contractor establishments, which has been reclassified as developed, reducing buildable acres elsewhere.

Employment Density

ECOnorthwest applied the BCCP's assumption of 18.5 jobs per gross acre to model a high-density employment growth scenario. However, shifting market conditions—such as reduced demand for office space and increased demand for industrial and flex space (which typically have lower employment densities)—led ECOnorthwest to also model medium- and low-employment density growth scenarios. This approach provides a range of potential employment densities that more accurately reflect evolving market conditions.

[3] Note that the acres do not total to 453 due to rounding.

Site Suitability: Aligning Market Potential

The Site Suitability Analysis assesses the competitiveness of three opportunity sites (Figure 2) within the BCPA to host key industries identified in the Economic Inventory (Appendix B includes the full site suitability analysis). This high-level evaluation focused on physical site characteristics—such as size, location, and constraints—without factoring in the likelihood of redevelopment. It provides a broad understanding of site benefits, barriers, and potential industry suitability, serving as a foundation for planning and zoning rather than a definitive assessment of development feasibility, building configurations or sizes.

Figure 2. Opportunity Sites

Source: ECOnorthwest Analysis, City of Wilsonville, Washington County, Metro

Infrastructure will be pivotal in shaping the types of industries and scale of development suitable for the area. This analysis incorporated available information on infrastructure elements such as water, wastewater, and roads, and planned urban improvements with development; however, detailed system capacities, final road alignments, and the timing of improvements—particularly in areas like West Railroad—remain uncertain. These factors will play a significant role in determining the market competitiveness and potential development timeline for a site.

Water and wastewater systems are expected to meet most demands, though high-water users may require additional capacity. Similarly, industries with high electricity demands, such as those requiring five megawatts or more, may necessitate infrastructure upgrades. Road alignments will impact parcel configurations, building sizes, and overall development potential. While these elements are critical to understanding site suitability, they are not yet classified as definitive constraints or advantages.

- **The SW Greenhill** site spans 57 acres, with 91 percent (52 acres) of the land unconstrained. Minimal slopes (affecting 11 percent of the site), a high proportion of undeveloped land, consolidated land ownership (two owners), and proximity to existing infrastructure make it one of the most development-ready locations in Basalt Creek. The site could be physically suitable for high-tech supply chain, cleantech industries, advanced manufacturing, food processing, warehousing and distribution, and industrial business parks or R&D campuses. Its proximity to transportation networks and regional workforce access further enhances its competitiveness.
- **The Craft Industrial** area is split into eastern and western portions by site constraints and consists of seven tax lots with fragmented ownership, most under five acres. Only 14 acres are unconstrained, and its proximity to residential areas limits its suitability for high-intensity industrial uses. Instead, the area aligns with the BCCP's vision for small scale or micro-industrial uses, such as live-work spaces or makerspaces.

  With site aggregation, the southeastern portion could accommodate small-scale industrial or office users on up to five acres. These uses could resemble industrial condo developments like the Commerce Circle Business Park or Riverwood Business Center in Wilsonville, which integrate office and small-scale production spaces. The northeastern portion, while it could also redevelop, is likely less appealing due to its irregular shape and nearby high-value residences. The presence of existing residences, including some high-value homes, are likely to delay redevelopment timelines compared to other opportunity sites.
- **The West Railroad** site spans 165 acres, with 55 percent (90 acres) of the land unconstrained. Its large parcels and access to regional transportation networks could make it physically suitable for uses such as general manufacturing, food processing, and warehousing or distribution. Proximity to Coffee Creek's industrial area further enhances its appeal to businesses providing support services to neighboring industries. However, significant infrastructure upgrades are required, and access is limited by only one established point of vehicular ingress and egress, as well as the low railroad undercrossing on SW Grahams Ferry Road, which does not currently allow passage by standard-height semi-trucks. Additionally, the site's proximity to a rail line and a mining operation could make the site less attractive to advanced manufacturing or other industries sensitive to vibration. Ongoing infrastructure alignment and capacity studies will provide further clarity on the site’s suitability for targeted industries.

Contractor Establishments: Redevelopment Opportunities and Challenges

Contractor establishments have a substantial presence in Basalt Creek, particularly in West Railroad and along SW Day Road (Appendix C includes the full analysis of contractor establishments). These properties—often comprising small offices, storage buildings, and laydown yards—contribute limited employment and yield lower property values compared to urbanized industrial land. Figure 3 identifies the current land use categories and highlights areas occupied by contractor establishments.

While the Site Suitability Analysis assessed opportunity sites based on physical characteristics and their potential to support target industries should landowners opt to develop or redevelop, this analysis evaluates the redevelopment potential of contractor establishments under current market conditions.

Figure 3. Land Use Categories with Constraints, BCPA, 2024

Source: ECOnorthwest Analysis, City of Wilsonville, Washington County, Metro

Key Findings

Existing contractor establishments generate substantial income for property owners, reducing their motivation to sell or redevelop. For redevelopment to be financially viable, urban industrial rents would need to increase by 60 percent or more to justify the investment. Developers assess property value based on what remains after accounting for construction, entitlement, and operational costs, as well as conservative revenue assumptions. In Basalt Creek this is likely to result in developers offering less than what existing owners value their property for, especially when they are already hosting or running successful contractor establishments.

Relocation options for businesses currently occupying these sites are limited, creating additional challenges. Owner-occupied properties are even less likely to redevelop, as owners face relocation costs and potential increases in operational expenses. With limited regional industrial land, relocation could push these businesses farther from their markets, increasing costs for labor, transportation, and operations. Without considerable increases in urban industrial rents or land values, redevelopment for these properties remains unlikely.

Contractor establishments are unlikely to transition to higher intensity uses without City intervention. The gap between property values expected by owners and what developers can pay is unlikely to close naturally, as rising rents for industrial uses will likely coincide with increased contractor establishment rents. If the City seeks to promote urban industrial development in these areas, a more proactive approach will be necessary, including targeted incentives and policies to encourage redevelopment.

Conclusion and Recommendations

The BCPA offers a unique opportunity for Wilsonville to support regional economic growth and industrial development. Its strategic location near transportation networks, access to a skilled labor force, and proximity to established industrial clusters position the area as a strong candidate for attracting businesses supporting semiconductor supply chain, cleantech, advanced manufacturing, and logistics. However, realizing this potential will require addressing critical challenges and capitalizing on existing opportunities.

Fragmented land ownership and contractor establishments, which continue to be approved under Washington County's jurisdiction, remain barriers to the higher-intensity urban industrial uses envisioned in the BCCP. These establishments generate substantial revenue for property owners, reducing the incentive to sell or redevelop. For redevelopment to occur, urban industrial rents would need to rise substantially to bridge the gap between property owners' expectations and what developers are willing to pay. However, this gap is unlikely to close in the near term because as urban industrial rents rise, contractor establishment rents are also likely to increase. Additionally, relocation options for contractor establishment businesses, especially for owner-occupied properties, are limited, creating further challenges.

Rural infrastructure that does not meet urban standards also remains a key barrier to industrial development. This issue affects the feasibility of both immediate development and long-term growth, particularly in West Railroad where access is limited and the railroad undercrossing on SW Grahams Ferry Road precludes truck passage. Addressing these constraints is essential to unlocking the area's potential for higher-density employment uses.

Despite these challenges, there are clear opportunities. Development-ready sites and engaged property owners provide a strong starting point. Stakeholders have expressed a willingness to invest in infrastructure improvements if given access to large unconstrained sites, creating potential for catalytic projects that could spur additional development.

Wilsonville must balance its development goals with market realities. The Portland Metro area's industrial demand is driven by businesses expanding or upgrading facilities. Imposing restrictive requirements, such as mandating a high share of manufacturing, could deter development and drive users to more accommodating locations. Additionally, declining demand for office space nationally and regionally, driven by remote and hybrid work trends, suggests a reduced role for office uses compared to the original BCCP. While there are some exceptions to weak demand for suburban office space, our assessment is that the Portland Metro market dynamics are more consistent with national trends.

In conclusion, Basalt Creek presents a strong opportunity for Wilsonville to foster economic growth and industrial expansion. However, achieving this vision requires overcoming substantial challenges related to land use, infrastructure, and market dynamics. These findings provide the foundation for identifying actionable steps to unlock the area's full potential and align development with the City's long-term goals.

Recommendations

The recommendations for the BCPA are structured into four categories: **Further Exploration, Planning, Funding, and Investment.** These strategies address zoning, infrastructure, and development challenges while providing a phased approach for implementation. Central to these recommendations is the recognition that the status quo is unlikely to change without the City taking a more direct approach to encouraging development. Challenges such as fragmented ownership, the presence (and continued growth) of contractor establishments, and substantial needed infrastructure upgrades to serve urban developments are unlikely to resolve without City intervention.

Wilsonville can approach Basalt Creek's development with varying levels of involvement. A conservative approach would prioritize zoning and regulation, planning control, and limited infrastructure investments to guide development. A more proactive approach would accelerate the BCPA's vision by supporting relocation of contractor establishments, acquiring and aggregating land, and investing in additional infrastructure needs in areas like West Railroad. Which strategy the City chooses will ultimately depend on balancing risks with the desire to unlock the area's potential.

FURTHER EXPLORATION

This category focuses on gathering data, engaging stakeholders, and building a foundation of knowledge to support strategic decisions.

- **Outreach to Property Owners**: Engage with property owners to understand their development plans, challenges, and willingness to participate in redevelopment efforts. Explore opportunities for land assembly and redevelopment partnerships.
    - *Craft Industrial Opportunity:* Engage with landowners in the Craft Industrial area to explore dividing the site into east and west portions (by partitioning lots), focusing on creating developable parcels that align with the area's potential and constraints.
- **Coordinate with Portland General Electric (PGE) on Power Needs**: Collaborate with PGE to evaluate existing and future power requirements for industries such as advanced manufacturing and semiconductor supply chains, as identified in the Economic Inventory.
- **Explore Partnerships**: Identify opportunities to work with public entities (e.g., Port of Portland, Business Oregon, Greater Portland Inc.) and private partners to align resources and attract desired industries.
- **Support Contractor Establishment Relocation or Compliance:** Develop strategies to help contractor establishments relocate or consolidate or conform with City standards. This could involve creating incentives for relocation or, if necessary, working with them to bring existing operations into compliance with City service and land use standards.

PLANNING

Strategic planning ensures the alignment of zoning, policies, and infrastructure with long-term economic goals.

- **Apply the Planned Development Industrial (PDI) Zone across Basalt Creek with Modifications.** This approach would support a wide range of industrial and office uses consistent with the BCCP and the Economic Inventory. It allows the market to determine the most appropriate locations for various business types while still prioritizing industries aligned with the City's employment and wage goals.
  - *Prohibit Low-Intensity Uses and Address Existing Contractor Establishments.* Establish zoning prohibitions or limitations on low-intensity uses, such as contractor establishments, that do not meet long-term employment density goals. For existing contractor establishments, determine the appropriate regulatory approach, such as designating them as conditional, nonconforming, or prohibited uses.
  - *Evaluate Additional Standards or Allowances for the Craft Industrial Area.* Given the site's constraints and proximity to residential development, the Craft Industrial Area has limited development potential. To maximize its utility, consider allowing additional uses—such as live-workspaces, small-scale offices, and small-scale production facilities—that may not fully align with the current PDI zone. This could involve creating a separate zoning designation or an overlay to expand the range of permitted uses within the PDI zone.
- **Update Urban Planning Area Agreement (UPAA)**: Amend agreement with Washington County to transfer planning authority for Basalt Creek to the City, ensuring alignment with Wilsonville's long-term vision. This would reduce the risk of continued low-intensity uses, alleviate staffing burdens at the County level, and reduce future pressures to expand the urban growth boundary (UGB).
  - *Example*: Troutdale has an Intergovernmental Agreement with Multnomah County that transfers planning authority to the City for areas within its UGB.
- **Preliminary Urban Renewal Area (URA) Analysis**: Evaluate the feasibility of establishing a URA or expanding the Coffee Creek URA to help fund infrastructure improvements and catalyze development. NOTE: The City already has funding for this task as part of the Wilsonville Industrial Land Readiness project.
- **Consider a Development Plan for West Railroad**: Develop a plan for West Railroad that balances industrial development with community priorities. While the BCCP deemed much of the site unbuildable and omitted detailed future use recommendations, the City has continued to address the area in broader land use and infrastructure planning. Building on these efforts, the plan should involve input from landowners, potential users, and ideally a master developer to ensure alignment with stakeholder needs and market trends. Importantly, creating this plan would not preclude zoning the area to guide immediate development efforts.

FUNDING

Identifying and securing funding sources will be critical to addressing infrastructure needs and supporting redevelopment.

- **Explore and Establish Funding Mechanisms such as:**
  - Use Urban Renewal to finance infrastructure improvements and reduce barriers for developers pending the results of the URA feasibility study.
  - Explore the potential for Local Improvement Districts (LIDs) and/or public-private partnerships to share costs and responsibilities. NOTE: Cost sharing mechanisms of owners of contractor establishments may be less attractive if they do not need the infrastructure improvements or connections to continue business operations.
- **Explore and Leverage State and Federal Funding:** Leverage grants, loans, and other funding programs to support infrastructure upgrades and attract investment. These could include, but are not limited to:[4]
  - Statewide Transportation Improvement Program (STIP)
  - Immediate Opportunity Fund (IOF)
  - Oregon Transportation Infrastructure Bank (OTIB).
  - Safe Drinking Water Revolving Fund (SDWRLF).
  - Water Wastewater Fund (W/W).
  - Special Public Works Fund (SPWF).
  - U.S. Economic Development Association (EDA) Public Works Program

INVESTMENTS

Targeted investments will help unlock development opportunities and create momentum for future growth.

- **Develop Infrastructure**: Focus early infrastructure improvements on properties that are cost-effective to serve and likely to develop in alignment with the BCPA vision, such as the SW Greenhill Road site. These early investments can demonstrate feasibility and attract additional development.
  - The City could collaborate with property owners, Greater Portland Inc. (GPI), and Business Oregon to attract a catalytic user that could justify and accelerate infrastructure development for the site. Combining this strategy with site acquisition efforts and development planning for West Railroad would further enhance its effectiveness and overall development potential.
- **Provide Development Incentives such as**:

[4] As a first step, the City should draft a list of potential projects and evaluate eligibility for funding programs; ECOnorthwest did not evaluate eligibility for these funding programs.

- Consider system development charge (SDC) adjustments or deferrals for targeted developments that support the city's vision for BCCP and where it would not place undue burdens on funds available for capital improvements.
- Market the City's "WIN" (Wilsonville Investment Now) program in conjunction with Basalt Creek development opportunities. NOTE: This urban renewal program would no longer be available if an area-wide urban renewal area is established.
- Provide relocation assistance to contractor establishments to enable redevelopment. This could include support identifying alternative sites and streamlining permitting processes if those sites are in Wilsonville.

- **Site Acquisition and Aggregation**: Partner with public or private entities to assemble large, contiguous parcels that can support high-value industrial users. Consider using Urban Renewal funds and public partner contributions to facilitate these efforts.
  - The City could explore securing **purchase options** on key parcels to facilitate land assembly. A purchase option allows the City the right to buy property within a specified timeframe, offering flexibility without the immediate cost of full acquisition. This proactive approach provides leverage and control over future development while allowing the City to decline the purchase if circumstances change or acquisition becomes unfeasible. To advance this strategy, the City should identify and prioritize purchase option agreements with property owners of high-opportunity sites, building momentum for collaboration and development.

Phasing

The implementation of the BCPA recommendations is structured into three phases: Immediate (0–3 years), Midterm (3–7 years), and Long-Term (7–15 years). Each phase focuses on actionable steps to address development challenges, align infrastructure, and catalyze economic growth while adapting to market trends.

IMMEDIATE ACTIONS (0–3 YEARS)

The initial phase establishes the foundational elements for Basalt Creek's development by addressing zoning, engaging stakeholders, and identifying funding strategies. Key priorities include:

- Establish zoning
- Amend UPAA with Washington County
- Engage property owners to discuss future plans, development potential, and incentives
- Explore ways to support contractor establishment relocation and/or accommodate and bring them to City standards (urban industrial development)

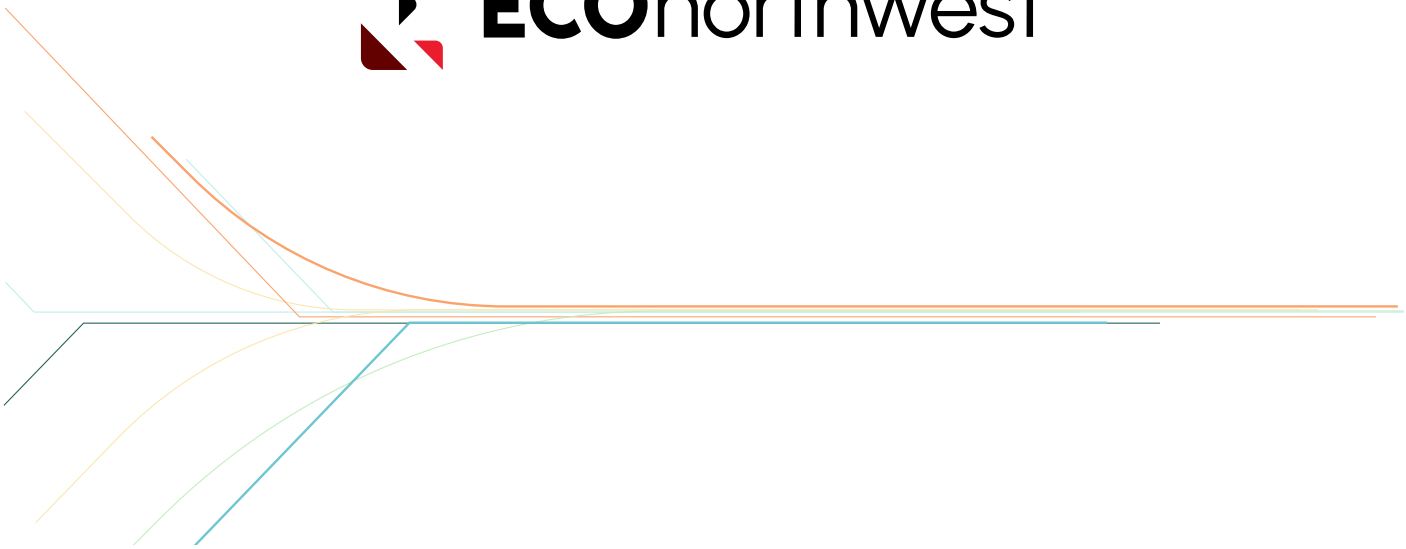
- Analyze funding needs and sources and develop funding strategy to support infrastructure investments and other priorities such as land acquisition and developer incentives
- Explore partnerships
- Coordinate with PGE on anticipated power needs
- Prioritize infrastructure to properties that are both high opportunity and "low-cost-to-serve," to showcase early wins

MIDTERM ACTIONS (3–7 YEARS)

This phase builds on early successes by advancing funding mechanisms, solidifying plans for key areas, and fostering development agreements. Major actions include:

- Adopt funding mechanisms to support infrastructure investments and other priorities (this is a likely prerequisite to land acquisition)
- Acquire key parcels (or purchase options) as opportunity and funding allows
- Develop West Railroad's development plan with input from landowners, potential users, and preferably a master developer
- Secure initial development agreements and fund major infrastructure upgrades through URA or other funding mechanism
- Continue to coordinate with PGE

LONG-TERM ACTIONS (7–15 YEARS)



The final phase focuses on sustaining Basalt Creek's momentum by adapting to market trends and completing infrastructure build-out to support full site utilization. Long-term priorities include:

- Monitor market trends and adjust zoning or policies to accommodate emerging industries
- Complete phased infrastructure build-out to support full site utilization

This phased approach ensures that Basalt Creek's development progresses systematically, balancing immediate actions with long-term investments to achieve the City's vision for economic growth and industrial expansion.

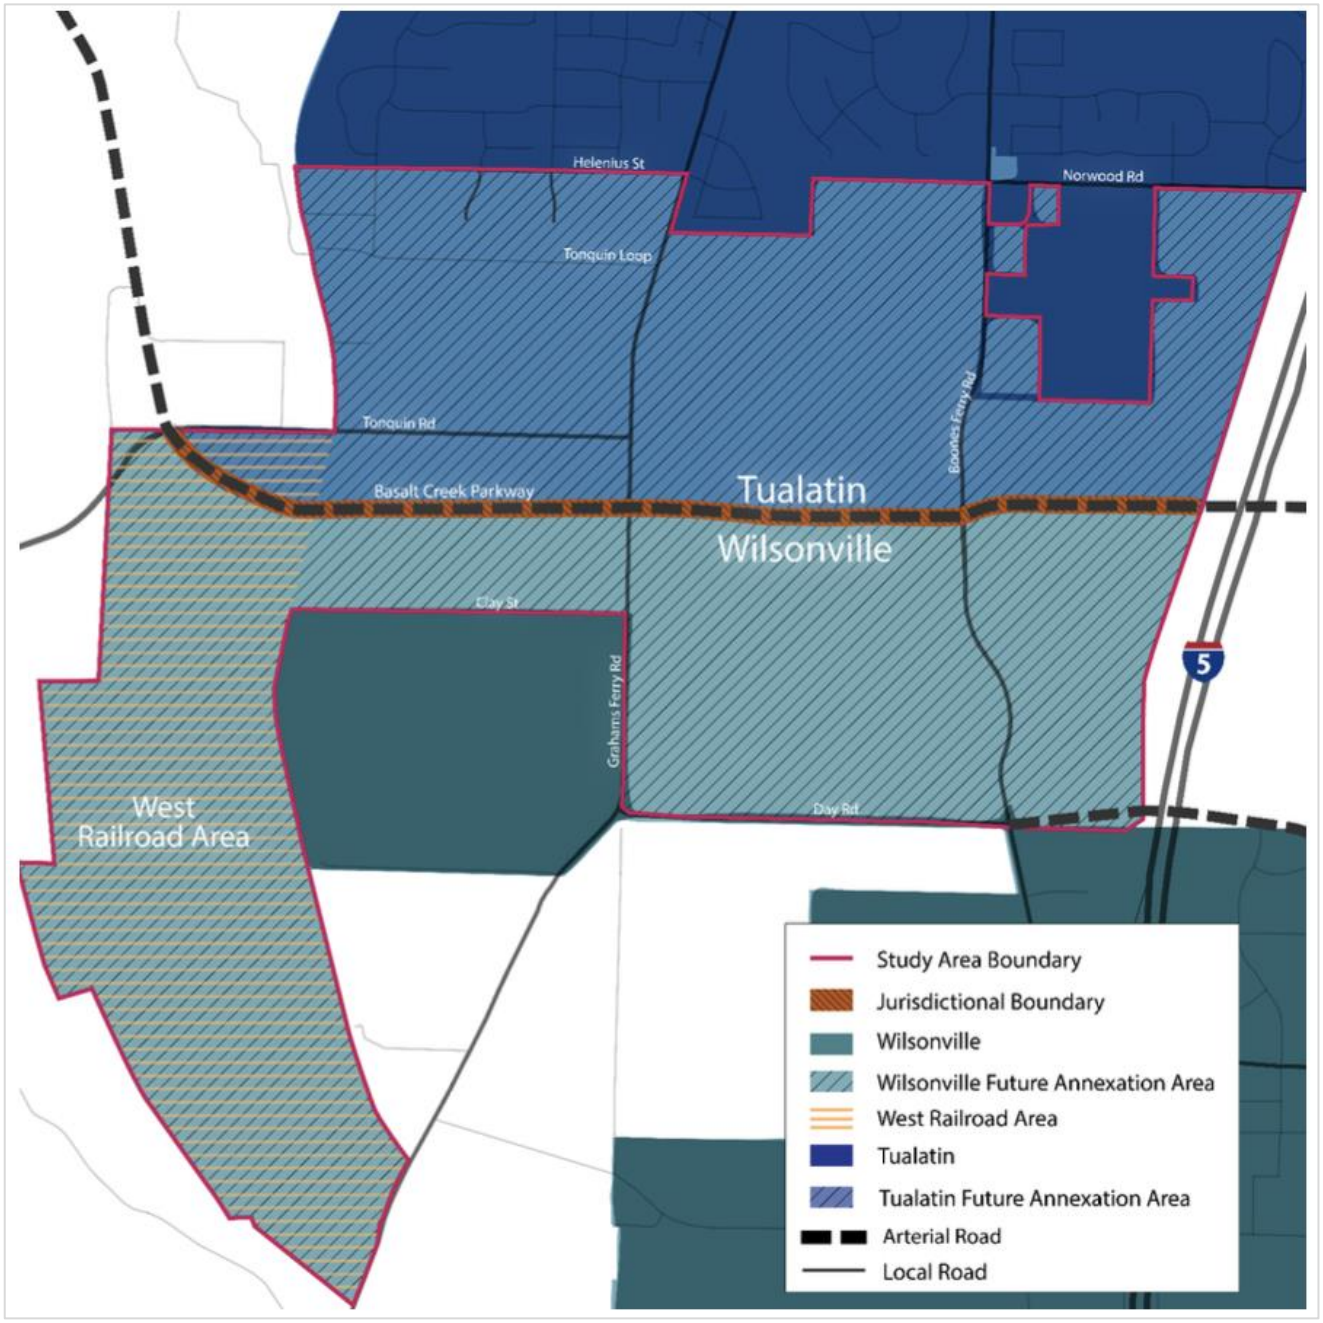
1. Introduction

Purpose and Background

After a multiyear planning process, Wilsonville, in partnership with Tualatin, developed and adopted the Basalt Creek Concept Plan (BCCP) in 2018. The BCCP established a framework for development in the area over the next twenty years. Wilsonville is planning for the development of its portion of the Basalt Creek Planning Area (BCPA), located in unincorporated Washington County.

The City adopted the BCCP in anticipation of future industrial development. However, at the time of adoption, a number of implementation steps remained. In the years following the adoption of the BCCP, Washington County has approved development consistent with County zoning. The BCPA now hosts several contractor establishments that, while providing jobs and economic activity, are not the type of development or commerce envisioned in the Concept Plan.

The City is currently working on the final implementation steps to make the BCPA development ready. These steps include designating the zoning to be used in the area as well as refining infrastructure funding plans. Since adoption of the BCCP in 2018, significant economic shifts have occurred at national, state, regional, and local levels to be considered during the current implementation steps. Given these economic shifts, reassessing Basalt Creek's market conditions is crucial for Wilsonville's implementation process. This reassessment will help ensure that development plans align with current economic realities and future projections.



To understand the changing market conditions, Wilsonville engaged ECOnorthwest to conduct an updated market assessment and industrial lands study for Wilsonville’s portion of Basalt Creek. This Economic Inventory report is a key component of that study, providing an overview of the current economic conditions and trends affecting the BCPA. The findings from this analysis will inform recommendations on how to translate the BCCP’s land use concepts into zoning designations and inform infrastructure planning to support economic development opportunities in the area.

Basalt Creek Planning Area Overview

The Basalt Creek Planning Area (BCPA) is an 847-acre area located in unincorporated Washington County between the southern border of incorporated Tualatin and the northern border of incorporated Wilsonville. This report focuses on the Wilsonville section, which includes 480 acres within the designated Wilsonville Future Annexation Area and West Railroad Area (as depicted in Figure 1). The BCPA is centrally located in the southern portion of the Portland metro, easily accessible and connected to other growing industrial areas, including Sherwood and Tualatin. It has access to the Portland metro and Mid-Valley labor sheds, making it well positioned to attract various types of industry.

Currently, the Wilsonville portion of the BCPA falls under Washington County's Future Development 20-Acre District (FD-20) zoning, which allows a variety of low-intensity uses. The area has limited development, with much of the developed land used for contractor establishments, including storage of equipment and vehicles. A contractor establishment is a facility where contractors and/or subcontractors store and organize their tools, equipment, supplies, and materials. These facilities can include buildings, grounds, or structures, and often have outdoor storage and assembly areas. While important uses, these lands host limited employment and assessed property value, much less than the employment densities and development typologies envisioned in the BCCP and typical of land within the metro urban growth boundary (UGB) and incorporated City limits.

Figure 1: Basalt Creek Planning Area

Source: Basalt Creek Concept Plan, 2018. Note: Wilsonville's portion of the Basalt Creek Planning Area (BCPA) is inclusive of the Wilsonville Future Annexation Area and West Railroad Area.

How does the Basalt Creek Concept Plan guide development?

After a multiyear planning process, Wilsonville, in partnership with Tualatin, developed and adopted the Basalt Creek Concept Plan (BCCP) in 2018. The BCCP established a framework for development in the area over the next 20 years. The BCCP identifies preferred land uses across the area and strives to coordinate future land use, transportation, and infrastructure investments between Tualatin, Wilsonville, and Washington County. In particular, the BCCP:

- Established a vision for urbanization of the Basalt Creek Planning Area
- Established a new jurisdictional boundary between Tualatin and Wilsonville (to determine which parts of the Planning Area may be annexed into and served by each City)
- Identified conceptual land uses across the area
- Recommended high-level designs for transportation and infrastructure systems to support future development
- Set specific action items and implementation measures

GUIDING PRINCIPLES

Guiding Principles represent the collective interests and goals for the Basalt Creek Planning Area, as agreed to and established by the Joint Councils of Tualatin and Wilsonville.

- **Maintain and complement the Cities' unique identities.**
- **Capitalize on the area's unique assets and natural location.**
- **Explore creative approaches to integrate jobs and housing.**
- **Create a uniquely attractive business community unmatched in the metropolitan region.**
- **Ensure appropriate transitions between land uses.**
- **Meet region responsibility for jobs and housing.**
- **Design cohesive and efficient transportation and utility systems.**
- **Maximize assessed property value.**
- **Incorporate natural resource areas, and provide recreational opportunities as community amenities and assets.**

Land Use Designations

The BCCP identified a mix of land use designations for the area based on its land suitability analysis and adjacent land uses. For Wilsonville, the BCCP proposed four main land use designations. However, West Railroad did not include a specific concept because it was viewed as having lower development potential and was slated for future study and consideration. These designations, as defined in the BCCP, are:

HIGH-TECH EMPLOYMENT DISTRICT

Most of the buildable acres in the Planning Area south of the proposed Basalt Creek Parkway are devoted to a mix of higher-density employment land. The High-Tech Employment District is expected to accommodate the largest number of jobs (1,916) with a mix of warehousing, manufacturing, and office buildings. This land use is in the southern and eastern sections of the Planning Area, covering all Wilsonville land east of SW Boones Ferry Road and most of the land south of SW Clay Street, which extends to SW Day Road and is bordered to the west by Coffee Creek Correctional Facility.

The BCCP assumed the following breakdown of uses for the High-Tech Employment District, which helped estimate the amount of traffic the development would generate.

Table 1. BCCP Assumed Breakdown of Uses for the High-Tech Employment District

USE	SHARE
Retail	1%
Office	45%
Industrial	38%
Warehousing	15%
TOTAL	**100%**

Source: Basalt Creek Concept Plan, 2018. Note: Share may not equal 100% due to rounding.

CRAFT INDUSTRIAL

The southwest corner of the intersection of SW Boones Ferry Road and the new Basalt Creek Parkway is planned as Craft Industrial, which allows for a mix of smaller-scale commercial uses and may include live-work units. These envisioned development types respond to the topography on those parcels and their location directly south across the Parkway from residential land and southwest of the neighborhood commercial node across the Parkway in Tualatin. Craft Industrial is a better fit with those surrounding uses, providing a transition to the higher-intensity employment uses to the south. This area allows less than 20 percent residential use and is expected to accommodate 27 new jobs and 6 new housing units in the form of live-work units.

The BCCP assumed the following breakdown of uses for the Craft Industrial District, which helped estimate the amount of traffic the development would generate.

Table 2. BCCP Assumed Breakdown of Uses for the Craft Industrial District

USE	SHARE
Retail	24%
Office	31%
Industrial	44%
Warehousing	1%
TOTAL	**100%**

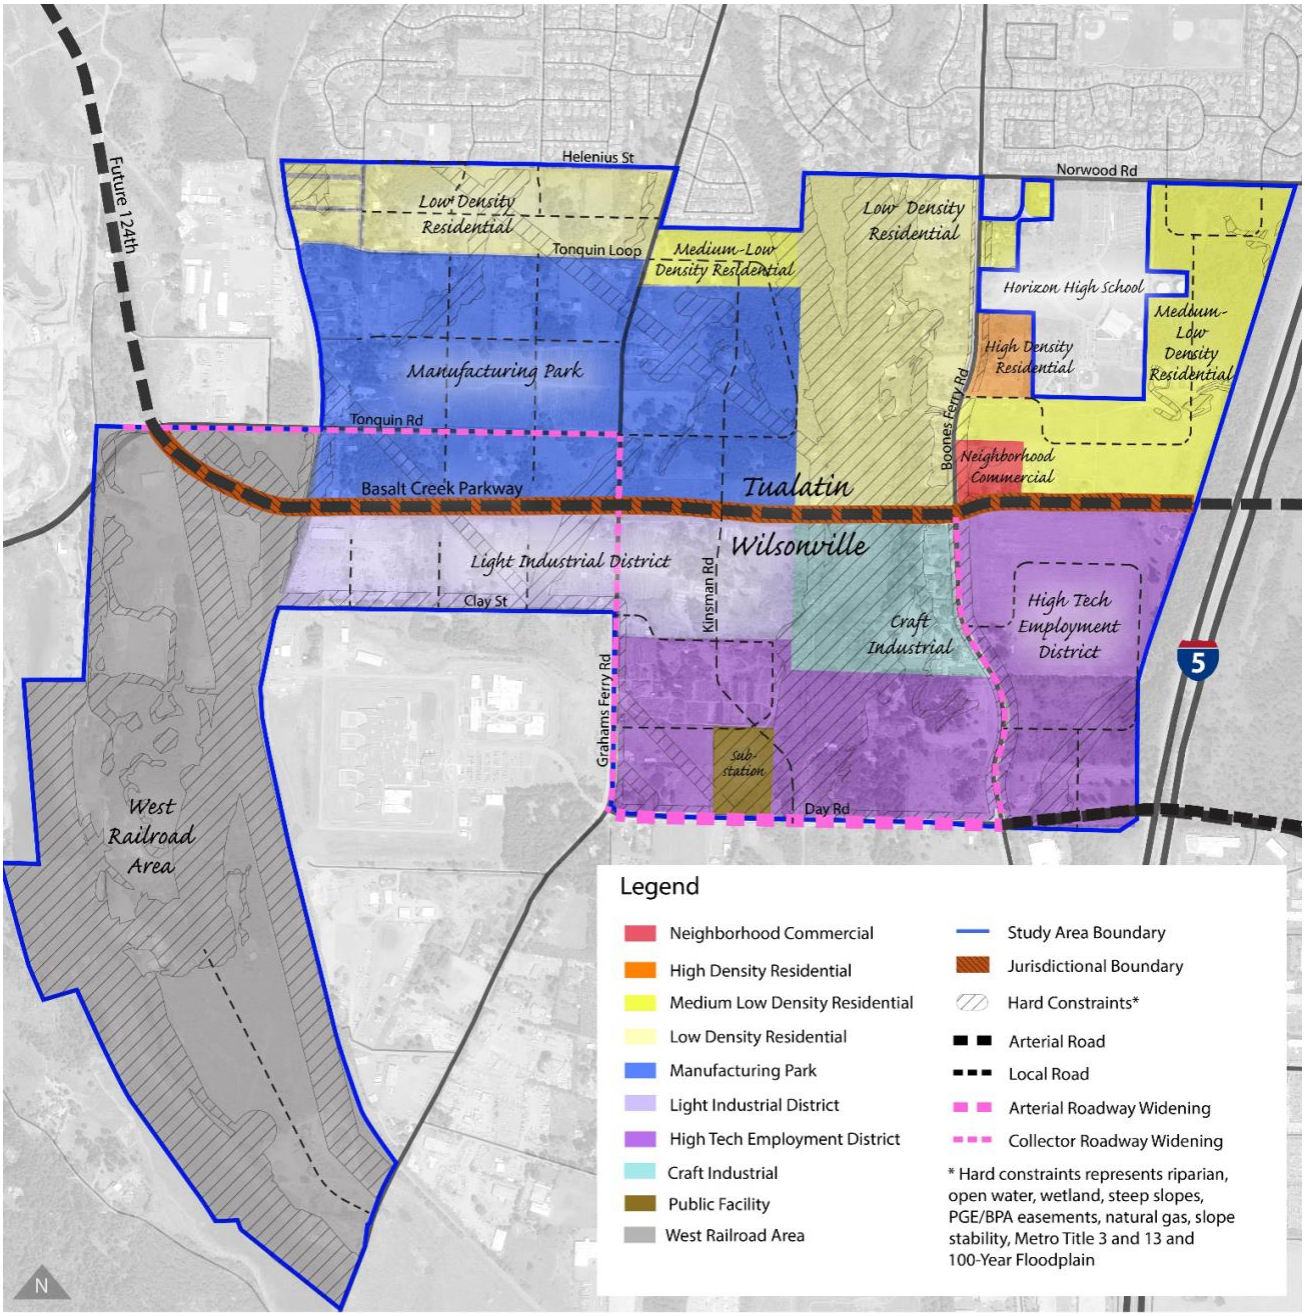
Source: Basalt Creek Concept Plan, 2018. Note: Share may not equal 100% due to rounding.

LIGHT INDUSTRIAL DISTRICT

This land is located across the southern edge of Basalt Creek Parkway and its future extension just north of Coffee Creek Correctional Facility, and it will be able to accommodate 581 new jobs, primarily in warehousing and light manufacturing.

The BCCP assumed the following breakdown of uses for the Light Industrial District, which helped estimate the amount of traffic the development would generate.

Table 3. BCCP Assumed Breakdown of Uses for the Light Industrial District



USE	SHARE
Retail	1%
Office	19%
Industrial	69%
Warehousing	11%
TOTAL	**100%**

Source: Basalt Creek Concept Plan, 2018. Note: Share may not equal 100% due to rounding.

WEST RAILROAD AREA

The West Railroad Area is divided from the rest of the Planning Area by the Portland and Western Railroad (PNWR) and the Coffee Creek Correctional Facility. When the BCCP was adopted, the area was heavily constrained by wetlands habitat, steep slopes, and fragmented property ownership. Initial estimates indicated that it would be costly to serve this area with adequate infrastructure due to its location. However, it was identified as having potential for resource conservation, future public access to nature, and possibly additional land uses. Because it was considered to have much lower development potential than the rest of the Planning Area, a future land use scenario was not created. Additional analysis on infrastructure funding and appropriate land uses was recommended once development and extension of infrastructure occurred in the rest of Basalt Creek.

Figure 2. Basalt Creek Land Use Concept Map

Source: Basalt Creek Concept Plan, 2018.
Note: West Railroad did not include a specific concept because it was viewed as having lower development potential and was slated for future study and consideration.

Implementation Measures

The BCCP also outlined the following implementation measures for the Cities:

1. **Update Urban Planning Area Agreements (UPAAs)** to acknowledge the future jurisdictional boundary and outline what areas may be annexed by each City, as well as transfer planning authority to the Cities.
2. **Amend Comprehensive Plans** to include the adoption of the Concept Plan.
3. **Assess zoning** and make sure it is compatible with anticipated land uses in the area and special design elements in the Concept Plan. The Concept Plan suggested Wilsonville consider applying the Coffee Creek Industrial Design Overlay District (form-based code) in the area.
4. **Annex as demand occurs** based on the pace of development and begin to make utility improvements adjacent to existing City services.
5. **Consider capital improvements** to spur development via financing the infrastructure themselves for reimbursement, creating a cooperative financing district, or developing the infrastructure to induce desired development.
6. **Consider master planning** in the area.

Wilsonville updated its UPAA in 2019 and amended its Comprehensive Plan after the Concept Plan was adopted. The City is now working on developing zoning and evaluating infrastructure needs as a part of this project.

Basalt Creek Concept Plan Proposed Employment Densities

The BCCP assigned employment densities to each land use designation to align with the regional employment capacity and traffic counts. According to the Concept Plan, the Wilsonville portion of the BCPA could support 2,524 jobs across 136.6 buildable acres, for an average employment density of 18.5 employees per gross buildable acre. The specific land use designations and respective employment densities are shown below. Note: West Railroad did not include a specific concept because it was viewed as having lower development potential in the near term and was slated for future study and consideration.

Table 4: Basalt Creek Concept Plan Land Use Designations

LAND USE DESIGNATION	BUILDABLE ACRES	TOTAL JOBS	JOBS PER GROSS BUILDABLE ACRE
Craft Industrial	1.3	27	21.7
Light Industrial District	35.3	581	16.5
High Tech Employment District	94.5	1,916	20.3
Functionally Unbuildable	5.6	0	0
TOTAL	**136.6**	**2,524**	**18.5**

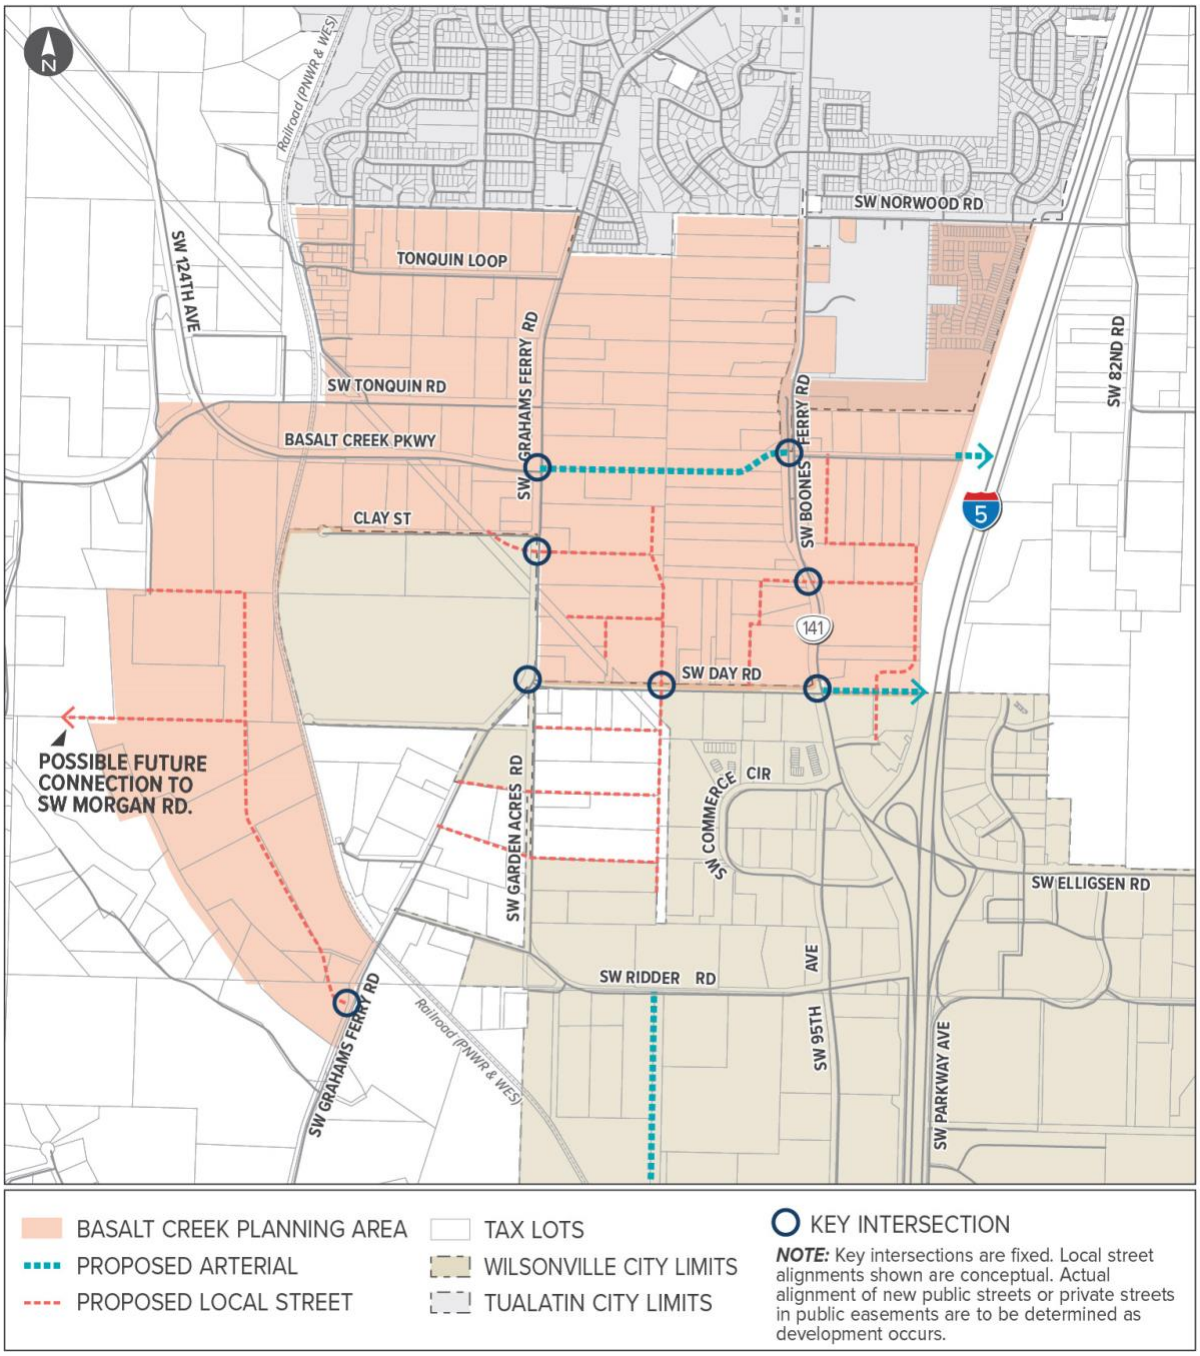
Other Guiding Plans and Documents

WILSONVILLE COMPREHENSIVE PLAN

Wilsonville's Comprehensive Plan, updated in 2024, designates Basalt Creek and West Railroad as areas of special concern (M and N), and it describes special considerations that must be addressed in development of these areas. Design objectives established for Area of Special Concern M, Basalt Creek, include:

- Consider adopting a form-based code similar to that adopted in the Coffee Creek Industrial Area for new industrial development in Basalt Creek.
- Protect key natural resources and sensitive areas while making recreational opportunities accessible by integrating the new parkland, open spaces, natural areas, and trails in Basalt Creek into existing regional networks. Development should protect, enhance, and provide access to these natural resources.
- Locate north-to-south trails near the Basalt Creek Canyon and provide bicycle connections that would connect to other cities and trail systems, serving as an asset for both residents and employees in the area.
- Provide strong transit access to support employment within Basalt Creek. Integrate transit access with the bike, pedestrian, and trail services at key access points along SW Grahams Ferry Road, SW Boones Ferry Road, SW Day Road, SMART Central, and the Coffee Creek Correctional Facility.

No design objectives were included for Area of Special Concern N, West Railroad; however, it is noted that the area will require additional planning before any development occurs.



BASALT CREEK TRANSPORTATION REFINEMENT PLAN

The 2013 Basalt Creek Transportation Refinement Plan (TRP) set the layout of major new roads and improvements for the area, including enhanced bike and pedestrian facilities and connections to the future SMART transit system. The TRP included an Action Plan that consisted of 18 transportation investments, which were prioritized according to short-term, medium-term, and long-term projects.

ONGOING INFRASTRUCTURE AND NATURAL RESOURCE PLANNING

The City is currently collaborating with several consultants to update its understanding of infrastructure needs, natural resources, and hazards in the BCPA. The City is working with DKS Associates to refine the street alignment in the BCPA. A preliminary street alignment, provided below, may undergo further changes in future iterations.

Figure 3. Proposed BCPA Street Plan

Source: DKS Associates

Simultaneously, Pacific Habitat Services is assisting the City in updating and refining natural hazard and resource maps of the area. For utility infrastructure, the City has engaged Consor to help with assessing water, wastewater, and stormwater needs, as well as with determining the costs of necessary upgrades. These collaborative efforts aim to provide a comprehensive and up-to-date overview of the area's development requirements and environmental considerations. These simultaneous projects will be incorporated and inform this planning process as information becomes available.

What has happened since the Basalt Creek Concept Plan was adopted?

Since adoption of the BCCP, significant shifts have occurred in the office and industrial real estate markets. The pandemic accelerated the trend toward remote work, leading to higher office vacancy rates and a redefinition of office space needs. Conversely, the industrial sector experienced strong growth characterized by high demand, rising rents, and robust development, which was driven in part by the federal Creating Helpful Incentives to Produce Semiconductors (CHIPS) and Science Act. National trends in these industries are detailed in Section 2, while regional and Wilsonville-specific trends are covered in Section 3.

The City of Wilsonville has not annexed any of Basalt Creek since the BCCP was adopted in 2018. As a result, the BCPA has remained under Washington County's jurisdiction and zoning. Some development has occurred at much lower densities than envisioned in the BCCP, which is allowed under the more permissive County zoning code. Many existing businesses, including contractor establishments, have few employees and are using large areas of land for equipment storage, which conflicts with the City's vision for higher employment density. These uses are permitted under Washington County zoning but do not align with Wilsonville's goals for the area, or with the goals, priorities, and industrial land needs within the greater Portland metro area. Wilsonville's portion of the BCPA consisted of 90 tax lots in 2022. Some areas have a high degree of parcelization, while others are less fragmented. There are a handful of large contiguous landholdings by single ownership. While there has been growth in contractor establishments, many of them existed before the BCCP was in place. These trends are discussed in more detail in Section 3.

The City is interested in future development in Basalt Creek that better aligns with its vision for higher industrial employment density. To make meaningful progress, the City must first establish appropriate zoning designations and plan for necessary infrastructure—key objectives of this project.

2. Changes in Market Conditions

Following the COVID-19 pandemic, office and industrial real estate markets faced challenging development conditions, particularly due to high interest rates, significantly slowing commercial real estate development activity. The increased cost of capital has made many projects economically unfeasible, especially speculative projects that rely on debt financing and those with longer loan payback periods.[1] Higher interest rates have also reduced property valuations, complicating the ability of developers to secure construction financing and attract equity investments.[2] Additionally, rising construction costs—driven by inflation and supply chain disruptions—have further complicated development efforts across these sectors.

This section examines national trends that have shaped office and industrial real estate markets in recent years. It compares these trends to projections from the 2014 Market Analysis by Leland Consulting Group, which informed the BCCP. Understanding the broader national context is crucial for several reasons: It provides a benchmark for comparing local performance. National trends often influence regional and local markets, albeit sometimes with a delay. This understanding helps identify potential opportunities or challenges that may affect Wilsonville and Basalt Creek in the future. It also allows for more informed decision-making and strategic planning at the local level.

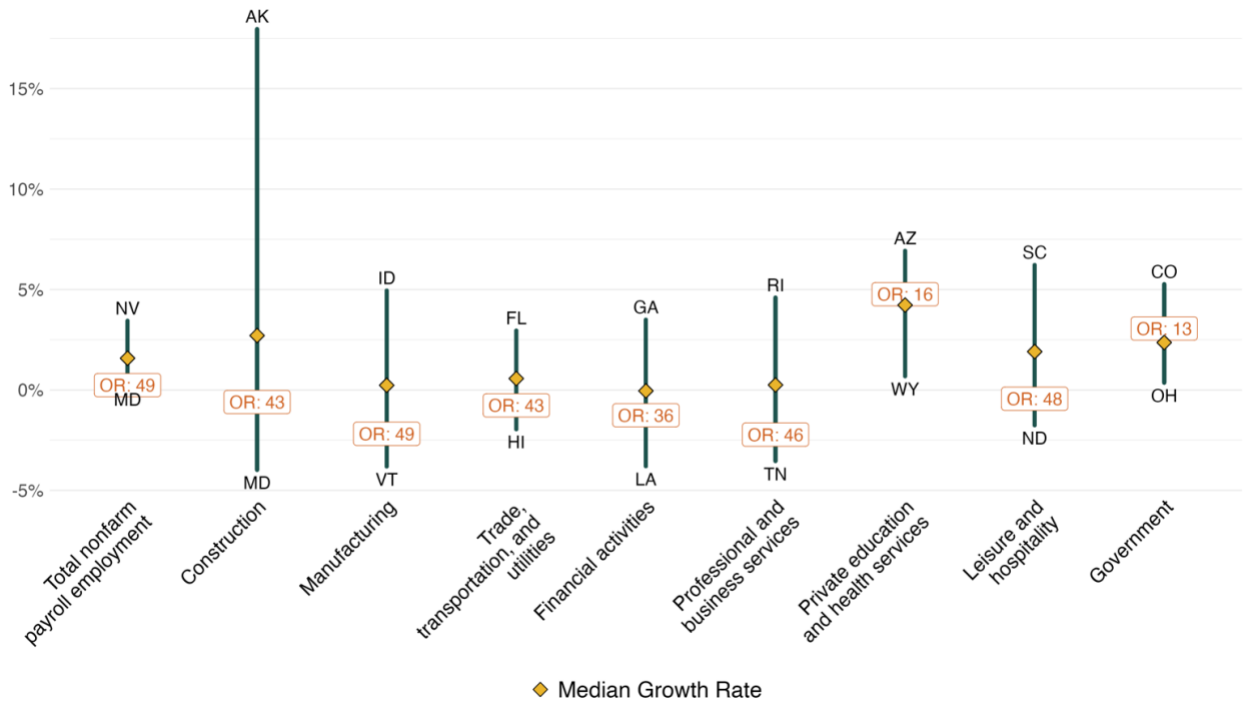
Regional and Wilsonville-specific trends are addressed separately in Section 3, building upon this national overview.

National and State Employment Trends

National Employment

The United States has seen robust employment growth since the COVID-19 pandemic. National employment increased by 21 percent between April 2020 and April 2024, surpassing prepandemic levels. The most recent year (April 2023 to April 2024) saw total nonfarm employment grow by 1.8 percent.[3]

Oregon Employment



Oregon's employment recovery, while positive overall since 2020, has fallen behind the national trend. From April 2020 to April 2024, the state's employment grew by 17 percent.

[1] If developers take on debt to finance a project, the longer they take to repay the loan, the more interest will accrue.
[2] In addition to loans, developers will typically finance projects in part with equity investments, in which investors become shareholders in the project.
[3] U.S. Bureau of Labor Statistics, Total Nonfarm Employment (not seasonally adjusted), 2020-2024.

However, in contrast to national growth, Oregon experienced a slight decline of 0.1 percent in employment between April 2023 and April 2024.[4]

The state's recent economic performance is concerning across multiple sectors. Oregon ranked 49th out of all states in nonfarm employment growth rate between April 2023 and April 2024. During this period, the state was among the bottom ten for employment growth (losing jobs while other states saw gains) in manufacturing, construction, trade, transportation and utilities, professional and business services, and leisure and hospitality.

Figure 4. Employment Growth Rates for All States by Sector (April 2023 to April 2024)

Source: U.S. Bureau of Labor Statistics Current Employment Survey, April 2024. Note: This figure compares Oregon's employment growth rate to all other states. For example, "OR: 49" for total nonfarm payroll employment means Oregon ranked 49th out of all states in employment growth rate between April 2023 and April 2024.

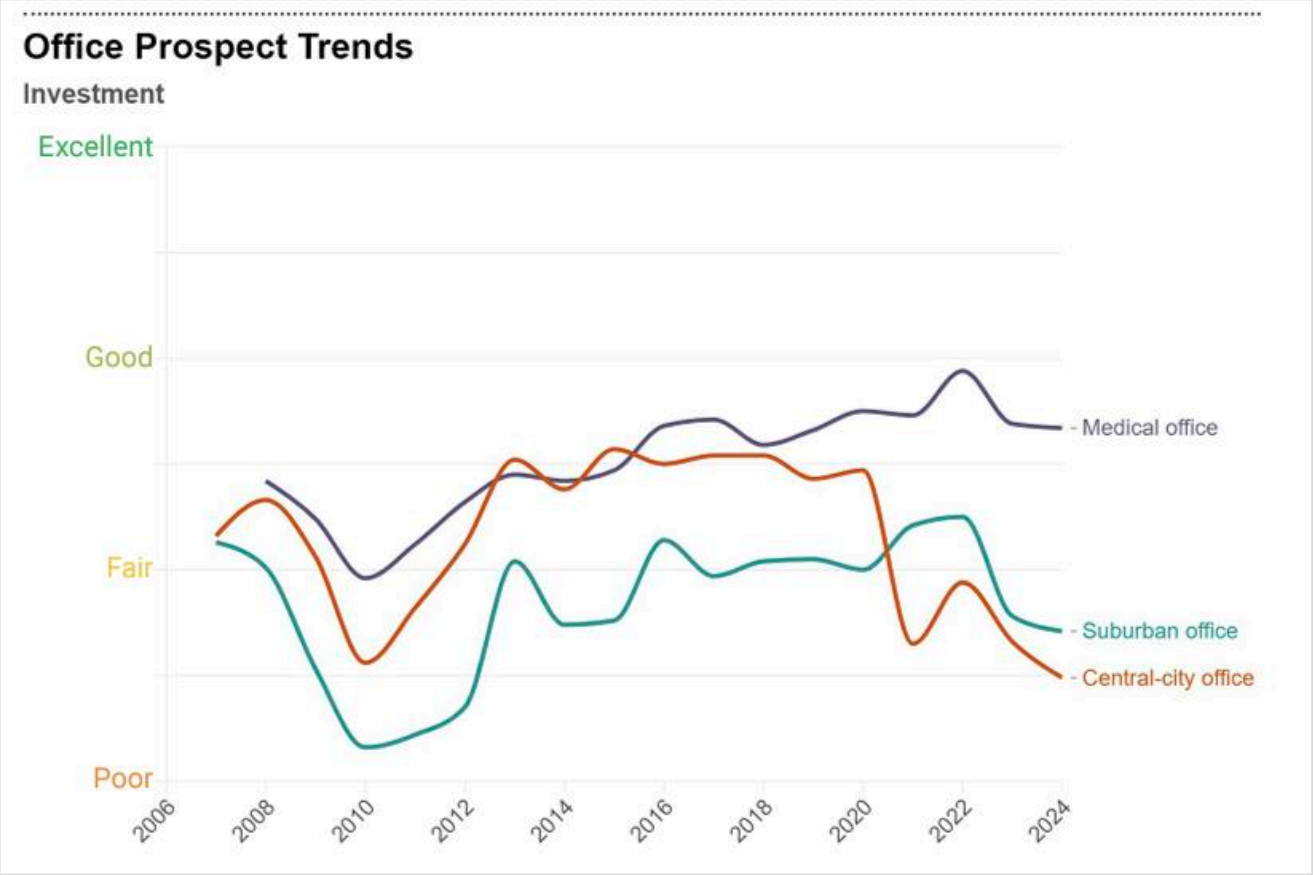
[4] U.S. Bureau of Labor Statistics, Total Nonfarm Employment (not seasonally adjusted), 2020-2024

National Office Trends

This section describes national trends for office space excluding industrial, manufacturing, or flex space, which is discussed in the following subsection. The 2014 Market Analysis, which informed the Basalt Creek concept planning process, highlighted a reduced demand for office space and a less robust market, predicting a slower pace for office development. This outlook was based on the fact that regional employment levels in Portland had only recently returned to their prerecession levels of 2008.

These trends have been further exacerbated by the COVID-19 pandemic and resulting market shifts toward remote work. According to the Bureau of Labor Statistics' American Time Use Survey, the share of employees working from home rose from 24 percent in 2019 to 34 percent in 2022.[5] Nationally, the office market as a whole is declining, although high-quality office space remains in relatively strong demand. Key findings include:

- **Negative net absorption:** National net absorption for office space came in negative (at negative 18.2 million square feet) for the tenth quarter in a row.[6] However, this trend is not uniform across U.S. markets, with a third of U.S. office markets having positive net absorption. JLL, a global commercial real estate and investment management company that tracks and reports on commercial real estate dynamics, noted that many properties and markets with high negative net absorption are earmarked for conversion to other uses.[7]
- **Shrinking inventory:** The construction pipeline has decreased by 67 percent since early 2020. As of Q2, 2024 office deliveries (referring to new construction added to the market) were 27 percent below the average since 2020, and the current pipeline is at its lowest point in a decade.[8] As office inventory removals outpace market deliveries, overall office market inventory has declined.[9]
- **Favored product types:** Certain types of office space are outperforming others, with tenants favoring high-quality buildings, such as those in attractive locations or featuring additional amenities. With new construction slowing down, existing high-quality assets will likely continue to see demand as competition decreases. In contrast, older and obsolete spaces may require investment or conversion, and the performance of middle-market spaces will vary depending on factors like location, space type, and submarket.[10]



Looking ahead, the office sector is expected to adjust to a hybrid work model, with peak attendance levels stabilizing at around 60 to 70 percent. This shift will set a new baseline for office space requirements. Cushman & Wakefield predicts that office occupancy will start to stabilize in the latter half of 2025 as the pace of adjustments to hybrid spaces

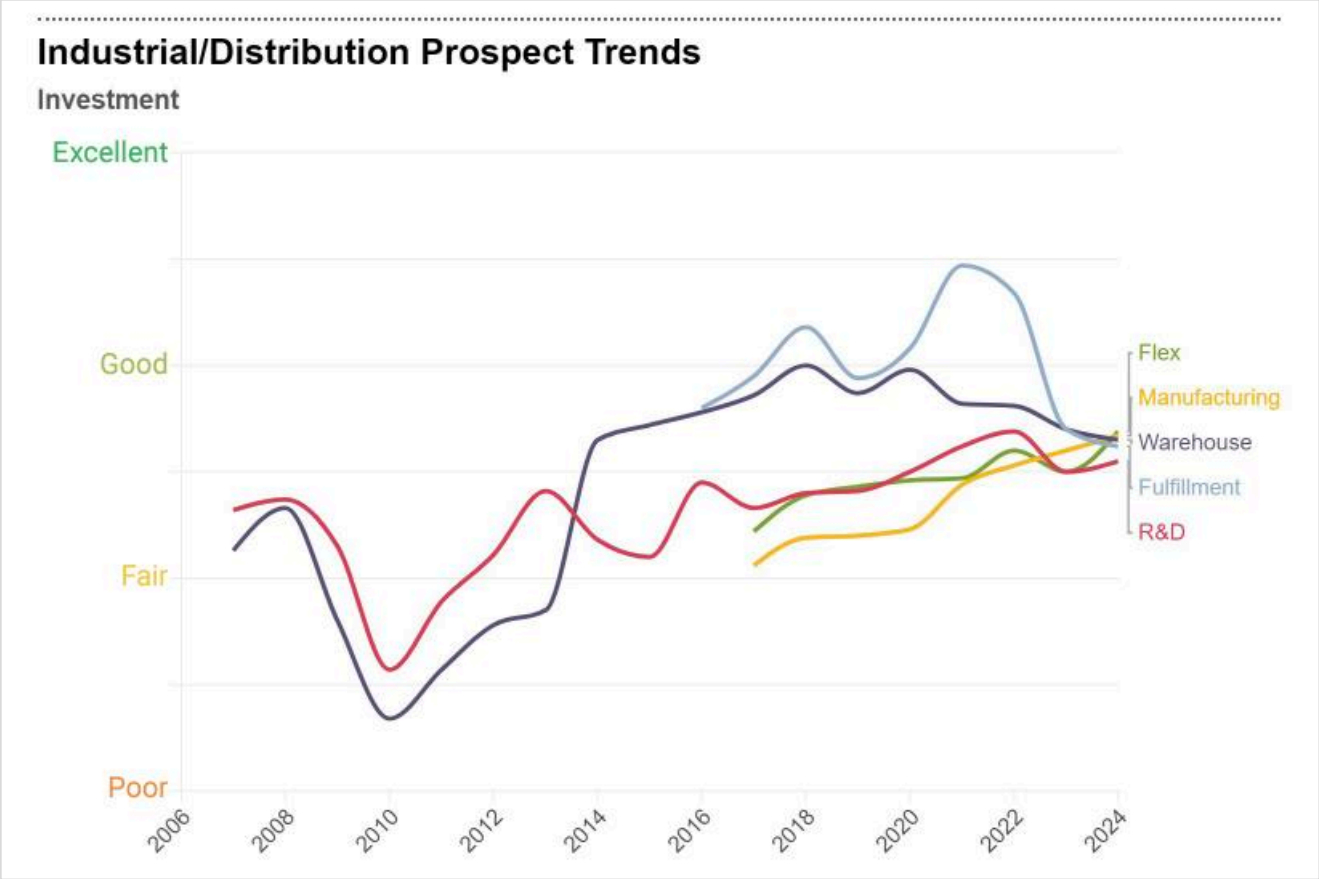
[5] BLS, American Time Use Survey, 2023; does not differentiate between part- and full-time workers
[6] Cushman & Wakefield, U.S. Office Marketbeat Q2 2024
[7] JLL, JLL U.S. Office Outlook Q1 2024
[8] Cushman & Wakefield, U.S. Office Marketbeat Q2 2024
[9] JLL, JLL U.S. Office Outlook Q1 2024
[10] Cushman & Wakefield, U.S. Office Marketbeat Q2 2024

slows down and growth in both employees and new businesses generate demand for office space.[11]

Figure 5 shows the Urban Land Institute's national office market investment prospect trends by secondary market type. While the investment prospect for suburban and central city office space has fallen between "poor" and "fair" in recent years, the investment prospect for medical office space has risen relatively steadily and is rated just below "good."

Figure 5: Urban Land Institute National Office Investment Prospect Trends

Source: Urban Land Institute 2024 Emerging Trends in Real Estate, United States and Canada



[11] Cushman & Wakefield, U.S. Office Marketbeat Q2 2024

National Industrial Trends

The 2014 Market Analysis, which informed the Basalt Creek concept planning process, reported that industrial space demand was likely to surge as the economy continued to recover from the 2008 recession, citing significant industrial space in the Portland region's development pipeline. It also highlighted that the I-5 South submarket would see some of the greatest demand, predicting that industrial development would continue to outpace office development—an accurate forecast.

The 2014 Market Analysis also correctly predicted stronger markets for research and development, advanced manufacturing, general manufacturing, and warehousing space. Figure 6 shows the Urban Land Institute's trends in investment prospects for industrial and distribution space nationally, showing increased development prospects for these space types from 2014 to around 2021. Historically, fulfillment and warehouse space were rated as better investment prospects than research and development, manufacturing, and flex space. However, in recent years the investment prospects for the various secondary market types have coalesced toward a similar prospect rating, just below "good."

Figure 6: Urban Land Institute National Industrial and Distribution Prospect Trends

Source: Urban Land Institute 2024 Emerging Trends in Real Estate, United States and Canada

In recent years, the industrial real estate market has shown strong performance, particularly in 2022 and 2023, though growth has started to slow in 2024. Despite this slowdown, the national industrial market remains relatively robust overall. Key trends include:[12]

- **Stabilizing vacancy rates:** Since mid-2022, vacancy rates have been rising, but the pace of increase has slowed. As of Q2 2024, the national vacancy rate stands at 6.1 precent and is expected to continue increasing. However, it remains below the 10-year prepandemic average (2010-2019) of 7 percent.
- **Positive net absorption:** Industrial market demand remains strong, with positive net absorption and rising rents. However, the rate of change has slowed compared to previous years. For instance, rents rose by 3.7 percent year over year since 2023 Q2, marking the slowest growth rate since 2020.
- **Slowing construction:** One reason for rising vacancy rates is the influx of new supply, with over 1.2 billion square feet delivered nationally in 2022 and 2023. However, the construction of new industrial projects has slowed significantly, decreasing by 46 percent from Q2 2023, reaching its lowest point in four years.

Nationally, the market is expected to stabilize over the next year as the shrinking construction pipeline and positive net absorption limit the available supply of industrial space. However, Cushman & Wakefield report that "the tailwinds of e-commerce growth, onshoring and nearshoring, and a resilient consumer all set the stage for fundamentals to trend positively going forward, albeit at a pace below 2021 and 2022 highs."[13,14] Key forecasted trends include:

- **Decreasing vacancy rates:** While vacancy rates are expected to continue to rise until early 2025, they are expected to peak at around 6.7 percent and then begin to decrease in the second half of 2025. In conjunction with this trend, annual net absorption is expected to increase through 2025.[15]
- **Increasing rents:** Although the rate of rent increase is expected to slow, asking rents for industrial space are anticipated to continue growing through 2025.[16]
- **Manufacturing growth:** According to JLL, the sustained growth in manufacturing due to reshoring trends (returning production to the United States) will likely continue to drive industrial demand nationally. Supply chains will seek strategically located facilities that can accommodate localized manufacturing, efficient distribution, and resilient inventory management systems.[17]

3. Wilsonville Basalt Creek Updated Market Assessment

The Basalt Creek Concept Plan (BCCP) was based on a market assessment conducted in 2014. In the decade since, significant changes have occurred in employment patterns and market conditions. This section provides an updated analysis of regional and Wilsonville-specific employment trends, current forecasts, and present market dynamics, building on the national overview in Section 2.

This updated information establishes a new baseline for understanding Basalt Creek's current market context. Additionally, this section evaluates Basalt Creek's competitive strengths and weaknesses and identifies industries most likely to establish a presence in the area.

Employment Trends and Forecast

In 2022, Wilsonville's employment landscape was characterized by a strong concentration in industrial sectors, with manufacturing, wholesale trade, and construction making up 43 percent of the City's total employment—a much higher share compared to the broader tri-county region. This focus on industrial jobs sets Wilsonville apart, highlighting its distinct role in the regional economy.

Employment Trends

In 2022, Wilsonville had 21,383 covered employees, representing 2.2 percent of the region's covered employment.[18] The City's top three sectors are manufacturing (17.8 percent, 3,796 jobs), wholesale trade (14.4 percent, 3,083 jobs), and construction (10.5 percent, 2,248 jobs). These three industries combined represent 43 percent of Wilsonville's total employment, nearly double the 22 percent share these sectors hold in the broader tri-county region (Clackamas, Multnomah, and Washington Counties).

This concentration in industrial jobs sets Wilsonville apart from the surrounding area. While Wilsonville's top sectors are manufacturing, wholesale trade, and construction, the tri-county region's largest employers are in health care and social assistance, government, and manufacturing.

Table 5: Industry Distribution, Wilsonville and Tri-County Region, 2022

SECTOR	WILSONVILLE		TRI-COUNTY	
	2022 COVERED EMPLOYMENT	SHARE OF EMPLOYMENT	2022 COVERED EMPLOYMENT	SHARE OF EMPLOYMENT
Agriculture, Forestry, Fishing and Hunting	41	0.2%	9,532	1.0%
Utilities, Mining, Quarrying, Oil and Gas Extraction	101	0.5%	2,552	0.3%
Construction	2,248	10.5%	58,672	6.1%
Manufacturing	3,796	17.8%	102,378	10.6%
Wholesale Trade	3,083	14.4%	46,341	4.8%
Retail Trade	2,078	9.7%	90,895	9.4%
Transportation and Warehousing	748	3.5%	43,835	4.5%
Information	121	0.6%	21,957	2.3%

[18] **Covered** employment includes employees covered by unemployment insurance. Examples of workers not included in covered employment are sole proprietors, some types of contractors (often referred to as "1099 employees"), or some railroad workers. Covered employment data is from the Oregon Employment Department.

Over the past decade, Wilsonville's employment grew slightly faster than that of the tri-county region. This growth was largely driven by an increase in construction jobs, which more than tripled during this period. Although the tri-county region also experienced growth in construction jobs, Wilsonville's rate of growth was considerably higher. Wilsonville also had strong employment growth in wholesale trade. Notably, while wholesale employment rose in Wilsonville, it declined across the broader tri-county region.

In contrast, Wilsonville experienced a decline in manufacturing employment, even as the region saw growth in this sector. Wilsonville maintained stable employment in the transportation and warehousing sector, while the tri-county region grew substantially.

Table 6: Change in Employment, Wilsonville and Tri-County Region (2012 to 2022)

SECTOR	CHANGE 2012-2022			
	NUMBER		PERCENT

BASALT CREEK PLANNING AREA EMPLOYMENT

The BCPA (Wilsonville portion only) grew in employment from 2012 to 2022, with 275 covered employees reported as of 2022. The average wage in the BCPA was $85,863, which is higher than both the tri-county ($73,995) and City average wages ($74,252), suggesting these are relatively well-paying jobs.

Table 7. Change in Employment and Wage, BCPA 2012-2022

YEAR	TAX LOTS	ESTABLISHMENTS	EMPLOYMENT	TOTAL PAY*	AVERAGE WAGE*
2012	80	11.0	194	$9,593,330	$49,450
2022	90	10.0	275	$23,612,269	$85,863
CHANGE	**10**	**-1**	**81**	**$14,018,939**	**$36,413**

Source: QCEW
*not inflation adjusted

Wilsonville's portion of the BCPA consisted of 80 tax lots in 2012 and 90 tax lots in 2022. Some areas in the BCPA have a high degree of parcelization, while others are less fragmented. There are a handful of large contiguous landholdings by single ownership. In 2012, 8 tax lots had businesses with covered employment, increasing slightly to 10 tax lots in 2022. Employment density on lots with covered employment remains low at 4.4 employees per acre as of 2022, with most tax lots having no covered employment at all.

Table 8. Lots with and without Covered Employment in the BCPA, 2012-2022

	2012			2022		
	TAX LOTS	ACRES	EMPLOYMENT DENSITY	TAX LOTS	ACRES	EMPLOYMENT DENSITY
With Employment	8	62	3.1	10	63	4.4
Without Employment	72	410	n/a	80	406	n/a
Total	**80**	**472**	**0.4**	**90**	**469**	**0.6**

Source: QCEW Note: The minor change in acreage from 2012 to 2022 resulted from constructing of the Basalt Creek Parkway and small adjustments in the recording of tax lots over that period.

It is important to note that these figures only account for covered employees.[19] Some of the land in the BCPA is actively used despite minimal reported employment. The area is primarily used for contractor establishments, including storage yards for various businesses, which typically require fewer employees. It is likely that additional workers are present but not included in the covered employment estimates, such as sole proprietors or other types of uncovered contractors. Due to the prevalence of storage-focused contractor establishments, many lots have minimal building improvements. The improvement-to-land-value ratio is low and has changed little over the past decade.

Table 9. Improvement to Land Value, BCPA, 2012-2022

	LAND VALUE	BUILDING VALUE	IMPROVEMENT TO LAND VALUE
2012	$16,577,800	$6,738,020	0.41
2022	$32,892,790	$16,996,440	0.52

Source: Regional Land Information System (RLIS)

[19] **Covered** employment includes employees covered by unemployment insurance. Examples of workers not included in covered employment are sole proprietors, some types of contractors (often referred to as "1099 employees"), or some railroad workers. Covered employment data is from the Oregon Employment Department.

Employment Forecast

Between 2020 and 2045, the City is projected to grow by 3,471 employees at an average annual growth rate of 0.7 percent. This rate is faster than Tualatin but slightly slower than Sherwood and the region overall. Washington County is projected to grow the fastest of the three counties in the region.

Table 10: Metro Employment Forecast, 2020 to 2045

			CHANGE 2020-2045		
	2020	2045	NUMBER	PERCENT	AAGR
Tualatin	34,115	36,792	2,677	8%	0.3%

AAGR = Annual Average Growth Rate

For 2022 to 2032, the Oregon Employment Department (OED) forecasts the strongest growth for the Portland tri-county region in commercial sectors, led by information, leisure and hospitality, and private education and health services. However, OED also predicts growth in industrial sectors, with the strongest relative growth in the construction industry followed by transportation, warehousing, and utilities.

Table 11: Portland Tri-County Industry Projections, 2022 to 2032

INDUSTRY	EMPLOYMENT		CHANGE	
	2022	2032	NUMBER	PERCENT

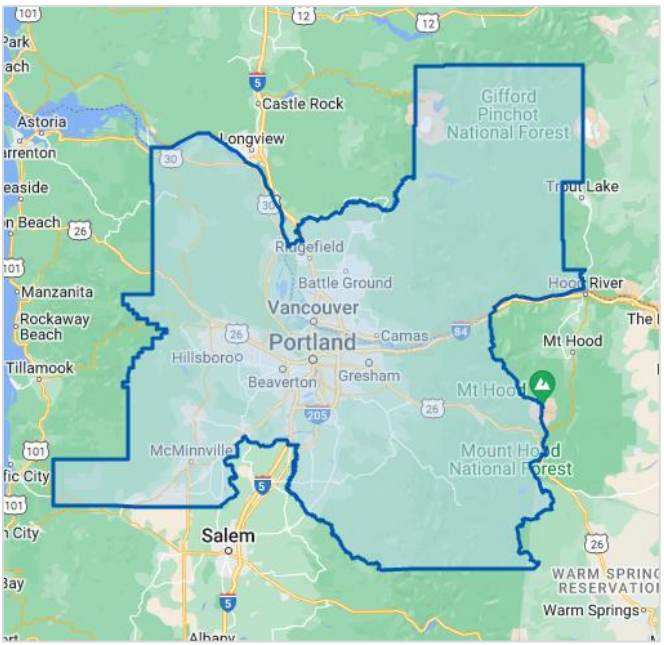
Real Estate Market Trends

The real estate market trends in Wilsonville and the Portland region generally align with the national trends outlined in Section 2. While Wilsonville's office market typically has a lower vacancy rate compared to the broader region, it has had consistently negative net absorption and recent spikes in the vacancy rate, reaching over 12 percent in 2024.

More positively, Wilsonville's industrial market has a relatively low vacancy rate, large average building sizes, and a variety of industrial space types that could appeal to a mix of tenants. Wilsonville is also well positioned to benefit from promising industrial trends in the broader region, including investments in semiconductor manufacturing and market growth that could attract tenants to the area. However, industrial development in Wilsonville has been limited over the past decade. Only 1.7 percent of its total industrial space has been built in the last 10 years, compared to 11 percent in the broader Portland metro area. According to CoStar, in the past five years, three buildings have been under construction in Wilsonville: one completed in 2022 and two slated to be completed in 2025.

NOTE ON COSTAR DATA

While CoStar data provides valuable, up-to-date data across a wide range of metrics, data quality is more limited in smaller markets and at the property level. The data here should be read as an indication of overall market statistics and trends, rather than an exact reflection of all properties in a given market.



This section analyzes real estate market trends for various submarkets encompassing the BCPA, including the I-5 South submarket (Figure 7) and the Portland metro area (Figure 8).

Figure 7: I-5 South Submarket Boundary

Office Market Trends

Portland Metro Regional Trends

Like the national office space market, office spaces in the Portland metro are experiencing high vacancy rates and lower leasing activity. Work-from-home policies have decreased the demand for office space. Consequently, tenants have increased bargaining leverage; they are pressuring landlords to reduce rates, increase lease concessions, and raise tenant improvement budgets. Despite these adjustments, an increase in vacancies is expected, with interest rates and economic uncertainty adding volatility to the office market.[20] Other key findings include:

- **Record high vacancy rates:** High vacancy rates have continued to climb, reaching a record high of 13.3 percent vacant office space in 2024 Q2.[21]
- **Continued negative net absorption:** Net absorption in the Portland market was just over negative 500,000 square feet in 2024 Q2, the fourth quarter in a row of negative net absorption. Since the beginning of 2020, the Portland office market has only had positive net absorption for five quarters.[22]
- **Leasing activity:** Leasing and sales activity are on par with 2023, indicating that the vacancy and absorption trends are due to companies exiting the marketplace or downsizing at a higher rate, likely due to continued work-from-home policies.[23]

However, the Portland office market is not uniform, with the suburban office market performing better than the downtown and regional office markets. The Portland suburbs' office vacancy rates are 8.6 percent, compared to 23.9 percent downtown.[24]

Wilsonville Office Market

Wilsonville currently has approximately 1.4 million square feet of office space, representing roughly 18 percent of office space in the I-5 South submarket and 1 percent in the broader Portland metro region. According to CoStar, over the past decade, one office building was added to Wilsonville's market in 2020, located at 29250 Southwest Town Center Loop West. This office building was about 30,000 square feet, or roughly 2 percent of Wilsonville's total office space. Over the same period, the Portland metro added a greater share (9 percent) of

[23] Kidder Matthews, Portland Office Market Report Q2 2024
[24] Cushman & Wakefield, Office Marketbeat Q2 2024 Portland Office Report

space to its office market. These projects, on average, have been significantly larger than usual office buildings, with a few very large projects surpassing 100,000 square feet.

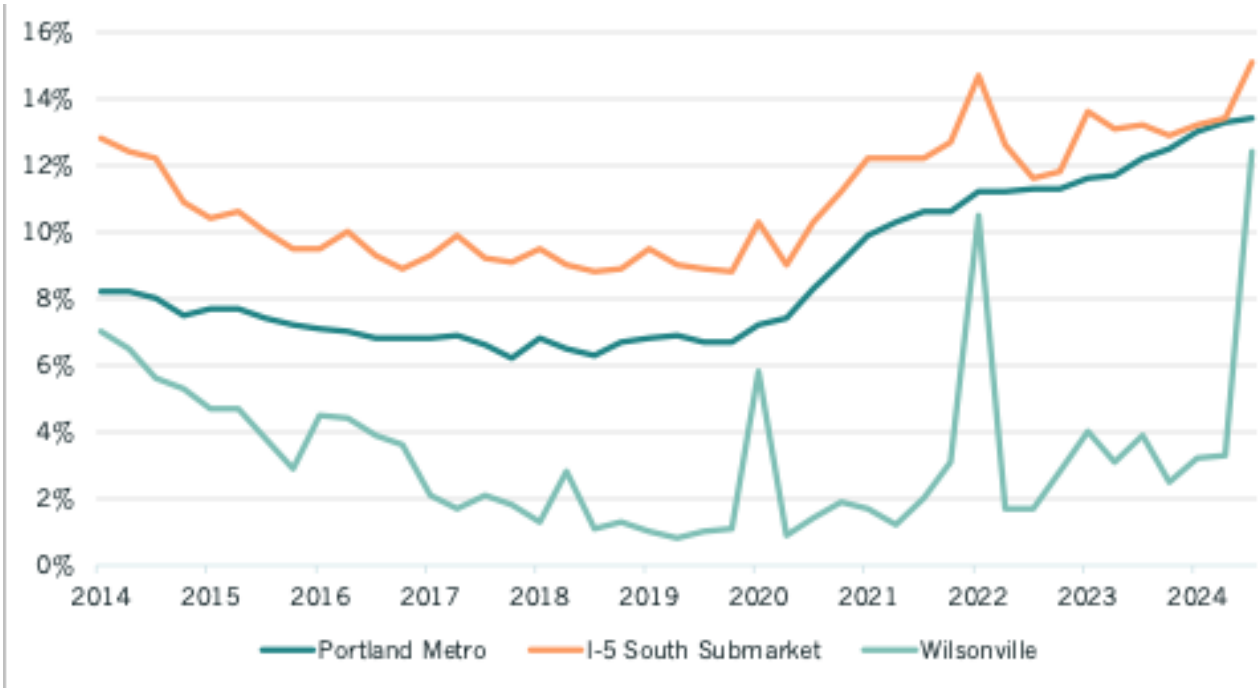

Table 12: Office Space Development Trends, 2014 to 2024

GEOGRAPHY	TOTAL BUILDINGS	TOTAL SQUARE FEET	AVERAGE BUILDING SIZE
ALL OFFICE DEVELOPMENT			
Portland Metro	6,217	118,809,170	19,110
I-5 South Submarket	431	7,533,437	17,479
Wilsonville	62	1,358,335	21,909
BUILT IN THE LAST 10 YEARS			
Portland Metro	66	10,354,342	156,884
I-5 South Submarket	4	80,976	20,244
Wilsonville	1	30,000	30,000

Source: CoStar, pulled August 2024

Per Costar, the I-5 South submarket office vacancy rates have been higher than the Portland metro's vacancy rates since 2014, although vacancy rates have been much more similar since 2022. Both have vacancy rates above 13 percent as of July 2024. While Wilsonville office vacancy rates have remained much lower, the end of a few leases are reflected in vacancy rate spikes in 2020, 2022, and 2024, when the vacancy rate spiked closer to the Portland metro average.

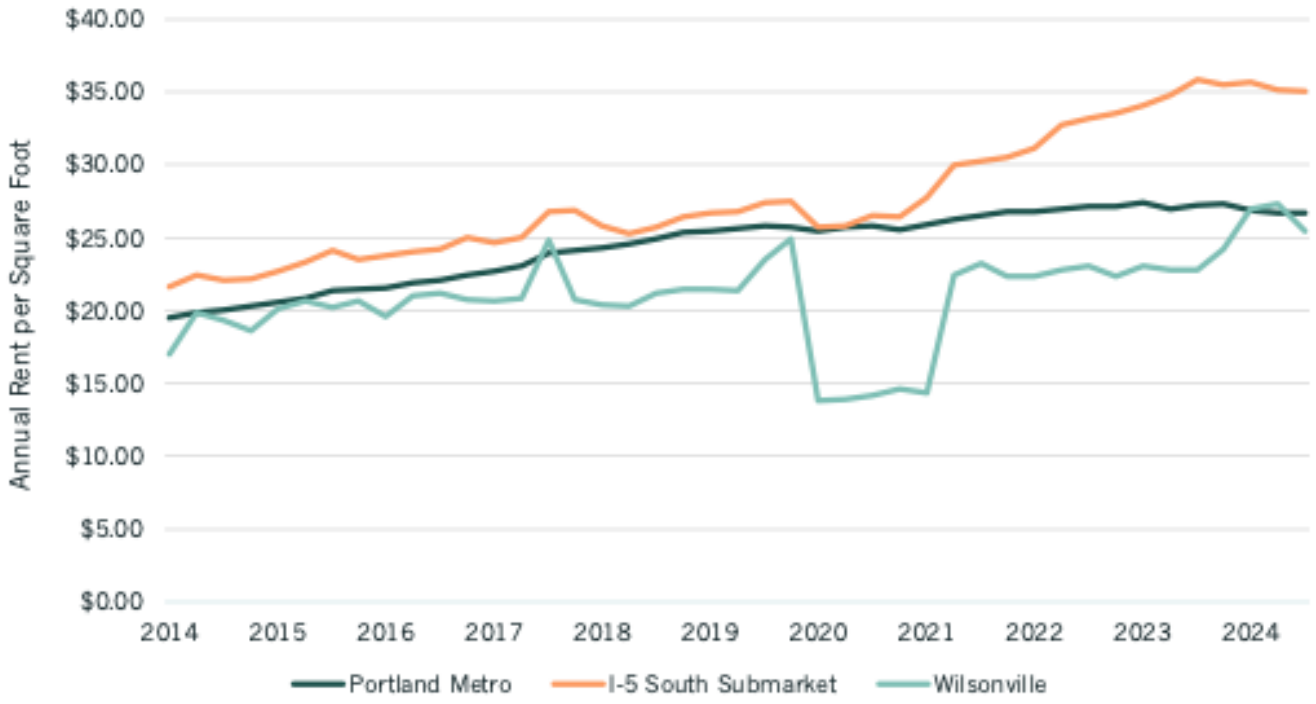

Figure 9: Office Vacancy Rate Trends, 2014-2024

Source: CoStar, pulled August 2024

Office rents have increased in the I-5 South submarket despite high vacancies, and they remain substantially above the Portland metro region's average, according to Costar. Historically, office rents in Wilsonville have been lower than in the Portland metro area. However, since an initial decline in 2020, rents in Wilsonville have risen steadily, reaching over $26 per square foot, now equal to the Portland metro average for the first time in a decade.

Figure 10: Office Lease Rate Trends, 2014-2024

Source: CoStar, pulled August 2024

Net absorption and delivery trends also indicate a relatively slow office market. From 2019 to 2024 Q3, net absorption was negative in all three areas. Over the same period, net absorption in the Portland metro area was negative 4.6 million square feet, negative 387,000 square feet in the I-5 South submarket, and negative 122,000 square feet in Wilsonville.

Industrial Market

Portland Metro Regional Trends

Like the national industrial market overall, the Portland metro area industrial market has been strong in recent years, particularly from 2021 to 2023. However, similar to national trends, a few metrics indicate that demand for industrial space is decelerating in the region:[25]

- **Increasing vacancy rates:** Vacancy for industrial space in the Portland metro region has risen steadily since early 2023, and net absorption was negative in both Q1 and Q2 of 2024. While overall leasing activity for industrial space in the area remained higher than the area's 10-year average, a few large companies downsizing or exiting the market contributed to negative net absorption and vacancy trends.
- **Slow lease-up for new construction:** The delivery of 1.2 million square feet to the market in early 2024 also contributed to the region's supply of vacant industrial space. However, newly constructed industrial space has been slow to lease up, with 93 percent of recent leasing activity in buildings built before 2010.
- **Rising unemployment rates:** In early 2024, Portland's unemployment rate (4.1 percent) surpassed the national average (3.8 percent) amid layoffs, including the shutdown of a large UPS location in North Portland, which impacted 300 sorting and distribution jobs.

However, investors and leasing professionals are confident in the regional market's long-term health, particularly due to significant investments in the region's semiconductor manufacturing sector.[26] Market strengths include:

- **CHIPS Act:** In 2022, the federal government allocated $50 billion as part of the CHIPS Act to bolster U.S. semiconductor manufacturing, which is expected to create thousands of regional manufacturing and construction jobs.[27] The expansion of the semiconductor industry could also have a ripple effect, creating demand for industrial space for equipment suppliers, supply chain materials manufacturers, and testing facilities.
- **Strong submarkets:** According to market reports from Cushman & Wakefield and CBRE, other strong industrial submarkets include food and beverage warehousing, tech warehousing, and auto part manufacturing.[28] These are some of the most common types of tenants seeking space in the market, although deals are taking longer on average to reach completion.[29]

[25] CBRE, Q2 2024 Portland Industrial Market Update
[26] Cushman & Wakefield, Industrial Marketbeat Q2 2024 Portland Industrial Report
[27] Cushman & Wakefield, Industrial Marketbeat Q2 2024 Portland Industrial Report
[28] Cushman & Wakefield, Industrial Marketbeat Q2 2024 Portland Industrial Report
[29] CBRE, Q2 2024 Portland Industrial Market Update

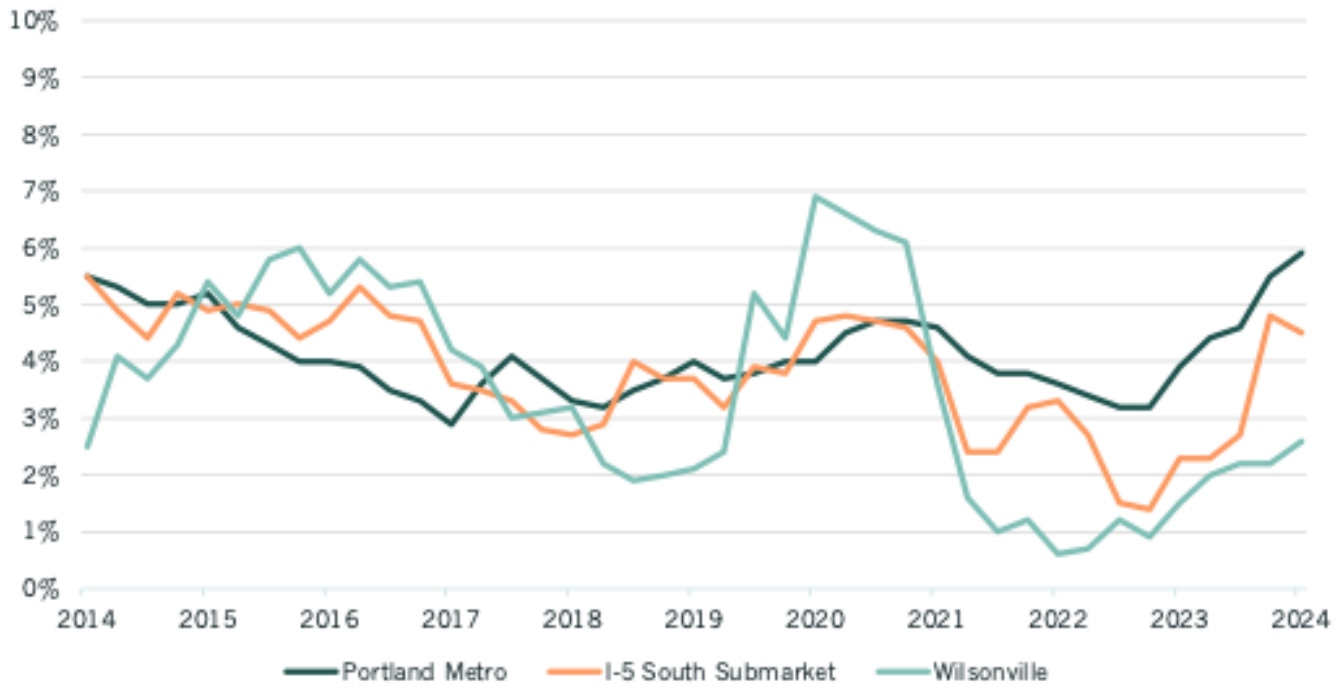
- **Market growth:** Current forecasts estimate that 2.4 million square feet will be delivered to the market in 2024, roughly 1 percent of the current Portland industrial space inventory. As reported by CBRE, investors and leasing professionals are confident that the Portland market has additional room for growth.

Wilsonville Industrial Market

Wilsonville has about 8.6 million square feet of industrial and flex space, representing roughly 24 percent of the I-5 South submarket and 3 percent of the Portland metro region's industrial space. The average size of Wilsonville's industrial building is roughly 63,000 square feet, almost twice as large as the average industrial building in the broader Portland metro (34,000 square feet).

Wilsonville has had limited industrial development in the past decade. Only 1.7 percent of Wilsonville's total industrial space was built in the last 10 years, compared to roughly 11 percent of the I-5 South submarket and Portland metro industrial space. This slow pace of development makes sense given the limited supply of developable industrial land in the City and, more precisely, the development constraints that exist on those lands.

Table 13: Industrial & Flex Space Development Trends, 2014 to 2024



GEOGRAPHY	TOTAL BUILDINGS	TOTAL SQUARE FEET	AVERAGE BUILDING SIZE
ALL INDUSTRIAL DEVELOPMENT			
Portland Metro	7,535	257,487,989	34,172
I-5 South Submarket	900	35,089,559	38,988
Wilsonville	137	8,605,081	62,811
BUILT IN THE LAST 10 YEARS			
Portland Metro	278	30,328,230	109,094
I-5 South Submarket	50	3,848,383	76,968
Wilsonville	2[30]	145,611	72,806

Source: CoStar, pulled August 2024

[30] The two buildings listed in CoStar are located at 96500 SW Parkway Ave (2025) and 10680 SW Clutter Road (2022). However, city staff noted three others: the Black Creek development in the Coffee Creek industrial area and two SSI Shredding facilities.

Wilsonville's industrial vacancy rate has remained below 6 percent for most of the past decade. In 2020 and 2021, Wilsonville saw a brief spike in vacancy, likely driven by the COVID-19 pandemic, which quickly dropped to just over 1 percent in 2022. As of July 2024, Wilsonville's combined industrial and flex space vacancy rate was 2.6 percent (Figure 12). Wilsonville's industrial vacancy rate has been below the Portland metro since 2021. As of July 2024, the Portland metro had a vacancy rate of 5.9 percent and I-5 South submarket had a vacancy rate of 4.5 percent.

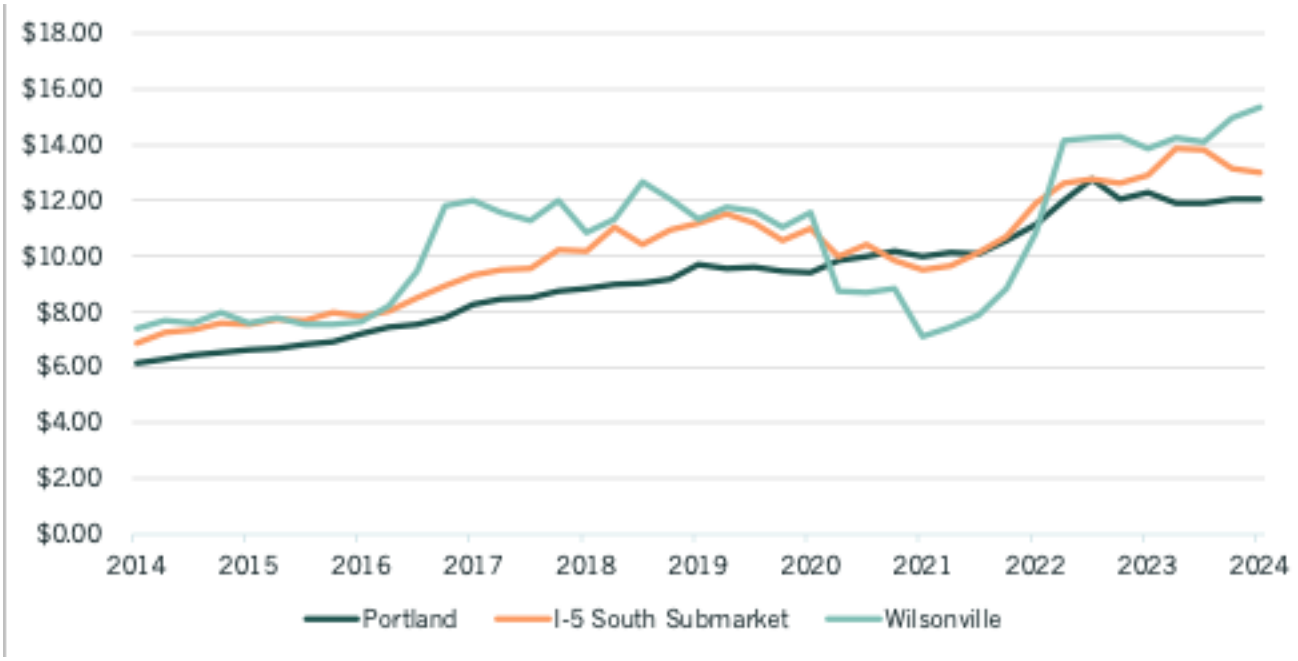


Figure 11: Industrial & Flex Vacancy Rate Trends, 2014-2024

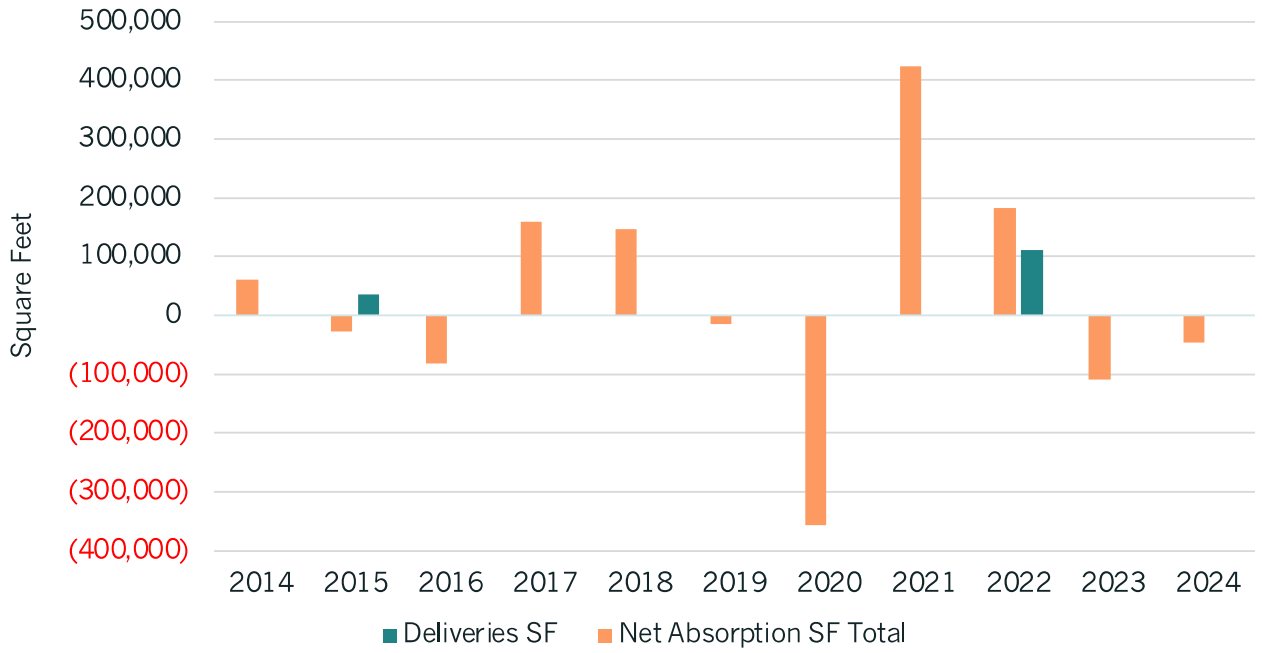
Source: CoStar, pulled August 2024

Triple net industrial rents in Wilsonville increased from 2014 to 2020 and were generally higher than the Portland metro region over the period.[31] Wilsonville shows a large drop in lease rates between 2020 and 2021, likely due to COVID-19 impacts. However, rates rebounded in 2022, reaching $15.35 per square foot in July 2024, higher than the Portland metro ($12.03) and I-5 South submarket ($12.99). The combination of rising rents and very low vacancy rates suggests a robust industrial market in Wilsonville, potentially attracting new development, especially speculative development.

Figure 12: Industrial & Flex Rents Trends, 2014-2024



Source: CoStar, pulled August 2024

[31] Triple-net (NNN) rents are annual rents on a per-square-foot basis not including any pass-through expenses such as taxes, insurance, and any utilities or maintenance costs, which are passed on to the tenant and paid separately.

Net absorption has been generally positive for industrial properties over the past decade, with a large vacancy in 2020; however, it was followed by high positive net absorption the following year. Net absorption was negative in 2023 and through August 2024 (when data was pulled) but at a smaller magnitude than in 2020.

Figure 13: Net Absorption for Industrial & Flex Space in Wilsonville, 2014 to 2024

Source: CoStar, pulled August 2024

TYPE OF INDUSTRIAL PRODUCT BUILT SINCE 2014

Within the industrial product type, CoStar delineates the properties into a secondary type based on their use, size, and amenities to industrial users. CoStar utilizes the following definitions for the secondary types of industrial space:

- **Distribution:** Spaces used for warehousing and distribution of inventory that are typically 200,000 square feet or more, have clear heights of 28 feet, are less than 5 percent office space, and have site coverage that can be up to 40 percent.
- **Warehouse:** Buildings that are 25,000 square feet or greater, are up to 20 percent office area, have clear heights of 22 feet or greater, and have site coverage up to 50 percent.
- **Manufacturing:** Buildings that are typically 300,000 square feet or greater with an office area up to 50 percent.
- **R&D:** Flex space specifically used for research and development.
- **Flex/Other/Misc.:** A versatile building that may be used with office (corporate headquarters), research and development, mixed-use industrial and retail sales, and includes but is not limited to industrial, warehouse, and distribution uses. At least half of the rentable area of the building must be used as office space. Flex buildings typically have ceiling heights under 18 feet, with light industrial zoning. Flex buildings have also been called Incubator, Tech and Showroom buildings in markets nationwide.

Table 14 shows industrial development by submarket, or secondary market, types. Over the past 10 years, the I-5 South submarket has captured a slightly smaller share of the total market at 8.7 percent compared to its total share of 10.2 percent. The secondary market type distribution has also changed. While the I-5 South submarket contains roughly 27 percent of the total market space for R&D and warehouse space, it has captured about 35 percent of the space built in the last 10 years. Meanwhile, it captured a smaller share of manufacturing and distribution development (19 percent in the past 10 years compared to 27 percent of the total market share).

Table 14: Industrial Development Trends by Secondary Market Type, Portland Metro and I-5 South Submarket, 2014 to 2024

	ALL DEVELOPMENT		PAST 10 YEARS		I-5 CAPTURE RATES	
	METRO	I-5	METRO	I-5	ALL DEV'T	2014-2024
Distribution	49,002,646	5,677,113	16,716,663	1,222,159	11.6%	7.3%
Manufacturing	43,382,806	6,661,789	5,802,456	700,301	15.4%	12.1%

Source: CoStar, pulled August 2024

Industrial development along the I-5 South submarket has recently concentrated in Tualatin and Sherwood, with Wilsonville falling behind. This trend is likely due to Wilsonville's shortage of development-ready industrial land and large parcels, a view supported by interviews with local developers, brokers, and economic development organizations.

Many speculative industrial developers are seeking large sites, as demonstrated by recent developments in Sherwood and Tualatin on parcels exceeding 10 acres. Notable examples include the recently completed Sherwood Commerce Center on a 30+ acre site and the proposed Rock Creek industrial site development on 25 acres in Sherwood. In Tualatin, the Tualatin Sherwood Corporate Park was completed in 2022 on over 40 acres, while the Hedges Creek Industrial Park is expected to be completed in 2025 on a 20-acre site.

Local developers report that most of the industrial demand is coming from existing regional businesses rather than out-of-state companies. These local industrial users are primarily looking to expand or upgrade their current facilities within the area. Many express a desire to be outside the City of Portland and Multnomah County, citing concerns about public safety and higher rates of taxation.

Figure 14. Secondary Industrial Space Recently Built or Proposed in I-5 South Submarket by City, 2019-2026

Source: CoStar, pulled August 2024

Target Industry Assessment

Wilsonville is well positioned within the region to capture industrial growth. It has access to a strong base of employment, proximity to I-5, and connections to other growing industrial areas in Sherwood and Tualatin. This section examines industries likely to be drawn to Wilsonville, considering its strengths and competitive edge. The analysis begins by identifying common barriers to industrial development, based on local stakeholder interviews. It then reassesses strengths and weaknesses outlined in the Basalt Creek Concept Plan (BCCP), updating these factors to reflect market and employment trends over the past decade. The section concludes by summarizing how these market trends will shape Basalt Creek's development.

Barriers to Industrial Development

Stakeholders identified a number of key barriers for industrial users that prevent development. While some of these challenges are more directly applicable to Basalt Creek than others, they all represent important considerations for the City as it prepares the area for development:

- **Site Readiness:** Many sites lack the necessary transportation and utility infrastructure and preparations to immediately accommodate industrial users.
- **Power Availability:** Immediate or quick access to heavy power is currently the most significant barrier for many industrial businesses. The increasing power demands of modern industrial operations make this a crucial factor.
- **Outdated Existing Buildings:** Many existing structures do not meet the needs of modern industrial users, requiring significant renovations or complete rebuilds.
- **Lack of Intermediate Industrial Spaces:** Medium-sized industrial users (users that require 20,000 to 40,000 square feet) have limited spaces to choose from.
- **Misaligned Visions and Overly Prescriptive Zoning:** Sometimes, the landowners' or city's vision for an area does not align with the diverse needs of potential users. Discussions with local developers and brokers highlight the importance of allowing a mix of uses for better financing opportunities. This is particularly relevant for speculative development, where end users are not known at the time of entitlement and construction. Overly prescriptive zoning that designates specific uses, such as manufacturing, can be more challenging to finance because banks see risk and concern if they perceive the list of potential tenants is too small or narrow. Additionally, various types of uses tend to cluster together due to supply chain benefits. For example, manufacturers often have suppliers located nearby. Overly prescriptive zoning can disrupt this natural ecosystem by preventing clustering.
- **Fragmented Land Ownership:** Areas with multiple small parcels under different ownership can make it difficult to assemble larger sites needed for significant industrial development.

- **Incompatible Neighboring Uses:** The presence of nonindustrial uses in close proximity can preclude development out of concern for possible or future conflicts that have the potential to limit or complicate the operations of industrial businesses.
- **Requirements for Connectivity:** In some cases, required access roads can deter large industrial developers because the roads may decrease the area of developable land while adding significant cost to a speculative project. Additionally, some industrial users who prioritize confidentiality and security may be less attracted to areas with public access requirements.

Comparative & Competitive Advantage

The BCCP outlined the Basalt Creek area's advantages and challenges, many of which are still relevant. The following includes Basalt Creeks' advantages and challenges drawing from the BCCP and updating based on new information gathered as a part of this report.

STRENGTHS AND COMPETITIVE ADVANTAGES

- Centrally located in the south metro, within the urban growth boundary, and designated in the City's comprehensive plan for industrial uses.
- Large contiguous cluster of existing and planned industrial employment areas, including Wilsonville's Coffee Creek Industrial Area, and adjacent employment lands in Tualatin and Sherwood.
- Large areas of contiguous land ownership with property owners who are interested in developing or selling for redevelopment.
- Long-term growth projections for employment and population in the southwest Portland metro area.
- Excellent access to I-5, I-205, and Highway 217. Additional transportation strengths include existing and planned arterial roads as well as local and regional transit service provided by TriMet, WES Commuter Rail, and SMART.[32]
- Access to an educated workforce as part of the Metro labor shed and Mid-Valley labor shed.
- Easily accessible to other growing industrial areas, particularly in Tualatin and Sherwood.
- Planned substation development.

CHALLENGES

- Zoning needs to be in place prior to development.
- Planning, financing, and construction of new infrastructure.

[32] Existing major arterials include SW Grahams Ferry Road, SW Boones Ferry Road, and SW Day Road; the City is also planning the extension of Basalt Creek Parkway.

- Existing low employment density uses (contractor establishments and storage uses) that generate income for property owners may reduce appetite to sell for redevelopment.
- Lot sizes and property aggregation. There is a mix of large and small lots throughout Basalt Creek. The time and cost required to secure properties from multiple parties to aggregate developable industrial properties of adequate size can be a significant deterrent to developers.
- Natural features, including wetlands and slopes. Basalt Creek and its surrounding slopes and wetland areas run north-south through the study area and divide the area into east and west sections.
- Growing power demands from industrial users and uncertainty on timing and capacity of additional service.[33]

Which industries may be attracted to Basalt Creek?

Basalt Creek's long-standing vision as an industrial area aligns well with current market trends, which show strong demand for industrial space both nationally and in the Portland metro region. Stakeholders point to Wilsonville's potential to attract a diverse range of industrial businesses, including those in the semiconductor supply chain, cleantech, advanced manufacturing, and data centers.

Wilsonville's appeal to these sectors stems from its strategic location in the south metro area, access to a skilled labor force, and proximity to related industries. The semiconductor sector in particular is poised for expansion due to recent CHIPS Act investments. Similarly, cleantech industries are anticipated to see growth within the Portland metro region. The availability of large areas of contiguous land ownership in the Basalt Creek Planning Area further enhances its attractiveness to major industrial users who seek large lots for development.

It is worth noting that while the Basalt Creek Concept Plan (BCCP) originally envisioned a mix of uses—including office space associated with industrial operations, primarily in the High-Tech Employment district—current market conditions suggest that office use will likely play a smaller role than initially planned. Instead, the focus is expected to shift more toward industrial and tech-oriented developments to capitalize on emerging economic opportunities. Below are details about the potential sectors and industries that may be particularly attracted to Wilsonville:

- **Semiconductor Sector Supply Chain:** This sector includes companies involved in the design, manufacturing, and testing of semiconductor chips, as well as those providing materials, equipment, and services to chip manufacturers. Wilsonville is attractive for this industry due to its proximity to existing semiconductor clusters in

[33] ECOnorthwest has reached out to PG&E to understand how much of a challenge access to adequate power may be and is waiting to hear back. This statement may be updated after that conversation.

the Portland metro area, access to a skilled workforce, and potential for large industrial sites. Basalt Creek would likely host businesses that support the supply chain rather than producing the chips themselves.

- **Cleantech, including Battery Technology:** Cleantech encompasses renewable energy technologies, energy efficiency solutions, and sustainable manufacturing processes. Businesses in this sector include energy storage and related sustainable material technologies and a variety of alternative energy technologies and production. Battery technology, crucial for electric vehicles and energy storage, is a growing subsector that is already present in Wilsonville. Wilsonville's strategic location and potential for large industrial sites make it suitable for cleantech manufacturing and R&D facilities.
- **Advanced Manufacturing:** This sector involves the use of innovative technologies to create products. It includes robotics, 3D printing, and smart manufacturing systems. Wilsonville's access to a skilled workforce and its location near tech hubs make it attractive for advanced manufacturing operations.
- **Distribution and Logistics:** This sector involves the storage, transportation, and delivery of goods. Wilsonville's location near major transportation routes (I-5 and I-205) and its proximity to Portland make it an ideal location for distribution centers and logistics hubs.
- **Data Centers:** Data centers are facilities used to house computer systems and associated components. Wilsonville's access to available land and the potential access to reliable power sources could make it attractive for data center development.[34] The proximity to tech companies in the Portland metro area is an additional advantage.

This diverse range of potential industries positions Wilsonville to capitalize on various economic opportunities, creating a resilient industrial base in Basalt Creek.

[34] Interviews with stakeholders have suggested that Wilsonville may be attractive to data centers. ECOnorthwest has reached out to PG&E to understand if Basalt Creek has/will have access to the power necessary for this type of use and is waiting to hear back.

4. Conclusion

The Basalt Creek area in Wilsonville is strategically positioned for industrial development with the potential to attract a variety of users, from manufacturing and logistics to data centers. The area's suitability for supporting the semiconductor supply chain is underscored by recent expansions of semiconductor suppliers in nearby Sherwood. Additionally, the area could be attractive to cleantech businesses, including those involved in battery storage and alternative energy technologies.

However, realizing this potential presents several challenges. Existing contractor establishments generate sufficient income for some property owners, reducing their incentive to sell or redevelop the land for higher-intensity industrial uses. Furthermore, relocation options for these businesses may be limited, complicating redevelopment efforts. (The feasibility of redevelopment will be further explored in a subsequent separate study.)

Conversely, some developers have already assembled land, and they are ready for immediate development, eager to capitalize on the strong industrial demand seen in nearby Coffee Creek, Tualatin, and Sherwood. Stakeholders emphasized the importance of large parcels in facilitating area redevelopment, with many developers willing to fund necessary infrastructure improvements if given access to such lots. For example, Schnitzer Properties owns property east of Grahams Ferry Road, south of Basalt Creek Parkway, and north of Day Road and eagerly awaits the adoption of zoning and policy to enable industrial development in this area. They intend to submit development and annexation applications as soon as zoning and policy is in place. Their recent development in Sherwood, known as the Sherwood Commerce Center, is an example of the type of development they are envisioning for their Basalt Creek property, offering flexible spaces for various industrial users.

It is crucial for Wilsonville to carefully balance its development goals for Basalt Creek with market realities. While the City may have preferences for certain types of businesses, being overly selective could deter development altogether. This is especially significant given the current economic climate. The BCCP originally envisioned office space within each district with the highest share in its High-Tech Employment District and anticipated that this office space would be in connection with industrial users. However, nationally and regionally demand for office space has been in decline with remote and hybrid work trends continuing to impact the need for office space. While office will likely still be a part of the BCPA, it may occupy a smaller share than originally envisioned.

Nationally, there's strong demand for industrial space. But Oregon's employment growth, which has been lagging national trends since 2020, may moderate this trend locally. Developers have stated that current industrial demand in the metro area is largely driven by regional businesses seeking to expand or upgrade their facilities. If Wilsonville imposes overly burdensome or restrictive requirements on the types of industrial users it allows (such as requiring a high share of manufacturing space), it risks limiting development feasibility and driving developers and industrial users to more accommodating locations.

The City must navigate these challenges while working toward its vision for Basalt Creek: a diverse mix of industrial uses, higher employment density, high-wage jobs, an enhanced tax base, and increased community prosperity.

Next Steps

These findings are preliminary and will be refined through further analysis, stakeholder engagement, and discussions with the Planning Commission and City Council. Upcoming tasks include completing the buildable lands inventory, conducting site suitability analyses for key locations, and assessing the feasibility of redeveloping contractor establishments. All these elements will ultimately be synthesized into a comprehensive final report outlining key findings and recommendations.

Appendix B: Buildable Lands Inventory and Site Suitability Analysis

ECOnorthwest

DATE:	December 20, 2024
TO:	City of Wilsonville
FROM:	ECOnorthwest: Nicole Underwood, Bob Parker, and Barrett Lewis
SUBJECT:	WILR Phase 1: BLI and Site Suitability Analysis

The Cities of Tualatin and Wilsonville adopted the Basalt Creek Concept Plan (BCCP) in 2018 after a lengthy joint planning process. Now, in 2024-25, the City of Wilsonville is working to advance the Basalt Creek Planning Area (BCPA) beyond the concept plan to a development-ready status by designating zoning and refining infrastructure plans. However, since adoption of the BCCP, economic conditions at national, state, regional, and local levels have shifted significantly and must now be considered.

To address these evolving conditions, the City hired ECOnorthwest to conduct a market assessment and industrial lands study focused on Wilsonville's portion of the BCPA. The study began with an Economic Inventory, which reviewed current market trends and industries suitable for the area.

This memorandum addresses Task 3 in the Scope of Work: updating the **Buildable Lands Inventory (BLI)** for the BCPA and conducting a **Site Suitability Analysis** for key opportunity sites. The updated BLI reflects recent land developments, adjusted constraints, and revised capacity estimates.

The Site Suitability Analysis examines three selected "opportunity sites" within the BCPA, assessing their potential to support the target industries identified in the Economic Inventory. This analysis considers site attributes, including size, location, access, topography, constraints, and surrounding land uses. It also considers infrastructure (transportation, water, sewer, stormwater) based on available data, with the understanding that infrastructure planning may evolve as work progresses.

Land Supply

This industrial Buildable Lands Inventory (BLI) updates the 2014 BLI from the original concept plan, providing a revised assessment of the buildable land *supply* available within Wilsonville's portion of the BCPA for employment-related growth and development. The amount of land needed to accommodate anticipated growth, often referred to as *demand* for land, depends on the type of employment-related development and other factors.

This BLI update serves two purposes: 1) to provide a revised assessment for developable acres in the BCPA and 2) to identify lands that have existing economic uses but low improvement values and/or low-density employment. These uses are inconsistent with the development vision expressed in the BCCP and are sites that may have redevelopment potential.

The BCPA encompasses a total of 453 acres across 85 tax lots. Of this:

- **173 acres** are currently in active use and are considered developed.
- **129 acres** are constrained by physical or environmental factors.
- **150 acres** are considered buildable and available for development.

The BLI also provides a basis for updating employment capacity. Given the 150 acres of buildable land and the expectation of employment densities between 10 and 18.5 employees per acre, the BCPA is expected to accommodate between 1,500 and 2,780 jobs and 2.3 million and 2.9 million square feet of development. The BCCP estimated total employment capacity at about 2,500 jobs.

This section outlines the methodology used to develop the BLI and employment and built space capacities, and it presents the results for Wilsonville's portion of the BCPA. ECOnorthwest analyzed GIS data from the City of Wilsonville, Metro, and Washington County, with City staff reviewing the findings for accuracy and completeness.

Methodology

The buildable lands inventory followed a structured process to assess land status:

1. **Generate UGB "land base":** ECOnorthwest established a baseline of tax lots within Wilsonville's portion of the BCPA designated for industrial and employment uses.
2. **Classify lands by development status:** The project team categorized parcels as vacant, partially vacant, or developed.
3. **Identify constraints:** ECOnorthwest applied physical and regulatory constraints, such as wetlands and natural resource protections, to identify unbuildable portions.

4. **Verify inventory results:** City staff reviewed classifications and aerial imagery to confirm accuracy.
5. **Tabulate and map results:** The team compiled findings into tables and maps to provide a clear overview of buildable lands.

The following section summarizes the results of the industrial BLI for the BCPA, presented in tabular and map formats.

Land Base

The land base for the Buildable Lands Inventory (BLI) includes all tax lots within Wilsonville's portion of the BCPA. Table 1 provides a breakdown of the land base by Wilsonville Comprehensive Plan designation within the BCPA.

Table 1. Employment Land Base by Wilsonville Comprehensive Plan Designation, BCPA, 2024

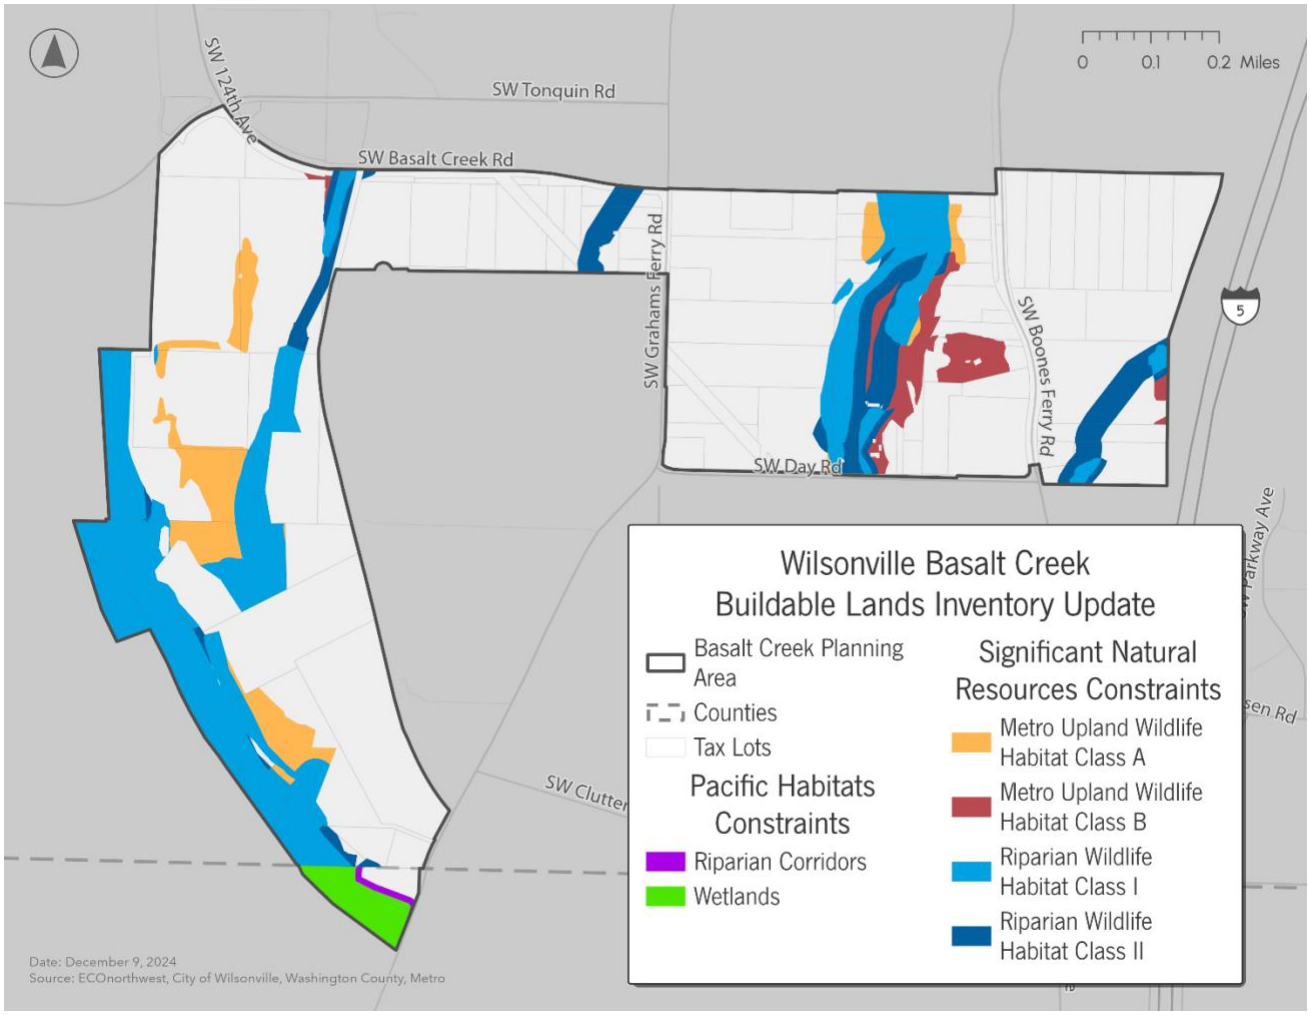
Plan Designation	Number of Tax Lots	Percent	Total Tax Lot Acreage	Percent (Total Acreage)
Industrial	63	74%	237	52%
Undesignated	22	26%	215	48%
Total	**85**	**100%**	**453**	**100%**

Source: ECOnorthwest analysis, City of Wilsonville, Clackamas County, Washington County, Metro

Development Status Classification

Table 2 displays the total acres of tax lots, categorized based on whether land is buildable. ECOnorthwest applied a rule-based classification of vacant, partially vacant, or developed land to determine the initial development status and verified the results through reviews by City staff. These reviews incorporated local knowledge and analyses of aerial maps.

Table 2. Employment Acres by Classification and Wilsonville Comprehensive Plan Designation, BCPA, 2024



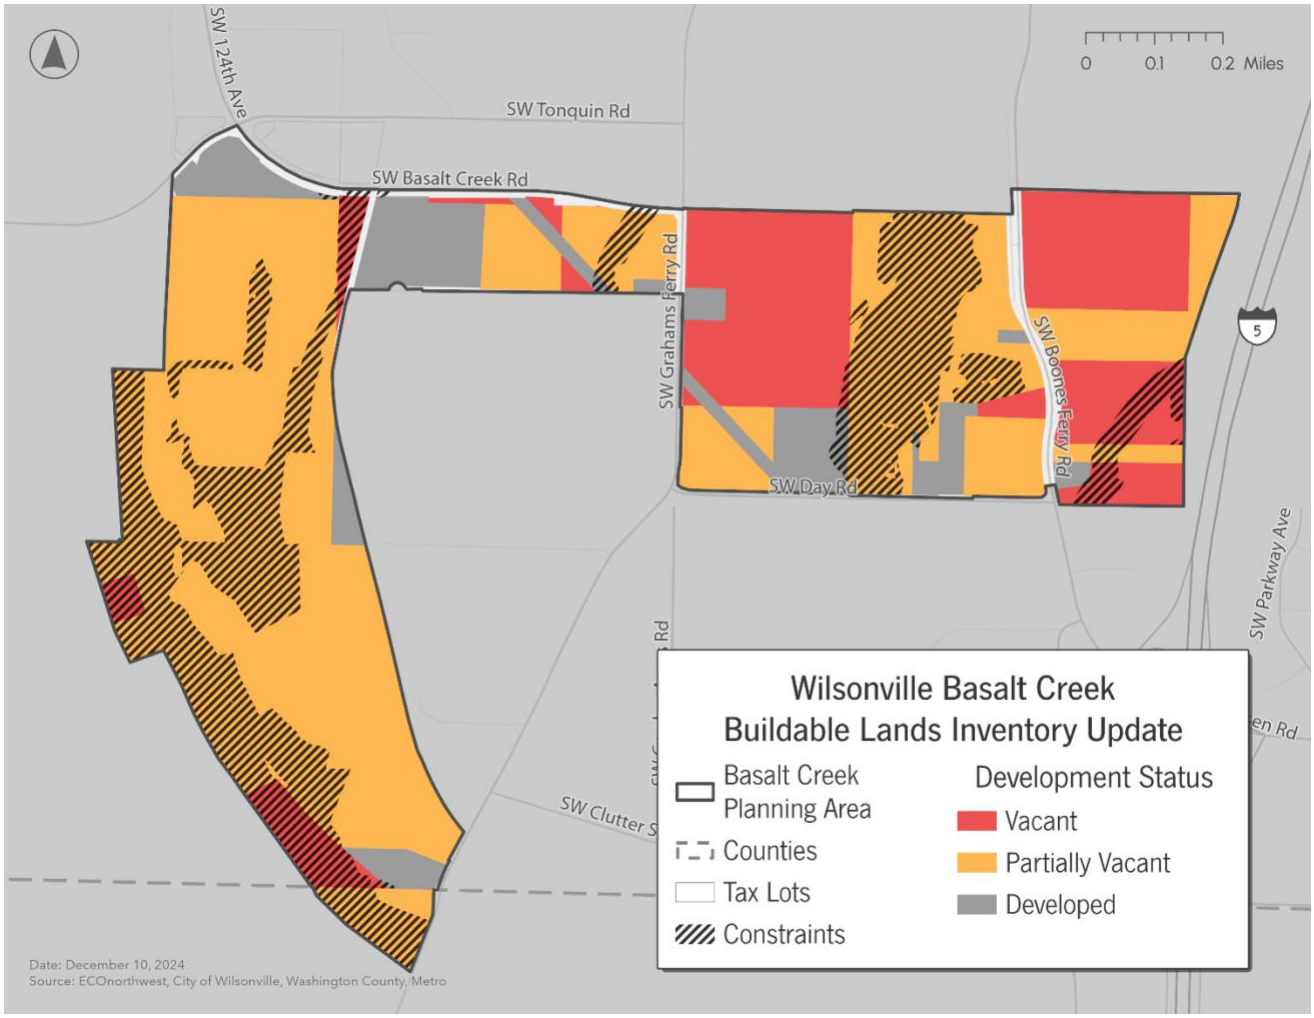
Plan Designation	Total Acres	Committed Acres	Constrained Acres	Buildable Acres
Industrial	237	63	48	127
Undesignated	215	110	81	24
Total	**453**	**173**	**129**	**150**

Source: ECOnorthwest Analysis, City of Wilsonville, Washington County, Metro, Pacific Habitat Services

Development Constraints

In coordination with City staff, ECOnorthwest identified physical constraints based on Washington County's Significant Natural Resources (SNR), as amended by Washington County Ordinances No. 901 and No. 902.[1] The SNR includes Metro Upland Wildlife Habitat Classes A and B, as well as Riparian Wildlife Habitat Classes I and II. For the single southern parcel located in the West Railroad area and within Clackamas County, GIS data provided by Pacific Habitat Services were used to identify physical constraints. These constraints are shown in Figure 1.

Figure 1. Development Constraints, BCPA, 2024



Source: ECOnorthwest Analysis, City of Wilsonville, Washington County, Metro, Pacific Habitat Services

[1] https://www.washingtoncountyor.gov/lut/planning/documents/ordinance-no-901a/download?inline

Figure 2 shows development status with constraints applied, resulting in buildable acres. Land classified as vacant or partially vacant and affected by these constraints is deemed unavailable for development and has been excluded from the inventory of buildable land.

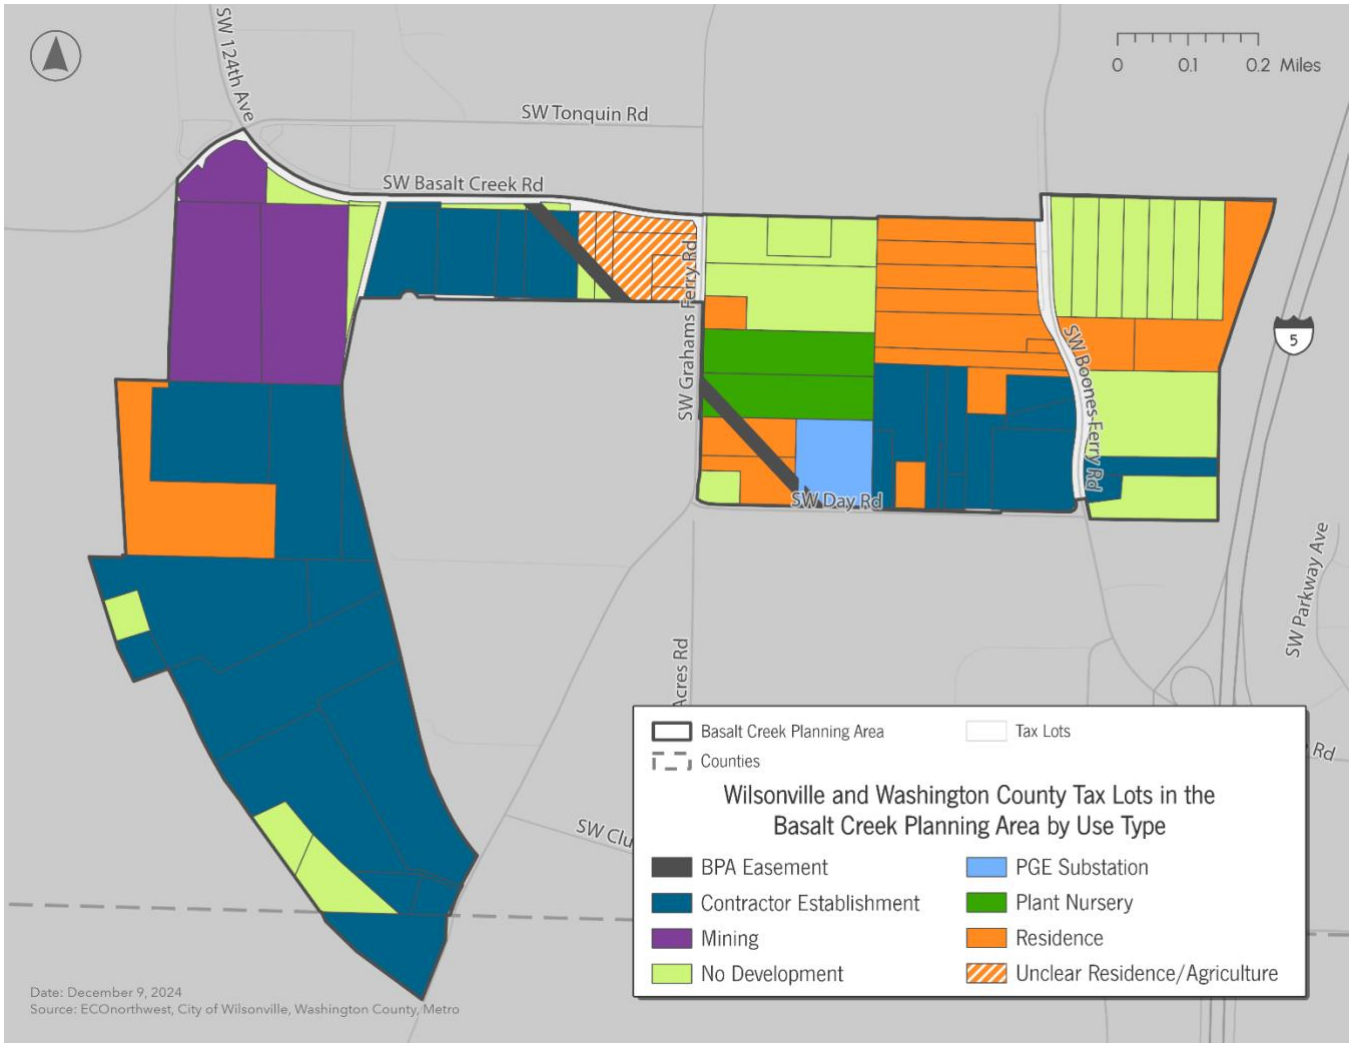


Figure 2. Development Status with Constraints, BCPA, 2024

Source: ECOnorthwest Analysis, City of Wilsonville, Washington County, Metro, Pacific Habitat Services

Figure 3 identifies land use categories for each site. ECOnorthwest collaborated with City staff to identify these categories through a detailed review process that combined local knowledge with aerial map analysis. Unlike basic classifications of vacant or partially vacant land, this map provides deeper insights into current land uses, offering valuable context for evaluating redevelopment potential and guiding the feasibility analysis (the results of which are shared in a separate memorandum).

Figure 3. Land Use Categories with Constraints, BCPA, 2024

Source: ECOnorthwest Analysis, City of Wilsonville, Metro

Vacant Buildable Land

The next step in the buildable lands inventory involved removing portions of vacant tax lots deemed unsuitable for development. Unsuitable areas fall into two categories:

1. Developed portions of partially vacant tax lots.
2. Areas affected by physical constraints (i.e., areas within Metro Upland Wildlife Habitat Classes A and B and Riparian Wildlife Habitat Classes I and II).

Table 3 presents the buildable acres—tax lot areas remaining after deducting these constraints—for both vacant and partially vacant land, categorized by Wilsonville's Comprehensive Plan designation. The BCPA has 150 total buildable acres available for development.

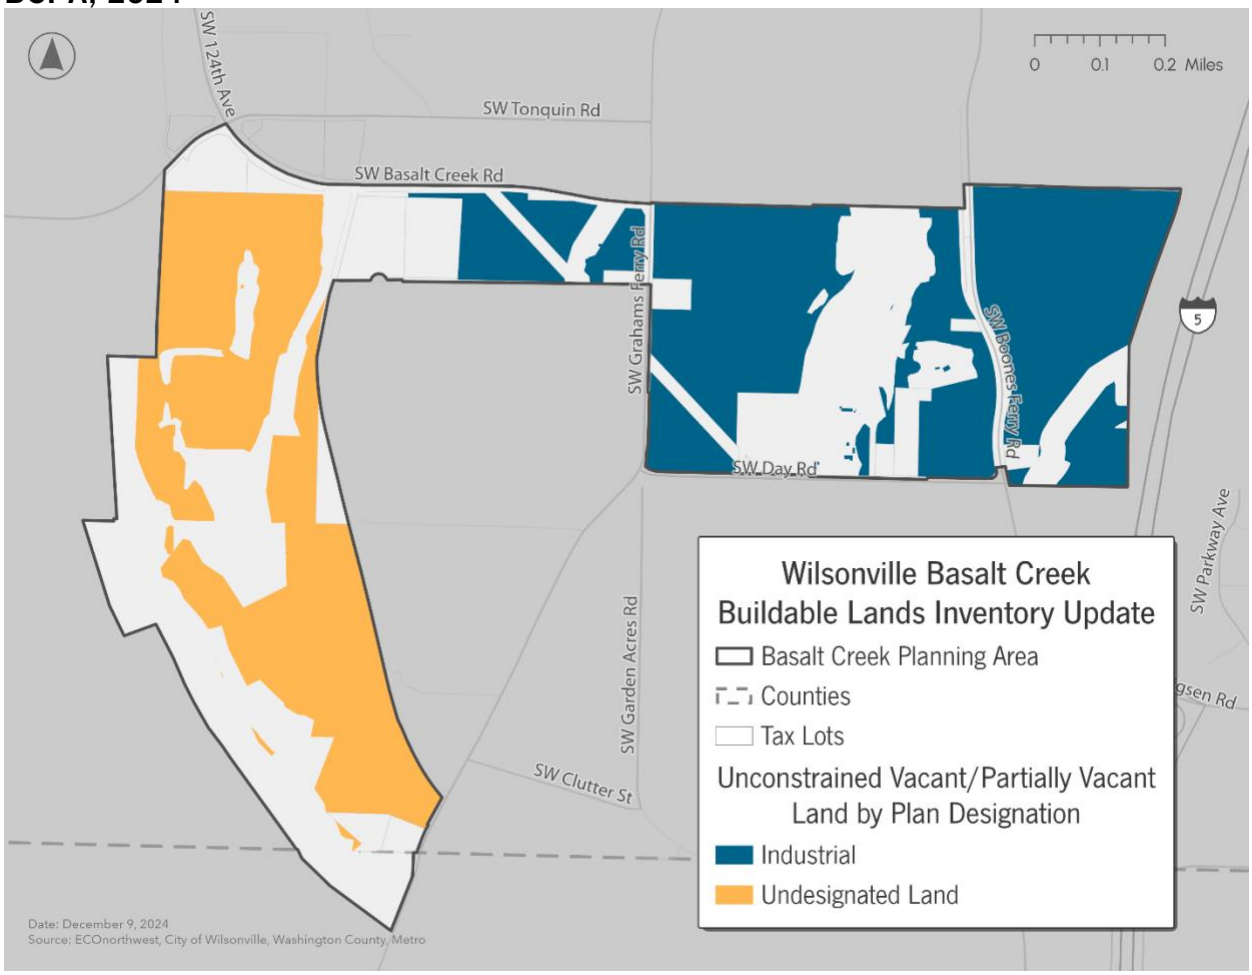

Table 3. Buildable Acres in Vacant and Partially Vacant Tax Lots by Wilsonville Comprehensive Plan Designations, BCPA, 2024

Plan Designation	Total Buildable Acres	Buildable Acres on Vacant Lots	Buildable Acres on Partially Vacant Lots
Industrial	127	87	40
Undesignated	24	0.4	23
Total	**150**	**87**	**63**

Source: ECOnorthwest Analysis, City of Wilsonville, Washington County, Metro

Figure 4 shows the buildable vacant and partially vacant land within the BCPA, categorized by Wilsonville Comprehensive Plan designation. It is important to note that tax lots shown as partially vacant in the map do not distinguish the part of the tax lot that is unavailable for development (or has redevelopment potential). However, the buildable lands inventory database accounts for these distinctions: the developed portions (unavailable for future development) are excluded, while the vacant portions are detailed in Table 4.

Figure 4. Buildable Employment Land by Wilsonville Comprehensive Plan Designation, BCPA, 2024

Source: ECOnorthwest Analysis, City of Wilsonville, Washington County, Metro, Pacific Habitat Services

Table 4 presents the size of buildable lots categorized by Wilsonville Comprehensive Plan designation across the BCPA. The planning area includes:

- Eight lots smaller than 0.5 acres, totaling 2 acres.
- Twenty-two lots between 0.5 and 2 acres, totaling 22 acres.
- Eighteen lots between 2 and 5 acres, totaling 57 acres.
- Six lots between 5 and 10 acres, totaling 46 acres.
- Two lots between 10 and 25 acres, totaling 23 acres.

Table 4. Buildable Acres and Tax Lots by Buildable Site Size by Wilsonville Comprehensive Plan Designation, BCPA, 2024

Plan Designation	Buildable Sites Size					
	0 - 0.5 Acres	0.5 - 1 Acres	1 - 2 Acres	2 - 5 Acres	5 - 10 Acres	10 - 25 Acres
Industrial	1	7	10	51	35	23
Undesignated	1	1	4	6	12	-
Acreage Total	**2**	**8**	**14**	**57**	**46**	**23**
Industrial	5	10	7	16	4	2
Undesignated	3	2	3	2	2	-
Tax Lot Total	**8**	**12**	**10**	**18**	**6**	**2**

Employment Capacity

ECOnorthwest analyzed the buildable land in Basalt Creek to update projections for potential job growth in the area. This assessment involved reviewing the capacity estimates from the BCCP and refining them using the updated land inventory of 150 buildable acres.

The analysis began with a review of research conducted by ECOnorthwest and other organizations on employment density. A common finding in such studies is the significant variability in employment density across industries, plan designations, and zoning districts. For example, an industrial zone may have employment densities ranging from 1-3 employees per acre for a warehousing facility and 10-15 employees per acre for flex spaces to densities over 25 employees per acre for office buildings.

The capacity estimates that follow are intended to provide a high-level estimate of job capacity based on the 2024 BLI update. Some factors, such as land needed for streets, would reduce capacity while others, such as higher lot coverages or multistory buildings, would increase capacity. The main utility of employment capacity estimates is in estimating

infrastructure needs. The figures that follow can be used to inform infrastructure demand estimates which can then be compared with infrastructure capacity to determine if existing and planned capacity are sufficient to accommodate expected employment densities.

Land Demand Methodology

When evaluating land and building capacity, two measures are commonly used to define the relationships between building size, floor area, and land area. These measures include:

- **Floor Area Ratio (FAR):** The ratio of a building's total square footage to the site's total square footage.
- **Employees Per Acre (EPA):** The total number of employees divided by the site size.

Basalt Creek Growth Capacity: Land Use Model Assumptions

This model builds on assumptions from the BCCP. Initially, the BCCP estimated an average of **18.5 jobs per gross acre** in Wilsonville's portion of Basalt Creek (excluding West Railroad). Key employment density estimates included:

- High-Tech Employment District: 20 jobs per gross acre.
- Craft Industrial: 22 jobs per gross acre.
- Light Industrial District: 16 jobs per gross acre.

ECOnorthwest applied the BCCP's assumption of 18.5 jobs per gross acre to model a high-density growth scenario. However, shifting market conditions—such as reduced demand for office space and increased demand for industrial and flex space (which typically have lower employment densities)—led ECOnorthwest to also model medium- and low-density growth scenarios to better reflect the potential range of employment densities in the study area. ECO also modeled different lot coverage ratios/FARs. The scenarios use lot coverages of 35 percent and 45 percent which is consistent with the assumptions used in the Task 4 redevelopment feasibility analysis of contractor establishments. The FARs of 0.35 and 0.45 reflect lot coverage ratios and the assumption that uses will be single story.

- **Low-Density Scenario:**
  - 10 employees per gross acre.
  - Lot coverage/FAR: 35 percent/0.35.
  - Reflects more traditional industrial densities and provides a more conservative estimate.
- **Medium-Density Scenario:**
  - 15 employees per gross acre.
  - Lot coverage/FAR: 45 percent/0.45.

- Assumes a greater share of office development compared to the low-density scenario, offering a more ambitious estimate.

- **High-Density Scenario (BCCP Adopted Assumption)**
  - 18.5 employees per gross acre.
  - Lot coverage/FAR: 45 percent/0.45.
  - Maintains the BCCP assumptions and envisions a greater share of office development than the other scenarios. It assumes the same lot coverage ratio which yields the same built space capacity as the medium-density scenario but with a higher number of employees occupying that space.

Results: Land Use Modeling for Basalt Creek

Table 5 outlines the results of this analysis, indicating that Wilsonville's portion of Basalt Creek has capacity for:

- **Employment:** Between 1,500 and 2,780 jobs.
- **Built Space:** Between 2.3 million and 2.9 million square feet.

These findings reflect the range of potential outcomes based on varying employment density assumptions.[2]

Table 5. Job Capacity and Built Space Capacity, Wilsonville BCPA

	Low	Medium	High
Job Capacity	1,500	2,250	2,780
Built Space Capacity (SF)	2,289,000	2,943,000	2,943,000

Source: Analysis by ECOnorthwest

[2] ECOnorthwest also analyzed the potential number of employees and built space under current density levels, estimated at approximately 5 employees per gross acre. If these existing conditions persist, the area is projected to accommodate around **750 employees** and **1.3 million square feet** of built space.

Site Suitability Analysis

The BCPA is well positioned to capture industrial growth in the South Metro region. It benefits from its strategic location with access to I-5, a robust employment base, and connections to other expanding industrial hubs in Sherwood and Tualatin. Over the summer, ECOnorthwest conducted an Economic Inventory to assess market conditions and identify industries most likely to establish a presence in Basalt Creek focusing on industrial and office uses in alignment with the BCCP vision.[3] The analysis highlighted strong national and regional demand for industrial space and identified key sectors with potential interest in the area, including the semiconductor supply chain, cleantech, advanced manufacturing, distribution and logistics, and data centers.

Although the BCCP originally envisioned a blend of industrial and office development, current market trends suggest a shift toward a greater emphasis on industrial uses. Office developments, while still anticipated, are expected to occupy a smaller footprint than initially planned.

WHICH SECTORS MAY BE ATTRACTED TO BASALT CREEK?

Below are the potential sectors that may be particularly attracted to Basalt Creek as identified in the Economic Inventory report.

- **Semiconductor Sector Supply Chain:** Companies providing materials, equipment, and services to chip manufacturers.
- **Cleantech, including Battery Technology:** Businesses involved in renewable energy technology, energy efficiency solutions, and sustainable manufacturing processes.
- **Advanced Manufacturing:** Companies using technology such as robotics, 3D printing, and computerized systems to manufacture specialized products or components.
- **Distribution and Logistics:** Storage, transportation, and delivery of goods.
- **Data Centers:** Facilities used to house computer systems and associated components.

To determine site specific competitiveness for these industries, ECOnorthwest evaluated three opportunity sites using the Mackenzie Infrastructure Finance Authority (IFA) Industrial Development Competitiveness Matrix as a foundation. Recognizing that industry requirements have evolved since the matrix's creation in 2015, the analysis incorporated updated reports and stakeholder feedback to align with current market demands. This Site Suitability Analysis assesses site characteristics such as size, location, and constraints to evaluate their ability to host target industries. While the analysis considered buildable land availability, its primary focus was on site potential, assuming redevelopment occurs. Feasibility and redevelopment likelihood of contractor establishments is addressed in a separate task.

[3] When evaluating the office market, medical office showed stronger growth than traditional office. However, ECOnorthwest did not further evaluate its potential, as it was not a use envisioned in the BCCP.

Opportunity Sites for Analysis

ECOnorthwest evaluated the following sites for their development potential (Figure 5):

- **SW Greenhill Site:** Selected for its consolidated land ownership and strong potential for near-term development, given the absence of active use.
- **Craft Industrial Area:** As a transitional area, the City seeks to assess this site's characteristics in detail to determine the most appropriate land uses. This will inform zoning designations.
- **West Railroad Site:** West Railroad lacked a defined concept in the original BCCP. To explore its potential, ECOnorthwest analyzed a portion of West Railroad, focusing on its development suitability. This will inform whether a zoning designation similar to the rest of the Basalt Creek area would be appropriate. The area also faces physical and service constraints, and the analysis evaluates whether these challenges might limit future development opportunities.

Figure 5. Opportunity Sites

Source: ECOnorthwest Analysis, City of Wilsonville, Washington County, Metro

Table 6 summarizes the size of unconstrained lots for the opportunity sites. Note that "unconstrained acres" here includes developed areas. In general, larger sites are more appealing to industrial users, who often seek parcels of 5 or more acres. Smaller sites, however, may require site aggregation to meet these needs. Notably, sites in SW Greenhill and West Railroad, which exceed 5 acres, could be especially attractive to developers. While all opportunity sites may require some degree of site aggregation, the Craft Industrial area faces the greatest challenge due to its relatively small lot sizes and fragmented land ownership.

Table 6. Unconstrained Acres and Tax Lots by Site Size for Opportunity Sites, BCPA, 2024

Site Suitability Area	Unconstrained Sites Size					
	0 - 0.5 Acres	0.5 - 1 Acres	1 - 2 Acres	2 - 5 Acres	5 - 10 Acres	10 - 25 Acres
Craft Industrial	-	1	5	8	-	-
SW Greenhill	-	-	-	31	-	21
West Railroad	0.3	-	3	10	19	60
Acreage Total	**0.3**	**1**	**9**	**49**	**19**	**81**
Craft Industrial	-	1	3	3	-	-
SW Greenhill	-	-	-	8	-	2
West Railroad	3	-	2	3	3	4
Tax Lot Total	**3**	**1**	**5**	**14**	**3**	**6**

Source: ECOnorthwest Analysis, City of Wilsonville, Washington County, Metro

Site Competitiveness Factors

The IFA Industrial Development Competitiveness Matrix includes the following factors for evaluating the competitiveness of different industries:

- Site Size
- Competitive Slope (physical slope of a parcel, which can impact its suitability for development)
- Access to Transportation and Trip Generation (Highway, Rail, and Airport Proximity)
- Access to Utility Infrastructure (Water, Sewer, Electricity, Telecommunications)
- Special Considerations

The industries evaluated in the IFA Industrial Development Competitiveness Matrix include the following, which align with the BCCP and the Economic Inventory findings, and are the focus of this analysis (the full matrix can be found in Appendix B.1):

- **Production Manufacturing:**
  - High-Tech/Cleantech Manufacturing
- **Value-Added Manufacturing and Assembly:**
  - Food Processing
  - Advanced Manufacturing and Assembly
- **Light/Flex Industrial:**
  - General Manufacturing
  - Industrial Business Parks and R&D Campuses
  - Business Services
- **Warehousing and Distribution**
  - Regional Warehouse/Distribution
  - Local Warehouse/Distribution
- **Specialized Uses:**
  - Data Centers

Industry-Specific Considerations

Recent growth in the semiconductor and cleantech sectors has prompted additional research to understand the evolving needs of these industries. To support this, the Oregon Legislature established the Oregon Semiconductor Task Force to identify industry needs and opportunities. Similarly, Business Oregon supported the creation of the Oregon Cleantech Competitiveness Assessment Report to evaluate the needs and prospects for cleantech industries. Key findings related to site-specific requirements from these initiatives are outlined below.

SEMICONDUCTOR SECTOR

The semiconductor industry offers Oregon a prime opportunity to expand advanced manufacturing, grow its traded sector, and create high-quality jobs. The $52 billion CHIPS Act, passed in July 2022, accelerates efforts to boost domestic semiconductor production by allocating $40 billion for manufacturing and $10 billion for research over five years.

The Metro region hosts a robust semiconductor cluster centered in Hillsboro. There has also been some semiconductor activity south of Hillsboro, including LAM Research in Sherwood and Tualatin, bolstering the supply chain presence in the South Metro. This established network positions the region to attract additional semiconductor-related investments.

The Semiconductor Task Force's Industrial Lands Subcommittee identified key site characteristics most important for the semiconductor industry:

- **Workforce Availability and Talent Proximity.** Access to skilled workers—engineers, technicians, and operators—is essential. Semiconductor clusters thrive where workers can easily transition between companies, creating a dynamic employment ecosystem. Workforce access is critical for both fabrication plants and supply chain operations.
- **Parcel Size and Usage.** Parcel size varies by operational needs. Fabrication plants require ***50–100 acres*** to accommodate clean rooms and infrastructure, with large-scale R&D and production facilities needing ***500+ acres***. Supply chain operations, such as equipment and material suppliers, generally need smaller parcels of ***15–35 acres***.
- **Infrastructure Readiness.** Reliable access to ***transportation, water, electricity, and wastewater systems*** is crucial. Semiconductor companies prioritize sites with infrastructure ready to support development within ***6 months to 3 years***.
- **Clustering with R&D Partners and Suppliers.** Collaboration with suppliers and R&D partners is vital. Fabrication plants benefit from proximity to suppliers for quick equipment maintenance and research. Supply chain operations also thrive in clusters, connecting with customers and transport hubs.
- **Environmental and Regulatory Considerations:** Predictable permitting processes are essential to avoid delays. While environmental regulations remain important, fast-tracked approvals are necessary to match the industry's pace.

SITE COMPETITIVENESS FOR THE CLEANTECH SECTOR

Oregon is well positioned to capitalize on the growth of cleantech industries, driven by federal initiatives like the Inflation Reduction Act and an increasing focus on sustainability. Cleantech encompasses a range of technologies, including renewable energy, energy-efficient materials, water technologies, and recycling systems. While the IFA Industrial Development Competitiveness Matrix provides general site characteristics for cleantech, the Oregon Cleantech Competitiveness Assessment Report—developed for Business Oregon—offers more detailed site selection criteria specific to established and emerging cleantech industries within the state. Key site characteristics for these subsectors are summarized below (a complete matrix is available in Appendix B.2). Scalability is essential for many users, as industries often begin on smaller sites but require the flexibility to expand as they grow.

- **Battery Storage:** These systems store renewable energy for later use, enhancing grid stability and reliability. Technologies range from lithium-ion to flow batteries, used in applications from small urban microgrids (0-5 acres) to large grid-scale facilities (25+ acres). Electrical system proximity and access for power generation facilities may vary, depending on the scale and intended use. Microgrid systems may only need connection to the local electrical grid, while large-scale grid storage may require connection to regional transmission lines or substations. Zoning flexibility for

energy uses is critical, while water needs and transportation access are generally less significant.

- **Mass Timber:** Engineered wood products like cross-laminated timber (CLT) and glued laminated timber (GLT) serve as sustainable alternatives to steel and concrete. Production facilities need medium to large sites (5-25+ acres), reliable transportation (particularly to arterial roads and railways) for raw materials, and substantial power supply.
- **Ag-Tech:** This sector integrates advanced technologies like AI, Internet of Things (IoT), agrivoltaics, and drones to optimize agriculture. Ag-tech operations, in this sense, are generally assumed to focus on software and small-scale equipment products, generally collaborating with large existing farms for R&D. These businesses typically require small sites (0-5 acres) with low transportation, water, and power demands.
- **Circular Economy:** This sector focuses on recycling and resource reuse, supporting waste-reduction and material-recovery technologies. Businesses range from R&D to recycling and upcycling facilities. Typically, these operations require small to medium-sized sites (0-25 acres), though the specific site needs depend on the types of raw materials and finished products, as well as the scalability of the industry. Good transportation access—especially to arterial roads and potentially railways—is important, along with moderate water and power requirements and flexible zoning options.
- **Solar and Wind Energy Production:** This sector encompasses both energy production and manufacturing. Manufacturing facilities share site requirements with advanced manufacturing industries, while energy production facilities vary significantly in scale. These range from small rooftop installations to large-scale farms, which require proximity to transmission lines and substations. The electrical system needs depend on the scale and purpose of the facility—microgrid systems may only require a connection to the local grid, while large-scale grid storage typically necessitates access to regional transmission lines or substations. Transportation access requirements also vary, but wind turbine manufacturing often requires rail access due to the size of components.
- **Water Technologies:** This sector focuses on addressing water scarcity and quality through innovations such as AI-driven leak detection, wastewater recycling, and desalination. It often involves both R&D and production facilities. These businesses typically require small to medium-sized sites (0-25 acres) with access to high-pressure water systems and significant power capacity, while having relatively low transportation needs.
- **Building Energy Technologies:** This sector focuses on innovations that improve energy efficiency, including smart HVAC systems and energy-efficient lighting to reduce building energy use. R&D and software development facilities in this space

typically require small sites (0-5 acres) with moderate to high electrical needs, while having low transportation and water requirements.

- **Electric Vehicle (EV) Infrastructure Technologies:** Supporting the adoption of EVs through charging networks and technology development, this sector generally requires medium to large sites (5-25+ acres) with high electrical power demands and good access to transportation networks.

Opportunity Site Characteristics

The market analysis revealed that Basalt Creek is well suited for various industrial uses, including light industrial, flex space, warehousing, distribution, advanced manufacturing, and support for cleantech and semiconductor sectors. These industries have specific site requirements. To assess how the three opportunity sites could accommodate different sectors, ECOnorthwest analyzed each site's characteristics and evaluated them against the competitiveness matrix and additional criteria specific to cleantech and semiconductor industries.

Table 7 outlines the physical characteristics of the three sites under analysis.

Table 7. Physical Characteristics of Opportunity Sites

SITE CHARACTERISTIC	SW GREENHILL	CRAFT INDUSTRIAL	WEST RAILROAD
Site Size and Ownership	♦ 57 acres ♦ 10 tax lots ♦ 2 owners (1 owns 42 acres, 1 owns 14 acres)	♦ 32 acres ♦ 7 tax lots ♦ 7 owners (fairly even site size distribution)	♦ 165 acres ♦ 15 tax lots ♦ 8 owners (1 owns 65 acres, 4 own ~20 acres each, 3 own smaller parcels)
Slope	Slopes of 10% or greater cover about 6 acres, or 11% of the total site area.	♦ Slopes of 10% or greater cover about 15 acres, or 46% of the total site area. These slopes are generally in the middle of the site, bordering Basalt Creek.	♦ Slopes of 10% or greater cover about 34 acres, or 20% of the total site area. However, some of these slopes are from activities on the sites and not physical attributes.
Surrounding Uses	♦ North: Planned for medium-low density residential and neighborhood commercial (Tualatin portion of BCPA) ♦ East: BCPA border and I-5 ♦ South: Undeveloped land, contractor establishment (planned High-Tech Employment District) ♦ West: Craft Industrial Opportunity Site	♦ North: Planned for (and under development) low-density residential (Tualatin portion of BCPA) ♦ East: SW Greenhill Opportunity Site (planned High-Tech Employment District) ♦ South: Contractor establishments, single residential property (planned High-Tech Employment District) ♦ West: Contractor establishments, plant nurseries, and undeveloped land (planned Light Industrial District)	♦ North: Adjacent to mining site ♦ East: Coffee Creek Correctional Facility and Coffee Creek Industrial area ♦ West: Coffee Creek provides a natural buffer ♦ South: Undeveloped land in Clackamas County
Constraints	♦ 52 unconstrained acres (91% of total area) ♦ Minimal constraints running along the eastern boundary	♦ 14 unconstrained acres (42% of total area); 9 of these acres are east of the constraints that dominate the central area; the remaining 5 acres occupy the northwest corner ♦ Constraints dominate the central north-south area	♦ 92 unconstrained acres (56% of total area) ♦ Constraints run along the entire western boundary and central northern half

Table 8 outlines the existing and planned utilities on the opportunity sites. Details on water, sewer, and roads were provided by City staff based on the most current local access maps from DKS. Final infrastructure alignment and capacity are still in the planning stages.

Table 8. Infrastructure and Utility Characteristics of Opportunity Sites

SITE CHARACTERISTIC	SW GREENHILL	CRAFT INDUSTRIAL	WEST RAILROAD
Water: Potable water delivery to BCPA requires Basalt Creek Parkway extension, Zone C booster station, and may require SW Grahams Ferry Rd extension. These systems will connect SW Tooze Rd to SW Day Rd – 10,200 LF 18" diameter pipe and 4,670 LF 12" diameter pipe. *Modeling needs to confirm these requirements.*	**Current:** No existing water lines in area. **Planned:** Requires water main along SW Boones Ferry Rd alignment (2,490 LF). Water lines assumed to generally follow local road layout (5,460 LF). Will connect proposed water lines to existing lines on SW Pioneer Ct and SW Day Rd. *Sizes to be confirmed during modeling.*	**Current:** No existing water lines in area. **Planned:** Assumed to utilize proposed water main along SW Boones Ferry Rd. *Sizes to be confirmed during modeling.*	**Current:** No existing water lines in area. **Planned:** Water lines assumed to follow road layout from SW Grahams Ferry to SW Tonquin Rd (6,900 LF). *Sizes to be confirmed during modeling.*
Roads	**Current:** Existing SW Boones Ferry Rd, SW Greenhill Rd **Planned:** New arterial to I-5 from SW Greenhill Rd (300 LF). New arterial from SW Day Rd to I-5 (1,060 LF). New local roads looping SW Greenhill Rd to SW Boones Ferry Rd (3,350 LF) and connecting to SW Pioneer Ct (2,110 LF).	**Current:** Existing SW Boones Ferry Rd. **Planned:** New local road looping SW Day Rd to SW Boones Ferry Rd (1,900 LF). Assumed to utilize SW Boones Ferry Rd.	**Current:** Existing SW Grahams Ferry Rd to south and SW Tonquin Rd to north. **Planned:** New local road connecting SW Grahams Ferry Rd to SW Tonquin Rd (6,900 LF) with a possible connection to SW Morgan Rd (2,570 LF).
Sewer: Wastewater collection for BCPA requires completion of Coffee Creek Interceptor Phase 2 – 2,000 LF of gravity system upsizing to 21" diameter pipe from SW Boeckman Rd along railroad to SW Ridder Rd. This also requires Coffee Creek Interceptor Railroad Crossing – 160 LF of 21" diameter pipe.	**Current:** No existing sewer lines in area. **Planned:** Gravity collection lines flow generally south and west along proposed road layout (5,460 LF). Requires new collection line along SW Day Rd (1,600 LF) and new line to travel south between SW Day Rd to connect to SW Garden Acres Rd just north of SW Ridder Rd (3,700 LF). *10-12" diameter collection lines are anticipated.*	**Current:** No existing sewer lines in area. **Planned:** Assumed to utilize proposed line along SW Boones Ferry Rd.	**Current**: No existing sewer lines in area. **Planned:** Gravity line flows from SW Clay St west, crosses railroad, and meets proposed local street alignment in West Railroad to SW Grahams Ferry Rd (6,900 LF). Lift station is required with pressure main along SW Grahams Ferry to SW Clutter St (380 LF) before returning to gravity along SW Clutter St to SW Garden Acres Rd (1,430 LF). *A 10" diameter pipe is anticipated for gravity lines.*
Natural Gas	The IFA matrix does not identify natural gas as a requirement for industries most likely to locate in the BCCP. Natural gas did not come up as a barrier for industrial development in interviews.		
Electricity	Discussions with PGE indicate that the area can accommodate industrial users with moderate power needs. However, large power users such as a data center may require infrastructure upgrades. These types of upgrades can take 3+ years.		
Telecommunication	Since the BCPA is located within the Metro, telecommunication service is expected to be adequate to meet the needs of likely users. Telecommunication capacity did not come up as a barrier for industrial development in interviews.		

Location in the overall region and access to highways, rail, other like businesses, and labor force also play a role in site selection for industries. Given the proximity of these sites within a very small area, we detail these overall characteristics for the BCPA rather than for each site (Table 9).

Table 9. Basalt Creek Transportation and Proximity Characteristics

SITE CHARACTERISTIC	BASALT CREEK EVALUATION
Available Trips	♦ The BCCP allocated 951 trips to Wilsonville's portion of Basalt Creek. The TRP identifies the necessary improvements to accommodate those trips. Additional development and trips would require an update to the TRP and additional capacity improvements to the planned system.
Transportation Access to Interstate or Principal Arterial	♦ The entirety of Basalt Creek is within 5 miles of access to I-5 and I-205 and is less than 10 miles from Highway 217.
Proximity to Regional Infrastructure Rail/Port/Airport	♦ Basalt Creek is ~27 miles from Portland International Airport and ~26 miles from the Port of Portland. ♦ A rail line runs through Basalt Creek. The type of rail line and potential for spurs are not known at this point.
Proximity to Labor Force	♦ Access to the broader Portland Metro and Mid-Valley labor forces.
Proximity to Goods	♦ Close proximity to wine region and agricultural land. ♦ Close proximity to distributors, other manufacturers, and tech hubs, including semiconductor businesses.

Evaluation of Compatible Uses

The suitability of potential users for each site is outlined below, based on site characteristics and industry-specific needs. This high-level evaluation focuses on physical site characteristics—such as size, location, and constraints—without factoring in the likelihood of redevelopment. It provides a broad understanding of site benefits, barriers, and potential industry suitability, serving as a foundation for planning and zoning rather than a definitive assessment of building configurations or sizes.

Infrastructure will be pivotal in shaping the types of industries and scale of development suitable for the area. This analysis incorporated available information on infrastructure elements such as water, wastewater, and roads; however, detailed system capacities, final road alignments, and the timing of improvements—particularly in areas like West Railroad—remain uncertain. These factors will play a significant role in determining site suitability.

Water and wastewater systems are expected to meet most demands, though high-water users may require additional capacity. Similarly, industries with significant electricity demands might necessitate infrastructure upgrades. Road alignments will impact parcel configurations, building sizes, and overall development potential. While these elements are critical to understanding site suitability, they are not yet classified as definitive constraints or advantages.

- **The SW Greenhill** site spans 57 acres, with 91 percent (52 acres) of the land unconstrained. Minimal slopes (affecting 11 percent of the site), a high proportion of undeveloped land, consolidated land ownership (two property owners), and proximity to existing infrastructure make it one of the most development-ready locations in Basalt Creek. The site could be physically suitable for a high-tech supply chain, cleantech industries, advanced manufacturing, food processing, small warehousing and distribution, and industrial business parks or R&D campuses. Its proximity to transportation networks and regional workforce access further enhances its competitiveness.
- **The Craft Industrial** area is split into eastern and western portions by site constraints and consists of seven tax lots with fragmented ownership, most under five acres. Only 14 acres are unconstrained, and its proximity to residential areas limits its suitability for high-intensity industrial uses. Instead, the area aligns with the Basalt Creek Concept Plan's vision for small-scale or micro-industrial uses, such as live-work spaces or makerspaces.

  With site aggregation, the southeastern portion could accommodate small-scale industrial or office users on up to five acres. These uses could resemble industrial condo developments like the Commerce Circle Business Park or Riverwood Business Center, which integrate office and small-scale production spaces. The northeastern portion, while it could also redevelop, is likely less appealing due to its irregular shape and nearby high-value residences. The presence of existing residences,

including some high-value homes, are likely to delay redevelopment timelines compared to other opportunity sites. However, the feasibility of redeveloping these residential properties was not assessed as a part of this study.

- **The West Railroad** site spans 165 acres, with 56 percent (92 acres) of the land unconstrained. Its large parcels and access to regional transportation networks could make it physically suitable for uses such as general manufacturing, food processing, and small to midsized warehousing or distribution. Proximity to Coffee Creek's industrial area further enhances its appeal to businesses providing support services to neighboring industries. However, significant infrastructure upgrades are required, and access is limited by the railroad undercrossing on SW Grahams Ferry Road. Additionally, the site's proximity to a rail line and a mining operation could make the site less attractive to advanced manufacturing or other industries sensitive to vibration. Ongoing infrastructure alignment and capacity studies will provide further clarity on the site's suitability for targeted industries.

In Table 10, the compatibility of each site with various industrial uses is color coded as follows:

- Red: Not competitive for the industry
- Yellow: Moderate potential
- Green: High compatibility and strong suitability

Table 10. Evaluation of Compatible Uses Based on Site Characteristics

INDUSTRIES		SW GREENHILL	CRAFT INDUSTRIAL	WEST RAILROAD
Production Manufacturing	High-Tech / Cleantech Manufacturing	Midsized, flat site; high power or utility demands could exclude some users depending on system capacity	May be able to accommodate a small user (under 5 acres) most likely on the southeastern portion; some users may prefer larger sites with expansion potential	Vibration *may* be a concern from nearby rail and/or mining; high power or utility demands could exclude some users depending on system capacity
Value-Added Manufacturing and Assembly	Food Processing	Water and sewer needs are high; high demands could exclude some users depending on system capacity	May be able to accommodate a small user (under 5 acres) most likely on the southeastern portion	Water and sewer needs are high; high demands could exclude some users depending on system capacity
	Advanced Manufacturing & Assembly	Midsized, flat site; lower water and sewer demand than high-tech industries	Site small and constrained; increased setbacks (if required) could be a problem; often requires on-site utility service areas	Vibration *may* be a concern from nearby rail and/or mining

INDUSTRIES		SW GREENHILL	CRAFT INDUSTRIAL	WEST RAILROAD
Light / Flex Industrial	General Manufacturing	Residential proximity may reduce appeal	Site small and constrained; residential proximity may reduce appeal	Desirable site size available; distance from sensitive uses (residential, park)
	Industrial Business Park and R&D Campus	Midsized, flat site; slightly small for some users	Site small and constrained	Constraints may limit large park potential
	Business / Admin Services	Midsized, flat site; high trip generation	May be able to accommodate a small user (under 5 acres) most likely on the southeastern portion; tolerates higher slopes; compatible near residential; high trip generation	Proximity to Coffee Creek Industrial area that hosts similar services is attractive; tolerates higher slopes; high trip generation
Warehouse & Distribution	Regional	Close to I-5; existing road infrastructure; site may be a little small for some users	Site too small and constrained; limited space for trucks	Constraints could limit large distribution centers; the City is evaluating needed improvement to better accommodate truck traffic
	Local	Close to I-5; existing road infrastructure; suitable for smaller users	Site too small and constrained; limited space for trucks	Close to I-5; suitable for smaller users; the City is evaluating needed improvement to better accommodate truck traffic
Specialized	Data Center	May be suitable, but power needs could exceed available capacity, requiring upgrades	Site too small and constrained	May be suitable, but power needs could exceed available capacity, requiring upgrades

Site Competitiveness for Semiconductor Industry

Basalt Creek lacks the large parcels required for fabrication plants but is positioned to accommodate supply chain businesses that support semiconductor manufacturing.

- **SW Greenhill:** High Potential – Could be competitive for the semiconductor supply chain businesses. This site is closest to development ready, which is highly competitive because semiconductor companies prioritize sites with infrastructure ready to support development within *6 months to 3 years.*
- **Craft Industrial:** Not Competitive – Given the small parcels on the Craft Industrial site, this site is not competitive for the semiconductor supply chain businesses.

- **West Railroad:** Moderate Potential – The longer timeline required to provide adequate infrastructure, combined with existing constraints, makes this site less attractive for the semiconductor industry.

Site Competitiveness for Cleantech

- **Craft Industrial:** Moderate Potential – Given the small parcels and extent of constraints, this site is not competitive for many cleantech businesses but may be attractive to small-scale users in ag-tech and building energy tech that require sites under 5 acres.

Table 11. Cleantech Evaluation of Compatible Uses for Craft Industrial

Battery Storage	Existing businesses add appeal, but energy demands may exceed supply; site size may be too small for many users
Mass Timber	Limited by small site size, lack of direct rail access, and high energy requirements
Ag-Tech	Site may be suitable for a small user
Circular Economy	Some users may prefer direct rail access; site may be too small for some users
Solar & Wind Energy	Small site; unsuitable for power generation and manufacturing
Water Tech	High demand user; water pressure adequacy and energy needs may pose challenges; site may be too small for some users
Building Energy Tech	Site may be suitable for a smaller user; energy demands could exceed supply
EV infrastructure Tech	Limited site size, lack of rail access, and high energy requirements

- **SW Greenhill and West Railroad:** High Potential – Site size and infrastructure could appeal to a variety of cleantech subsectors, including battery storage, ag-tech, circular economy, water tech, and building energy tech.

Table 12. Cleantech Evaluation of Compatible Uses

Battery Storage	Existing businesses add appeal, but energy demands may exceed supply
Mass Timber	Limited by lack of direct rail access and high energy requirements
Ag-Tech	Sites meet needs well
Circular Economy	High transportation needs: some facilities may prefer direct rail access
Solar & Wind Energy	Unsuitable for power generation; possible for manufacturing but limited by rail and power needs
Water Tech	High demand user; water pressure adequacy and energy needs may pose challenges; low transportation needs
Building Energy Tech	Sites meet needs well; energy demands could exceed supply
EV infrastructure Tech	Limited by lack of rail access and high power requirements

Conclusion

Land Supply

The BCPA offers a promising opportunity to support a diverse range of industrial and employment uses that align with Wilsonville's economic development goals. Since the previous Buildable Lands Inventory (BLI) update, the area has experienced growth in contractor establishments. The updated BLI identifies **150 acres of buildable land,** comprising **87 acres of vacant land** and **63 acres of partially vacant land,** after accounting for constraints and existing development. The supply is distributed across parcels of varying sizes, ranging from small lots under 5 acres to larger parcels exceeding 25 acres, providing a mix of options suitable for different industry needs. Given the 150 acres of buildable land and the expectation of employment densities between 10 and 18.5 employees per acre, the BCPA is expected to accommodate between **1,500 and 2,780 jobs**.

Site Suitability Analysis

The Site Suitability Analysis evaluates the competitiveness of three opportunity sites within the BCPA based on their ability to host key industries identified in the Economic Inventory. This evaluation focuses on physical site characteristics, such as size, location, and constraints, rather than the likelihood of redevelopment. Redevelopment feasibility is addressed in a separate deliverable.

- **SW Greenhill:** With its minimal constraints, lack of development, consolidated land ownership, and existing infrastructure, this site could be physically suited for cleantech, high-tech supply chains, advanced manufacturing industries, food processing, small warehousing and distribution, and industrial business parks or R&D campuses requiring medium-sized parcels. This validates the uses originally envisioned in the BCCP for the area.
- **Craft Industrial:** Due to significant constraints, the site is currently more suitable for micro-industrial uses, such as live-work spaces, as originally identified in the BCCP. However, with site aggregation, the southeastern portion could accommodate small-scale business or administrative services and production uses, similar to industrial condo developments like Commerce Circle Business Park or Riverwood Business Center. The presence of existing residences, including some high-value homes, are likely to delay redevelopment timelines compared to other opportunity sites.
- **West Railroad:** This site has potential for development in general manufacturing, food processing, warehousing and distribution, and business services. However, significant infrastructure upgrades are required, and existing constraints may limit the scale of some types of development.

Next Steps

The findings presented in this memorandum are preliminary and will be further refined through ongoing discussions with the Planning Commission and City Council. This analysis is being conducted in parallel with an evaluation of redevelopment feasibility for contractor establishments. Ultimately, these components, along with insights from the Economic Inventory, will be synthesized into a summary report that outlines key findings and recommendations.

Appendix B.1 IFA Industrial Development Competitiveness Matrix

ECOnorthwest

16	SPECIAL CONSIDERATIONS:		Adequate distance from sensitive land uses (residential, parks, large retail centers) necessary. High throughput of materials. Large yard spaces and/or buffering required. Often transportation related requiring marine/rail links.	Acreage allotment includes expansion space (often an exercisable option). Very high utility demands in one or more areas common. Sensitive to vibration from nearby uses.	May require high volume/supply of water and sanitary sewer treatment. Often needs substantial storage/yard space for input storage. Onsite water pre-treatment needed in many instances.	Surrounding environment of great concern (vibration, noise, air quality, etc.). Increased setbacks may be required. Onsite utility service areas. Avoid sites close to wastewater treatment plants, landfills, sewage lagoons, and similar land uses. Lower demands for water and sewer treatment than Production High-Tech Manufacturing.	Adequate distance from sensitive land uses (residential, parks) necessary. Moderate demand for water and sewer. Higher demand for electricity, gas, and telecom.	High diversity of facilities within business parks. R&D facilities benefit from close proximity to higher education facilities. Moderate demand on all infrastructure systems.	Relatively higher parking ratios may be necessary. Will be very sensitive to labor force and the location of other similar centers in the region. High reliance on telecom infrastructure.	Transportation routing and proximity to/from major highways is crucial. Expansion options required. Truck staging requirements mandatory. Minimal route obstructions between the site and interstate highway such as rail crossings, drawbridges, school zones, or similar obstacles.	Transportation infrastructure such as roads and bridges to/from major highways is most competitive factor.	Must be located witihn or near FAA-regulated UAV testing sites. Moderate utility demands. Low reliance on transportation infrastructure.	Larger sites may be needed. The 25 acre site requirement represents the more typical site. Power delivery, water supply, and security are critical. Surrounding environment (vibration, air quality, etc.) is crucial. May require high volume/supply of water and sanitary sewer treatment.	Located in more remote locations in the state. Usually without direct access (within 50 miles) of Interstate or City of more than 50,000 people.

Mackenzie; Business Oregon

Terms:

More Critical ↑ Less Critical	**'Required'** factors are seen as mandatory in a vast majority of cases and have become industry standards
	'Competitive' significantly increases marketability and is *highly recommended by Business Oregon* . May also be linked to financing in order to enhance the potential reuse of the asset in case of default.
	'Preferred' increases the feasibility of the subject property and its future reuse. Other factors may, however, prove more critical.
* Competitive Acreage: Acreage that would meet the site selection requirements of the majority of industries in this sector.	
**Total Site: Building footprint, including buffers, setbacks, parking, mitigation, and expansion space	
† Data Center Water Requirements: Water requirement is reported as gallons per MWh to more closely align with the Data Center industry standard reporting of Water Usage Effectiveness (WUE).	
‡ Data Center Sewer Requirements: Sewer requirement is reported as 200% of the domestic usage at the Data Center facility. Water and sewer requirements for Data Centers are highly variable based on new technologies and should be reviewed on a case-by-case basis for specific development requirements.	

Appendix B.2 Cleantech Industrial Sector Land Use Competitiveness Matrix

The Oregon Cleantech Competitiveness Assessment Report (Appendix D in the report) identified the following land use requirements for key cleantech subsectors in Oregon as described below.

Cleantech Land Use Criteria

Land use requirements for attracting and growing industrial users vary across sectors. We have reviewed typical land use and infrastructure needs based on existing facility development, anticipated growth needs, and similarities to existing established industrial users within the State. We have reviewed land use competitiveness for the following development criteria, which are commonly used when evaluating sites for attracting potential industrial users:

1. Total site size: Gross property area, including building footprint, setbacks, parking, laydown space, buffers and/or mitigation areas, and expansion areas.
   A. Small: 0-5 acres
   B. Medium: 5-25 acres
   C. Large: > 25 acres
2. Use allowance: Specific manufacturing use allowed under current zoning. Development standards also may limit feasibility of necessary elements such as utility yards.
   A. Low: Allowed outright
   B. Medium: Allowed conditionally or with limitations
   C. High: Not allowed
3. Site slope tolerance: Elevation differences across the site; generally, industries with large-footprint buildings or laydown yards require flatter sites.
   A. Low: 0-5%
   B. Moderate: 0-7%
   C. High: 0-12%
4. Access to interstate or principal arterial transportation routes: Access to shipping routes and available capacity for trips generated.
   A. Low: Relatively low need for access to transportation routes.
   B. Moderate: Access to principal transportation routes is preferred.
   C. High: Access to principal transportation routes is required.
5. Railroad access: Proximity and capacity for rail freight systems, for either raw materials or finished goods.
   A. Low: Relatively low need for rail access.
   B. Moderate: Access to rail access is preferred.
   C. High: Access to rail access is required.
6. Marine port access: Proximity and capacity for marine cargo shipping, for either raw materials or finished goods.
   A. Low: Relatively low need for marine access.
   B. Moderate: Access to marine access is preferred.

C. High: Access to marine access is required.

7. Airport access: Proximity and flight availability for employees, customers, or air cargo.
   A. Low: Relatively low need for airport access.
   B. Moderate: Access to airport access is preferred.
   C. High: Access to airport access is required.
8. High-pressure water supply: Proximity and capacity for high-pressure water supply, typically as municipal water.
   A. Low: Significant water usage is not expected to be a critical component of this industry.
   B. Moderate: Water usage may be high for this industry; high-pressure water supply is preferred.
   C. High: High-pressure water supply is required.
9. Electricity supply: Proximity and capacity for electrical power.
   A. Low: Significant electricity usage is not expected to be a critical component of this industry.
   B. Moderate: Electrical usage may be high for this industry; high-demand service and/or redundancy is preferred.
   C. High: High-demand service and/or redundant electrical supply is required.

The following table summarizes our recommendations of land use competitiveness for the selected Cleantech sectors across the criteria listed above.

Table 13. Competitiveness Matrix for Select Cleantech Industries

	Battery Storage	Mass Timber	Ag-Tech	Circular Economy	Solar & Wind Energy Prod	Water Tech	Building Energy Tech	EV Infrastructure Tech
Site Size	Small to Large[4]	Med to Large	Small[5]	Small to Med[6]	Med to Large[7]	Small to Med	Small	Med to Large
Use Allowance	Varies by jurisdiction							
Slope Tolerance	Mod.	Low	High	Mod.	Mod.	Low	High	Mod.
Transportation Access	Low	High	Low	High	Mod.	Low	Low	High
Rail Access	Low	Mod.	Low	Mod.	Wind: High Solar: Low	Low	Low	Mod.
Marine Access	Low	Low	Low	Low to Mod.	Low to High[8]	Low	Low	Low to Mod.
Airport Access	Low	Low	Mod.	Low	Low	Low	Mod.	High
High-Pressure Water Needs	Low	Low to Mod.	Low	Mod.	Mod.	High	Low	Low
Electrical Supply Needs	High[9]	Mod. to High	Low	Mod.	High[6]	High	Mod. to High	High

Source: Oregon Cleantech Competitiveness Assessment Report, 2024

[4] Battery storage site sizes may vary widely, from urban microgrid installations to large-scale power grid storage.
[5] The Ag-Tech industries identified in this study are assumed to generally focus on software and small-scale equipment products. These companies may use large-scale farms for product development or research; however, since those are likely to be existing operating farm facilities, we do not identify them as a land use criterion here.
[6] Site facility size for circular economy is dependent on the raw materials and finished products involved and the industry scaling.
[7] Site size for solar/wind manufacturing facilities is similar to advanced manufacturing industries, while sites for solar/wind power generation vary greatly depending on scale, ranging from rooftop systems to grid-scale farms.
[8] Offshore wind power requires marine facilities to transport turbines and equipment to the generating site. Land-based wind power marine access varies.
[9] Electrical system proximity and access for power generation facilities may vary depending on the scale and intended use. Microgrid systems may only need connection to the local electrical grid, while large-scale grid storage may require connection to regional transmission lines or substations.

Appendix B.3 Buildable Lands Inventory Methodology

The BLI is intended to identify industrial lands that are available for development for employment uses within the City of Wilsonville's BCPA. The inventory is sometimes characterized as *supply* of land to accommodate anticipated employment growth. The amount of land needed to accommodate anticipated growth, often referred to as *demand* for land, depends on the type of employment-related development and other factors.

This appendix presents methods and definitions used to develop the industrial buildable lands inventory for the BCPA. The results (shown in the Land Supply section of the memorandum) are based on analyses by ECOnorthwest of data from the City of Wilsonville, Washington and Clackamas Counties, Metro, and Pacific Habitat Services. The analysis was reviewed by City staff. The remainder of this appendix summarizes key findings of the BLI.

Methods and Definitions

The BLI in Wilsonville's BCPA includes all land that allows industrial uses within the jurisdiction of Wilsonville's comprehensive plan use designations or unincorporated areas of Washington and Clackamas Counties. From a practical perspective, land was included in the BLI if it met all the following criteria:

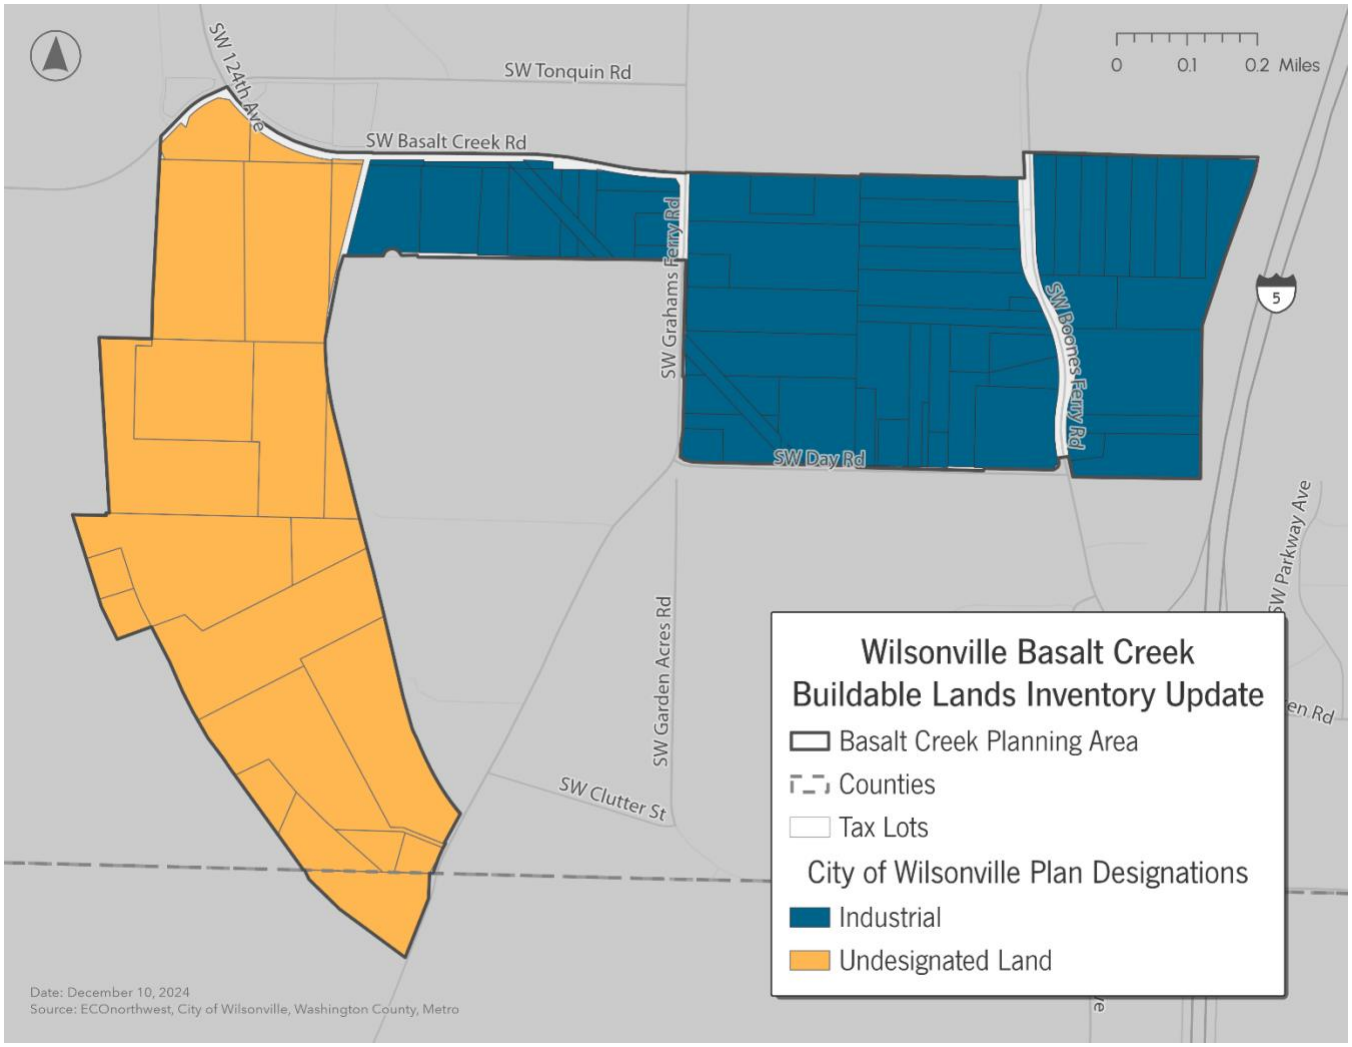
1. It is inside the BCPA
2. It is within a Wilsonville Comprehensive Plan designation or unincorporated areas of Washington and Clackamas Counties.
3. It is inside a tax lot (as defined by Metro), and
4. Its plan designation allows employment uses. *Note that tax lots do not generally include road or railroad rights-of-way or water.*

The inventory then builds from the tax lot–level database to estimate buildable land by Comprehensive Plan designation.

Inventory Steps

The five steps in the BLI are:

1. Generate UGB "land base"
2. Classify lands by initial development status
3. Identify constraints
4. Verify inventory results
5. Tabulate and map results



Step 1: Generate UGB "Land Base"

The industrial inventory used all tax lots within the BCPA with the appropriate types of comprehensive plan designations that fall under those land use categories:

- Industrial (I)
- Undesignated land (i.e., unincorporated land)

Figure 6 below shows a map of these designations used in the BLI.

Figure 6. Land Base by Wilsonville Comprehensive Plan Designation, BCPA, 2024

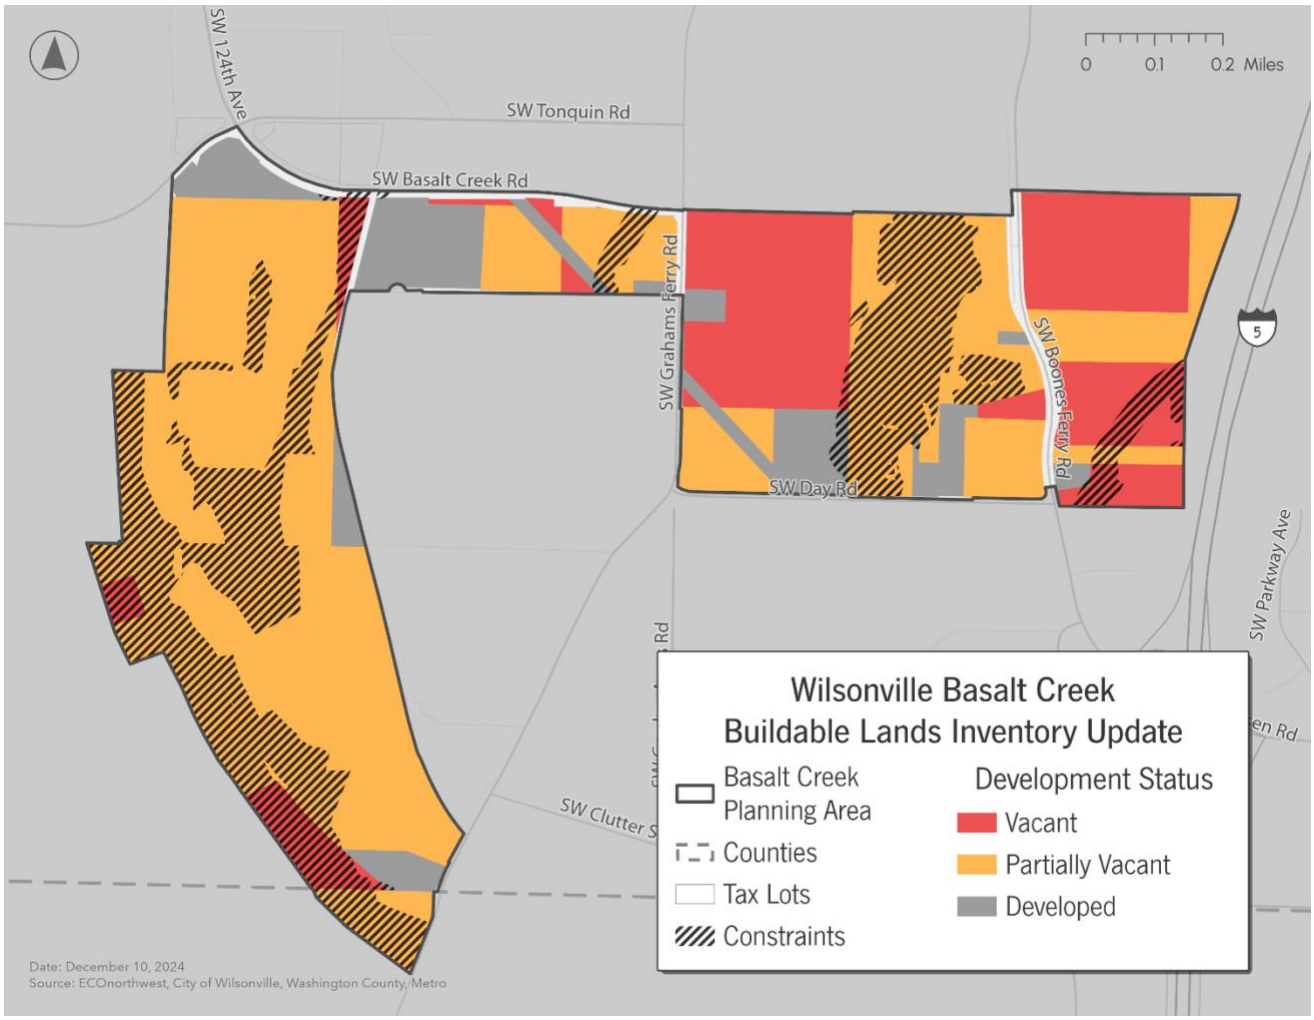
Source: ECOnorthwest Analysis, City of Wilsonville, Metro

Step 2: Classify Lands by Development Status

In this step, ECOnorthwest initially classified each tax lot with an employment plan designation (based on the definitions above) into one of three mutually exclusive categories based on development status:

- Vacant land
- Partially vacant land
- Developed land

ECOnorthwest identified buildable land and classified development status using a rule-based methodology adapted from Metro's Buildable Land Inventory documentation[10] and utilizing Metro's vacant and developed land GIS inventories. These classifications serve as a starting point for identifying development statuses and are further refined in step 4 through visual review by ECOnorthwest and the City of Wilsonville.



The rules are described in Table 14, and the development status classifications of the BLI land base are visualized in map format in Figure 7.

Table 14. Rules for Development Status Classification

DEVELOPMENT STATUS	DEFINITION	METHODOLOGICAL BASIS
Vacant Land	A tax lot where the area is: (a) Less than 2,000 sq ft and less than 10% developed, or (b) More than 95% vacant.	*Metro Appendix 2 - 2024 Buildable Land Inventory (BLI) and Capacity Estimates*[11]
Partially Vacant Land	A tax lot where the area does not meet the vacant land definition and is more than one-half acre vacant	No statutory definition
Developed Land	A tax lot that is not vacant or partially vacant.	*Metro Appendix 2*

[11] Ibid.

Figure 7. Development Status with Constraints, BCPA, 2024

Source: ECOnorthwest Analysis, City of Wilsonville, Washington County, Metro, Pacific Habitat Services

Step 3: Identify Constraints

As shown in

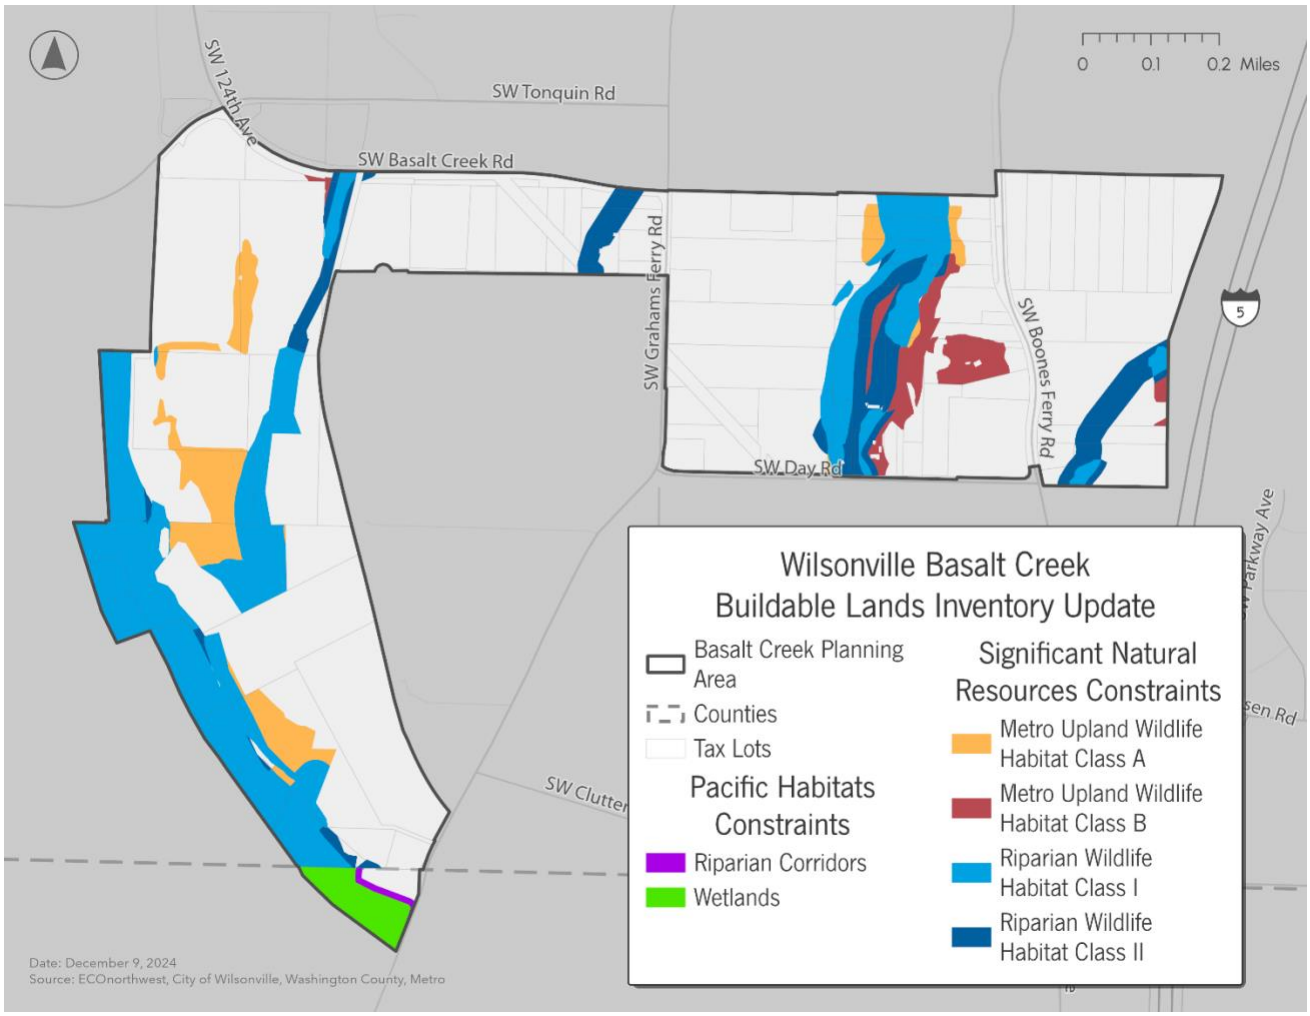

Table 15, the BLI included development constraints consistent with guidance in OAR 660-009-0005(2) and discussion with Wilsonville City staff.

Table 15. Constraints Included in BLI

DEVELOPMENT STATUS	STATUTORY AUTHORITY	THRESHOLD	SOURCE
Goal 5 Natural Resource Constraints			
Significant Natural Resources (SNR)	*OAR 660-009-0005(2)*	Lands within SNR classifications: ♦ Metro Upland Wildlife Habitat Classes A and B ♦ Riparian Wildlife Habitat Classes I and II	Washington County
Riparian Corridors	*OAR 660-009-0005(2)*	Lands within riparian corridors (Clackamas County only)	Pacific Habitat Services
Wetlands	*OAR 660-009-0005(2)*	Lands within wetlands (Clackamas County only)	Pacific Habitat Services

These areas were evaluated as prohibitive constraints (unbuildable). All constraints were merged into a single constraint file, which was then used to identify the area of each tax lot that is constrained. These areas were deducted from lands identified as vacant or partially vacant. Figure 8 shows a map of the individual constraints.

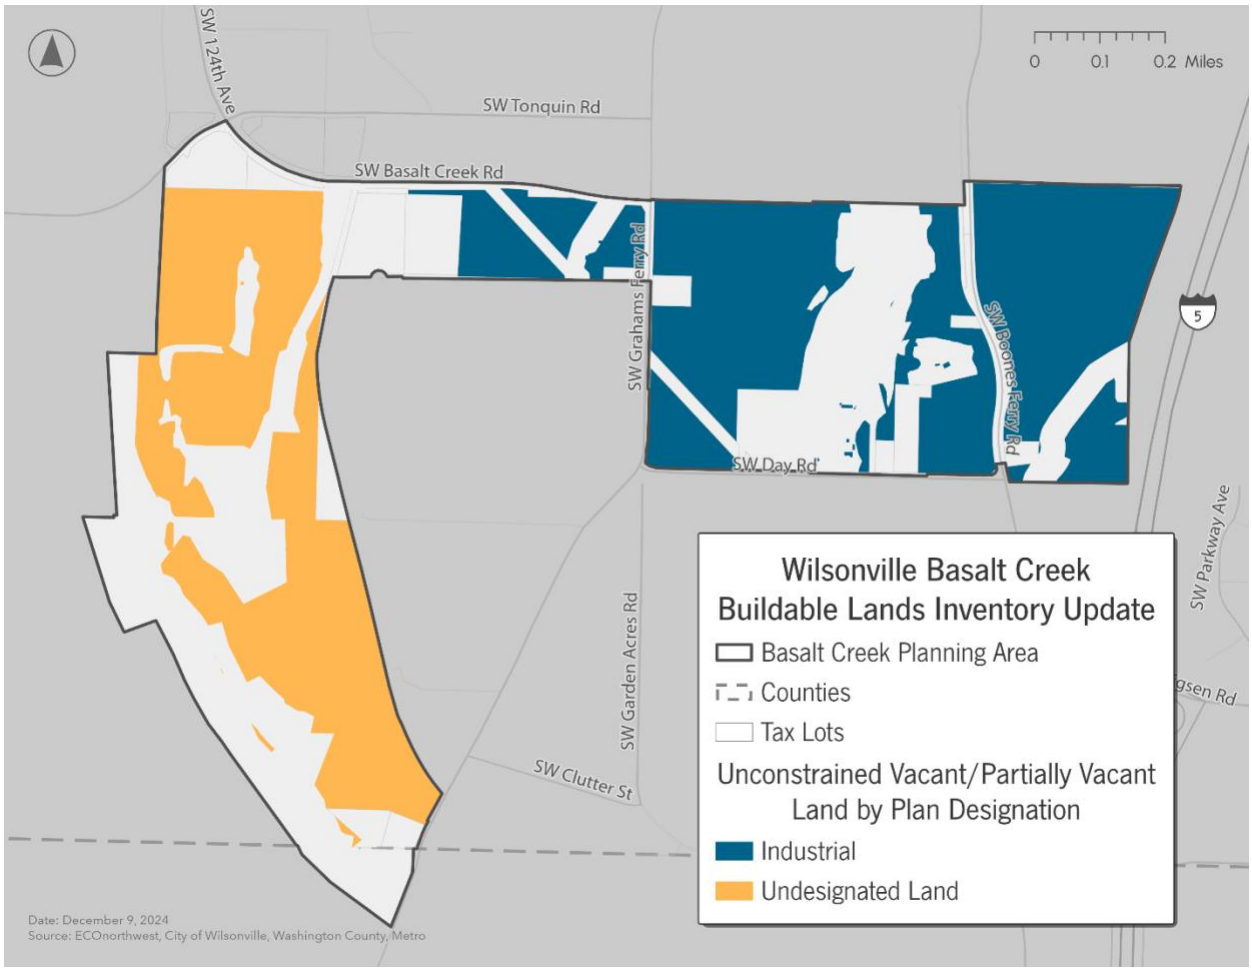
Figure 8. Development Constraints, BCPA, 2024

Source: ECOnorthwest Analysis, City of Wilsonville, Washington County, Metro, Pacific Habitat Services

Step 4: Verify Inventory Results

ECOnorthwest used a multistep verification process. The first verification step involved a "visual assessment" of land classifications using GIS and recent aerial photos. The visual assessment involved reviewing classifications overlaid on recent aerial photographs to verify uses on the ground. ECOnorthwest reviewed all tax lots included in the inventory using the visual assessment methodology. The second round of verification involved City staff verifying the visual assessment output. ECOnorthwest amended the BLI based on City staff review and a discussion of staff's comments.

Step 5: Tabulate and Map Results



The results of the industrial BLI are presented in tabular form in Table 16 and in a map in Figure 9.

Table 16. Buildable Acres in Vacant and Partially Vacant Tax Lots by Wilsonville Plan Designations, BCPA, 2024

Plan Designation	Total Buildable Acres	Buildable Acres on Vacant Lots	Buildable Acres on Partially Vacant Lots
Industrial	127	87	40
Undesignated	24	0.4	23
Total	**150**	**87**	**63**

Appendix C: Redevelopment Feasibility of Contractor Establishments

ECOnorthwest

DATE:	December 12, 2024
TO:	City of Wilsonville
FROM:	ECOnorthwest: Nicole Underwood, Michelle Anderson, and Bob Parker
SUBJECT:	WILR Phase 1: Redevelopment Feasibility of Contractor Establishments

The Cities of Tualatin and Wilsonville adopted the Basalt Creek Concept Plan (BCCP) in 2018 after a lengthy joint planning process. Now, in 2024-25, the City of Wilsonville is working to advance the Basalt Creek Planning Area (BCPA) beyond the concept plan to a development-ready status by designating zoning and refining infrastructure plans. However, since adoption of the BCCP, economic conditions at national, state, regional, and local levels have shifted significantly and must now be considered.

To address these evolving conditions, the City hired ECOnorthwest to conduct a market assessment and industrial lands study focused on Wilsonville's portion of the BCPA. This study comprises several interconnected tasks:

- An **Economic Inventory** that evaluated current market trends and identified industries suitable for the area (completed).
- An updated **Buildable Lands Inventory (BLI)** that reflects recent land developments, adjusted constraints, and revised capacity estimates (ongoing).
- A **Site Suitability Analysis** that evaluates three key opportunity sites for their potential to support target industries based on attributes like size, location, and access (ongoing).
- An **Analysis of Future Development of Contractor Establishments in the BCPA** given prevailing lease rates and market conditions (this memorandum).

This memorandum addresses the fourth task by evaluating the redevelopment potential of contractor establishments within the BCPA. Currently, the Wilsonville portion of the BCPA falls under Washington County's Future Development 20-Acre District (FD-20) zoning, which allows a variety of low-intensity uses. The area has limited development, with much of the developed land used for contractor establishments, which typically include small offices (often converted residences), storage buildings, and laydown yards. While these uses contribute to jobs and economic activity, they yield limited employment opportunities and lower property values compared to those envisioned in the BCCP or those typically expected for land within the metro urban growth boundary (UGB) and city limits.

The primary question we address in this task is: What is the redevelopment potential of existing contractor establishments in the BCPA, given prevailing lease rates and market conditions? This analysis will help the City understand what types of development the market will support, which desired development types identified in the BCCP are viable under current economic conditions, and what conditions might be necessary in the future to support desired development.

The findings from this analysis will guide recommendations on policy interventions and strategic actions the City can take to support desired development and promote redevelopment feasibility. These efforts are part of a broader initiative to position Basalt Creek as a key area for regional job growth and long-term economic success.

Redevelopment Feasibility of Existing Contractor Establishments

The Economic Inventory identified a range of industrial users who may find Basalt Creek particularly attractive due to its prime location in the Southwest Metro area, access to a skilled workforce, availability of industrial land, strong transportation networks, and proximity to existing industrial clusters. Discussions with stakeholders also highlighted strong regional demand for industrial space.

However, several challenges complicate redevelopment efforts. Many existing contractor establishments generate significant income for property owners, reducing their motivation to sell or redevelop the land for higher-intensity industrial uses. Additionally, relocation options for businesses currently occupying these sites may be limited, creating further barriers to redevelopment.

These challenges raise critical questions about whether current market rents and sales prices are sufficient to make redevelopment feasible in the BCPA. This analysis evaluates the conditions needed to support redevelopment in Basalt Creek.

WHICH SECTORS MAY BE ATTRACTED TO BASALT CREEK?

Below are the potential sectors that may be particularly attracted to Basalt Creek, as identified in the Economic Inventory report.

- **Semiconductor Sector Supply Chain:** Companies providing materials, equipment, and services to chip manufacturers.
- **Cleantech, including Battery Technology:** Businesses involved in renewable energy technology, energy efficiency solutions, and sustainable manufacturing processes.
- **Advanced Manufacturing:** Companies using technology such as robotics, 3D printing, and computerized systems to manufacture specialized products or components.
- **Distribution and Logistics:** Storage, transportation, and delivery of goods.
- **Data Centers:** Facilities used to house computer systems and associated components.

Methods and Approach

What are the key questions?

While there is clear demand for industrial space in the BCPA, the question remains: **What conditions (e.g., market, ownership, site, zoning) are needed to promote and incentivize urban industrial development as envisioned in the BCCP?** To answer this core question, ECOnorthwest identified several subquestions to guide the analysis.

- What types of property owners are in the study area, and who is respectively occupying the site (e.g., the owner or tenant)?
  - Understanding ownership and occupancy dynamics helps assess the financial motivations of property owners and helps determine whether redevelopment offers an incentive.
- What are the potential future uses for these sites?
  - Identifying potential future uses informs construction costs, market rents, and site utilization. Evaluating the likely range of site utilization (based on constraints and zoning) helps determine whether redevelopment would offer higher returns compared to current uses.

By addressing these supporting questions, ECOnorthwest evaluated scenarios where ownership, occupancy, and future uses align to incentivize redevelopment. This structured approach provides insights into the conditions necessary to drive redevelopment in the BCPA.

How did we answer the key questions?

ECOnorthwest used a detailed pro forma model to evaluate multiple potential development scenarios. These scenarios incorporated variations in current ownership and occupancy, potential future uses, and site utilization (for additional details, see Appendix). For this quantitative analysis, we focused on conditions that could support new development, either on recently acquired properties (e.g., speculative purchases) or on land likely to transact for redevelopment in the future.

WHAT IS A PRO FORMA?

The pro forma method, a standard tool in real estate feasibility studies, replicates the decision-making process of investors and lenders. It assesses the balance between development costs, expected revenue, and financing structures to identify potential viability gaps.

The pro forma considers the site utilization and potential building program of each scenario, development hard costs (construction labor and materials), other development costs (soft

costs, contingency, developer fee, etc.), costs of capital, relevant operating costs, and land acquisition costs. For each scenario, the pro forma calculated the rent levels required to cover these costs and achieve financial feasibility.

DATA LIMITATIONS AND METHODOLOGY

While the quantitative analysis provided valuable insights, data limitations in the study area and the I-5 South Submarket (such as limited observations of contractor establishment rents) posed some challenges. These limitations are typical for studies in smaller submarkets. To address this, we supplemented the analysis with qualitative methods, including interviews with developers and brokers, to validate assumptions and refine recommendations. We also conducted a range of sensitivity testing to account for potential variance (e.g., higher and lower potential contractor establishment rents) instead of basing the results of our analysis on one assumption. As a result, we believe the findings accurately reflect current market conditions in Wilsonville and provide a reliable basis for evaluating redevelopment feasibility in the BCPA.

WHY IS DEVELOPMENT FEASIBILITY AND PRO FORMA ANALYSIS IMPORTANT?

Development can be costly and risky. Getting funding to construct new development requires lenders and investors to be reasonably confident they will earn enough financial return to justify the risks.

Economic or market feasibility is generally assessed by comparing the expected revenues (rents, sales prices) against the costs of development. If a development project is not profitable, it is not feasible; it will not be built. While some of the factors that determine market feasibility are outside a jurisdiction's direct control (e.g., labor and materials costs, interest rates, market rents), local jurisdictions can provide incentives (such as tax exemptions or land donations) or adjust building, utility, and zoning fees; zoning; programs; and other regulations that can have a substantial impact on whether development could be feasible or not.

ASSUMPTIONS AND INDUSTRY STANDARDS

We based several assumptions on industry standards to ensure consistency and accuracy:

- **Construction Costs:** Used national averages adjusted with a Portland metro–specific multiplier to account for regional building conditions.
- **Other Development Costs and Operating Costs:** Applied standard rates for soft costs (architectural design, site engineering, permitting and entitlement fees, capital carrying costs, etc.), contingency, and developer fees.

For a more detailed overview of the data, assumptions, and methodology, please refer to the Appendix.

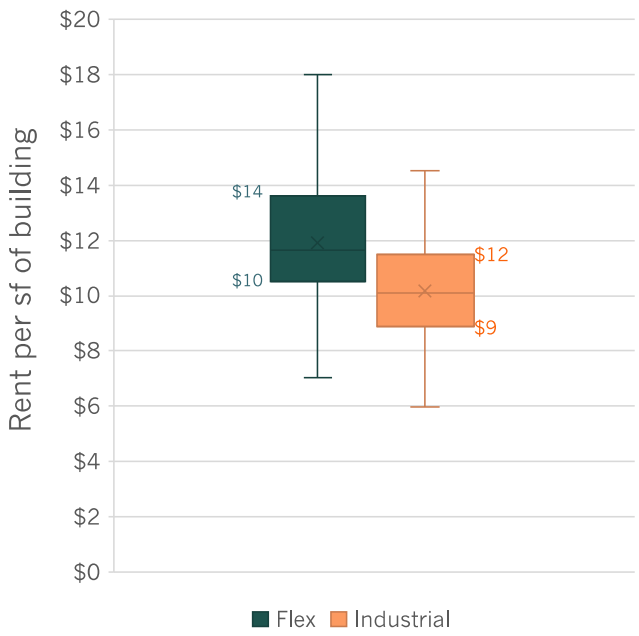
UNDERSTANDING THE PRICE OF LAND IN THE BCPA: HOW THIS IS FACTORED INTO FEASIBILITY RESULTS

Predicting the price that a landowner would require when selling property for development is an imperfect science—each landowner has reasons to sell or hold their land. Some property owners are willing to develop their land without selling, but based on interviews, we determined this would be rare in the study area. For the purposes of this analysis, we assumed the value of the property (i.e., the price of the land at which an owner would be willing to sell) could be derived from current comparable property sales prices in the area using a **"comps approach"** as well as using an **"income-based approach"** that considers the revenue stream from current tenants on the property. Therefore, this memo analyzes the rent needed based on the range of land values given these two approaches.

We identified vacant land sales (including contractor establishment sales) in the I-5 South Submarket using CoStar data. Most of the vacant land properties recently transacted (over the last 4 years) for approximately $7 to $17 per square foot of land. One improved land transaction (with a contractor establishment) had a sale price that indicated it transacted for $26 per square foot of land. These observations served as our range of land prices using a comps approach. Many of these comps, both vacant land and contractor establishments, might have been leased to tenants and generated income; however, the prices they sold for could have been decided via an unknown variety of methods (including an income-based approach and then a subsequent negotiation). Therefore, for the purposes of this analysis, we refer to all these observed transactions as being within the "comps approach" method.

The income-based approach relied on data collected during interviews, which indicated the rent for contractor yards in the area could range from $0.18 to $0.23 per square foot of land per month. We considered this gross annual revenue, net of approximately 5 percent for various operating costs, and divided by a range of capitalization (cap) rates (5 percent to 7 percent) to estimate the value. Using a cap rate is a common valuation approach in the commercial real estate industry. This analysis resulted in a range of $19 to $52 per square foot of land—considerably higher than most of the results from the comps approach. This approach more accurately reflects the value current owners place on the potential future revenue from their existing tenants, as well as the level of incentive required to encourage them to sell and repurpose the property. Although this income-based value could eventually be negotiated during a potential sale, we still use this range in our analysis to reflect values that a landowner might require to sell their land.

Key Findings



Current uses are generating substantial revenue with minimal management effort or risk.

Our market research and interviews highlighted that the rent for current uses varied based on whether the site was mostly open land or a building was present. Sites without buildings typically structured their rent per square foot of land, and this typically ranged from $0.18 to $0.23 per month. For example, a 1-acre site could generate annual gross rent of approximately $95,000 to $120,000 with minimal management effort or operating costs. (This is intended for illustrative purposes only and can scale to larger site sizes.)

Over the past four years, vacant land in the area has sold for around $7 to $17 per square foot. For the same illustrative 1-acre site, this translates to sale prices ranging from $305,000 to $750,000. The resulting ratio of annual gross lease revenue to property value ranges from 13 percent (a monthly rent of $0.18 per square foot relative to a land value of $17 per square foot) to 39 percent (a monthly rent of $0.23 per square foot relative to a land value of $7 per square foot). This means that property owners who recently purchased land and rent it to contractor establishments could recover their investment within 2.5 to 8 years. For long-term landowners who have already paid off their investment, rents represent additional income with minimal effort. Either way, given the substantial revenue from these uses, a landowner has very little incentive to redevelop.

For sites with buildings and yards, rents are typically based on the building area and range from $0.85 to $1.30 per square foot of building per month, or $10.20 to $15.60 per square foot per year. In comparison, flex and industrial spaces in the I-5 South Submarket rent for $9 to $14 per square foot per year, meaning that rent for an existing contractor establishment building with a yard is already achieving similar market rents to potential future uses. Not only are some of these contractor establishments already achieving comparable rents to flex and industrial uses, but they are also doing so without the risks of redevelopment (which include new capital investment, entitlements, the time to convert the land to the new use and generate revenue, and opportunity cost, among others).

Figure 1. Market Rent of Potential Future Uses

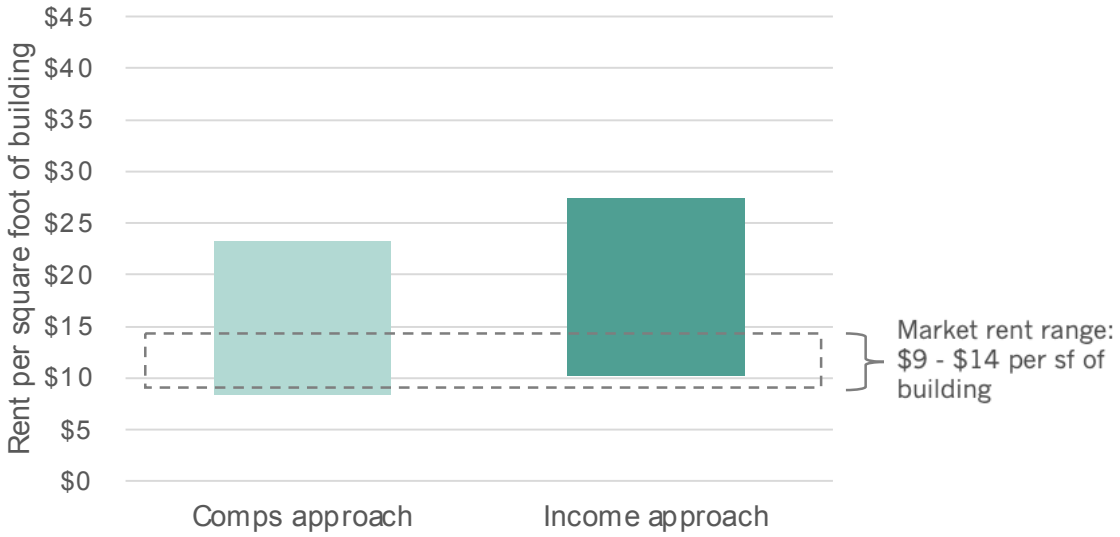
Source: ECOnorthwest analysis, CoStar

Rents would likely need to increase by at least three-fifths (60 percent), if not double (100 percent), to fund construction and create incentive to flip existing contractor establishments.

For our pro forma analysis, we evaluated a range of scenarios based on the variation in ownership and occupancy, future uses, future site utilization, and land acquisition costs (see Appendix for more detail). As previously discussed, ECOnorthwest solved for the rent needed to cover these various costs and then compared to the potential market rent of the flex and industrial uses observed in the I-5 South Submarket. We show these results for a range of potential land acquisition prices and construction costs.

We analyzed results for three different physical scenarios based on observed comparable developments (using the relationship between building square footage and site square footage):

- **Very high site utilization** based on 45 percent site coverage, similar to Graham's Ferry Industrial Center. Note: future development in some portions of BCPA may face constraints due to natural site features or zoning standards that may make achieving this site utilization challenging.
- **High site utilization** based on 35 percent site utilization, similar to the Sherwood Commerce Center
- **Low site utilization** based on 20 percent site utilization, similar to observed flex and industrial uses built over the last 20 years in the I-5 South Submarket



INTERPRETING THE RESULTS CHARTS

Development feasibility hinges on a range of different assumptions. Rather than picking one specific set of assumptions, the results charts shown in this memo encompass a range of potential assumptions, namely land acquisition costs and development costs.

ECOnorthwest compared the feasibility results to both the comps approach and income approach—**one column** in the following charts shows the resulting range of rents needed if assuming a comps approach, and **one column** shows the range needed based on an income approach. **Both columns** also include sensitivity testing given a range of construction costs and land prices, which is reflected in the size of the bars (the same range is assumed for each of the land price method scenarios). **A dashed box** is also shown to represent the range of observed rents for potential future uses. The rent results would ideally be within, if not lower than, this range for the development to be feasible.

In the **very high site utilization** scenario, future flex and industrial uses are only feasible when land acquisition costs remain low—below $20 per square foot—and other development costs are average or low. This combination of assumptions results in rents similar to the existing market rents of $9 to $14 per square foot of building (see comparison to gray bar shown in results chart in Figure 2). To make redevelopment feasible for properties with land costs higher than $20 per square foot (common for land with existing uses), the market rent for flex and industrial uses would likely need to increase by at least three-fifths, if not double, while construction costs remain constant.

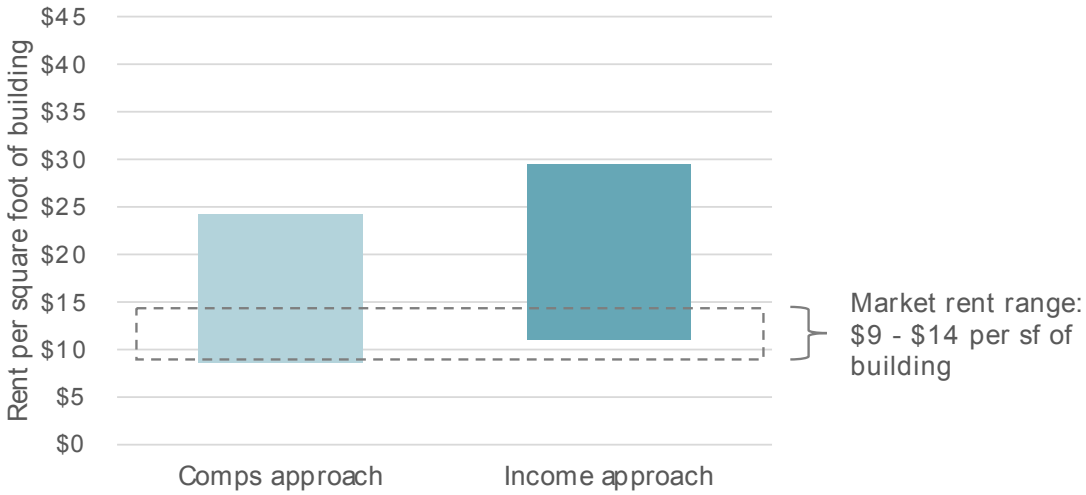


Figure 2. Rent Needed for Very High Site Utilization (45%)

Source: ECOnorthwest analysis

The results in the **high site utilization scenario** are similar to the very high site utilization scenario. However, relative to the latter, rents would need to increase to cover the same range of land and development costs. Future flex and industrial uses are only feasible when land acquisition costs remain low—below $20 per square foot—and other development costs are average or low. This combination of assumptions results in rents similar to the existing market rents of $9 to $14 per square foot of building (see comparison to gray bar shown in results chart in Figure 3). To make redevelopment feasible for properties with land costs higher than $20 per square foot (common for land with existing uses), the market rent for flex and industrial uses must increase by at least three-quarters, if not double, while construction costs remain constant.

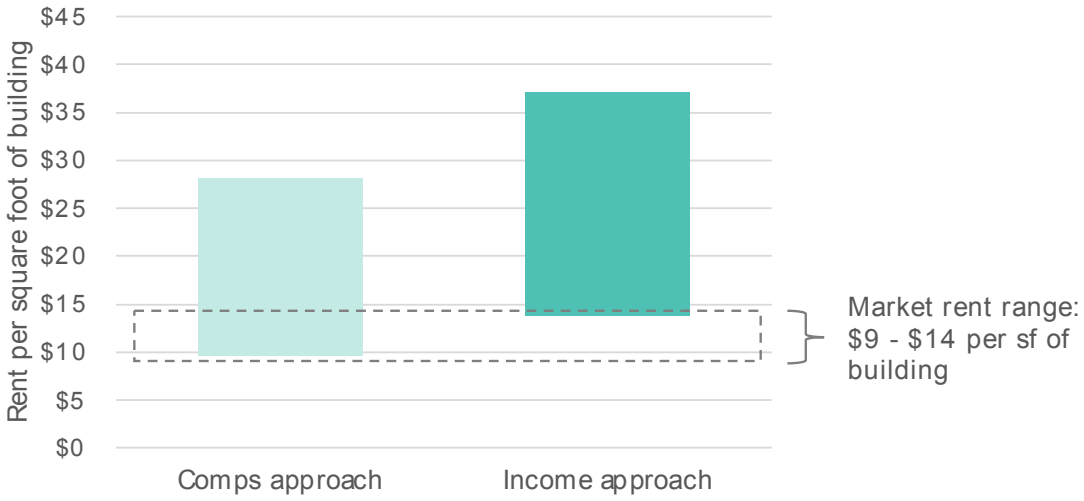

Figure 3. Rent Needed for High Site Utilization (35%)

Source: ECOnorthwest analysis

In the **low site utilization scenario**, future flex and industrial uses are only feasible when land acquisition costs are assumed to be low—less than $10 per square foot, based on the low end of recent comparable sales of vacant land—and other development costs are low. This combination of assumptions results in rents similar to the existing market rents of $9 to $14 per square foot of building (see comparison to gray bar shown in results chart in Figure 4). For properties with existing uses (where land is likely to transact between $19 and $52 per square foot), the market rent for flex and industrial uses must double while construction costs remain constant to make redevelopment feasible.

Figure 4. Rent Needed for Low Site Utilization (20%)

Source: ECOnorthwest analysis

Owner-occupied sites face greater feasibility challenges when landowners want to maintain their business operations.

Owner-occupied sites present more complex financial considerations compared to vacant or tenant-occupied properties. Landowners using their property for their own business must account for additional costs if they relocate, including relocation expenses, higher rents (or purchase prices) for new properties, and potentially higher ongoing business costs. For example, moving farther from suppliers or services could result in increased fuel or labor expenses.

To justify relocating their business, landowners would likely need to sell their property at an even higher price than what the quantitative analysis assumes. This requirement would, in turn, translate to higher rents than those shown in the results charts (Figure 3 and Figure 4). However, if the landowner does not intend to maintain their business, financial considerations would be less complex. Without the need to account for future business costs or the loss of tenant income, necessary rents could align more closely with those projected in the comps approach.

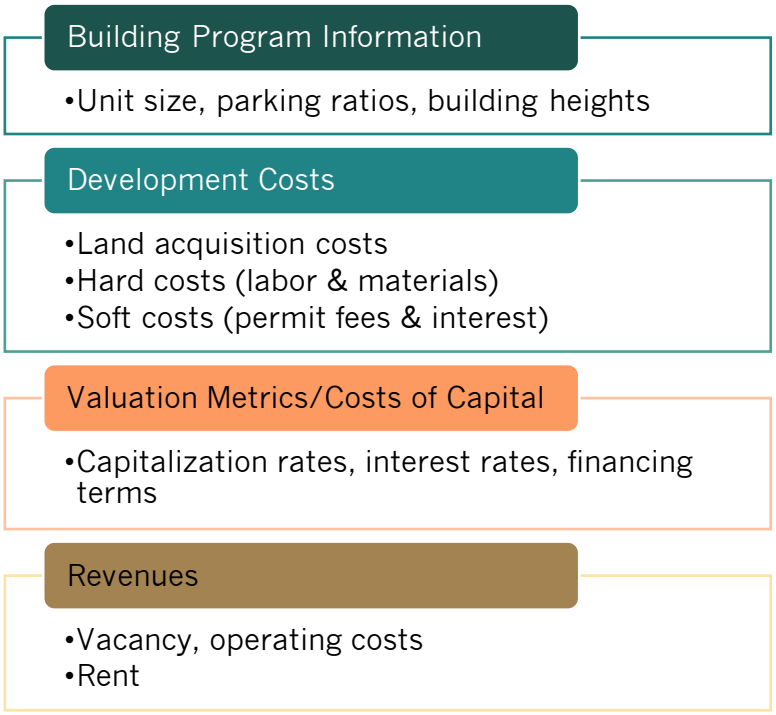
Conclusion and Next Steps

Current contractor establishments generate significant revenue with minimal effort or risk, reducing financial incentives for redevelopment. Rents for existing contractor establishments, particularly those with buildings, are already comparable to market rates for industrial and flex uses in the I-5 South Submarket. Therefore, for redevelopment to become financially feasible, market rents would likely need to rise by at least three-fifths, if not double, depending on site utilization, land acquisition costs, and construction costs. Higher site utilization scenarios present some redevelopment feasibility when land acquisition costs are low (below $20 per square foot). Conversely, properties with higher land costs or existing uses would either have substantially higher rents or reduced development costs (e.g., construction, financing) to achieve feasibility.

Owner-occupied properties are less likely to redevelop if the owner wants to maintain their business operations. Redevelopment is difficult for owner-occupants, as they must consider relocation costs and potential increases in operational expenses. Limited regional industrial land supply could push these businesses to relocate further from their markets, increasing costs for labor, transportation, and operations. Without substantial increases in land values or rents, redevelopment for these properties remains unlikely.

Achieving the City's development vision for Basalt Creek will require strategic interventions. Potential approaches could include purchasing and aggregating properties to create development-ready parcels, subsidizing infrastructure costs, adjusting system development charges (SDCs), offering other development incentives, or implementing other strategies yet to be identified.

The findings in this memorandum are preliminary and will be refined through further analysis and discussions. This study is being conducted alongside updates to the buildable lands inventory and site suitability analysis. Ultimately, these components will be synthesized with insights from the Economic Inventory into a comprehensive final report that outlines key findings and actionable recommendations.



Appendix C.1

Financial Feasibility Methods

To model development feasibility, ECOnorthwest employed a pro forma model, which is a common method used in real estate feasibility studies because it simulates the decision-making process of investors and lenders. The pro forma assesses the balance between development costs, expected revenue, and financing structure, which helps to identify viability gaps.

Figure 5. Factors Used in the Pro Forma Analysis

Source: ECOnorthwest

This method provides a general analysis of prototypical development scenarios, or prototypes, without accounting for unique conditions that might influence development feasibility (e.g., higher predevelopment costs). Therefore, this analysis serves as a strong indicator of the relative likelihood of development rather than an absolute measure of feasibility.

The pro forma considers the site utilization and potential building program of each scenario, development hard costs (construction labor and materials), other development costs (soft costs, contingency, developer fee, etc.), costs of capital, relevant operating costs, and land acquisition costs. It then calculates the rent required to cover these costs for each scenario.

Scenarios Evaluated

To establish relevant assumptions for the pro forma model, we first identified the scenarios needed to address the research questions. These scenarios were based on variations in current ownership and occupancy, potential future uses, and site utilization.

CURRENT SITE OWNERSHIP AND OCCUPANCY

We started with an understanding of the current site ownership and occupancy. Based on our understanding, there were three main categories:

- **Owners of vacant or unused land.** This category includes people who recently purchased land with the intent to develop and existing owners potentially interested in selling their land for new development.
- **Owners renting to contractor establishment tenants.** These owners might sell their property but would need compensation for the foregone future revenue from their tenants.
- **Owners using the land for their own contractor establishments.** Financial considerations for this group vary substantially. Landowners would need to account for up-front and ongoing costs associated with relocating their businesses, making this scenario more complex to quantify compared to vacant or tenant-occupied sites.

APPROACH TO ESTIMATING LAND PRICE

- **Vacant and underutilized land:** We used a comparable sales ("comps") approach to estimate land price, which accounts for the sales price of recently purchased land, especially by those intending to develop (see the callout box on page 5 for details on the comps approach).
- **Tenant-occupied land:** For owners renting to contractor establishment tenants, we used an income-based approach to estimate the financial hurdle of land price. This better reflects the potential foregone revenue from tenants (see the callout box on page 5 for details on the income-based approach).
- **Owner-occupied land:** Due to varied business conditions of landowners who are using the land for their own contractor establishment, we evaluated this scenario qualitatively, considering insights from the other scenarios.

FUTURE BUILDING PROGRAMS

We then considered the potential future building programs that could occur on these former contractor establishment sites. We based the building square footage of our two prototypes on observed comparable flex and industrial spaces, based on CoStar data from the I-5 South Submarket. Key considerations included:

- **Site Utilization:** Over the past 20 years, average site utilization (building area relative to site area) in the I-5 South Submarket was about 20 percent. Recent developments such as the Sherwood Commerce Center and Graham's Ferry Industrial Center achieved 35 percent and 45 percent site utilization, respectively. But this was enabled by maximizing impervious coverage for parking and truck logistics. Future development in some portions of the study area may face constraints due to natural site features or zoning

standards. We therefore modeled three prototypes to capture a range of potential future development conditions:

- **Low utilization:** 20 percent
- **High utilization:** 35 percent
- **Very high utilization:** 45 percent

CONSTRUCTION COSTS

Lastly, for the scenarios we modeled, we evaluated a range of potential construction costs for flex and industrial uses. We referenced the **2024 National Building Cost Manual** by Craftsman to arrive at a range of potential construction costs for various building types that could house future flex and industrial uses. We conducted sensitivity testing of the potential rents needed to cover low to high construction costs, and the results that informed our key findings are inclusive of the range used.

The land cost, site utilization, and building costs were all assumptions that varied in our analyses as we conducted sensitivity testing of different scenarios (e.g., high site coverage, high land costs, high construction costs). All other pro forma assumptions we held constant. We describe the specifics of these assumptions in the section below.

Detailed Methods and Assumptions

To evaluate future flex or industrial rental uses, we began by calculating development costs. This involved applying the cost-per-square-foot values (see Table 1. Scenarios and Assumptions Used) to the building square footage derived from the site utilization. From that construction cost, we calculated the soft cost, contingency, and developer fees to arrive at the total development cost.

Given the potential range of sources to fund these projects, we used a high-level approach and assumed all sources of money that funded the project would require a 6 percent annual return based on a 30-year term. We calculated a payment inclusive of this return, based on the total development cost, to arrive at the rent needed to cover these annual costs. We also assumed these rents would be triple net and that, therefore, the operating costs would be passed on to the tenant, which is common for flex and industrial lease terms. We highlight the specific assumptions of this analysis, and any relevant ranges, in Table 1.

Table 1. Scenarios and Assumptions Used

Source: ECOnorthwest, CoStar, Redfin, Craftsman, Stakeholder Interviews

Assumption	Values
Land price	Ranged from $7 to $26 based on observed sales comps of vacant land as well as one sale observation of a contractor establishment. Ranged from $19 to $52 per square foot based on income-based approach.
Building program	(3) square footage estimates based on a calculation of 20% site utilization, 35% site utilization, 45% site utilization
Construction costs	$75 to $200 per square foot of building; $20 per square foot of paving
Soft costs	20% of hard costs
Contingency	5% of hard and soft costs
Developer fee	5% of hard and soft costs plus contingency
Costs of capital	6% annual interest range, 30-year term for all funding sources
Operating costs	Assumed triple net rents

Wilsonville Industrial Land Readiness – Basalt Creek

City Council Work Session
June 2, 2025
Presented by: Cindy Luxhoj AICP, Associate Planner
Dan Pauly AICP, Planning Manager
Matt Lorenzen, Economic Development Manager

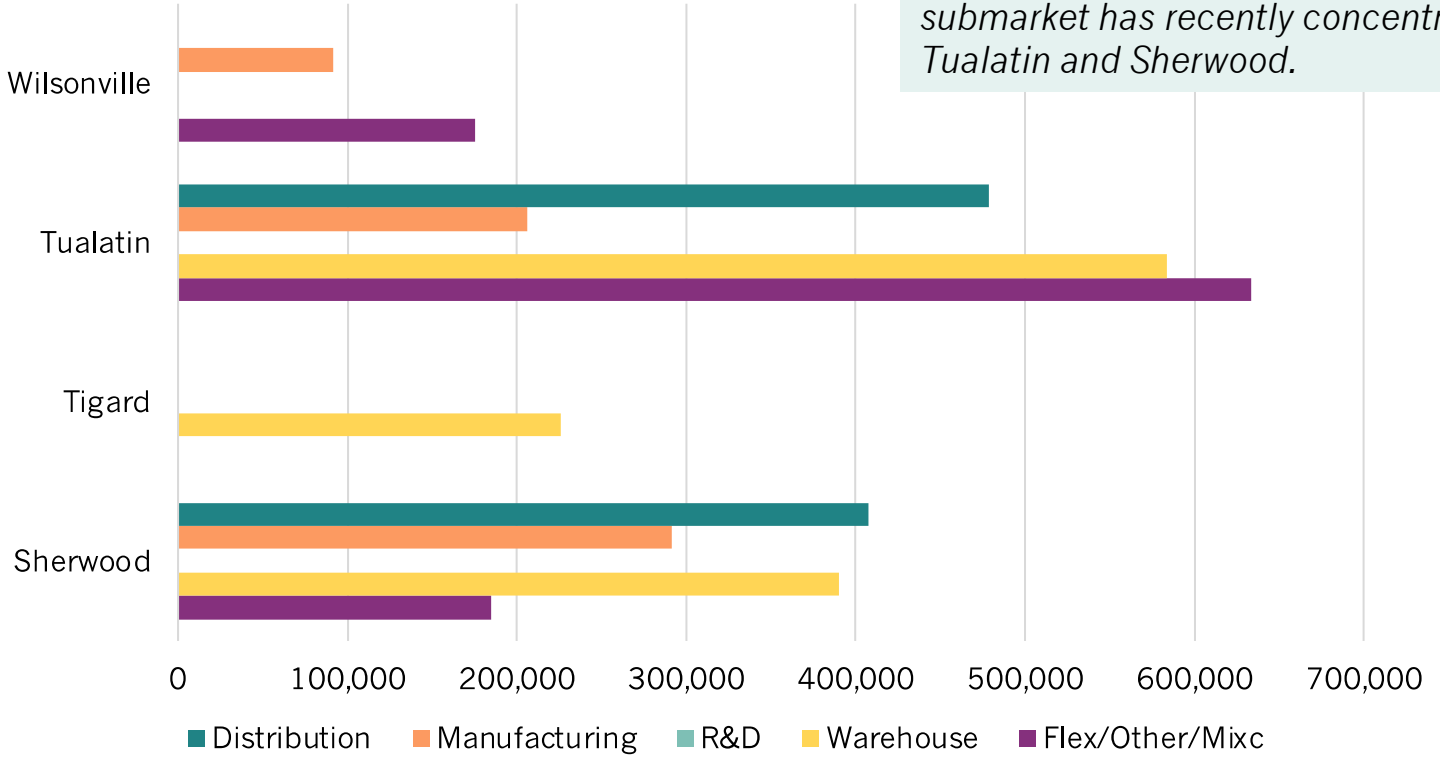
Market/Economic Key Findings

Changes in Employment

- **National:**
  - Strong employment growth since 2020
- **State:**
  - Oregon's employment recovery from the pandemic, while positive, lagged national trends

- **Wilsonville:**
  - In 2022 Wilsonville had 21,383 covered employees
  - Wilsonville's three largest industries were manufacturing, wholesale trade, and construction
  - These sectors make up 43% of jobs in Wilsonville and 22% of jobs in the Tri-County region

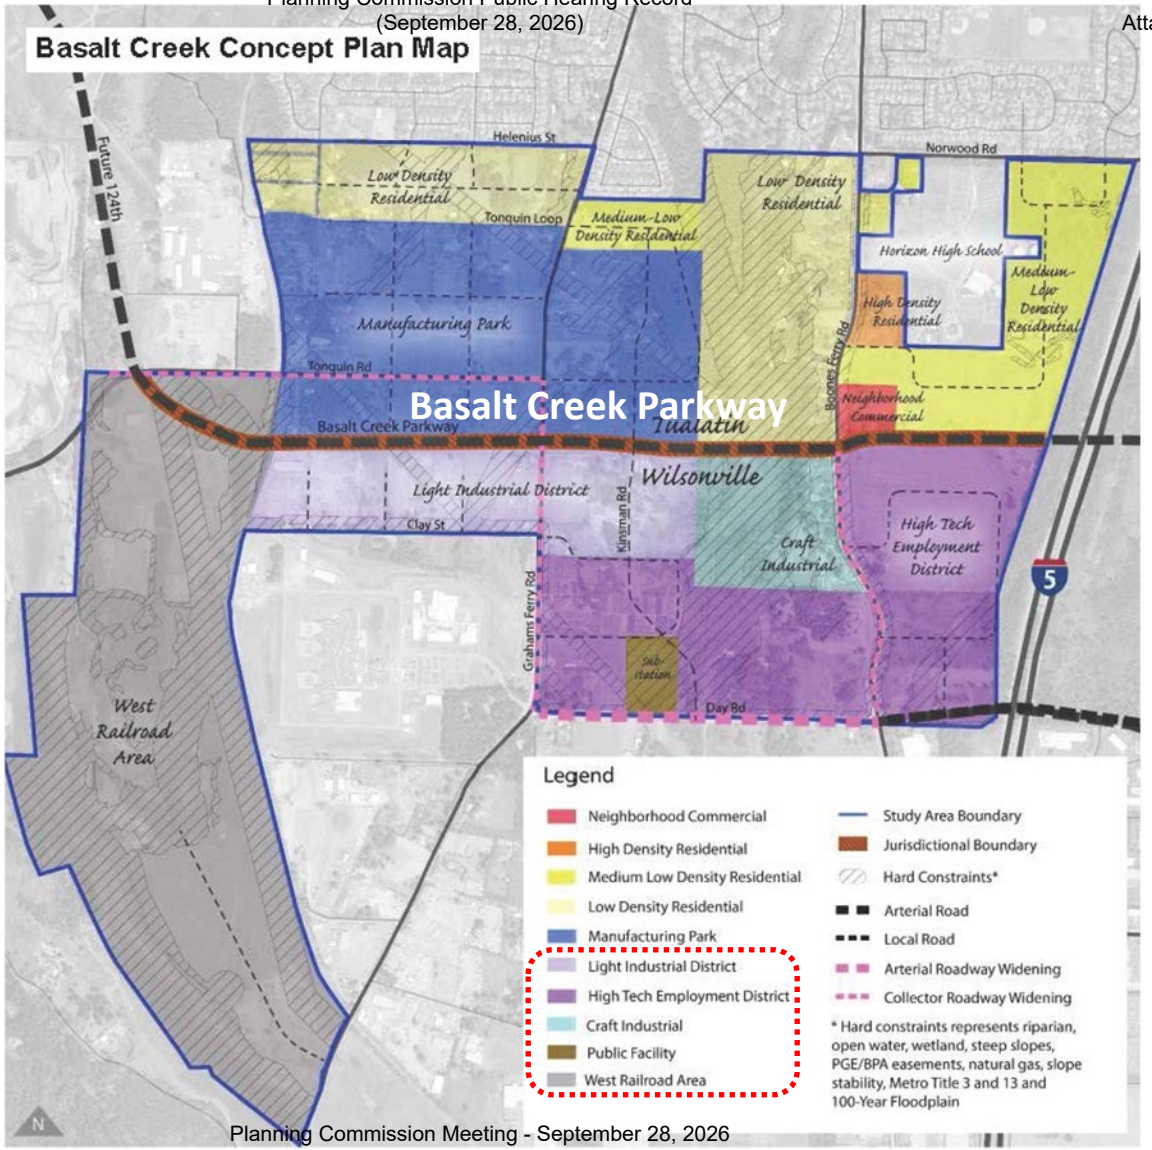
Office Market Trends



- **National:**
  - Office market declining
  - Expected to adjust to hybrid work model
- **Portland Metro:**
  - Record high vacancy rates
  - Low leasing activity
  - Suburban office markets performing better than downtown
- **Wilsonville:**
  - Lower vacancy rates than broader region with recent spikes as leases end
  - Rents on par with Portland Metro for first time in a decade, but below I-5 South Submarket

Industrial Market Trends

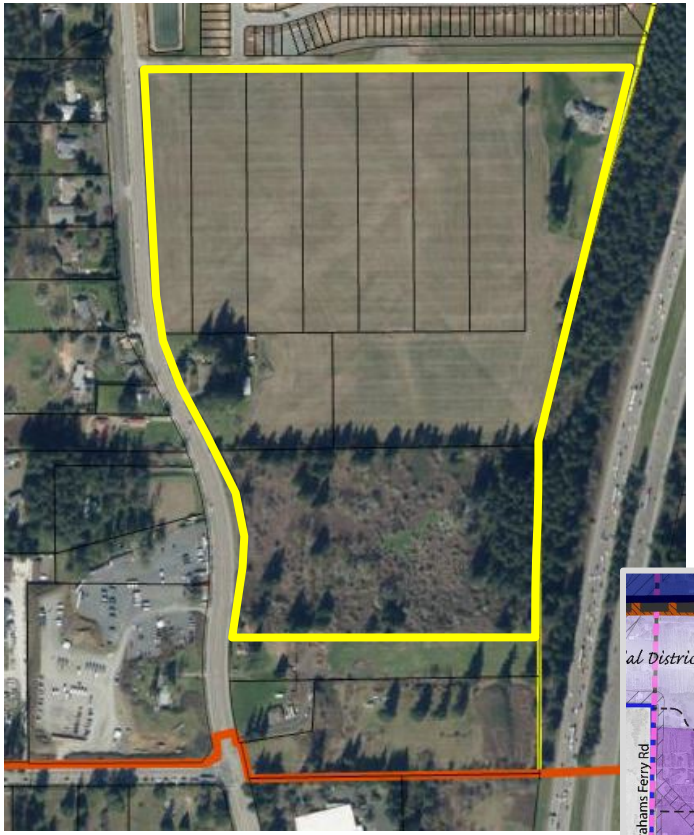
- **National:**
  - Growth decelerating, but remains relatively strong overall
- **Portland Metro:**
  - Strong growth between 2021 and 2023, but decelerating
  - Investor confidence in market
  - Continued growth in industrial space
- **Wilsonville:**
  - Very low vacancy, below broader market
  - Increasing rents, above broader market
  - Limited industrial development over past decade



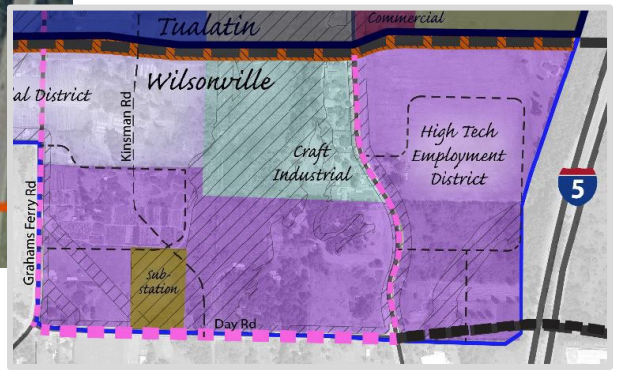
Industrial & Flex Trends I-5 South Submarket, 2019-2026

Industrial development in the I-5 South submarket has recently concentrated in Tualatin and Sherwood.

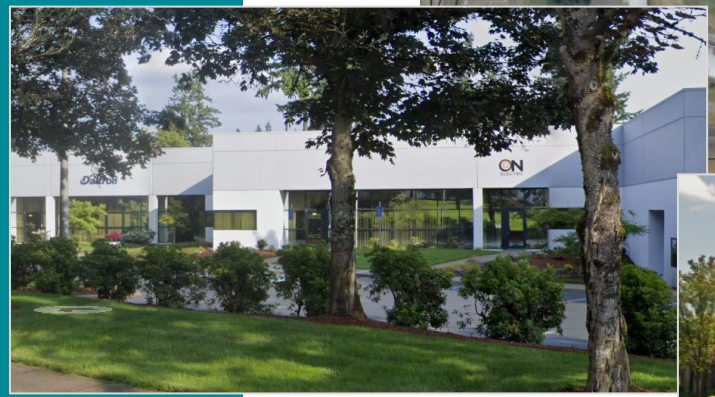
Land Use Type Suitability

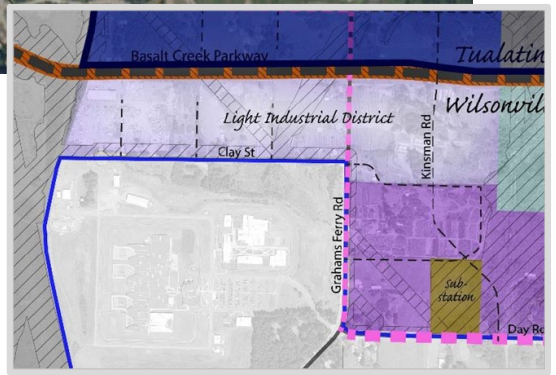


WILSONVILLE
OREGON

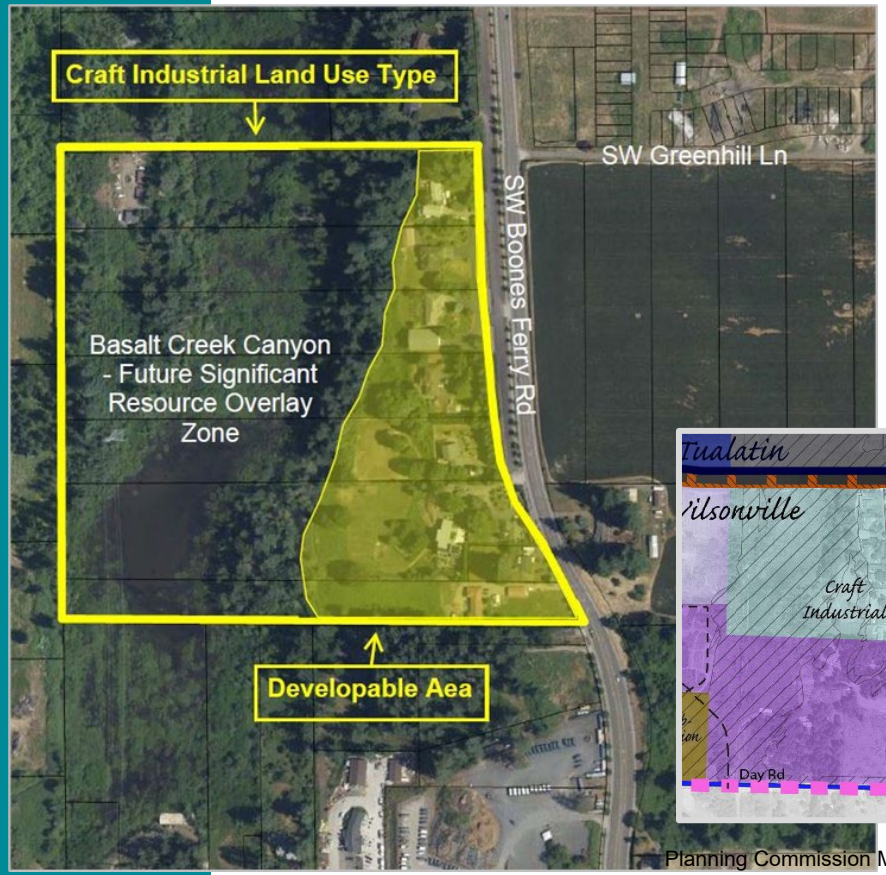


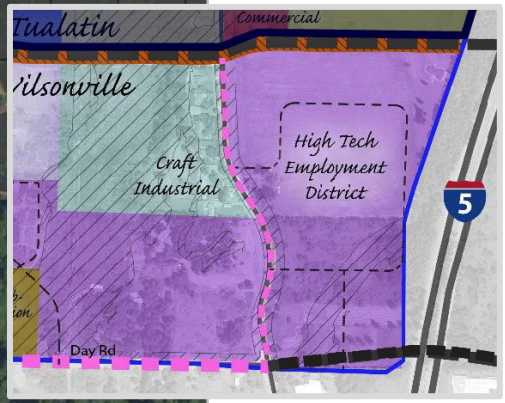
High-Tech Employment



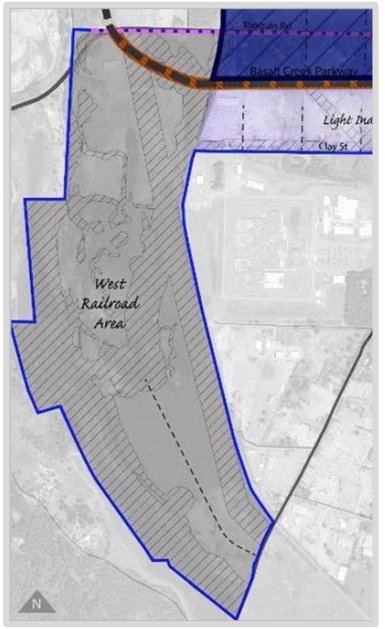


Light Industrial





Craft Industrial



West Railroad

Potential Zoning

- High-Tech Employment and Light Industrial
  - Planned Development Industrial (PDI) Zone
    - Explore zoning limitations on:
      - Low-intensity uses
      - Large-scale uses
- Craft Industrial
  - New Craft Industrial (CI) Zone
- All or portion of Basalt Creek
  - Consider northern extension of Industrial Design Overlay District

Planning Commission Input

- Implement High-Tech Employment, Light Industrial, and Craft Industrial land use types
- Apply Planned Development Industrial Zone to High-Tech and Light Industrial land use types with additions as noted
- Establish new Craft Industrial Zone
- Consider extending Coffee Creek Industrial Design Overlay District (form-based code) to all or part of planning area

Discussion

- Does the City Council concur that the Concept Plan land use types continue to align with the City's vision for Basalt Creek?
- Does the City Council have additional guidance that would help inform Development Code and economic development actions for the different land use types?

ACTION MINUTES

June 02, 2025, at 5:00 PM

Wilsonville City Hall & Remote Video Conferencing

PRESENT:
Mayor O'Neil
Councilor President Berry
Councilor Dunwell
Councilor Cunningham
Councilor Shevlin

STAFF PRESENT:
Amanda Guile-Hinman, City Attorney
Bill Evans, Communications & Marketing Manager
Bryan Cosgrove, City Manager
Dan Pauly, Planning Manager
Dwight Brashear, Transit Director
Erika Valentine, Arts & Culture Program Coordinator
Jeanna Troha, Assistant City Manager
Katherine Smith, Assistant Finance Director
Keith Katko, Finance Director
Kelsey Lewis, Grants & Programs Manager
Kimberly Rybold, Senior Planner
Kimberly Veliz, City Recorder
Matt Lorenzen, Economic Development Manager
Zach Weigel, City Engineer
Zoe Mombert, Assistant to the City Manager

WORK SESSION [5:00 PM]

REVIEW OF AGENDA AND ITEMS ON CONSENT

There was none.

COUNCILORS' CONCERNS

Councilors commented on the important agenda items for the regular meeting, highlighting the need for professionalism and respect in discussions.

PRE-COUNCIL WORK SESSION

1. Sewer & Storm System Development Charge Update

Staff provided a briefing on the updated sewer and storm System Development Charge (SDC) and discussed the next steps with Council.

2. Wilsonville Industrial Land Readiness (Basalt Creek)

Staff sought Council input on policy direction for the Basalt Creek Planning Area to inform the Master Plan.

ADJOURN [6:12 PM]

EXECUTIVE SESSION [6:19 PM]

- ORS 192.660(2)(h) Legal Counsel/Litigation

ADJOURN [6:35 PM]

CITY COUNCIL MEETING [7:00 PM]

CALL TO ORDER

1. Roll Call

2. Pledge of Allegiance

3. Motion to approve the following order of the agenda.

Moved to approve the order of the agenda 5-0.

MAYOR'S BUSINESS

4. Upcoming Meetings

Upcoming meetings were announced by the Mayor as well as the regional meetings he attended on behalf of the City.

COMMUNICATIONS

5. heARTs of Wilsonville: Many Cultures, One Heart Public Art Project Update

Staff summarized the process undertaken to execute "heARTs of Wilsonville: Many Cultures, One Heart," a public art project that temporarily installed ten hand-painted fiberglass hearts at visible locations throughout Wilsonville. This project was funded by a Wilsonville-Metro Community Enhancement grant award.

CITIZEN INPUT AND COMMUNITY ANNOUNCEMENTS

This is an opportunity for visitors to address the City Council on any matter concerning City's Business or any matter over which the Council has control. It is also the time to address items not on the agenda. It is also the time to address items that are on the agenda but not scheduled for a public hearing. Staff and the City Council will make every effort to respond to questions raised during citizen input before tonight's meeting ends or as quickly as possible thereafter. Please limit your comments to three minutes.

COUNCILOR COMMENTS, LIAISON REPORTS AND MEETING ANNOUNCEMENTS

Councilors announced prior and upcoming meetings and events.

CONSENT AGENDA

6. **Resolution No. 3196**
   A Resolution Of The City Of Wilsonville Authorizing The City Manager To Execute A Construction Contract With VSS International, Inc For The Fiscal Year (FY) 2026 Slurry Seal Project (Capital Improvement Project 4014).

7. Minutes of the May 5, 2025, City Council Meeting.

8. Minutes of the May 19, 2025, City Council Meeting.

The Consent Agenda was adopted 5-0.

NEW BUSINESS

There was none.

CONTINUING BUSINESS

There was none.

PUBLIC HEARING

9. **Ordinance No. 898**
   An Ordinance Of The City Of Wilsonville Adopting The 2025-2045 Housing Needs And Capacity Analysis As A Sub-Element Of The Comprehensive Plan And Related Comprehensive Plan Text Amendments.

After a public hearing Ordinance No. 898 was adopted on first reading 5-0.

10. **Resolution No. 3203**
    A Resolution Of The City Of Wilsonville Adopting The Housing Production Strategy.

After a public hearing Resolution No. 3203 was adopted 5-0.

11. **Resolution No. 3198**
    A Resolution Declaring The City's Eligibility To Receive State Shared Revenues.

After a public hearing Resolution No. 3198 was adopted 5-0.

12. **Resolution No. 3199**
    A Resolution Declaring The City's Election To Receive State Shared Revenues.

After a public hearing Resolution No. 3199 was adopted 5-0.

13. **Resolution No. 3200**
    A Resolution Of The City Of Wilsonville Adopting The Budget, Making Appropriations, Declaring The Ad Valorem Tax Levy, And Classifying The Levy As Provided By ORS 310.060(2) For Fiscal Year 2025-26.

After a public hearing Resolution No. 3200 was adopted 3-2.

14. **Resolution No. 3201**
    A Resolution Of The City Of Wilsonville Authorizing A Supplemental Budget Adjustment For Fiscal Year 2024-25.

After a public hearing Resolution No. 3201 was adopted 5-0.

WORK SESSION

Wilsonville Industrial Land Readiness (Basalt Creek Master Plan) (Luxhoj)(Pauly)

CITY COUNCIL MEETING
STAFF REPORT

Meeting Date: May 19, 2025	**Subject:** Wilsonville Industrial Land Readiness – Basalt Creek **Staff Members:** Cindy Luxhoj AICP, Associate Planner, and Dan Pauly AICP, Planning Manager **Department:** Community Development
Action Required	**Advisory Board/Commission Recommendation**
☐ Motion ☐ Public Hearing Date: ☐ Ordinance 1st Reading Date: ☐ Ordinance 2nd Reading Date: ☐ Resolution ☒ Information or Direction ☐ Information Only ☐ Council Direction ☐ Consent Agenda	☐ Approval ☐ Denial ☐ None Forwarded ☒ Not Applicable **Comments:** N/A
Staff Recommendation: Review the Basalt Creek industrial area background information in preparation for upcoming work sessions.	
Recommended Language for Motion: N/A	
Project / Issue Relates To:	

☒Council Goals/Priorities: Attract high-quality industry and support economic opportunity for all in Wilsonville	☒Adopted Master Plan(s): Basalt Creek Concept Plan	☐Not Applicable

ISSUE BEFORE COUNCIL:

Review the background information and regulatory context of the Basalt Creek industrial area to prepare for upcoming work sessions regarding the City's vision and planned land uses for the area, which will shape the Master Plan expected to be adopted at the end of the year.

EXECUTIVE SUMMARY:

Since the adoption of the Basalt Creek Concept Plan in 2018, prepared jointly with the City of Tualatin, several years have passed. During this period, both Cities have individually advanced implementation efforts. However, Wilsonville has yet to complete certain steps, including master planning, amending the Development Code for appropriate zoning, and preparing an infrastructure funding plan. Consequently, it was necessary to review the Concept Plan, update specific components, and address these unfinished tasks to facilitate future urban industrial development in Basalt Creek.

This informational item provides background and context on three key topics in preparation for the upcoming work sessions on Basalt Creek, including one scheduled for June 2:

- **Regulatory Context**: The rationale for including Basalt Creek in the urban growth boundary and the regulatory framework guiding industrial land planning for the area.
- **Land Use Types**: Designated land use types in the Basalt Creek Concept Plan and the envisioned development for these areas.
- **Guiding Principles**: How the Concept Plan's Guiding Principles reflect Wilsonville's aspirations for the area.

Regulatory Context

Metro added the Basalt Creek Planning Area to the urban growth boundary in 2004 through Ordinance No. 04-1040B to address regional employment land needs (Attachment 1). Consistent with the Metro Ordinance, the Basalt Creek Concept Plan (BCCP) designated Wilsonville's portion of the plan area for a range of industrial uses. The BCCP is unique, because it was a collaborative project between Tualatin and Wilsonville as the cities expand to share a future boundary. The planning also included extensive coordination with Washington County and Metro.

Basalt Creek Concept Plan Land Use Types

The BCCP designates properties for High-Tech Employment, Light Industrial, and Craft Industrial (Attachment 2):

- **High-Tech Employment**: Located with high visibility from Interstate-5 and along SW Boones Ferry and Day Roads, this land use type is intended for high-tech single-users, manufacturing, and some warehouse space in one- to five-story buildings, with roughly half office and half other industrial use.
- **Light Industrial**: Situated in the central part of the Planning Area, this land use type is expected to include primarily manufacturing and warehouse uses in single- or multi-tenant buildings, with some office and commercial activities, assumed to be roughly two-thirds industrial and one-third split between office and warehousing uses.
- **Craft Industrial**: Located immediately west of SW Boones Ferry Road, this area responds to existing single-family residential development and natural resource constraints. Initially, it is envisioned to include home businesses and cottage industries in garages, converted portions of homes, and accessory buildings. Over time, redevelopment could incorporate a variety of craft industries, maker spaces, and other complementary employment uses.

Over the last year the City has worked with consultants to prepare studies that reevaluate these land use types under current market and other conditions. This work aims to inform refinement of the land uses during Master Plan development and drafting implementing Development Code language. At the June 2 City Council Work Session, staff will present information from recent studies, along with input from the Planning Commission, and seek Council's guidance on implementing these land uses.

None of the three land use types above were applied to an area of the 2004 urban growth boundary (UGB) addition referred to as West Railroad. This area is west of Portland and Western Railroad along the Coffee Lake wetlands extending from Grahams Ferry Road to Basalt Creek Parkway/Tonquin Road (see Attachment 2). Due to constraints such as natural resource limitations and inadequate infrastructure, planning for the West Railroad area was postponed during concept planning and it was not assigned a land use type. This postponed work is now part of the current project and will be presented to City Council when ready.

Basalt Creek Concept Plan Guiding Principles

The Guiding Principles established by the Joint Council of Tualatin and Wilsonville in the BCCP encapsulate the Cities' interests and goals for the area. Adapted for Wilsonville, these principles include:

- Maintain and complement Wilsonville's unique identity
- Capitalize on the area's unique assets and natural location
- Explore creative approaches to integrate jobs and housing in the Craft Industrial District
- Create a uniquely attractive business community unmatched in the metropolitan region
- Ensure appropriate transitions between land uses
- Meet regional responsibility for jobs
- Design cohesive and efficient transportation and utility systems
- Maximize assessed property value
- Incorporate natural resource areas and provide recreational opportunities as community amenities and assets

EXPECTED RESULTS:

With additional background and context City Council will be prepped to guide implementation for the Basalt Creek planning area over the coming months, including a master plan and Development Code amendments, economic development strategies, and an infrastructure funding plan.

TIMELINE:

Additional work sessions with the City Council and Planning Commission are planned for the coming months. Public hearings on related Development Code amendments are expected at the end of this year.

CURRENT YEAR BUDGET IMPACTS:
Funding for the first phase of the Wilsonville Industrial Land Readiness project is allocated in the fiscal year (FY) 2024-25 Planning Division budget and, for the second phase, will be allocated in the FY 2025-26 budget. The first phase was primarily funded by a $100,000 grant from Business Oregon, with additional funding available, if needed, from a $290,000 Metro grant, which also will fund the second project phase.

COMMUNITY INVOLVEMENT PROCESS:
The Basalt Creek Concept Plan review process included comprehensive community involvement. In the first phase of the Wilsonville Industrial Land Readiness (WILR) project, ECONorthwest gathered input from Business Oregon, Greater Portland Inc., property owners, and developers to understand the demand for industrial land in Wilsonville and property owners' current and future plans. This input informed the preparation of studies and reports and will guide the determination of appropriate zoning standards and necessary Code amendments.

POTENTIAL IMPACTS OR BENEFIT TO THE COMMUNITY:
Adopting appropriate zoning standards, creating an infrastructure funding plan, and pursuing economic development strategies will remove barriers to development and enable the implementation of the Basalt Creek Concept Plan. When developed, Basalt Creek will generate jobs, contributing to the income and property tax base, supporting economic mobility through family-wage employment, and enhancing Wilsonville's livability. This will allow the industrial area to reach its full economic potential, positively impacting the greater Wilsonville community.

ALTERNATIVES:
As zoning standards, economic strategies, and an infrastructure funding plan are developed, alternatives will be explored and developed with the City Council and Planning Commission.

BEFORE THE METRO COUNCIL

FOR THE PURPOSE OF AMENDING THE METRO URBAN GROWTH BOUNDARY, THE REGIONAL FRAMEWORK PLAN AND THE METRO CODE TO INCREASE THE CAPACITY OF THE BOUNDARY TO ACCOMMODATE GROWTH IN INDUSTRIAL EMPLOYMENT	)))))))	ORDINANCE NO. 04-1040B Introduced by the Metro Council

WHEREAS, by Ordinance No. 02-969B (For The Purpose Of Amending The Urban Growth Boundary, The Regional Framework Plan And The Metro Code In Order To Increase The Capacity Of The Boundary To Accommodate Population Growth To The Year 2022), the Council amended Title 4 (Industrial and Other Employment Areas) of the Urban Growth Management Functional Plan to increase the capacity of industrial land to accommodate industrial jobs; and

WHEREAS, the Metro Council adopted an Employment and Industrial Areas Map as part of Title 4 (Retail in Employment and Industrial Areas) in Ordinance No. 96-647C (For the Purpose of Adopting a Functional Plan for Early Implementation of the 2040 Growth Concept) on November 21, 1996; and

WHEREAS, the Council amended the Regional Framework Plan ("RFP") by Exhibit D to Ordinance No. 02-969B (For the Purpose of Amending the Metro Urban Growth Boundary, the Regional Framework Plan and the Metro Code in Order to Increase the Capacity of the Boundary to Accommodate Population Growth to the Year 2022), adopted on December 5, 2002, to establish a new 2040 Growth Concept design type entitled "Regionally Significant Industrial Area" ("RSIA") and to add Policies 1.4.1 and 1.4.2 to protect such areas by limiting conflicting uses; and

WHEREAS, by Exhibit F to Ordinance No. 02-969B the Council amended Title 4 (Industrial and Other Employment Areas) of the Urban Growth Management Functional Plan ("UGMFP") to implement Policies 1.4.1 and 1.4.2 of the RFP; and

WHEREAS, by Exhibit E of Ordinance No. 02-969B the Council adopted a "Generalized Map of Regionally Significant Industrial Areas" depicting certain Industrial Areas that lay within the UGB prior to its expansion as part of Task 2 of periodic review as RSIAs; and

WHEREAS, Title 4 calls upon the Council to delineate specific boundaries for RSIAs derived from the "Generalized Map of Regionally Significant Industrial Areas" after consultation with cities and counties; and

WHEREAS, by Ordinance No. 02-969B, the Council added capacity to the UGB but did not add sufficient capacity to accommodate the full need for land for industrial use; and

WHEREAS, the Metro Council submitted Ordinance No. 969B, in combination with other ordinances that increased the capacity of the UGB, to the Land Conservation and Development Commission (LCDC) as part of Metro's periodic review of the capacity of its UGB; and

WHEREAS, on July 7, 2003, LCDC issued its "Partial Approval and Remand Order 03-WKTASK-001524" that approved most of the Council's decisions, but returned the matter to the Council for completion or revision of three tasks: (1) provide complete data on the number, density and mix of housing types and determine the need for housing types over the next 20 years; (2) add capacity to the UGB for the unmet portion of the need for land for industrial use; and (3) either remove tax lots 1300, 1400 and 1500 in Study Area 62 from the UGB or justify their inclusion; and

WHEREAS, the Council completed its analysis of the number, density and mix of housing types and the need for housing over the planning period 2002-2022 and incorporated its conclusions in a revision to its Housing Needs Analysis; and

WHEREAS, the Council increased the capacity of the UGB both by adding land to the UGB and by revising the Regional Framework Plan and Title 4 of the UGMFP to meet the previously unmet portion of the need for land for industrial use; and

WHEREAS, a change in design type designation of a portion of Study Area 12 added to the UGB on December 5, 2002, by Ordinance No. 02-969B from residential to industrial will help the region accommodate the need for industrial use without reducing the region's residential capacity below the region's residential need; and

WHEREAS, the Council decided to remove tax lots 1300, 1400 and 1500 in Study Area 62 from the UGB; and

WHEREAS, the Council consulted its Metropolitan Policy Advisory Committee and the 24 cities and three counties of the metropolitan region and considered comments and suggestions prior to making this decision; and

WHEREAS, prior to making this decision, the Council sent individual mailed notification to more than 100,000 households in the region and held public hearings on Title 4 and the efficient use of industrial land on December 4 and 11, 2003, public workshops at six locations around the region in March, 2004, on possible amendments to the UGB, and public hearings on the entire matter on April 22 and 29, May 6, May 27, and June 10 and 24, 2004; now, therefore

THE METRO COUNCIL HEREBY ORDAINS AS FOLLOWS:

1. Policy 1.12 of the Regional Framework Plan is hereby amended, as indicated in Exhibit A, attached and incorporated into this ordinance, to guide the choice of farmland for addition to the UGB when no higher priority land is available or suitable.

2. Title 4 (Industrial and Other Employment Areas) of the Urban Growth Management Functional Plan is hereby amended, as indicated in Exhibit B, attached and incorporated into this ordinance, to improve implementation of Title 4 by cities and counties in the region.

3. The Employment and Industrial Areas Map is hereby amended, as shown in Exhibit C, attached and incorporated into this ordinance, to depict the boundaries of Regionally Significant Industrial Areas pursuant to Policy 1.4.1 of the Regional Framework Plan in order to ensure more efficient use of the areas for industries reliant upon the movement of freight and to protect the function and capacity of freight routes and connectors in the region.

4. The Revised Housing Needs Analysis, January 24, 2003, is hereby further revised, as indicated in Exhibit D, Addendum to Housing Needs Analysis, April 5, 2004, attached and incorporated into this ordinance, to comply with the first item in LCDC's "Partial Approval and Remand Order 03-WKTASK-001524."

5. The Metro UGB is hereby amended to include all or portions of the Study Areas shown on Exhibit E with the designated 2040 Growth Concept design type, ~~and more precisely identified in the Industrial Land Alternative Analysis Study, February, 2004, Item (c) in Appendix A,~~ subject to the conditions set forth in Exhibit F, and to exclude tax lots 1300, 1400 and 1500 in Study Area 62 ~~and the southeast portion of Study Area 9 from the UGB~~, also shown on Exhibit E and more precisely identified in the Staff Report, "In Consideration of Ordinance No. 04-1040, For the Purpose of Amending the Metro Urban Growth Boundary, the Regional Framework Plan and the Metro Code to increase the capacity of the Boundary to Accommodate Growth in Industrial Employment", Item (a) in Appendix A. Exhibits E and F are attached and incorporated into this ordinance to comply with the second and third items in LCDC's "Partial Approval and Remand Order 03-WKTASK-001524."

6. Ordinance No. 02-969B is hereby amended to change the 2040 Growth Concept design type designation for that 90-acre portion of Study Area 12 that projects from the rest of the study area to the southeast along Highway 26 from "Inner Neighborhood" to "Regionally Significant Industrial Area."

~~6~~7. The Appendix, attached and incorporated into this ordinance, is hereby adopted in support of the amendments to the UGB, the Regional Framework Plan and the Metro Code in sections 1 through 3 of this ordinance. The following documents comprise the Appendix:

a. Staff Report, "In Consideration of Ordinance No. 04-1040, For the Purpose of Amending the Metro Urban Growth Boundary, the Regional Framework Plan and the Metro Code to increase the capacity of the Boundary to Accommodate Growth in Industrial Employment", April 5, 2004.

OMA/RPB/kvw (06/18/04)

Exhibit A to Ordinance No. 04-1040B

REGIONAL FRAMEWORK PLAN POLICY 1.12
Protection of Agriculture and Forest Resource Land

~~1.12~~1.12.1 Agricultural and forest land outside the UGB shall be protected from urbanization, and accounted for in regional economic and development plans, consistent with this Plan. However, Metro recognizes that all the statewide goals, including Statewide Goal 10, and Goal 14, Urbanization, are of equal importance to Goals 3 and 4, which protect agriculture and forest resource lands. These goals represent competing and, some times, conflicting policy interests which need to be balanced.

~~**1.12.1 Rural Resource Lands**~~

~~Rural resource lands outside the UGB that have significant resource value should actively be protected from urbanization. However, not all land zoned for exclusive farm use is of equal agricultural value.~~

1.12.2 When the Council must choose among agricultural lands of the same soil classification for addition to the UGB, the Council shall choose agricultural land deemed less important to the continuation of commercial agriculture in the region.

~~**1.12.2 Urban Expansion**~~

~~Expansion of the UGB shall occur in urban reserves, established consistent with the urban rural transition objective. All urban reserves should be planned for future urbanization even if they contain resource lands.~~

1.12.3 Metro shall enter into agreements with neighboring cities and counties to carry out Council policy on protection of agricultural and forest resource policy through the designation of Rural Reserves and other measures.

~~**1.12.3 Farm and Forest Practices**~~

~~Protect and support the ability for farm and forest practices to continue. The designation and management of rural reserves by the Metro Council may help establish this support, consistent with the Growth Concept. Agriculture and forestry require long term certainty of protection from adverse impacts of urbanization in order to promote needed investments.~~

1.12.4 Metro shall work with neighboring counties to provide a high degree of certainty for investment in agriculture in agriculture and forestry and to reduce conflicts between urbanization and agricultural and forest practices.

Exhibit B to Ordinance No. 04-1040B

TITLE 4: INDUSTRIAL AND OTHER EMPLOYMENT AREAS

3.07.410 Purpose and Intent

A. The Regional Framework Plan calls for a strong economic climate. To improve the region's economic climate, **[the plan] Title 4** seeks to **provide and** protect **[the] a** supply of sites for employment by limiting **[incompatible uses within] the types and scale of non-industrial uses in Regionally Significant Industrial Areas (RSIAs),** Industrial Areas and Employment Areas. **Title 4 also seeks to provide the benefits of "clustering" to those industries that operate more productively and efficiently in proximity to one another than in dispersed locations. Title 4 further seeks [T]t**o protect the capacity and efficiency of the region's transportation system for **the** movement of goods and services, and to **[promote the creation of jobs within designated Centers and discourages certain kinds of commercial retail development outside Centers] encourage the location of other types of employment in Centers, Employment Areas, Corridors, Main Streets and Station Communities**. **[It is the purpose of Title 4 to achieve these policies.] The** Metro **Council** will **[consider amendments to this title in order to make the title consistent with new policies on economic development adopted] evaluate the effectiveness of Title 4 in achieving these purposes** as part of **its** periodic **[review] analysis of the capacity of the urban growth boundary**.

3.07.420 Protection of Regionally Significant Industrial Areas

A. Regionally Significant Industrial Areas (RSIA) are those areas **[that offer the best opportunities for family-wage industrial jobs] near the region's most significant transportation facilities for the movement of freight and other areas most suitable for movement and storage of goods**. Each city and county with land use planning authority over **[areas] RSIAs** shown on the **[Generalized Map of Regionally Significant Industrial Areas adopted in Ordinance No. 02-969] Employment and Industrial Areas Map** shall derive specific plan designation and zoning district boundaries of **[the areas] RSIAs within its jurisdiction** from the Map, taking into account the location of existing uses that would not conform to the limitations on non-industrial uses in **[subsection C, D and E]** this section, and **[its] the** need **[of individual cities and counties]** to achieve a mix of **[types of]** employment uses.

B. **[Each city and county with land use planning authority over an area designated by Metro on the 2040 Growth Concept Map, as amended by Ordinance No. 02-969, as a Regionally Significant Industrial Area shall, as part of compliance with section 3.07.1120 of the Urban Growth Management Functional Plan, derive plan designation and zoning district boundaries of the areas from the Growth Concept Map] Cities and counties shall review their land use regulations and revise them, if necessary, to include measures to limit the size and location of new buildings for retail commercial uses - such as stores and restaurants - and retail and professional services that cater to daily customers – such as financial, insurance, real estate, legal, medical and dental offices - to ensure that they serve primarily the needs of workers in the area. One such measure shall be that new buildings for stores, branches, agencies or other outlets for these retail uses and services shall not occupy more than 3,000 square feet of sales or service area in a single outlet, or multiple outlets that occupy more than 20,000 square feet of sales or service area in a single building or in multiple buildings that are part of the same development project, with the following exceptions:**

1. Within the boundaries of a public use airport subject to a facilities master plan, customary airport uses, uses that are accessory to the travel-related and freight movement activities of airports, hospitality uses, and retail uses appropriate to serve the needs of the traveling public; and

2. Training facilities whose primary purpose is to provide training to meet industrial needs.

C. **[After determining boundaries of Regionally Significant Industrial Areas pursuant to subsections A and B, the city or county]** **Cities and counties** shall **[adopt implementing ordinances that limit development in the areas to industrial uses, uses accessory to industrial uses, offices for industrial research and development and large corporate headquarters in compliance with subsection E of this section, utilities, and those non-industrial uses necessary to serve the needs of businesses and employees of the areas]** **review their land use regulations and revise them, if necessary, to include measures to limit the siting and location of new buildings for the uses described in subsection B and for non-industrial uses that do not cater to daily customers - such as bank or insurance processing centers - to ensure that such uses do not reduce off-peak performance on Main Roadway Routes and Roadway Connectors shown on Metro's Freight Network Map, November, 2003, below standards set in the 2004 Regional Transportation Plan or require added road capacity to prevent falling below the standards**.

D. **[Notwithstanding subsection C, a city or county shall not approve:**

1. A commercial retail use with more that 20,000 square feet of retail sales area in a single building or in multiple buildings that are part of the same development project;
or

2. Commercial retail uses that would occupy more than five percent of the net developable portion of all contiguous Regionally Significant Industrial Areas] **No city or county shall amend its land use regulations that apply to lands shown as RSIA on the Employment and Industrial Areas Map to authorize uses described in subsection B that were not authorized prior to July 1, 2004.**

E. **[As provided in subsection C of this section, a city or county may approve an office for industrial research and development or a large corporate headquarters if:**

1. The office is served by public or private transit; and

2. If the office is for a corporate headquarters, it will accommodate for the initial occupant at least 1,000 employees]

[F. A city or county] **Cities and counties** may allow division of lots or parcels into smaller lots or parcels as follows:

1. Lots or parcels **[less]** **smaller** than 50 acres may be divided into any number of smaller lots or parcels**[;].**

2. Lots or parcels **[50 acres or]** larger **than 50 acres** may be divided into smaller lots and parcels **pursuant to a master plan approved by the city or county** so long as the resulting division yields **[the maximum number of lots or parcels of]** at least **[50 acres]** **one lot or parcel of at least 50 acres in size[;].**

3. **Lots or parcels 50 acres or larger, including those created pursuant to paragraph (2) of this subsection, may be divided into any number of smaller lots or parcels pursuant to a master plan approved by the city or county so long as at least 40 percent of the area of the lot or parcel has**

been developed with industrial uses or uses accessory to industrial use, and no portion has been developed, or is proposed to be developed, with uses described in subsection B of this section.

4. Notwithstanding paragraphs 2**[,] and** 3 **[and]** of this subsection, any lot or parcel may be divided into smaller lots or parcels or made subject to rights-of-way for the following purposes:

a. To provide public facilities and services;

b. To separate a portion of a lot or parcel in order to protect a natural resource, to provide a public amenity, or to implement a remediation plan for a site identified by the Oregon Department of Environmental Quality pursuant to ORS 465.225;

c. To separate a portion of a lot or parcel containing a nonconforming use from the remainder of the lot or parcel in order to render the remainder more practical for a permitted use; **or**

d. **[To reconfigure the pattern of lots and parcels pursuant to subsection G or this section]**

[e.] To allow the creation of a lot for financing purposes when the created lot is part of a master planned development.

[G. A city or county may allow reconfiguration of lots or parcels less than 50 acres in area if the reconfiguration would be more conducive to a permitted use and would result in no net increase in the total number of lots and parcels. Lots or parcels 50 acres or greater in area may also be reconfigured so long as the resulting area of any such lot or parcel would not be less than 50 acres.]

[H] F. Notwithstanding subsections **[C and D] B** of this section, a city or county may allow the lawful use of any building, structure or land existing at the time of adoption of its ordinance to implement this section to continue and to expand to add up to 20 percent more floor area and 10 percent more land area. Notwithstanding subsection E of this section, a city or county may allow division of lots or parcels pursuant to a master plan approved by the city or county prior to **[December 31, 2003] July 1, 2004**.

3.07.430 Protection of Industrial Areas

A. **[In Industrial Areas mapped pursuant to Metro Code section 3.07.130 that are not Regionally Significant Industrial Areas, c] C**ities and counties shall **[limit new and expanded retail commercial uses to those appropriate in type and size to serve the needs of businesses, employees and residents of the Industrial Areas] review their land use regulations and revise them, if necessary, to include measures to limit new buildings for retail commercial uses - such as stores and restaurants - and retail and professional services that cater to daily customers – such as financial, insurance, real estate, legal, medical and dental offices - in order to ensure that they serve primarily the needs of workers in the area. One such measure shall be that new buildings for stores, branches, agencies or other outlets for these retail uses and services shall not occupy more than 5,000 square feet of sales or service area in a single outlet, or multiple outlets that occupy more than 20,000 square feet of sales or service area in a single building or in multiple buildings that are part of the same development project, with the following exceptions:**

1. Within the boundaries of a public use airport subject to a facilities master plan, customary airport uses, uses that are accessory to the travel-related and freight movement activities of airports, hospitality uses, and retail uses appropriate to serve the needs of the traveling public; and

2. Training facilities whose primary purpose is to provide training to meet industrial needs.

B. **[In an Industrial Area, a city or county shall not approve:**

1. A commercial retail use with more than 20,000 square feet of retail sales area in a single building or in multiple buildings that are part of the same development project; or

2. Commercial retail uses that would occupy more than ten percent of the net developable portion of the area or any adjacent Industrial Area] Cities and counties shall review their land use regulations and revise them, if necessary, to include measures to limit new buildings for the uses described in subsection A to ensure that they do not interfere with the efficient movement of freight along Main Roadway Routes and Roadway Connectors shown on Metro's Freight Network Map, November, 2003. Such measures may include, but are not limited to restrictions on access to freight routes and connectors, siting limitations and traffic thresholds. This subsection does not require cities and counties to include such measures to limit new other buildings or uses.

C. **No city or county shall amend its land use regulations that apply to lands shown as Industrial Area on the Employment and Industrial Areas Map to authorize uses described in subsection A of this section that were not authorized prior to July 1, 2004.**

D. Cities and counties may allow division of lots or parcels into smaller lots or parcels as follows:

1. Lots or parcels smaller than 50 acres may be divided into any number of smaller lots or parcels.

2. Lots or parcels larger that 50 acres may be divided into smaller lots and parcels pursuant to a master plan approved by the city or county so long as the resulting division yields at least one lot or parcel of at least 50 acres in size.

3. Lots or parcels 50 acres or larger, including those created pursuant to paragraph (2) of this subsection, may be divided into any number of smaller lots or parcels pursuant to a master plan approved by the city or county so long as at least 40 percent of the area of the lot or parcel has been developed with industrial uses or uses accessory to industrial use, and no portion has been developed, or is proposed to be developed with uses described in subsection A of this section.

4. Notwithstanding paragraphs 2 and 3 of this subsection, any lot or parcel may be divided into smaller lots or parcels or made subject to rights-of-way for the following purposes:

a. To provide public facilities and services;

b. To separate a portion of a lot or parcel in order to protect a natural resource, to provide a public amenity, or to implement a remediation plan for a site identified by the Oregon Department of Environmental Quality pursuant to ORS 465.225;

c. To separate a portion of a lot or parcel containing a nonconforming use from the remainder of the lot or parcel in order to render the remainder more practical for a permitted use; or

d. To allow the creation of a lot for financing purposes when the created lot is part of a master planned development.

E. Notwithstanding **[subsection B]** **subsection A** of this section, a city or county may allow the lawful use of any building, structure or land **existing** at the time of **[enactment of an]** **adoption of its** ordinance **[adopted pursuant to this section]** **to implement this section** to continue and to expand to add up to 20 percent more **[floorspace]** **floor area** and 10 percent more land area. **Notwithstanding subsection D of this section, a city or county may allow division of lots or parcels pursuant to a master plan approved by the city or county prior to July 1, 2004.**

3.07.440 Employment Areas

A. Except as provided in subsections C, D and E, in Employment Areas mapped pursuant to Metro Code Section 3.07.130, cities and counties shall limit new and expanded retail commercial uses to those appropriate in type and size to serve the needs of businesses, employees and residents of the Employment Areas.

B. Except as provided in subsections C, D and E, a city or county shall not approve a commercial retail use in an Employment Areas with more than 60,000 square feet of gross leasable area in a single building, or retail commercial uses with a total of more than 60,000 square feet of retail sales area on a single lot or parcel, or on contiguous lots or parcels, including those separated only by transportation right-of-way.

C. A city or county whose zoning ordinance applies to an Employment Area and is listed on Table 3.07-4 may continue to authorize retail commercial uses with more than 60,000 square feet of gross leasable area in that zone if the ordinance authorized those uses on January 1, 2003.

D. A city or county whose zoning ordinance applies to an Employment Area and is not listed on Table 3.07-4 may continue to authorize retail commercial uses with more than 60,000 square feet of gross leasable area in that zone if:

1. The ordinance authorized those uses on January 1, 2003;

2. Transportation facilities adequate to serve the retail commercial uses will be in place at the time the uses begin operation; and

3. The comprehensive plan provides for transportation facilities adequate to serve other uses planned for the Employment Area over the planning period.

E. A city or county may authorize new retail commercial uses with more than 60,000 square feet of gross leasable area in Employment Areas if the uses:

1. Generate no more than a 25 percent increase in site-generated vehicle trips above permitted non-industrial uses; and

2. Meet the Maximum Permitted Parking – Zone A requirements set forth in Table 3.07-2 of Title 2 of the Urban Growth Management Functional Plan.

Exhibit D to Ordinance No. 04-1040B
Addendum to Housing Needs Analysis
April 5, 2004

I. INTRODUCTION

The attached three Tables satisfy the requirements of ORS 197.298(5)(a)(E) to provide at least 3 years of data on the number, density and average mix of housing for vacant, partially vacant, redevelopment and infill (refill) and mixed use designated land. Table 5(a)(E) – 1 provides number, density and mix data on refill land for the period 1997 through 2001. Table 5(a)(E) – 2 provides the same data for development on vacant and partially vacant land for the period 1998 through 2001. Table 5(a)(E) – 3 displays the number, density and mix data for development on mixed use land for the period 1998 – 2001.

As noted in the original Housing Needs Analysis submission, the data in the attached Tables are subsets of more aggregated data contained in the original Housing Needs Analysis Report. While interesting and informative, the data in the attached Tables do not contradict the conclusions and actions taken in conjunction with the Urban Growth Report and periodic review. Nor do the data affect the determinations of the overall average density and overall mix of housing types at which residential development must occur in order to meet housing needs through 2022, as depicted in the original Housing Needs Analysis, pages 2 through 7 and Figures 3.1, 3.2, 3.3, 5.1 and 5.3.

The remainder of the report consists of an explanation of methodology and data sources and a synopsis of the data content of each of the tables.

II. METHODOLOGY AND DATA SOURCES

A. Data Sources

In order to retrospectively meet the requirements of State Statute we made maximum use of Metro's RLIS archived data that extend back in some degree to 1995. These data consist of the following elements:

1. Land use data at the tax lot level designating land by vacant, developed and zoning category.

2. County assessor tax lot data showing use, value, sales data, etc.

3. Geo-coded building permit data by building type.

4. Air photos for each year taken approximately in July of each year with a trend of improving resolution level over time.

B. Sampling Approach

We elected to measure the data using a 20% sampling approach so that we could manually audit each of the selected data points to insure accuracy. Machine processing of the data is not possible due to the following sources of measurement error.

1. Building permit geo-coding variability as approximately 70% of building permits actually geo-code exactly to the correct tax lot.

2. Building permit data error due to incomplete reporting, undetected duplicates and inaccurate descriptions of building type, work done and location.

3. Slight registration discrepancies between tax lot maps, air photos and archived land use coverages.

4. Variability between the time a building permit is issued, building takes place and the tax lot is created and enumerated in the County Assessor's tax lot coverage. The practical consequence of this is often that a row house constructed on a 2,500 sq. ft. lot appears to be on a 100,000 sq. ft. plus lot because the subdivision plat is not yet available in the data base.

For multi-family units we modified the 20% sample to include 100% of all building permits for 20 or more units and applied the 20% rate to permits of under 20 units. This avoided the potential sampling errors associated with having a few permits for multi-family of over 100 or more units.

C. Expansion Back to the Population Totals

Because we elected a 100% count of multi-family the sample was not self-weighting. As a consequence after the analysis was complete we used a two phase approach to estimate the building permit population. First, we expanded our sample by building type back to the totals reported in our building permit data base. Secondly, since our building permit data base is incomplete relative to the totals reported to the State and Federal Government, we expanded our building permit data base to match the County totals by building type.

D. Definition of Entities Being Measure

State Statute requires we report on the number and densities by building type of development on "refill", "vacant", "partly vacant" and "mixed use" land. These entities we define and discuss in the context of our RLIS data base and measurement protocols as follows:

1. Refill: Housing units developed on land that Metro already considers developed in its data base. Refill is further divided into redevelopment and infill. Redevelopment occurs after an existing building has been removed. Infill is additional building without removal of existing buildings.

   a. ***Method of Measurement***: We measure refill by counting the number of permits that locate on land Metro considers developed in the next fiscal year. For instance for the year "1998" we would compare the RLIS developed and vacant lands inventory for the year ending June 30, 1998 with all building permits issued beginning July 1, 1998 and ending June 30, 1999. Building permits located on land Metro classed vacant as of June 30, 1998 would be classed as development on vacant land and permits landing on land Metro classed as developed as of June 30, 1998 would be classed as refill.

   b. ***Measurement Protocols***: As noted earlier we select a 20% sample of all permits for new residential construction from the RLIS data base for the relevant years (with the exception of the 100% of multi-family permits equal to or exceeding 20 units). Each permit is scrutinized manually by a

trained intern using the RLIS data base and air photos to insure it is properly located and that the permit is for valid construction that did occur as the permit indicated. The analyst then determines whether the permit constitutes refill or vacant land development. Beginning with this study the analyst further classifies the permit to "legal – Urban Growth Report" refill and "economic – MetroScope" refill. This distinction results from the fact that RLIS analysts classify some individual lots in developing green field areas as developed prior to actual development occurring and also classify land cleared for urban renewal areas as vacant. In the former case the economic interpretation is development on new and in the latter case the economic interpretation is refill development. However, to be consistent with the RLIS land accounting system on which the Urban Growth Report is based we classify development the way RLIS accounts for it. On the other hand, the MetroScope land use model used for forecasting and policy evaluation counts green field development as vacant land consumption and urban renewal as refill (redevelopment). Consequently, we report refill data for both classifications.

2. Vacant and partially vacant: In RLIS tax lots that are "completely vacant" (90% vacant) are classed as totally vacant. If the unoccupied portion of a tax lot with development exceeds ½ acre, the unoccupied portion is classed a partially vacant. Green field sites under development may transition from vacant to partially vacant, back to totally vacant to developed and back again to totally vacant depending on the patterns of tax lot subdivision activity and zone changes. This also is true for urban renewal redevelopment sites. There are also a limited number of partially vacant sites in established residential areas where present zoning would allow further subdivision and development.

   a. ***Method of Measurement***: Using the audited building permit sample we machine processed the permits classed as legally vacant to fully vacant and partially vacant. Due to map registration discrepancies the RLIS developed lands coverage for 1997 could not be used so we dropped 600 observations for that year. In addition, another 1400 observations failed the machine screening in that they could not be conclusively classed as either vacant or partially vacant without manual auditing. The 2000 observations excluded from the vacant and partially vacant analysis resulting in the number of units developed on some type of vacant land dropping from 39,000 to 25,000. Though not relevant to the refill study or overall results, discussions with RLIS analysts indicated that the machine filtering process was more likely to exclude partially vacant than vacant tax lots. The bias, resulting from this procedure was minimized, by restating our inventory totals of vacant and partially vacant land using the same screening procedures.

   b. ***Measurement Protocols***: Once the refill data base was reclassed between vacant and partially vacant, we tabulated all the development on vacant land by the type of vacant land it fell on by building type (multi-family and single family) and by lot size.

3. Mixed use development: In our RLIS data base mixed use development is classed as MUC1, MUC2 and MUC3. From the original audited refill data base we selected all the records of building permits that fell on land classed as MUC1, MUC2 or MUC3 regardless of whether it was refill, vacant or partially vacant. Again matching the RLIS land use inventory for 1997 proved problematic for machine selection procedures and this year was excluded. The resulting selection process produced 402 observations representing over 4,600 units constructed from 1998 through 2001.

E. Years of Data Included in the Retrospective Analysis

We included building permit data from 12/97 through 6/2002 that could be reliably recovered and geo-coded from our existing RLIS data base. This time period allows us to evaluate 5 years of recent history in regard to "refill" and 4 years of history for "vacant", "partly vacant" and "mixed use" land.

III. SYNOPSIS OF RESULTS

A. Data Table 5E1: Refill Numbers by Type and Density 1997 – 2001

The data displayed on Table 5E1 show the amount of residential development of vacant and refill land that occurred during the period 1997 through 2001. During that period nearly 54,000 dwelling units located within the Metro region.[1] Of the 54,000 dwelling units, 26.5% occurred as refill according to the legal – Urban Growth Report definition. Using the economic-MetroScope definition 30.4% were refill reflecting the increasing importance of redevelopment in urban renewal areas and centers. Nearly 20,000 of the units constructed were multi-family with a legal refill rate of 31.5% and an economic rate of 40.2%. 34,000 units constructed were single family with a legal refill rate of 23.6% and an economic rate of 24.7%. Average lot sizes are also reported for every category.[2] For multi-family average lot sizes range from 1,800 to 2,000 sq. ft. depending on category. For single family average lot sizes range from 6,600 to 8,400 sq. ft. with refill development generally in the 6,500 – 7,000 sq. ft. range.

B. Table 5E1(a): Median Lot Size Data

This table provides additional and somewhat more meaningful weighted median lot size data. When we compare the average lot sizes in Table 5E1, we observe substantive differences in most cases. In general the median lot sizes are 30% less for vacant single family, 25% more for vacant multi-family, 25% less for refill single family and 30% less for refill multi-family. For all types combined the weighted median is 27% less for vacant and 26% less for refill. Assuming that the present median is a superior measure of long run average lot size, the combined weighted median of 4,417 sq. ft. should be used to determine vacant land consumption. This figure combined with the 39,619 units located on legally vacant land over the 5 year period implies a land consumption of slightly over 4,000 net buildable acres. Using a plausible range of gross to net conversion factors of .55 - .7 yields a gross buildable acre consumption of 1,150 to 1,450 acres per year, within the range estimated in the original Housing Needs Analysis.[3]

---

[1] **Real Estate Report for Metropolitan Portland, Oregon**, Spring 2003. Numbers are based on building permits summarized at the County level and only approximate the UGB. This procedure slightly overstates UGB land consumption.

[2] Average as contrasted to median inflates land consumption as the measure is substantially influenced by a few large lot single family permits on urban land still zoned RRFU that will subsequently be subdivided. RLIS procedure of assuming ½ acre of land consumption for permits on non-subdivided land also inflates average lot size.

[3] While appearing precise, attempting to estimate long run densities and land consumption from individual lot sizes involves substantial uncertainties. The most serious of these is the gross to net conversion factor as we only observe

C. Table 5E2: Housing on Fully Vacant and Partially Vacant Land

The accompanying table presents the required data on development on a subcategory of vacant land – fully vacant land and land partially vacant. As noted in the methods section, fully or partially vacant is classified relative to the tax lot existing at the time of the RLIS vacant and developed lands inventory. As also noted in the methods section, due to procedures and quirks of the land development and reporting process land may be fully vacant, partially vacant or developed refill land several times during the development process. In addition as a result of attempting to categorize and measure "partially vacant" we discover that the acreage totals are extremely volatile and sensitive to whatever criteria we use in the machine query process to differ partial from full. Very minor discrepancies between vacant land coverages and assessor's tax lot coverages can dramatically change the inventories of fully and partially vacant. In the methods section we note that we use the same selection criteria for both the inventory totals and the classification of the refill sample into fully and partially vacant.

Of the over 39,000 legal vacant units located in the Metro Region for the period 1997 – 2001 we were able to reliably classify 25,000 units covering the period 1998 – 2001. Of these 15,500 (62.6%) were on fully vacant land and 9,300 (37.4%) were on partially vacant land. Looking at *Table 5E2(a) Fully Vacant and Partially Vacant Land Inventory 1998 – 2001* (replacing Table 4.1AB in the original Housing Needs Analysis) that on average partially vacant comprised 34.3% of the vacant land inventory. In sum development on partially vacant land overall has been occurring at roughly the same rate as development on fully vacant land and appears to not be materially different.

At the same time we recognize that there are a number of instances where partially vacant land shares a tax lot with a high valued single family home. In order to better understand the likelihood of further development under these circumstances, we used our single family sales price study to estimate the "optimum lot size" by neighborhood and house size. We define optimum lot size as the lot size at which at the loss of value to a homeowner by selling off part of his lot just equals the amount he gains by selling the land. If the homeowner sells more land, the value of his house declines more than he gains by the sale. Conversely, if he sells less land, the land unsold contributes less to the value of his home than the amount he would receive were he to sell it. Making that calculation for Dunthorpe we found that a $1,000,000 home on 5 acres would have a positive incentive to sell off land down to about 1 – 1.5 acres. By comparison, a $600,000 home on 1 acre would have an incentive to sell off no more than ½ acre. Significantly, in 2000 the average Dunthorpe selling price was $590,000 for a 3,100 sq. ft. house on a 22,000 sq. ft. lot, almost exactly the optimum lot size determined from our estimates. On average then we would expect Dunthorpe to have no additional capacity other than that resulting from subdivision of lots at least 1 acre to sizes no smaller than ½ acre. Optimum lot size calculations vary dramatically by neighborhood. For instance, the average house in the Powellhurst-Gilbert neighborhood has a positive incentive to sell off land down to and sometimes below a 5,000 sq. ft. lot minimum. This is more often the case within the Metro region notwithstanding the exceptionally high value areas such as Dunthorpe.

D. Table 5E3: Housing on Mixed Use Designated Land

As required by statute the accompanying table shows development for the period 1998 – 2001 that occurred on land Metro considered at the time of development to be MUC1, MUC2 and MUC3. As pointed out in the methods section, the mixed use inventory includes refill, vacant and partially vacant

---

net buildable land consumption and cannot measure land lost to streets, parks, schools, freeways, etc. The second drawback is that average lot size measures are always exaggerated by a few large lot placements (often of manufactured homes) done by private individuals that will undoubtedly be further subdivided sometime in the future.

lands. Over the 4 year period we noted 4,600 housing units developed of which 3,000 were multi-family and 1,600 were single family. Average lot size for multi-family was 1,400 sq. ft. and single family lot size was 2,300 sq. ft. Table 5E3(a) depicts the 2040 Plan mixed use capacity as of 8/98. Total mixed use capacity at that time was roughly 23,000 units. Mixed use development constituted about 11% of residential development for the 4 year period 98 – 2001. As of 1998, mixed use capacity of 23,000 units constituted 12% of the capacity 193,000 dwelling unit capacity estimated at the time. As was the case with vacant and partially vacant, this sub-classification of land type seems to produce housing at a rate commensurate with its proportion of the land inventory.

Exhibit 5E1_: Housing on Vacant and Refill Land - Number, Type and Density 1997 Through 2001

Exhibit F to Ordinance No. 04-1040B
Conditions on Addition of Land to the UGB

I. GENERAL CONDITIONS APPLICABLE TO ALL LANDS ADDED TO THE UGB

A. The city or county with land use planning responsibility for a study area included in the UGB shall complete the planning required by Metro Code Title 11, Urban Growth Management Functional Plan ("UGMFP"), section 3.07.1120 ("Title 11 planning") for the area. Unless otherwise stated in specific conditions below, the city or county shall complete Title 11 planning within two years after the effective date of this ordinance. Specific conditions below identify the city or county responsible for each study area.

B. The city or county with land use planning responsibility for a study area included in the UGB, as specified below, shall apply the 2040 Growth Concept design types shown on Exhibit E of this ordinance to the planning required by Title 11 for the study area.

C. The city or county with land use planning responsibility for a study area included in the UGB shall apply interim protection standards in Metro Code Title 11, UGMFP, section 3.07.1110, to the study area until the effective date of the comprehensive plan provisions and land use regulations adopted to implement Title 11.

D. In Title 11 planning, each city or county with land use planning responsibility for a study area included in the UGB shall recommend appropriate long-range boundaries for consideration by the Council in future expansions of the UGB or designation of urban reserves pursuant to 660 Oregon Administrative Rules Division 21.

E. Each city or county with land use planning responsibility for an area included in the UGB by this ordinance shall adopt provisions – such as setbacks, buffers and designated lanes for movement of slow-moving farm machinery – in its land use regulations to enhance compatibility between urban uses in the UGB and agricultural practices on adjacent land outside the UGB zoned for farm or forest use.

F. Each city or county with land use planning responsibility for a study area included in the UGB shall apply Title 4 of the UGMFP to those portions of the study area designated Regionally Significant Industrial Area ("RSIA"), Industrial Area or Employment Area on the 2040 Growth Concept Map (Exhibit C). If the Council places a specific condition on a RSIA below, the city or county shall apply the more restrictive condition.

G. In the application of statewide planning Goal 5 (Natural Resources, Scenic and Historic Areas, and Open Spaces) to Title 11 planning, each city and county with land use responsibility for a study area included in the UGB shall comply with those provisions of Title 3 of the UGMFP acknowledged by the Land Conservation and Development Commission ("LCDC") to comply with Goal 5. If LCDC has not acknowledged those provisions of Title 3 intended to comply with Goal 5 by the deadline for completion of Title 11 planning, the city or county shall consider, in the city or county's application of Goal 5 to its Title 11 planning, any inventory of regionally significant Goal 5 resources and any preliminary decisions to allow, limit or prohibit conflicting uses of those resources that is adopted by resolution of the Metro Council.

H. Each city and county shall apply the Transportation Planning Rule (OAR 660 Div 012) in the planning required by subsections F (transportation plan) and J (urban growth diagram) of Title 11.

II. SPECIFIC CONDITIONS FOR PARTICULAR AREAS

A. Damascus Area

1. Clackamas County and Metro shall complete Title 11 planning requirements through the incorporation of this area into the greater Damascus/Boring Concept Plan planning effort currently underway. This planning shall be completed within the same time frame as specified in Ordinance No. 02-969B.

2. In the planning required by Title 11, subsections (A) and (F) of section 3.07.1120, Clackamas County or any future governing body responsible for the area shall provide for annexation of those portions of the area whose planned capacity is sufficient to support transit to the Tri-met District.

3. In the planning required by Title 11, subsections (A) and (F) of section 3.07.1120, Clackamas County or any future governing body responsible for the area shall provide for annexation of those portions of the area whose planned capacity is sufficient to support transit to the Tri-met District.

B. Beavercreek Area

1. Clackamas County or, upon annexation to Oregon City, the city and county, with Metro, shall complete Title 11 planning for the area.

2. This area shall be planned in conjunction with the adjoining tax lot added to the UGB in 2002, under Ordinance No. 02-969B.

~~C. Borland Area – North of I-205~~

~~1. Clackamas County or, upon annexation to the City of Tualatin, the city and county, in coordination with the Cities of Lake Oswego, Tualatin, and West Linn and Metro, shall complete Title 11 planning within four years following the effective date of Ordinance No. 04-1040. The county and city, in conjunction with Lake Oswego and West Linn and Metro shall recommend long-range boundaries in the Stafford Basin and general use designations for consideration by the Council in future expansions of the UGB.~~

~~2. Until the effective date of new regulations adopted pursuant to Title 11, the city or county with land use planning responsibility for the area shall not allow the division of a lot or parcel that is 50 acres or larger into lots or parcels smaller than 50 acres.~~

~~D~~C. Tualatin Area

1. Washington County or, upon annexation to the Cities of Tualatin or Wilsonville, the cities, in conjunction with Metro, shall complete Title 11 planning within ~~four~~ two years following the selection of the right-of-way alignment for the I-5/99W Connector, or within seven years of the effective date of Ordinance No. 04-1040, whichever occurs earlier.

2. Title 11 planning shall incorporate the general location of the projected right of way ~~location~~ alignment for the I-5/99W connector and the Tonquin Trail as shown on the 2004 Regional Transportation Plan. If the selected right-of-way for the connector follows the approximate course of the "South Alignment," as shown on the Region 2040 Growth Concept Map, as amended by Ordinance No. 03-1014, October 15, 2003, the portion of the Tualatin Area that lies north of the right-of-way shall be designated "~~Inner~~Outer Neighborhood" on the Growth Concept Map; the portion that lies south shall be designated "Industrial."

3. The governments responsible for Title 11 planning shall consider using the I-5/99W connector as a boundary between the city limits of the City of Tualatin and the City of Wilsonville in this area.

~~E~~D. Quarry Area

1. Washington County or, upon annexation to the cities of Tualatin or Sherwood, the cities**,** and Metro shall complete Title 11 planning for the area.

2. Title 11 planning shall, if possible, be coordinated with the adjoining area that was included in the UGB in 2002 under Ordinance No. 02-969B.

3. Until the effective date of new regulations adopted pursuant to Title 11, the city or county with land use planning responsibility for the area shall not allow the division of a lot or parcel that is 50 acres or larger into lots or parcels smaller than 50 acres.

4. Title 11 planning shall incorporate the general location of the projected right-of-way for the Tonquin Trail as shown on the 2004 Regional Transportation Plan.

~~F~~E. Coffee Creek Area

1. Washington and Clackamas Counties or, upon annexation of the area to the ~~City~~ cities of Tualatin or Wilsonville**,** the city, ~~and~~ in conjunction with Metro, shall complete the Title 11 planning for the area within ~~four~~ two years following the selection of the right-of-way alignment for the I-5/99W Connector, or within seven years of the effective date of Ordinance No. 04-1040B, whichever occurs earlier.

2. ~~The concept~~ Title 11 planning shall incorporate the general location of the projected right of way location for the I-5/99W connector and the Tonquin Trail as shown on the 2004 Regional Transportation Plan.

~~G. Wilsonville East Area~~

~~1. Clackamas County or, upon annexation of the area to the City of Wilsonville, the city, and Metro shall complete the Title 11 planning for the area within two years of the effective date of Ordinance No. 04-1040.~~

~~2. In the planning required by Title 11 a buffer shall be incorporated to mitigate any adverse effects of locating industrial uses adjacent to residential uses located southwest of the area.~~

~~3. Until the effective date of new regulations adopted pursuant to Title 11, the city or county with land use planning responsibility for the area shall not allow the division of a lot or parcel that is 50 acres or larger into lots or parcels smaller than 50 acres.~~

~~H~~F. Cornelius Area

1. Washington County, or, upon annexation of the area to the City of Cornelius, the city and Metro shall complete the Title 11 planning for the area.

~~I~~G. Helvetia Area

1. Washington County, or upon annexation of the area to the City of Hillsboro, the city, and Metro shall complete the Title 11 planning for the area.

2. Until the effective date of new regulations adopted pursuant to Title 11, the city or county with land use planning responsibility for the area shall not allow the division of a lot or parcel that is 50 acres or larger into lots or parcels smaller than 50 acres.

Exhibit G to Ordinance No. 04-1040B
Findings of Facts, Conclusions of Law

Introduction

The Metro Council adopted Ordinance 04-1040B in response to LCDC Partial Approval and Remand Order 03-WKTASK-001524, entered July 7, 2003. LCDC's order followed its review of seven ordinances (Nos. 02-969B, 02-983B, 02-984A, 02-985A, 02-986A, 02-987A and 02-990A) adopted by the Metro Council as part of Periodic Review Work Task 2. The findings of fact and conclusions of law that explained how those ordinances complied with state planning laws, together with the supplemental findings and conclusions set forth in this exhibit, are part of the explanation how Ordinance No. 04-1040B complies with those laws. These findings also explain how Ordinance No. 04-1040B complies with the three requirements of the remand order.

REQUIREMENT NO. 1:

REMAND ORDER ON SUBTASK 17: COMPLETE THE ACCOMMODATION OF THE NEED FOR THE INDUSTRIAL LAND NEED COMPONENT OF EMPLOYMENT LAND THAT REMAINS APPROVAL OF WORK TASK 2.

I. GENERAL FINDINGS FOR TASK 2 REMAND DECISION ON UGB

A. Coordination with Local Governments

Metro worked closely with the local governments and special districts that comprise the metropolitan region. The Metro Charter provides for a Metropolitan Policy Advisory Committee ("MPAC") composed generally of representatives of local governments, special districts and school districts in the region. MPAC reviewed all elements of this periodic review decision. MPAC made recommendations to the Metro Council on most portions of the decision. All recommendations were forwarded formally to the Council and the Council responded. Metro Councilors and staff held many meetings with local elected officials in the year since LCDC's remand (July 7, 2003).

The record of this decision includes correspondence between local governments and Metro, including Metro's responses to concerns and requests from local governments and local districts related to industrial land.

Metro accommodated the requests and concerns of local governments as much as it could, consistent with state planning laws and its own Regional Framework Plan (Policy 1.11) and Regional Transportation Plan (Policy 2.0).

B. Citizen Involvement

These findings address Goal 1 and Regional Framework Plan Policy 1.13.

To gather public input on this Task 2 remand decision, Metro conducted an extensive citizen involvement effort. The findings for Ordinance No. 02-969B set forth Metro's effort leading to adoption of that ordinance on December 5, 2002. Those findings are incorporated here. Since that time, the Metro notified by mail nearly 75,000 people of the pending decision to expand the UGB for industrial land. Metro also provided individual mailed notice to nearly 5,000 landowners of possible revisions to Title 4 (Industrial and Other Employment Areas) of the Urban Growth Management Functional Plan ("UGMFP"). In March, 2004, Metro held six workshops on industrial land throughout the region, attended by some 1,200 people. Finally, the Council held public hearings on the UGB expansion and Title 4 on December 4 and December 11 of 2003 and April 22 and 29, May 6 and 27, and June 10 and 24 of 2004.

These efforts bring Metro into compliance with Goal 1 and Metro's Regional Framework Plan. More important, this work to involve Metro area citizens has contributed greatly to their understanding of the importance of this set of decisions for the region and have brought Metro invaluable comment on options available to it.

C. Need for Land

These findings address ORS 197.296; ORS 197.732(1)(c)(A); Goal 2, Exceptions, Criterion (c)(1); Oregon Administrative Rules 660-004-0010(1)(c)(B)(i) and 660-004-0020(2)(a); Goal 9 (local plan policies); Goal 10; Goal 14, Factors 1 and 2; Metro Regional Framework Plan ("RFP") Policies 1.2, 1.4, 1.4.1 and 1.4.2; and Metro Code 3.01.020(b)(1) and (2).

The findings for Ordinance No. 02-969B set forth Metro's analysis of the need for land for new jobs through the year 2022. The Urban Growth Report-Employment ("UGR-E") provides the details of that analysis. The analysis indicates that the region will need approximately 14,240 acres to accommodate an additional 355,000 jobs (all employment, commercial and industrial). Based upon new information that came to the Council during hearings on Title 4 revisions and UGB expansion, Metro completed a supplement (Ordinance No. 04-1040B, Appendix A, Item b) to the UGR-E that describes emerging trends in industrial use.

Leading to adoption of the ordinances that expanded the UGB in December, 2002, Metro analyzed the capacity of the existing UGB to accommodate this employment growth. The analysis determined that the UGB contained a surplus of land (759.6 acres) for commercial employment and a deficit of land (5,684.9 acres) for industrial development. The UGR-E provides the details of this analysis.

Following adoption of the December, 2002, ordinances, Metro analyzed the capacity of the expanded UGB. Those ordinances left Metro with a deficit of 1,968 acres of industrial land and a surplus of 393 acres of commercial land. From this analysis, the Council concluded that the UGB, as expanded by ordinances in December, 2002, did not have sufficient capacity to accommodate the remaining unmet need for industrial land. This deficit was one reason for LCDC's July 7, 2003, remand order directing Metro to complete the accommodation of this need for industrial land.

Based upon interviews with industrial developers, brokers and consultants, the Regional Industrial Land Survey ("RILS") and Metro's UGR-E, Metro refined the need for industrial land. Not just any land will satisfy the need for industrial use. Metro defined the need as 1,968 acres of land composed generally of less than 10 percent slope that lies either within two miles of a freeway interchange or within one mile of an existing industrial area. RILS and the UGR-E also calculate the need for parcels of varying sizes by sectors of the industrial economy. Table 13 of the UGR-E shows a need for 14 parcels 50 acres or larger for the warehouse and distribution and tech/flex sectors (page 25).

D. Alternatives: Increase Capacity of the UGB

These findings address ORS 197.732(c)(B); Goal 14, Factors 3 and 4; Goal 2, Exceptions, Criterion 2; OAR 660-004-0010(1)(B)(ii) and 660-004-0020(2)(b); Metro Code 3.01.020(b)(1)(E); and RFP Policies 1.2, 1.3, 1.4, 1.6, 1.7, 1.8 and 1.9.

To address the shortfall in employment capacity, Metro considered measures to increase the efficiency of land use within the UGB designated for employment. Metro's UGMFP Title 4, first adopted in 1996, limited non-employment uses in areas designated Industrial and Employment. Analysis of results of local implementation of Title 4 indicates that commercial uses and other non-industrial uses are converting land designated for industrial use to non-industrial use.

In response to this information, the Metro Council amended the RFP in Ordinance No. 02-969B in December, 2002, to improve the protection of the existing industrial land base. The Council created a new 2040 Growth Concept design type – "Regionally Significant Industrial Land" ("RSIA") – and revised Title 4 to establish new limitations on commercial office and commercial retail uses in RSIAs. Metro estimated that these new measures would reduce the shortfall in industrial land by 1,400 acres by reducing encroachment by commercial uses. The Council counted this "savings" of industrial land in its determination that the deficit of industrial land following the December, 2002, expansion of the UGB was 1,968 net acres.

Following adoption of the December ordinances, the Council began implementation of the new policy and code, including the mapping of RSIAs. The process of developing the map with cities and counties in the region uncovered implementation difficulties with the provisions of the new Title 4 that limited commercial retail and office uses. With Ordinance No. 04-1040B, the Council once again revised Title 4 with two objectives: greater flexibility for traded-sector companies and retention of the 1,400-acre "savings" estimated from the December, 2002, revisions. Based upon the analysis of Title 4 revisions in the supplement to the UGR-E (Ordinance No. 04-1040B, Appendix A, Item b), the Council estimates that the revisions, in combination with conditions placed upon areas added to the UGB for industrial use, will continue to "save" 1,400 acres of industrial land from intrusion by commercial uses.

During hearings on the remand from LCDC, the Council received testimony that an increasing number of industrial jobs is finding space in office buildings rather than in traditional industrial buildings. The Council relied upon this testimony to revise Title 4 limitations on offices in industrial areas. The Council also relied upon the testimony to apply the 393-acre surplus of commercial land taken into the UGB by the December, 2002, ordinances to the need for 1,968 acres of industrial land. The Council assumed that offices in the region's designated Employment Areas, Centers, Corridors, Station Communities and Mains Streets would absorb industrial jobs. This assumption reduced the need for industrial land from 1,968 to 1,575 net acres.

Also during the hearings, the cities of Wilsonville, Oregon City and Fairview brought news of recent plan amendments (adopted after completion of Metro's inventory of industrial land) adding land to the industrial land supply. The Council concluded that the land added by Wilsonville (127 acres) and Oregon City (74 acres) are actually available for industrial use, subject to timing and infrastructure requirements. The Council concluded that the Fairview land, though designation industrial in the city's comprehensive plan, is not yet appropriately zoned to make it available for industrial use. These actions reduced the need for industrial land from 1,575 to 1,374 net acres.

The City of Gresham requested a change to the 2040 Growth Concept Map and the Title 4 Employment and Industrial Areas map for a 90-acre tract that is part of Study Area 12 and adjacent to land added to the UGB in December, 2002, for industrial use. The city says further planning work on its part has revealed that some 20 acres of the tract are suitable for industrial use. The Council makes this change in Ordinance No. 04-1040B, reducing the need from 1,374 to 1,354.

In a further effort to accommodate industrial development more efficiently within the UGB, the Council discovered that it had assumed a commercial development refill rate of 50 percent, lower than the most recently observed rate of 52 percent. For the reasons stated above, the Council concludes that this infill and re-development of lands in designated Employment Areas, Centers, Corridors, Station Communities and Mains Streets will accommodate some of the increasing number of industrial jobs that is locating in offices rather than factories or other traditional industrial buildings. Correction of the commercial refill rate assumption reduces the need for industrial land from 1,354 to 1,180 acres.

E. Alternatives: Expand the UGB

These findings address ORS 197.732(c)(B), (C) and (D) and Goal 2, Exceptions; ORS 197.298(1); Goal 11; Goal 14, Factors 3-7; OAR 660-004-0010(1) and 660-004-0020(2); RFP Policies 1.2, 1.3.1, 1.4, 1.4.1, 1.7, 1.7.2, 1.9, 1.12.1, 1.12.2 and 5.1.1; Regional Transportation Plan Policy 3.0 and Metro Code 3.01.020(b)(3) through (7) and 3.01.020(d)

The measures taken by the Council to increase the capacity of the existing UGB for industrial use, described above leave an unmet need for industrial land of 1,180 acres.

Metro began the search for the most appropriate land for inclusion in the UGB by applying the priorities in ORS 197.298(1). Because Metro has not re-designated "urban reserve" land since its 1997 designation was invalidated on appeal, the highest priority for addition of land is exception land.

Metro first included for consideration all exception land that was studied for inclusion in the December, 2002, ordinances, but not included at that time (59,263 acres). Metro then expanded the search to consider all other land, resource land included, that met the siting characteristics that help define the need for industrial land (less than 10 percent slope and within two miles of a freeway interchange or one mile of an existing industrial area (9,071 acres). In all, Metro looked at approximately 68,000 acres to find the most appropriate land.

Once Metro mapped land by its statutory priority, Metro analyzed the suitability of the land for industrial use, considering the locational factors of Goal 14, the consequences and compatibility criteria of the Goal 2 and statutory exceptions process, the policies of the Regional Framework Plan (RFP) and the criteria in the Metro Code that are based upon Goal 14. This analysis is set forth in the Alternatives Analysis Study, Item (c) in Appendix A of Ordinance No. 04-1040B and subsequent staff reports [Appendix A, Items (a) and (y)].

The Alternatives Analysis and testimony from the hearings gave the Council few easy or obvious choices among the lands it considered. The land most suitable for the types of industrial use forecast in the region for the next 20 years is flat land near freeway interchanges or near existing industrial areas. In addition, the region needs parcels 50 acres or larger for the warehouse and distribution and tech/flex sectors. The land most likely to meet these needs at the perimeter of the UGB is agricultural land, the last priority for inclusion under ORS 197.298(1).

The highest priority for inclusion, under the priority statute, where no urban reserves have been designated, is exception land. But the character of most exception areas makes them unable to fill the region's needs for industrial use. The great majority of exception land outside the UGB is designated for residential use, and most of that is settled with residences. Parcels are generally small (five acres and smaller), the topography is usually rolling and often steep, and streams, small floodplains and wildlife habitat are common. And residents, as evidenced by testimony at Council hearings, are often vigorously opposed to industrial intrusions into what they consider their neighborhoods.

The Council excluded from further consideration those exception lands that lie further than two miles from a freeway interchange and more than one mile from existing industries for the reason that these areas cannot meet the identified need for industrial land. The Staff Report [Appendix A, Item (a)] describes these specific areas in detail at pages 13 to 18.

The Council excluded other study areas (or portions of them) from further consideration even though they could meet the identified need (less than 10 percent slope and either within two miles from a freeway interchange or within one mile from existing industries) because they are unsuitable for industrial use. Further analysis showed that some combination of parcelization, existing development, limitations on use

imposed by Title 3 of the UGMFP (Water Quality, Flood Management and Fish and Wildlife Conservation), poor road access, difficulty in providing public services and negative effects of urbanization on nearby agricultural practices renders the areas unsuitable for industrial use. Portions of the areas contain designated farm or forest land. The Staff Report [Appendix A, Item (a)] describes these specific areas in detail at pages 18 to 25 (and portions of other areas at pages 13 to 18).

The Council also excluded those exception areas that are not contiguous to the UGB, or to areas added to the UGB for industrial use, and do not contain enough suitable land to comprise a minimum of 300 gross acres. Based upon an analysis of industrial areas within the pre-expansion UGB and reasoning set forth in "Formation of Industrial Neighborhoods", memorandum from Lydia Neill to David Bragdon, October 24, 2003, the Council concludes that these small areas cannot satisfy the need for industrial land.

The Council looked next to resource land, beginning with land of lowest capability. The Council included 354 acres (236 net acres) designated for agriculture in the Quarry Study Area, composed predominantly of the poorest soils (Class VII) in the region. Other land with poor soils in the vicinity were rejected due to steep slopes. The Council included 63 acres (30 net acres) designated for forestry in the Beavercreek Study Area composed of Class IV and VI soils and 102 acres (69 net acres) of Class III and IV soils in the Damascus West Study Area. No other land with soil capability lower than Class II can meet the need for industrial use identified by the Council.

Finally, the Council turned to the many lands under consideration with predominantly Class II soils. To choose among thousands of acres of this flat farmland near urban industrial areas or near freeway interchanges, the Council considered the locational factors of Goal 14 and policies in its Regional Framework Plan ("RFP") and Regional Transportation Plan ("RTP"). Further, the Council sought advice from a group of farmers and agriculturalists in the three counties, assembled by the Oregon Department of Agriculture ("ODA"). This group submitted a report to the Council entitled "Limited Choices: The Protection of Agricultural Lands and the Expansion of the Metro Area Urban Growth Boundary for Industrial Use." [Appendix A, Item (i).)] Preliminary guidance from ODA led the Council to consider an amendment to Policy 1.12 of the RFP on agricultural land, adopted and applied in Ordinance No. 04-1040B: "When the Council must choose among agricultural lands of the same soil classification for addition to the UGB, the Council shall choose agricultural land deemed less important to the continuation of commercial agriculture in the region." (Exhibit A.)

The Council finds that the region will be able to urbanize the lands it has added to the UGB in an efficient and orderly fashion. The Council concludes that the overall consequences of urbanization of these lands are acceptable, especially given the protections in place in the RFP and Metro Code for sensitive resources. Through mitigation measures required by the conditions in Exhibit F, the Council believes it can achieve compatibility between urbanization of the land added to the UGB and adjacent land outside the UGB.

The Council also believes that it is able to maintain separations between communities at the urban fringe sufficient to allow each community to retain a sense of place. The Council chose ridgelines, streams, power lines, roads and property lines to define the boundaries of the UGB in an effort to provide a distinct boundary and a clear transition between urban and rural uses.

The Council also finds that the lands it added to the UGB for industrial use contribute to a compact urban form. The lands are adjacent to the existing UGB. Many involve exception lands that are already partially urbanized and contain some components of public facilities needed to serve urban industrial uses. The Council rejected some areas of exception land that extend far from the UGB and would require long extensions of linear services such as sewer, water and stormwater lines. The Council chose land that adheres closely to siting characteristics needed by the industries likely to grow during the planning period: proximity

to existing industrial areas and accessibility to freeway interchanges. These choices contribute to the region's urban form which, among other things, calls for siting uses with higher densities (commercial and residential) in Centers and other design types served by high-capacity public transit.

Combined with areas added to the UGB for employment in the December, 2002, periodic review ordinances, areas added by Ordinance No. 04-1040B for industrial use are distributed round the region. Most of the jobs land was added to the east side of the region in December, 2002. This ordinance adds industrial land mostly to the south and west sides of the region. In particular, addition of 262 acres north of Cornelius will add jobs, income, investment and tax capacity to a part of the region with disproportionately little of those resources.

F. Water Quality

Each local government responsible for an area added to the UGB must complete the planning requirements of Title 11, Urban Growth Management Functional Plan ("UGMFP"), including compliance with the water quality provisions of Title 3 of the UGMFP.

G. Areas Subject to Natural Disasters and Hazards

The Council has excluded environmentally constrained areas from the inventory of buildable land (see UGRs) and from its calculation of the housing and jobs capacity of each study area (see Alternatives Analysis). Each local government responsible for an area added to the UGB must complete the planning requirements of Title 11, Urban Growth Management Functional Plan ("UGMFP"), including compliance with Title 3 of the UGMFP on floodplains and erosion control.

The Council considered the best information available on known hazards, including earthquake hazard. The study areas with the highest earthquake hazard have been rejected. The are small portions of several study areas with known earthquake hazards added to the UGB. Local governments responsible for Title 11 planning are required by that title (and Goal 7) to take these portions into account in their comprehensive plan amendments.

H. Economic Development

As part of Task 2 of periodic review, Metro reviewed the economic development elements of the comprehensive plans of each of the 24 cities and three counties that comprise the metro area. Metro used the review in its determination of the region's need for employment land and for coordination with local governments of its choices to add land to the UGB for employment purposes.

Revisions to Title 4 (Industrial and Other Employment Areas) of the UGMFP and the conditions placed upon lands added to the UGB (Exhibit F of Ordinance No. 04-1040B and exhibits to December, 2002, ordinances) add significant protection to sites designated for industrial use, both those added to the UGB and those within the UGB prior to expansion, to help ensure their availability for that purpose.

Inclusion of these areas adds 1,920 acres (1,047 net acres) to the UGB for industrial use. Combined with the efficiency measures described in Section D of these Findings (Alternatives: Increase Capacity of the UGB), above, and actions taken in December, 2002, these additions to the UGB accommodate approximately 99 percent of the need for industrial land [identified in the 2002-2022 Urban Growth Report: An Employment Land Need Analysis (9,366 net acres)]. Given the unavoidable imprecision of the many assumptions that underlie the determination of need for industrial land – the population forecast; the employment capture rate; the industrial refill rate; employment density (particularly given changes in building types used by industry over time); the rate of encroachment by non-industrial uses; and the vintage

industrial relocation rate – the Council concludes that its actions in the December, 2002, ordinances and in this Ordinance No. 04-1040B provide a 20-year supply of industrial land for the region and comply with part 2 (periodic review Subtask 17) of LCDC's Partial Approval and Remand Order 03-WKTASK-001524, July 7, 2003.

II. SPECIFIC FINDINGS FOR PARTICULAR AREAS ADDED TO UGB IN TASK 2 REMAND DECISION

These findings address ORS 197.298; ORS 197.732(1)(c)(B), (C) and (D); Goal 2, Exceptions, Criteria (c)(2), (3) and (4); Oregon Administrative Rules (OAR) 660-004-0010(1)(B)(ii), (iii) and (iv); OAR 660-004-0020(2)(b), (c) and (d); Goal 5; Goal 11; Goal 12; Goal 14, Factors 3 through 7; Metro Code 3.01.020(b)(3) through (7) and 3.01.020(d); Metro RFP Policies 1.2, 1.3, 1.4, 1.6, 1.7, 1.11 and 1.12; and Regional Transportation Plan Policies 2.0, 3.0, 4.0 and 14.0.

A. Damascus West

The Council relies upon the facts and analysis in the Industrial Land Alternative Analysis Study [Appendix A, Item(c) in Ordinance No. 04-1040B, pp. 21-23; 111; A-1 – A-4] and the Staff Report [Appendix A, Item (a), p. 27] to support its conclusion that addition of a portion of Damascus West will provide for an orderly and efficient transition from rural to urban land use. The Council chose this area of resource land because it contains a concentration of larger parcels (five parcels between 10 and 20 acres). Parcels of this range are needed for the types of industries Metro expects will grow during the planning period (UGR-E, p. 25) and are generally unavailable in exception areas. Also, soils in the area are Class III and IV, of lower capability than other resource land under consideration. In addition, the area lies within a ground-water restricted area designated by the Oregon Department of Water Resources. Finally, it occupies a small notch that extends into land within the UGB and is relatively isolated by topography and forested land from other agricultural lands to the south, as noted in the report of the Metro Agricultural Lands Technical Workgroup led by the Oregon Department of Agriculture ["Limited Choices: The Protection of Agricultural Lands and the Expansion of the Metro Area Urban Growth Boundary for Industrial Use", Appendix A, Item (i)].

1. Orderly Services

The Council relies upon the Study Area Goal 14 Analysis Summary and the Ratings for Transportation Services Feasibility contained in its Alternative Analysis Study (Appendix A, Item 6, pages 111 and Table A-2, respectively) for its determination that these services can be provided to the Damascus West area in an orderly and economic manner by extending services from existing serviced areas. Condition IIA(1) of Exhibit F calls for transportation and public facility and service plans within the same four years allowed for Title 11 planning of the entire Damascus area by Condition IIA(1) of Exhibit M of Ordinance No. 02-969B.

The Alternative Analysis Study (p. 20) sets forth the likely service providers for sewer, water and storm-water services and assigns a serviceability rating for the larger Damascus Study Area. Serviceability generally ranges from "easy" to "difficult" to serve (Table 1, p. 111) and compares favorably with areas not included (such as Borland Road South, Norwood/Stafford and Wilsonville West). Transportation services will be only moderately difficult to provide for reasons set forth in the Alternative Analysis Study, p. 21.

2. Efficiency

The Council relies on the same information on provision of essential services mentioned above for its conclusion that the area can urbanize efficiently, particularly knowing that Damascus West will be planned in conjunction with the greater Damascus area added to the UGB in December, 2002. The Council

also relies upon its findings and conclusions above (part I, General Findings, section D, Alternatives: Increase Capacity of UGB) regarding actions it has taken to increase the efficiency of the use of employment land within the existing UGB.

3. Consequences

The Council relies upon the analysis of the consequences of urbanization on the Damascus West area set forth in the Alternative Analysis Study, pp. 21-22 and Table A-3. The analysis indicates that the consequences will be low, especially considering the requirements of Title 11 of the UGMFP that comprehensive planning and land use regulations for the area protect the portions (streams, wetlands, floodplains and steep slopes) of the area subject to Title 3 of the UGMFP and the conditions in Exhibit F of Ordinance No. 04-1040B.

The Council has placed a condition on comprehensive planning for the area that the local government responsible for planning considered Metro's adopted Goal 5 inventory during its planning (see Condition IG, Exhibit F). The local governments will eventually adopt provisions to implement Metro's Goal 5 program following the Council's adoption of that program, if the local government's ordinance do not already comply.

4. Compatibility

The Agricultural Analysis Consequences shows that urbanization of the Damascus West area would have low adverse consequences for nearby agriculture (Alternative Analysis Study, p. 21; Table A-4). This is, in part, due to the facts that the area occupies a small notch that extends into land within the UGB and is relatively isolated by topography and forested land from other agricultural lands to the south, as noted in the report of the Metro Agricultural Lands Technical Workgroup led by the Oregon Department of Agriculture ["Limited Choices: The Protection of Agricultural Lands and the Expansion of the Metro Area Urban Growth Boundary for Industrial Use", Appendix A, Item (i)]. Ordinance No. 04-1040B, Exhibit F, imposes Condition IE upon urbanization of Damascus West to reduce conflict and improve compatibility between urban use in the area and agricultural use on land to the south.

5. Natural and Cultural Resources

The Alternative Analysis Study addresses Goal 5 and 6 resources in the Damascus West area protected by Clackamas County in its acknowledged comprehensive plan (p. 22). The county will be responsible for protecting these resources in the area when it amends its comprehensive plan and zoning ordinance to implement expansion of the UGB. Condition IG of Exhibit F requires the county to consider Metro's inventory of Goal 5 resources in their application of Goal 5 to the Damascus area. Title 3 (Water Quality, Flood Management and Fish and Wildlife Conservation) of the UGMFP requires Clackamas County to protect water quality and floodplains in the area. Title 11 of the UGMFP, section 3.07.1120G, requires the county to protect fish and wildlife habitat and water quality. Title 11, section 3.07.1110, protects the status quo in the interim period of county planning for the area.

6. Public Utilities and Services

Under statewide Planning Goal 11, Metro is responsible for coordination of the preparation of public facility plans within the district. Metro will fulfill this responsibility through implementation of Title 11 of the UGMFP, which (1) prohibits Clackamas County from upzoning and from dividing land into resulting lots or parcels smaller than 20 acres until the county revises its comprehensive plan and zoning ordinances to authorize urbanization of land Metro brings into the UGB; and (2) requires the county to develop public facilities and services plans and urban growth diagrams with the general locations of necessary public

facilities such as sanitary sewers, storm sewers and water lines for the area. Metro and the county began this work with the evaluation of the serviceability of the Damascus area in the Alternative Analysis Study (pages 20-21 and 111).

7. Transportation

Metro shares responsibility to ensure that its Task 2 decision for the Damascus West area does not significantly affect a transportation facility or allow uses that are inconsistent with the identified function, capacity and performance standards of transportation facilities. Metro fulfills this responsibility through implementation of Title 11 of the UGMFP, which (1) prohibits Clackamas County from upzoning and from land divisions into resulting lots or parcels smaller than 20 acres in the area until the county revises its comprehensive plans and zoning ordinances to authorize urbanization of land Metro brings into the UGB; and (2) requires the county to develop conceptual transportation plans and urban growth diagrams with the general locations of arterial, collector and essential local streets for the area. Metro and Clackamas County began this work with the evaluation of the serviceability of the area in the Alternative Analysis Study (p. 21 and Table A-2) and consideration of how to provide services as part of the analysis required to satisfy Goal 14, factors 3 and 4.

Metro's 2000 Regional Transportation Plan (RTP) anticipated inclusion of the area within the UGB. The plan's "Priority System" of planned transportation facilities shows improvements planned for the area to serve anticipated growth. Among the improvements is the Sunrise Highway, a likely alignment for which (shown on the 2040 Growth Concept Map) borders the portion of the Damascus West Study Area included by this ordinance. The "Financially Constrained System" includes improvements that will add capacity to East Sunnyside Road near the included area (see discussion of RTP below).

8. Regional Framework Plan

The area lies within ½-mile of Damascus Town Center and will provide additional employment to support the center. The area will not only provide employment opportunities for new residents of the Damascus area, but also improve the ratio between jobs and housing in the east side of the region.

9. Regional Transportation Plan

Through its Joint Policy Advisory Committee on Transportation, Metro has coordinated transportation planning and funding of transportation improvements with local governments in the region. The Regional Transportation Plan adopted a "Priority System" of improvements through the year 2020. The Priority System includes the most critical improvements needed to implement the 2040 Growth Concept. Among the improvements are the "East Multnomah County Transportation Projects" and the "Pleasant Valley and Damascus Transportation Projects" that will provide the basic transportation services to the area (pages 5-49 to 5-57). Figures 1.4, 1.12, 1.16, 1.17, 1.18 and 1.19 of the RTP show how the region's street design, motor vehicle, public transportation, freight, bicycle and pedestrian systems will extend into the Damascus area.

B. Beavercreek

The Council relies upon the facts and analysis in the Alternative Analyses Study [2003 in Appendix A, Item(d) in Ordinance No. 04-1040B, pp. 32-34; 111; A-1 – A-4] and the Staff Report [Appendix A, Item (a), p. 25] to support its conclusion that addition of a portion of the Beavercreek area will provide for an orderly and efficient transition from rural to urban land use. The Council added this single tract, zoned for forest use but occupied by a portion of a larger golf course, in part because the Council included the other half of the golf course in the UGB by Ordinance No. 02-969B in December, 2002 (as part of Task 2), and

designated it for industrial use. The predominant soils on the tract are Class IV and VI. This parcel (63 acres; 30 net acres) helps satisfy the identified need for large parcels (see UGR-E, page 25), particularly in combination with the other part of the golf course included in December, 2002.

1. Orderly Services

The Council relies upon the Study Area Goal 14 Analysis Summary and the Ratings for Transportation Services Feasibility contained in its Alternative Analysis Study (Appendix A, Item 6, pages 111 and Table A-2, respectively) for its determination that these services can be provided to this portion of the Beavercreek area in an orderly and economic manner by extending services from existing serviced areas. Condition IA of Exhibit F calls for transportation and public facility and service plans within two years. Condition IIB(2) specifies that Title 11 planning of the area be done in conjunction with Title 11 planning for the adjoining area added to the UGB by Ordinance No. 02-969B.

The Alternative Analysis Study (p. 32-33) sets forth the likely service providers for sewer, water and storm-water services and assigns a serviceability rating for the larger Beavercreek area. The developable portion of the area included in the UGB adjoins and will be served by the same providers that will serve the area added to the UGB in December, 2002. Serviceability generally ranges from “easy” to “difficult” to serve (Table 1, p. 111) and compares favorably with areas not included (such as Borland Road South, Norwood/Stafford and Wilsonville West). Table A-2 shows transportation services for the larger Beavercreek area to be difficult. However, for the portion of Beavercreek added, transportation services will be the same as those provided to the adjoining property added to the UGB in December, 2002.

2. Efficiency

The Council relies on the same information on provision of essential services mentioned above for its conclusion that the area can urbanize efficiently, particularly knowing that this portion of the Beavercreek area will be planned in conjunction with the portion added to the UGB and designated for industrial use in December, 2002. Both portions can be urbanized more efficiently if the portions are planned and urbanized together.

The Council also relies upon its findings and conclusions above (part I, General Findings, section D, Alternatives: Increase Capacity of UGB) regarding actions it has taken to increase the efficiency of the use of employment land within the existing UGB.

3. Consequences

The Council relies upon the analysis of the consequences of urbanization on this portion of the Beavercreek area set forth in the Industrial Land Alternative Analysis Study, p. 34 and Table A-3). The analysis indicates that the consequences will be high if the Council were to include the entire Beavercreek study area (2,540 acres). But Ordinance No. 04-1040B includes only a single, 63-acre tract, half of a golf course the other half of which was included in the UGB by Ordinance No. 02-969B. Title 11 of the UGMFP requires that comprehensive planning and land use regulations for the area protect the portions (streams, wetlands, floodplains and steep slopes) of the tract subject to Title 3 of the UGMFP and the conditions in Exhibit F of this ordinance.

The Council has placed a condition on comprehensive planning for the area that the local government responsible for planning considered Metro’s adopted Goal 5 inventory during its planning (see Condition IG, Exhibit F). The local governments will eventually adopt provisions to implement Metro’s Goal 5 program following the Council’s adoption of that program, if the local government’s ordinance do not already comply.

4. Compatibility

The Agricultural Analysis Consequences shows that urbanization of the Beavercreek area would have moderate adverse consequences for nearby agriculture (p. 111). There will be little effect on agriculture from urbanization of this small portion of the area, however, because the tract itself is part of a golf course, and there are no nearby agricultural activities.

5. Natural and Cultural Resources

The Alternative Analysis Study addresses Goal 5 and 6 resources in the larger Beavercreek area protected by Clackamas County in its acknowledged comprehensive plan (page 34). The single portion of the larger area added to the UGB by this ordinance contains no inventoried Goal 5 sites protected by Clackamas County. Condition IG of Exhibit F requires the county to consider Metro's inventory of Goal 5 resources in their application of Goal 5 to the small portion of the Beavercreek area included in the UGB. Title 3 (Water Quality, Flood Management and Fish and Wildlife Conservation) of the UGMFP requires Clackamas County to protect water quality and floodplains in the area. Title 11 of the UGMFP, section 3.07.1120G, requires the counties to protect fish and wildlife habitat and water quality. Title 11, section 3.07.1110, protects the status quo in the interim period of county planning for the area.

6. Public Facilities and Services

Under statewide Planning Goal 11, Metro is responsible for coordination of the preparation of public facility plans within the district. Metro will fulfill this responsibility through implementation of Title 11 of the UGMFP, which (1) prohibits Clackamas County or Oregon City from upzoning and from dividing land into resulting lots or parcels smaller than 20 acres until the county or city revises its comprehensive plan and zoning ordinances to authorize urbanization of land Metro brings into the UGB; and (2) requires the county or city to develop public facilities and services plans and urban growth diagrams with the general locations of necessary public facilities such as sanitary sewers, storm sewers and water lines for the area. Metro, the county and the city began this work with the evaluation of the serviceability of the Beavercreek area in the Alternative Analysis Study done as part of Ordinance No.02-969B (pages 108-09; A-9, A-13;) and the Industrial Land Alternative Analysis Study done as part of Ordinance No. 04-1040A (pages 25, 32-33 and 111).

7. Transportation

Metro shares responsibility to ensure that its Task 2 decision for the Beavercreek area does not significantly affect a transportation facility or allow uses that are inconsistent with the identified function, capacity and performance standards of transportation facilities. Metro fulfills this responsibility through implementation of Title 11 of the UGMFP, which (1) prohibits Clackamas County or Oregon City from upzoning and from land divisions into resulting lots or parcels smaller than 20 acres in the area until the county or city revises its comprehensive plan and zoning ordinances to authorize urbanization of land Metro brings into the UGB; and (2) requires the county or city to develop a conceptual transportation plan and urban growth diagram with the general locations of arterial, collector and essential local streets for the area. Metro, the county and the city began this work with the evaluation of the serviceability of the Beavercreek area in the Alternative Analysis done as part of Ordinance No.02-969B (pages 108-09; A-9, A-15-19) and the Analysis done as part of Ordinance No. 04-1040B (pages 25 and 33 and A-2).

The City of Oregon City indicates that the Beavercreek area can be provided with transportation services. The small included portion adjoins an area that is more serviceable than other portions of the larger Beavercreek area considered by the Council. It is contiguous to the city and can be served in an orderly manner.

8. Regional Framework Plan

This small addition of industrial land (63 acres) will be planned in combination with adjoining industrial land added by Ordinance No. 02-969B to comprise a more efficient industrial area. The area will provide employment to support the Oregon City Regional Center.

9. Regional Transportation Plan

Through its Joint Policy Advisory Committee on Transportation, Metro has coordinated transportation planning and funding of transportation improvements with local governments in the region. The Regional Transportation Plan adopted a "Priority System" of improvements through the year 2020. The Priority System includes the most critical improvements needed to implement the 2040 Growth Concept. Among the improvements is the "Highway 213 Corridor Study" to complete a long-term traffic management plan and identify projects to implement the plan (pages 5-59 to 5-61).

C. Quarry (Partial)

The Council relies upon the facts and analysis in the Industrial Land Alternative Analyses Study [Appendix A, Item(c) in Ordinance No. 04-1040B, pp. 64-66; 111; A-1 – A-4] and the Staff Report [Appendix A, Item (a), pp. 26-27] to support its conclusion that addition of a portion of the Quarry Study Area will provide for an orderly and efficient transition from rural to urban land use. The Council chose this area of resource land because it contains a concentration of larger parcels, relatively few of which are developed with residences. Parcels of this range are needed for the types of industries Metro expects will grow during the planning period (UGR-E, p. 25) and are generally unavailable in exception areas. Also, soils in the area are predominantly Class VII, of lower capability than other resource land under consideration. Significant portions are devoted to quarry operations, which have removed soils altogether. There are major quarry operations adjoining this area to the east and elsewhere nearby. There is also significant industrial development and zoning north and east of the Quarry area. See "Perfect for Industry", prepared by Davis, Wright, Tremaine, LLP, April 29, 2004. The Council included one of the quarry areas in the UGB in Ordinance No. 02-990A for industrial use. Some agricultural activity takes place in the northern section of this area, but it is isolated from other areas devoted to agriculture by quarry operations and other nonfarm activities [Tualatin Valley Sportsmens Club (gun club), for example].

1. Orderly Services

The Council relies upon the Quarry Study Area Goal 14 Analysis Summary and the Ratings for Transportation Services Feasibility contained in its Industrial Land Alternative Analysis Study (Appendix A, Item (c), pages 111 and Table A-2, respectively) for its determination that urban services can be provided to the Quarry area in an orderly and economic manner by extending services from existing serviced areas. Condition IIE(2) of Exhibit F calls for coordination of transportation and public facility and service planning for this area with the adjoining area added to the UGB for industrial use on December 12, 2002.

The Alternatives Analysis (p. 64-65) sets forth the likely service providers for sewer, water and storm-water services and assigns a serviceability rating for the Quarry Study Area. Serviceability ranges from "easy" to "moderately difficult" to serve (Table 1, p. 111) and compares favorably with areas not included (such as Borland Road South, Norwood/Stafford and Wilsonville West). Transportation services would be easy to provide for reasons set forth in the Alternative Analysis Study, p. 65.

2. Efficiency

The Council relies on the same information on provision of essential services mentioned above for its conclusion that the area can urbanize efficiently, particularly knowing that this portion of the Quarry Study Area will be planned in conjunction with the quarry area to the east, added to the UGB and designated for industrial use in December, 2002. This portion lies close to existing services and Tualatin-Sherwood and Oregon Roads. Both portions can be urbanized more efficiently if the portions are planned and urbanized together.

The Council also relies upon its findings and conclusions above (part I, General Findings, section D, Alternatives: Increase Capacity of UGB) regarding actions it has taken to increase the efficiency of the use of employment land within the existing UGB.

3. Consequences

The Council relies upon the analysis of the consequences of urbanization on this portion of the Quarry Study Area set forth in the Alternative Analysis Study, p. 65-66 and Table A-3). The analysis indicates that the environmental consequences will be low. In addition, Title 11 of the UGMFP requires that comprehensive planning and land use regulations for the area protect the portions (streams, wetlands, floodplains and steep slopes) of the area subject to Title 3 of the UGMFP and the conditions in Exhibit F of this ordinance.

The Council has placed a condition on comprehensive planning for the area that the local government responsible for planning considered Metro's adopted Goal 5 inventory during its planning (see Condition I G, Exhibit F). The local governments will eventually adopt provisions to implement Metro's Goal 5 program following the Council's adoption of that program, if the local government's ordinance do not already comply.

4. Compatibility

The Agricultural Analysis Consequences shows that urbanization of the Quarry Study Area would have few adverse consequences for nearby agriculture. The area has the UGB on three sides and quarry operations to the east and southeast. The portion devoted to agriculture is in the northwest portion, isolated from agricultural operations south of the quarries.

5. Natural and Cultural Resources

The Alternative Analysis Study addresses Goal 5 and 6 resources in the Quarry Study Area protected by Washington County in its acknowledged comprehensive plan (page 65-66). Significant portions of the area are identified as aggregate sites in the county's Goal 5 inventory and are protected by aggregate overlays. Under Metro's Title 11, current county land use regulations will remain in place until the county, or one of the cities (Tualatin or Sherwood), adopts new plan provisions and land use regulations to allow industrial uses in the area, at which time the county or city will apply Goal 5 to the area and re-consider the decision to protect the quarries under Goal 5.

Condition IG of Exhibit F requires the county or cities to consider Metro's inventory of Goal 5 resources in its application of Goal 5 to the Quarry area included in the UGB. Title 3 (Water Quality, Flood Management and Fish and Wildlife Conservation) of the UGMFP requires the county to protect water quality and wetlands in the area. Title 11 of the UGMFP, section 3.07.1120G, requires the county to protect fish and wildlife habitat and water quality. Title 11, section 3.07.1110, protects the status quo in the interim period of county or city planning for the area.

6. Public Facilities and Services

Under statewide Planning Goal 11, Metro is responsible for coordination of the preparation of public facility plans within the district. Metro will fulfill this responsibility through implementation of Title 11 of the UGMFP, which (1) prohibits Washington County or the City of Sherwood or Tualatin from upzoning and from dividing land into resulting lots or parcels smaller than 20 acres until the county or city revises its comprehensive plan and zoning ordinances to authorize urbanization of land Metro brings into the UGB; and (2) requires the county or city to develop public facilities and services plans and urban growth diagrams with the general locations of necessary public facilities such as sanitary sewers, storm sewers and water lines for the area. Metro, the county and the cities began this work with the evaluation of the serviceability of the Quarry Study Area in the Alternative Analysis done as part of Ordinance No.02-969B (pages 161-63; A-9) and the Analysis done as part of Ordinance No. 04-1040B (pages 64-65 and 111).

7. Transportation

Metro shares responsibility to ensure that its Task 2 decision for the Quarry Study Area does not significantly affect a transportation facility or allow uses that are inconsistent with the identified function, capacity and performance standards of transportation facilities. Metro fulfills this responsibility through implementation of Title 11 of the UGMFP, which (1) prohibits Washington County or the City of Sherwood or Tualatin from upzoning and from land divisions into resulting lots or parcels smaller than 20 acres in the area until the county or city revises its comprehensive plan and land use regulations to authorize urbanization of land Metro brings into the UGB; and (2) requires the county or city to develop a conceptual transportation plan and urban growth diagram with the general locations of arterial, collector and essential local streets for the area. Metro and the county and cities began this work with the evaluation of the serviceability of the area in the Alternatives Analysis done as part of Ordinances No.02-969B (pages 108-09; A-9, A-15-19) and 990A and the Analysis done as part of Ordinance No. 04-1040B (pages 64-65 and A-2). The cities indicate a willingness to serve the Quarry area with transportation services pending the determination of service boundaries.

8. Regional Framework Plan

This addition of industrial land will be planned in coordination with adjoining industrial land to the east added by Ordinance No. 02-990A to comprise a more efficient industrial area. The area will provide employment to support the Sherwood and Tualatin Town Centers. The Quarry area runs along the Tualatin-Sherwood Road within two miles of the two centers. Given that the added portion of the Quarry area is suitable for the types of industry likely to grow in the future, the Council includes the area notwithstanding that this part of the region is relatively well-endowed with employment.

By adding the Quarry area to the UGB, following addition of the quarry area to the east, Metro will be bringing a “notch” into the UGB that lies between the two cities of Sherwood and Tualatin. This keeps the form of the region compact and efficient.

9. Regional Transportation Plan

Through its Joint Policy Advisory Committee on Transportation, Metro has coordinated transportation planning and funding of transportation improvements with local governments in the region. The Regional Transportation Plan adopted a “Priority System” of improvements through the year 2020. The Priority System includes the most critical improvements needed to implement the 2040 Growth Concept. Among the improvements are the “The Tualatin-Sherwood Major Investment Study”, to complete environmental design for the I-5 to 99W principal arterial connector, and the “Tualatin-Sherwood

Connector", to construct the four-lane tollway connection (pages 5-65 to 5-67). Although a final corridor for this facility has not yet been chosen, it is almost certain that it will pass less than a mile from the south border of the Quarry area.

D. Coffee Creek (partial)

The Council relies upon the facts and analysis in the Alternatives Analyses [Appendix A, Item(c) in Ordinance No. 04-1040B, pp. 58-60; 111; A-1 – A-4] and the Staff Report [Appendix A, Item (a), pp. 26] to support its conclusion that addition of a portion of the Coffee Creek Study Area [264 acres (97 net acres) of 442 in the study area] will provide for an orderly and efficient transition from rural to urban land use. The Council chooses this portion because it is almost entirely exception land (there is a 4.6-acre tract of resource at the northern edge), it can be planned in conjunction with land added to the UGB in December, 2002, for industrial use, urban services are available in the vicinity, and urbanization will have no effect on agricultural practices on adjacent land due to its isolation from agricultural activities.

1. Orderly Services

The Council relies upon the Coffee Creek Study Area Goal 14 Analysis Summary and the Ratings for Transportation Services Feasibility contained in its Industrial Land Alternative Analysis Study (Appendix A, Item 6, pages 111 and Table A-2, respectively) for its determination that urban services can be provided to the Quarry area in an orderly and economic manner by extending services from existing serviced areas. Condition IIF(1) of Exhibit F allows four years for Title 11 planning for this area so that planning for urban services can be done in conjunction with such planning for the adjoining area added to the UGB for industrial use on December 5, 2002.

The Alternative Analysis Study sets forth the likely service providers for sewer, water and storm-water services and assigns a serviceability rating for the Coffee Creek area (p. 58-60; Table 1, p. 111). Serviceability ranges from "moderate" to "difficult" to serve and compares favorably with areas not included (such as Borland Road South and Wilsonville West).

2. Efficiency

The Council relies on the same information on provision of essential services mentioned above for its conclusion that the area can urbanize efficiently, knowing that this portion of the Coffee Creek Study Area will be planned in conjunction with the area to the east, added to the UGB and designated for industrial use in December, 2002. The area lies adjacent to a principal north-south rail line that will make industrial use and movement of freight more efficient.

The Council also relies upon its findings and conclusions above (part I, General Findings, section D, Alternatives: Increase Capacity of UGB) regarding actions it has taken to increase the efficiency of the use of employment land within the existing UGB.

3. Consequences

The Council relies upon the analysis of the consequences of urbanization on this portion of the Coffee Creek area set forth in the Alternative Analysis Study, p. 58-60 and Table A-3). Because the Council included only the easternmost portion of the study area – the portion that borders the UGB on the west – the adverse consequences will be reduced. Title 11 of the UGMFP requires that comprehensive planning and land use regulations for the area protect the portions (streams, wetlands, floodplains and steep slopes) of the area subject to Title 3 of the UGMFP and the conditions in Exhibit F of this ordinance.

The Council has placed a condition on comprehensive planning for the area that the local government responsible for planning considered Metro's adopted Goal 5 inventory during its planning (see Condition IG, Exhibit F, Ordinance No. 04-1040B). The local government will eventually adopt provisions to implement Metro's Goal 5 program following the Council's adoption of that program, if the local government's ordinance do not already comply.

4. Compatibility

The Agricultural Analysis Consequences shows that urbanization of the included portion of the Coffee Creek area would have no adverse consequences for nearby agriculture (p. 111). The area has quarry operations nearby and is isolated from commercial agricultural activity by stream drainages.

5. Natural and Cultural Resources

The Alternative Analysis Study addresses Goal 5 and 6 resources in the Coffee Creek Study Area protected by Washington County in its acknowledged comprehensive plan (p. 60). The quarries in the area are protected by aggregate overlays by Washington County. Under Metro's Title 11, current county land use regulations will remain in place until the county, or the City of Wilsonville or Tualatin, adopts new plan provisions and land use regulations to allow industrial uses in the area, at which time the county or city will apply Goal 5 to the area and re-consider the decision to protect the quarries under Goal 5.

Condition IG of Exhibit F requires the county or city to consider Metro's inventory of Goal 5 resources in its application of Goal 5 to the portion of Coffee Creek area included in the UGB. The area contains streams, wetlands and floodplains. Title 3 (Water Quality, Flood Management and Fish and Wildlife Conservation) of the UGMFP requires the county or city to protect water quality and wetlands in the area. Title 11 of the UGMFP, section 3.07.1120G, requires the county or city to protect fish and wildlife habitat and water quality. Title 11, section 3.07.1110, protects the status quo in the interim period of county or city planning for the area.

6. Public Facilities and Services

Under statewide Planning Goal 11, Metro is responsible for coordination of the preparation of public facility plans within the district. Metro will fulfill this responsibility through implementation of Title 11 of the UGMFP, which (1) prohibits Washington County or the City of Wilsonville or Tualatin from upzoning and from dividing land into resulting lots or parcels smaller than 20 acres until the county or city revises its comprehensive plan and zoning ordinances to authorize urbanization of the area; and (2) requires the county or city to develop public facilities and services plans and urban growth diagrams with the general locations of necessary public facilities such as sanitary sewers, storm sewers and water lines for the area.

7. Transportation

Metro shares responsibility to ensure that its Task 2 decision for the Coffee Creek Study Area does not significantly affect a transportation facility or allow uses that are inconsistent with the identified function, capacity and performance standards of transportation facilities. Metro fulfills this responsibility through implementation of Title 11 of the UGMFP, which (1) prohibits the county or city from upzoning and from land divisions into resulting lots or parcels smaller than 20 acres in the area until the county or city revises its comprehensive plan and zoning ordinance to authorize urbanization of the area; and (2) requires the county or city to develop conceptual transportation plans and urban growth diagrams with the general locations of arterial, collector and essential local streets for the area.

8. Regional Framework Plan

This addition of industrial land will be planned in combination with adjoining industrial land to the east added by Ordinance No. 02-969B to comprise a more efficient industrial area. The Coffee Creek Study Area will provide employment to support the Tualatin and Wilsonville Town Centers, to the north and south respectively. Given that the developable portion of the area is exception land and is suitable for the types of industry likely to grow in the future, the Council includes the Coffee Creek area notwithstanding that this part of the region is relatively well-endowed with employment.

Adding the Coffee Creek area to the UGB, lying between and adjacent to the Cities of Tualatin and Wilsonville, following addition of the area to the east, keeps the form of the region compact and efficient.

9. Regional Transportation Plan

Through its Joint Policy Advisory Committee on Transportation, Metro has coordinated transportation planning and funding of transportation improvements with local governments in the region. The Regional Transportation Plan ("RTP") adopted a "Priority System" of improvements through the year 2020. The Priority System includes the most critical improvements needed to implement the 2040 Growth Concept. Among the improvements are improvements to Boones Ferry Road from Durham Road in the north to Elligsen Road in the south, east of the Coffee Creek Study Area.

The RTP also includes "The Tualatin-Sherwood Major Investment Study", to complete environmental design for the I-5 to 99W principal arterial connector, and the "Tualatin-Sherwood Connector", to construct the four-lane tollway connection (pages 5-65 to 5-67). Although a final corridor for this facility has not yet been chosen, it is almost certain that it will pass through or just to the north of the Coffee Creek area, likely enhancing its access to I-5. Finally, the principal north-south rail line that lies along the eastern boundary of the area will offer an additional mode of transport for movement of freight in the area.

E. Tualatin

The Council relies upon the facts and analysis in the Industrial Land Alternative Analyses Study [Appendix A, Item(c) in Ordinance No. 04-1040B, pp. 61-63; 111; A-1 – A-4] and the Staff Reports [Appendix A, Item (a), pp. 27-28] to support its conclusion that addition of a portion of the Tualatin Study Area will provide for an orderly and efficient transition from rural to urban land use. The Council chose this area because it is exception land (rural residential and rural industrial) with characteristics that make it suitable for industrial use. It lies within two miles of the I-5 corridor and within one mile of an existing industrial area, and portions of the area are relatively flat. These characteristics render it the most suitable exception area under consideration for warehousing and distribution, a significant industrial need facing the region.

The City of Tualatin and many residents of the area expressed concern about compatibility between industrial use and residential neighborhoods at the south end of the city. They have also worried about preserving an opportunity to choose an alignment between Tualatin and Wilsonville for the I-5/99W Connector; the south alignment for this facility passes through the northern portion of the Tualatin Study Area.

In response to these concerns, the Council placed several conditions upon addition of this area to the UGB. First, the Council extended the normal time for Title 11 planning for the area: two years following the identification of a final alignment for the Connector, or seven years after the effective date of Ordinance No. 04-1040B, whichever comes sooner. This allows Title 11 planning by Washington County, the cities of Tualatin and Wilsonville and Metro to accommodate planning for the Connector alignment. Second, the

Council states that, so long as the alignment for the Connector falls close to the South Alignment shown on the 2040 Growth Concept Map, it will serve as the buffer between residential development to the north (the portion least suitable for industrial uses) and industrial development to the south (the portion of the area most suitable for industrial use)

1. Orderly Services

The Council relies upon the Tualatin Study Area Goal 14 Analysis Summary and the Ratings for Transportation Services Feasibility contained in its Industrial Land Alternative Analysis Study (Appendix A, Item (c), pages 111 and Table A-2, respectively) for its determination that urban services can be provided to the area in an orderly and economic manner by extending services from existing serviced areas.

The Alternatives Analysis (pp. 61-62) sets forth the likely service providers for sewer, water and storm-water services and assigns a serviceability rating for the Tualatin Study Area. Serviceability ranges from "easy" to "difficult" to serve (Table 1, p. 111). Throughout Task 2 of periodic review the Council has found, however, that provision of services to almost every exception area is difficult and expensive. The City of Wilsonville anticipates further industrial development in the portion of the study area north and northwest of the existing city, in part due to the siting of the Coffee Creek Correctional Facility, and expects to be the service provider over time. Given the critical need for sites proximate to interchanges on I-5 and the rarity of such sites, the Council has decided to include the Tualatin Study Area notwithstanding.

2. Efficiency

The Council relies on the same information on provision of essential services mentioned above (Orderly Services) for its conclusion that the area can urbanize efficiently. The Council also relies upon its findings and conclusions above (part I, General Findings, section D, Alternatives: Increase Capacity of UGB) regarding actions it has taken to increase the efficiency of the use of employment land within the existing UGB.

This area lies between two cities and among areas added to the UGB for industrial use in December, 2002, making urbanization of the area more efficient than projecting urbanization from the UGB into a rural area. Given the likelihood that the region will build the I-5/99W Connector through this area, industrial development in the area will ensure efficient use of that facility.

3. Consequences

The Council relies upon the analysis of the consequences of urbanization on the Tualatin Study Area set forth in the Alternative Analysis Study, pp. 62-63 and Table A-3). The analysis indicates that the consequences will be low to moderate, especially considering the requirements of Title 11 of the UGMFP that comprehensive planning and land use regulations for the area protect the portions (streams, wetlands, floodplains and steep slopes) of the area subject to Title 3 of the UGMFP and the conditions in Exhibit F of Ordinance No. 04-1040B.

The Council has placed a condition on comprehensive planning for the area that the local government responsible for planning considered Metro's adopted Goal 5 inventory during its planning (see Condition IG, Exhibit F). The local governments will eventually adopt provisions to implement Metro's Goal 5 program following the Council's adoption of that program, if the local government's ordinance do not already comply.

4. Compatibility

The Agricultural Analysis Consequences shows that urbanization of the Tualatin Study Area would have low adverse consequences for agriculture (Alternative Analysis Study, p. 62; Table A-4). Although there are a few agricultural uses in the study area itself, the area is designated entirely for rural residential and rural industrial uses, pursuant to exceptions from statewide planning Goals 3 and 4. The area is isolated from land designated for agriculture by the UGB, I-5 and mining operations to the west. Hence, it is unlikely that industrial use will conflict with agricultural activities on land designated for agricultural or forest use.

5. Natural and Cultural Resources

The Alternative Analysis Study addresses Goal 5 and 6 resources in the Tualatin Study Area protected by Washington County in its acknowledged comprehensive plan (pp. 62-63). There are aggregate mines in the vicinity; portions of Washington County's Mineral and Aggregate Overlay District B cover small portions of the study are in the northwest and southwest corners and the top central portion.

The county, or the City of Wilsonville or Tualatin upon annexation to one of the cities, will be responsible for protecting these resources when it amends its comprehensive plan and zoning ordinance to implement expansion of the UGB. Condition IG of Exhibit F requires the county or city to consider Metro's inventory of Goal 5 resources in their application of Goal 5 to the Tualatin Study Area. Title 3 (Water Quality, Flood Management and Fish and Wildlife Conservation) of the UGMFP requires the county or city to protect water quality and floodplains in the area. Title 11 of the UGMFP, section 3.07.1120G, requires the county or city to protect fish and wildlife habitat and water quality. Title 11, section 3.07.1110, protects the status quo in the interim period of county or city planning for the area.

6. Public Facilities and Service

Under statewide Planning Goal 11, Metro is responsible for coordination of the preparation of public facility plans within the district. Metro will fulfill this responsibility through implementation of Title 11 of the UGMFP, which (1) prohibits Washington County and the cities of Wilsonville and Tualatin from upzoning and from dividing land into resulting lots or parcels smaller than 20 acres until the county or city revises its comprehensive plan and zoning ordinances to authorize urbanization of the area; and (2) requires the county or city to develop public facilities and services plans and urban growth diagrams with the general locations of necessary public facilities such as sanitary sewers, storm sewers and water lines for the area.

7. Transportation

Metro shares responsibility to ensure that its Task 2 decision for the Tualatin Study Area does not significantly affect a transportation facility or allow uses that are inconsistent with the identified function, capacity and performance standards of transportation facilities. Metro fulfills this responsibility through implementation of Title 11 of the UGMFP, which (1) prohibits Washington County and the cities of Tualatin and Wilsonville from upzoning and from land divisions into lots or parcels smaller than 20 acres in the area until the county or city revises its comprehensive plan and zoning ordinances to authorize urbanization of land added to the UGB; and (2) requires the county or city to develop conceptual transportation plans and urban growth diagrams with the general locations of arterial, collector and essential local streets for the area. Metro began this work with the evaluation of the serviceability of the area in the Alternative Analysis Study (pp. 61-62 and Table A-2) and consideration of how to provide services as part of the analysis required to satisfy Goal 14, factors 3 and 4.

Table A-2 recognizes that provision of transportation to new industrial uses in the area will be difficult. The Oregon Department of Transportation, Region 1 ("ODOT"), expects the volume-to-capacity ratio on I-5 in the vicinity of the North Wilsonville interchange to be "extremely poor" by 2025, and states

that the interchange "may need to be reviewed for impact" if the Council adds land to the UGB dependent upon the interchange. The "Priority System" in Metro's RTP calls for improvement to Boones Ferry Road from Durham Road in Tualatin to Elligsen Road in Wilsonville and for construction of a four-lane tollway between I-5 and Highway 99W, the sourthern and most likely alignment of which passes through the study area. There is no planned improvement to the capacity of the freeway or the interchange in the RTP or either city's TSP. In 2002, however, a joint ODOT/Wilsonville study concluded that in 2030, widening of I-5 to eight lands would be required to meet interstate freeway capacity standards set by Metro and ODOT. This study will help Metro, ODOT, Wilsonville and Tualatin understand the improvements needed to accommodate industrial use in the study area. The 2004 Federal RTP also identifies a corridor refinement study for I-5 in the vicinity. These studies will inform Title 11 planning for the study area.

8. Regional Framework Plan

The Tualatin Study Area lies midway between the Tualatin and Wilsonville Town Centers, and is nearly as close to the Sherwood Town Center as to Tualatin and Wilsonville. Industrial development in the study area will provide additional employment to support businesses in those centers. The Council includes this area, notwithstanding that this part of the region is relatively well-endowed with employment, because it has more of the characteristics needed for warehousing and distribution than other areas considered. The Wilsonville South Area has many of the same characteristics. But it lies on the opposite side of the Willamette River and requires a trip on I-5 across the river to gain access to the Wilsonville Town Center. The Council concludes that addition of the north portion of the Tualatin Study Area provides better urban form to the city and the region than adding land on the south side of the Willamette River.

9. Regional Transportation Plan

Through its Joint Policy Advisory Committee on Transportation, Metro has coordinated transportation planning and funding of transportation improvements with local governments in the region. The Regional Transportation Plan adopted a "Priority System" of improvements through the year 2020. The Priority System includes the most critical improvements needed to implement the 2040 Growth Concept. Among the improvements in the vicinity of the Tualatin Study Area are improvement to Boones Ferry Road from Durham Road in Tualatin to Elligsen Road in Wilsonville and construction of a four-lane tollway between I-5 and Highway 99W, the southern and most likely alignment of which passes through the study area.

F. Helvetia (Partial)

The Council relies upon the facts and analysis in the Industrial Land Alternative Analyses Study [Appendix A, Item(c) in Ordinance No. 04-1040B, pp. 104-06; 111; A-1 to A-4] and the Staff Reports [Appendix A, Item (a), p. 28] to support its conclusion that addition of a 249-acre portion of the Helvetia Study Area will provide for an orderly and efficient transition from rural to urban land use. The Council chose this area because it has several characteristics that render it among the most suitable sites under consideration for industrial use: a large parcels; relatively flat land; and proximity to a freeway interchange. The Urban Growth Report-Employment (UGR-E) identifies a specific need for large parcels (50 acres or larger) (Ordinance No. 02-969B, Appendix A, Item 4, page 25). This portion of the Helvetia Study Area contains one parcel between 50 and 100 acres.

Two-thirds of this area (162 acres) is designated for agriculture in Washington County's comprehensive plan (predominantly Class II soil). The farmland portion lies between the existing UGB (to the south and east) and the exception land portion to the west. West Union Road separates the included farmland from excluded farmland to the north. The Council includes this farmland because the exception land portion (87 acres) contains some land suitable for industrial use. Also, among farmlands considered,

this farmland is already affected by nearby urban and rural residential use. Further, the Council found only two areas designated for agriculture of higher priority (Class IV or III soils) suitable for industrial use (Damascus West and Quarry Study Areas) (see discussion of West Union Study Area, below).

The Council considered including a portion of the Evergreen Study Area, which also contains a combination of exception land and Class II farmland, because it, too, contains several large parcels. The Council favored the Helvetia area because the farmland portion of the Evergreen area that lies between the UGB to the east, the exception land to the west and NW Meek Road to the north includes considerably more farmland than the included portion of the Helvetia Area (478 acres versus 162 acres in Helvetia). Further, unlike the exception land portion of Helvetia, the exception land portion of the Evergreen Study Area does not contain land suitable for industrial use.

The Council also considered inclusion of the West Union Study Area, which contains farmland of Class II and III soils. The Council chose the Helvetia area rather that the West Union area because the portion of the West Union area with higher-priority Class III soils is not suitable for industrial use (slopes greater than 10 percent), and this portion lies to the north of the portion with predominantly Class II soils (adjacent to the UGB). Also, the Council found no good barrier in the West Union area to separate farmland included from farmland excluded until Cornelius Pass Road to the north, which would enclose many more acres of farmland (862 acres) than the 162 acres in the Helvetia area.

The Council also considered Class II farmland in the Wilsonville East Study Area in order to find large parcels suitable for industrial use. The Council chose the Helvetia Study Area over the Wilsonville area because the former will be considerably easier to provide with public facilities and services (p. 111). As a result, inclusion of the Helvetia area has the support of the City of Hillsboro, while the City of Wilsonville opposes inclusion of the Wilsonville East area.

The Council considered two other study areas composed predominantly of Class II soils: the Noyer Creek and South Hillsboro areas. According to the report of the Metro Agricultural Lands Technical Workgroup led by the Oregon Department of Agriculture ["Limited Choices: The Protection of Agricultural Lands and the Expansion of the Metro Area Urban Growth Boundary for Industrial Use", Appendix A, Item (i)], both areas have higher value for commercial agriculture than the Helvetia area.

Finally, the Council considered Class II farmland south of Wilsonville, near the I-5 corridor on the south side of the Willamette River. The Council rejected this farmland because inclusion would constitute a projection away from the urbanization portion of the metropolitan region, toward Marion County to the south. Industrial development south of the river would also be separated from the services of the City of Wilsonville and the rest of the metropolitan region, connected only by a limited access (interstate highway) bridge across the river. Inclusion of the Helvetia area would better achieve the compact urban form sought by Policies 1 and 1.6 of the RFP and Policy 3 of the Regional Transportation Plan. The Oregon Department of Agriculture urged the Council not to add farmland south of the Willamette River because it would further introduce urban uses into that core area of the Willamette Valley's commercial agriculture. Although the department also expressed concern about inclusion of the Helvetia area, it placed a higher priority on protection of farmland south of the Willamette River. The Council concludes that inclusion of the Helvetia area rather than the Wilsonville South Study area farmland better achieves Policy 1.12.2 of the RFP.

In short, of the Class II farmlands considered by the Council, this portion of the Helvetia Study Area best meets the identified need for industrial land and is most separated from nearby agricultural lands. Other than the exception lands that are part of this study area, there are no other exception lands that can help the region meet its need for larger parcels for industrial use.

1. Orderly Services

The Council relies upon the Helvetia Study Area Goal 14 Analysis Summary and the Ratings for Transportation Services Feasibility contained in its Industrial Land Alternative Analysis Study (Appendix A, Item (c), pages 111 and Table A-2, respectively) for its determination that urban services can be provided to the area in an orderly and economic manner by extending services from existing serviced areas.

The Alternatives Analysis (pp. 104-05) sets forth the likely service providers for sewer, water and storm-water services and assigns a serviceability rating for the larger Helvetia Study Area. Serviceability ranges from "easy" to "moderate" to serve the entire area (Table 1, p. 111). It will be easier to serve the smaller portion of the study area included by the Council because it is the portion closest to the existing UGB (borders on east and south) and services just to the east.

2. Efficiency

The Council relies on the same information on provision of essential services mentioned above (Orderly Services) for its conclusion that the area can urbanize efficiently. The Council also relies upon its findings and conclusions above (part I, General Findings, section D, Alternatives: Increase Capacity of UGB) regarding actions it has taken to increase the efficiency of the use of employment land within the existing UGB.

This area borders the UGB on two sides, with employment and industrial uses on the urban sides of the UGB, making urbanization of the area for industrial use more efficient than projecting urbanization from the UGB into a rural area.

3. Consequences

The Council relies upon the analysis of the consequences of urbanization on the Helvetia Study Area set forth in the Alternative Analysis Study, pp. 105-06 and Table A-3). The analysis indicates that the consequences will be moderate. The requirements of Title 11 of the UGMFP that comprehensive planning and land use regulations for the area protect the portions (streams, wetlands, floodplains and steep slopes) of the area subject to Title 3 of the UGMFP and the conditions in Exhibit F of Ordinance No. 04-1040B will reduce adverse consequences from urbanization of the area.

The Council has placed a condition on comprehensive planning for the area that the local government responsible for planning consider Metro's adopted Goal 5 inventory during its planning (see Condition IG, Exhibit F). The local government will eventually adopt provisions to implement Metro's Goal 5 program following the Council's adoption of that program, if the local government's ordinance do not already comply.

4. Compatibility

The Agricultural Analysis Consequences shows that urbanization of the Helvetia Study Area would have high adverse consequences for nearby agriculture (Alternative Analysis Study, pp. 105-06; Table A-4). The analysis, however, is based urbanization of the entire Helvetia Study Area (1,339 acres) rather than just the portion included within the UGB (249 acres). Adverse consequences and incompatibility from urbanization of the included portion will be much reduced, given that the UGB borders this portion on the east and south sides, West Union Road borders the portion on the north side, and much of this portion (87 acres) is exception area lying between the included farmland portion and the excluded farmland portion to the west.

According to the report of the Metro Agricultural Lands Technical Workgroup led by the Oregon Department of Agriculture ["Limited Choices: The Protection of Agricultural Lands and the Expansion of the Metro Area Urban Growth Boundary for Industrial Use", Appendix A, Item (i)], the included portion of the Helvetia area is less important to commercial agriculture in the region than other agricultural areas under consideration because it lies amid urban and rural residential uses: "However, the workgroup could not ignore the land use pattern both within the area, the location of the area within a small notch of the current urban growth boundary and the two hard edges provided by Helvetia and West Union Roads" (p. 11).

Ordinance No. 04-1040B, Exhibit F, imposes Condition IE upon urbanization of the area to reduce conflict and improve compatibility between urban use in the area and agricultural use on land to the north and west.

5. Natural and Cultural Resources

The Alternative Analysis Study addresses Goal 5 and 6 resources in the Helvetia Study Area protected by Washington County in its acknowledged comprehensive plan (p. 106). The county, or the City of Hillsboro upon annexation to the city, will be responsible for protecting these resources in the area when it amends its comprehensive plan and zoning ordinance to implement expansion of the UGB. Condition IG of Exhibit F requires the county or the City of Hillsboro to consider Metro's inventory of Goal 5 resources in their application of Goal 5 to the Helvetia area. Title 3 (Water Quality, Flood Management and Fish and Wildlife Conservation) of the UGMFP requires the county or city to protect water quality and floodplains in the area. Title 11 of the UGMFP, section 3.07.1120G, requires the county or city to protect fish and wildlife habitat and water quality. Title 11, section 3.07.1110, protects the status quo in the interim period of county or city planning for the area.

6. Public Facilities and Services

Under statewide Planning Goal 11, Metro is responsible for coordination of the preparation of public facility plans within the district. Metro will fulfill this responsibility through implementation of Title 11 of the UGMFP, which (1) prohibits Washington County or the City of Hillsboro from upzoning or from dividing land into resulting lots or parcels smaller than 20 acres until the county or city revises its comprehensive plan and zoning ordinances to authorize urbanization of land Metro brings into the UGB; and (2) requires the county or city to develop public facilities and services plans and urban growth diagrams with the general locations of necessary public facilities such as sanitary sewers, storm sewers and water lines for the area.

7. Transportation

Metro shares responsibility to ensure that its Task 2 decision for the Helvetia Study Area does not significantly affect a transportation facility or allow uses that are inconsistent with the identified function, capacity and performance standards of transportation facilities. Metro fulfills this responsibility through implementation of Title 11 of the UGMFP, which (1) prohibits Washington County or the City of Hillsboro from upzoning and from land divisions into resulting lots or parcels smaller than 20 acres in the area until the county or city revises its comprehensive plan and zoning ordinances to authorize urbanization of land Metro brings into the UGB; and (2) requires the county or city to develop conceptual transportation plans and urban growth diagrams with the general locations of arterial, collector and essential local streets for the area. Metro began this work with the evaluation of the serviceability of the area in the Alternative Analysis Study (pp. 104-05 and Table A-2) and consideration of how to provide services as part of the analysis required to satisfy Goal 14, factors 3 and 4.

The Oregon Department of Transportation ("ODOT"), Region 1, notes that the Shute Road interchange on Hwy. 26, to which most of the trips generated by development in the Helvetia area will go, "is already inadequate to accommodate the 2003 Urban Growth Boundary ("UGB") expansion in this area." Metro's 2004 RTP includes an interchange improvement to serve the industrial land added to the UGB for industrial use in December, 2002, with partial funding. The RTP also identifies the need to widen several stretches of Hwy. 26 from four to six lanes. The county or city, together with Metro, will fully assess the effects of development on these facilities during Title 11 planning. Title 11 calls for a conceptual transportation plan as part of amendment of city or county comprehensive plans and land use regulations, to which statewide planning Goal 12 and the Transportation Planning Rule apply.

8. Regional Framework Plan

The Helvetia Study Area lies adjacent to, and will likely become part of the North Hillsboro Industrial Area. This industrial area is the anchor of the high tech cluster that runs from this tract to Wilsonville. It contains the largest concentration of high technology firms in the state. The area supports businesses in the Hillsboro Regional Center, other Centers on the west side of the region, and the Central City. Industrial development in the Helvetia Study Area will provide additional employment to support those centers. The Council includes this area, notwithstanding that this part of the region is relatively well-endowed with employment, because, as noted above, it the characteristics needed for the industrial sectors likely to grow during the planning period.

9. Regional Transportation Plan

Through its Joint Policy Advisory Committee on Transportation, Metro has coordinated transportation planning and funding of transportation improvements with local governments in the region. The Regional Transportation Plan ("RTP") adopted a "Priority System" of improvements through the year 2020. The Priority System includes the most critical improvements needed to implement the 2040 Growth Concept. Among the improvements in the vicinity of the Helvetia Study Area in Metro's 2004 RTP is an interchange improvement to serve the industrial land added to the UGB for industrial use in December, 2002, with partial funding.

G. Cornelius

The Council relies upon the facts and analysis in the Industrial Land Alternative Analyses Study [Appendix A, Item(c) in Ordinance No. 04-1040B, pp. 84-87; 111; A-1 to A-4] and the Staff Reports [Appendix A, Item (a), p. 27] to support its conclusion that addition of this 262-acre portion of the Cornelius Study Area will provide for an orderly and efficient transition from rural to urban land use. Slightly more than half (56 percent) of the included portion is designated for agriculture in Washington County's comprehensive plan (predominantly Class II soil). The farmland portion lies in two tracts separated by an exception area. A second tract of exception land borders the farmland on the east side. Together, these four adjacent tracts comprise the portion of the study area included in the UGB.

The Council chose this portion of the study area because it has characteristics that render it suitable for industrial use: large and mid-sized parcels and relatively flat land. The Urban Growth Report-Employment (UGR-E) identifies a specific need for large parcels (50 acres or larger) (Ordinance No. 02-969B, Appendix A, Item 4, page 25). The included portion of the study area contains one parcel between 50 and 100 acres [Appendix A, Item (a), p.30].

The Council also chose this area to help achieve Policies 1.2, 1.3.1 and 1.4 of the Regional Framework Plan (RFP), which call, among other things, for an equitable and balanced distribution of employment opportunities, income, investment and tax capacity throughout the region. The Council considered the fiscal and equity effects of including this area on the City of Cornelius. Given that the city

has the highest poverty rate, the lowest property tax revenue per capita, the lowest land improvement market value and the longest average commute in the region, the Council concluded that industrial development in this area would help achieve these policies better than inclusion of any other Class II agricultural land.

The Council considered including a portion of the Evergreen Study Area, which also contains a combination of exception land and Class II farmland, because it, too, contains several large parcels. The Council favored the Cornelius area for the reasons stated above, and because the farmland portion of the Evergreen area that lies between the UGB to the east, the exception land to the west and NW Meek Road to the north includes considerably more farmland than the included portion of the Cornelius Study Area (478 acres versus 147 acres in the Cornelius area).

The Council also considered inclusion of the West Union Study Area, which contains farmland of Class II and III soils. The Council chose the Cornelius area rather that the West Union area because the portion of the West Union area with higher-priority Class III soils is not suitable for industrial use (slopes greater than 10 percent), and this portion lies to the north of the portion with predominantly Class II soils (adjacent to the UGB).

The Council also considered Class II farmland in the Wilsonville East Study Area in order to find large parcels suitable for industrial use. The Council chose the Cornelius area over the Wilsonville area for the reasons stated above, and because the former will be considerably easier to provide with public facilities and services (p. 111). As a result, inclusion of the Cornelius area has the support of the City of Cornelius, while the City of Wilsonville opposes inclusion of the Wilsonville East area.

The Council considered two other study areas composed predominantly of Class II soils: the Noyer Creek and South Hillsboro areas. The Cornelius area is easier to provide with public services than either Noyer Creek or South Hillsboro. Inclusion of industrial land in the Cornelius area will better accomplish Policies 1.2, 1.3.1 and 1.4 of the RFP than inclusion of Noyer Creek or South Hillsboro.

Finally, the Council considered Class II farmland south of Wilsonville, near the I-5 corridor on the south side of the Willamette River. The Council rejected this farmland because inclusion would constitute a projection away from the urbanization portion of the metropolitan region, toward Marion County to the south. Industrial development south of the river would also be separated from the services of the City of Wilsonville and the rest of the metropolitan region, connected only by a limited access (interstate highway) bridge across the river. Inclusion of the Cornelius area would better achieve the compact urban form sought by Policies 1 and 1.6 of the RFP and Policy 3 of the Regional Transportation Plan. The Oregon Department of Agriculture urged the Council not to add farmland south of the Willamette River because it would further introduce urban uses into that core area of the Willamette Valley's commercial agriculture. Although the department also expressed concern for expansion of the UGB north of Council Creek in the Cornelius area (part of the included area lies north of Council Creek; part lies south), it placed a higher priority on protection of farmland south of the Willamette River. The Council concludes that inclusion of the Cornelius area rather than the Wilsonville South Study Area farmland better achieves Policy 1.12.2 of the RFP.

1. Orderly Services

The Council relies upon the Cornelius Study Area Goal 14 Analysis Summary and the Ratings for Transportation Services Feasibility contained in its Industrial Land Alternative Analysis Study (Appendix A, Item (c), pages 111 and Table A-2, respectively) for its determination that urban services can be provided to the area in an orderly and economic manner by extending services from the City of Cornelius.

The Alternatives Analysis (pp. 84-85) sets forth the likely service providers for sewer, water and storm-water services and assigns a serviceability rating for the entire Cornelius Study Area. Serviceability ranges from "easy" to "moderate" to serve the entire area (Table 1, p. 111). It will be easier to serve the portion of the study area included by the Council because it is the portion closest to the existing UGB (borders on south) and existing services.

2. Efficiency

The Council relies on the same information on provision of essential services mentioned above (Orderly Services) for its conclusion that the area can urbanize efficiently. The Council also relies upon its findings and conclusions above (part I, General Findings, section D, Alternatives: Increase Capacity of UGB) regarding actions it has taken to increase the efficiency of the use of employment land within the existing UGB.

This area borders the UGB to the south, with employment and industrial uses along a portion of the urban side of the UGB. The included portion also includes two exception area of predominantly rural residential use. Inclusion of the exceptions areas will, over time, lead to more efficient use of the areas.

3. Consequences

The Council relies upon the analysis of the consequences of urbanization on the Cornelius Study Area set forth in the Alternative Analysis Study, pp. 86-87 and Table A-3). The analysis indicates that the consequences will be moderate. The requirements of Title 11 of the UGMFP that comprehensive planning and land use regulations for the area protect the portions (streams, wetlands, floodplains and steep slopes) of the area subject to Title 3 of the UGMFP and the conditions in Exhibit F of Ordinance No. 04-1040B will reduce adverse consequences from urbanization of the area.

The Council has placed a condition on comprehensive planning for the area that the local government responsible for planning consider Metro's adopted Goal 5 inventory during its planning (see Condition IG, Exhibit F). The local government will eventually adopt provisions to implement Metro's Goal 5 program following the Council's adoption of that program, if the local government's ordinance do not already comply.

4. Compatibility

The Agricultural Analysis Consequences shows that urbanization of the Cornelius Study Area would have high adverse consequences for nearby agriculture (Alternative Analysis Study, pp. 84-85; Table A-4). The analysis, however, is based urbanization of the entire study area (1,154 acres) rather than just the portion included within the UGB (262 acres). Adverse consequences and incompatibility from urbanization of the included portion will be much reduced, given that the UGB borders this portion on the south side, and that the farmland portions of the included area border two exception areas, also included.

Ordinance No. 04-1040B, Exhibit F, imposes Condition IE upon urbanization of the area to reduce conflict and improve compatibility between urban use in the area and agricultural use on land to the north and west.

5. Natural and Cultural Resources

The Alternative Analysis Study addresses Goal 5 and 6 resources in the Cornelius Study Area protected by Washington County in its acknowledged comprehensive plan (p. 86). The county, or the City of Cornelius upon annexation to the city, will be responsible for protecting these resources in the area when it amends its comprehensive plan and zoning ordinances to implement expansion of the UGB. Condition IG of

Exhibit F requires the county or the city to consider Metro's inventory of Goal 5 resources in their application of Goal 5 to the area. Title 3 (Water Quality, Flood Management and Fish and Wildlife Conservation) of the UGMFP requires the county or city to protect water quality and floodplains in the area. Title 11 of the UGMFP, section 3.07.1120G, requires the county or city to protect fish and wildlife habitat and water quality. Title 11, section 3.07.1110, protects the status quo in the interim period of county or city planning for the area.

6. Public Facilities and Services

Under statewide Planning Goal 11, Metro is responsible for coordination of the preparation of public facility plans within the district. Metro will fulfill this responsibility through implementation of Title 11 of the UGMFP, which (1) prohibits Washington County or the City of Cornelius from upzoning or from dividing land into resulting lots or parcels smaller than 20 acres until the county or city revises its comprehensive plan and zoning ordinances to authorize urbanization of land Metro brings into the UGB; and (2) requires the county or city to develop public facilities and services plans and urban growth diagrams with the general locations of necessary public facilities such as sanitary sewers, storm sewers and water lines for the area.

7. Transportation

Metro shares responsibility to ensure that its Task 2 decision for the Cornelius Study Area does not significantly affect a transportation facility or allow uses that are inconsistent with the identified function, capacity and performance standards of transportation facilities. Metro fulfills this responsibility through implementation of Title 11 of the UGMFP, which (1) prohibits Washington County or the City of Cornelius from upzoning and from land divisions into resulting lots or parcels smaller than 20 acres in the area until the county or city revises its comprehensive plan and zoning ordinances to authorize urbanization of land Metro brings into the UGB; and (2) requires the county or city to develop conceptual transportation plans and urban growth diagrams with the general locations of arterial, collector and essential local streets for the area. Metro began this work with the evaluation of the serviceability of the area in the Alternative Analysis Study (pp. 85 and Table A-2) and consideration of how to provide services as part of the analysis required to satisfy Goal 14, factors 3 and 4.

The Oregon Department of Transportation ("ODOT"), Region 1, notes that industrial development in the Cornelius area will worsen the level of service on the Tualatin Valley Highway between Cornelius and Hilslboro. The "Financially Constrained" and "Priority System" in Metro's Regional Transportation Plan ("RTP") include several projects that will address congestion in the corridor (Projects 3156, 3164, 3166, 3167, 3168 and 3171). The county or city, together with Metro, will fully assess the effects of development on these facilities during Title 11 planning. Title 11 calls for a conceptual transportation plan as part of amendment of city or county comprehensive plans and land use regulations, to which statewide planning Goal 12 and the Transportation Planning Rule apply.

8. Regional Framework Plan

The included portion of the Cornelius Study Area lies directly north of and adjacent to the City of Cornelius. The area is within one mile of the designated Main Street of Cornelius (there is no designated Town Center). Industrial development in the included area will provide additional employment to support the businesses on Main Street, and provide employment opportunities for the many residents of Cornelius who now travel to other parts of the region for work. As stated above, industrial development in this area will help achieve Policies 1.2, 1.3.1 and 1.4 of the RFP better than inclusion of any other land, including other farmland.

9. Regional Transportation Plan

Through its Joint Policy Advisory Committee on Transportation, Metro has coordinated transportation planning and funding of transportation improvements with local governments in the region. The Regional Transportation Plan ("RTP") adopted a "Priority System" of improvements through the year 2020. The Priority System includes the most critical improvements needed to implement the 2040 Growth Concept. Among the improvements in the vicinity of the included portion of the Cornelius Study Area in Metro's RTP are intersection safety improvements on the TV Highway couplet and improved transit service (see list of projects noted in section 8, above).

REQUIREMENT NO. 2:

REMAND ORDER ON SUBTASK 17: EITHER REMOVE TAX LOTS 1300, 1400 AND 1500 FROM THE BOUNDARY OF EXPANSION AREA 62, OR JUSTIFY THEIR INCLUSION UNDER GOAL 14.

Ordinance No. 04-1040A amends the UGB to remove Tax Lots 1300, 1400 and 1500, all in Study Area 62, from the UGB (Exhibit E). The Council concludes that there is no need to include these lots given the small surplus of land for residential use that resulted from expansion of the UGB by Ordinance No. 02-969B.

REQUIREMENT NO. 3:

REMAND ORDER ON SUBTASK 12B: PROVIDE DATA ON THE ACTUAL NUMBER DENSITY AND AVERAGE MIX OF HOUSING TYPES AS REQUIRED BY ORS 197.296(5) AND DETERMINE THE OVERALL AVERAGE DENSITY MUST OCCUR IN ORDER TO MEET HOUSING NEEDS OVER THE NEXT 20 YEARS AS REQUIRED BY ORS 197.296(7)

Ordinance No. 04-1040A further revises the Revised Housing Needs Analysis ("HNA") to display data required by ORS 197.296(5) (Exhibit D). The data show the number, density and average mix of housing types arranged by type of buildable land (vacant, partially vacant, redevelopment and infill and mixed-use land). These data were subsets of aggregated data in the HNA, but were not displayed in the Revised HNA submitted to LCDC with the Task 2 Submittal on January 24, 2003.

The purpose for collecting the data is to help determine "the overall average density and overall mix of housing types at which residential development of needed housing types must occur in order to meet housing needs over the next 30 years." ORS 197.296(7). Metro determined the overall density and mix of needed housing types in the Revised HNA submitted on January 24, 2003 (see pages 2-7, Figures 3.1, 3.2, 3.3, 5.1 and 5.3). [add text and explanation from earlier HNA] The data newly displayed in this revision do not affect Metro's earlier determination.

SUPPLEMENTAL STAFF REPORT

IN CONSIDERATION OF ORDINANCE NO. 04-1040B, FOR THE PURPOSE OF AMENDING THE METRO URBAN GROWTH BOUNDARY, THE REGIONAL FRAMEWORK PLAN AND THE METRO CODE TO INCREASE THE CAPACITY OF THE BOUNDARY TO ACCOMMODATE GROWTH IN INDUSTRIAL EMPLOYMENT

ORDINANCE NO. 04-1040B

Date: June 21, 2004 **Prepared by: Lydia Neill**

INTRODUCTION

This staff report is intended to summarize the deliberations by the Metro Council and the Metropolitan Policy Advisory Committee (MPAC) that have taken place since April 2004. Discussions and recommendations by MPAC are highlighted in italics. This report will also introduce several technical memorandums that address issues raised during testimony at public hearings in May and June 2004. Discussions in this supplemental staff report will address the Metro Council's revision to the Chief Operating Officer's (COO) recommendation. The primary staff report dated April 5, 2004 contains information that formed the basis for the COO recommendation.

BACKGROUND

Metro is required to assess the capacity of the urban growth boundary (UGB) every five years under ORS 197.299(1). Metro is currently in Periodic Review with the Department of Land Conservation and Development (DLCD) under work program approval order #001243. As part of this review Metro is required to forecast and provide a 20-year land supply for residential, commercial and industrial uses inside the UGB. The Metro Council had forecasted a shortage of 38,700 dwelling units, 140 acres of commercial land and 4,285 acres of industrial land for the period 2002 to 2022. In December 2002 the Metro Council added 18,638 acres of land to the UGB that satisfied all of the demand for residential and commercial uses but only a portion of the overall need for industrial land.

A remand work order was issued by the Land Conservation and Development Commission (LCDC) due to the incomplete actions on industrial lands and several other issues. The remand order 03-WK Task 001524 requires Metro to fulfill the industrial land need, complete the Housing Needs Analysis by providing data on the number mix and housing types required by ORS 197.296(5), and either remove tax lots 1300, 1400 and 1500 adjacent to King City or provide a justification for their inclusion in the UGB by June 2004.

The 2002-2022 Urban Growth Report: An Employment Land Need Analysis Updated December 2002 (Employment UGR), identified a demand for 4,285 net acres of industrial land and a demand for 140 net acres of commercial land. The Metro Council's December expansion decision included roughly half of the industrial land need. The 2002 UGB decision added 2,850 net acres of job land to the UGB that is divided among three 2040 design types; 533 net acres of employment land, 818 net acres of industrial land and 1,499 net acres of Regionally Significant Industrial Area (RSIA) land.[1] Thus, within the 2002 UGB expansion there is a current industrial land need of 1,968 net acres and a commercial land surplus of 393 net acres.

[1] RSIAs are a 2040 design type that identifies industrial areas that have regional significance because of their location near the region's most important transportation facilities for the movement of traded sector freight.

The Employment UGR identified the demand for vacant industrial land by employment sector and distributed the demand by parcel size. These sectors represent the industries that are expected to grow over the next 20 years and include their associated demand for land. This demand allocation reflects past demand, development practices and existing land use policies. The general demand for vacant industrial land is distributed as follows:

- 70 percent warehouse and distribution
- 13 percent general industrial
- 17 percent tech/flex[2]

Fulfilling the Need for Industrial Land

Adopting Efficiency Measures- Title 4

As part of the tasks to complete Periodic Review, Metro examined ways to use land more efficiently and adopted policies to maximize the use of land within the UGB. In 2002, Metro adopted provisions in the Urban Growth Management Functional Plan, Title 4, that limits non-industrial uses in industrial areas. Subsequent to its adoption, local governments and industry representatives have come before the Metro Council to make the case that traditional land use categories are now less relevant to understanding industrial uses because many industrial activities including research and development, office and manufacturing often occur in the same facility. Amendments to Title 4 are intended to preserve land for industrial uses by restricting the amount and types of commercial uses that currently locate on industrial land.

Changes to Title 4 will preserve the transportation capacity for the movement of goods and services and direct other types of employment to centers, employment areas, corridors, main streets and station communities. Both RSIA's and industrial areas place limitations on the size of the retail commercial uses not serving the industrial area. Allowances are made for locating training facilities in industrial areas and commercial uses in airport locations. A discussion of the legislative changes to Title 4 are included on pages 7 and 8.

Impacts of Adopting Title 4 on the UGR

New Title 4 regulations specifically limit the amount and square footage of retail and office uses justify the savings of industrial land discussed in the Employment UGR. The Employment UGR estimates a savings of 1,400 acres of industrial land from implementing new measures and mapping of RSIA lands.[3] Table 1 discusses the supply of industrial land and the impact of the Title 4 policy changes to reduce the deficit of industrial land.

Reductions to the Industrial Land Need

Commercial Land Surplus

The Employment UGR identified a commercial land surplus of 393 acres. The surplus is based upon the available supply of land for commercial purposes and an assumption that a percentage of commercial activities would continue to take place on industrially zoned lands. Testimony received during the discussion of revisions to Title 4, argued the traditional building types accommodating office and industrial uses are merging based on the needs of a knowledge-based economy. Approximately 30 percent of the land need identified in the Employment UGR is for tech-flex and general industrial uses. These uses have higher job densities that are consistent with office type buildings. Based on this fact additional

[2] Tech-flex development is a building type that provides flexible space to accommodate a variety of users from light assembly, product storage and research.
[3] Employment UGR, page 46.

flexibility has been incorporated into Title 4 regulations to accommodate the need for industrial office uses. Concurrently, these same types of office, industrial uses, (i.e. software development etc.) could also locate on commercial land in traditional office building types. Therefore, the surplus of commercial land is being applied to help satisfy the overall need for industrial lands.

Adjustments to the Commercial Refill Rate

This adjustment to the refill rate is reflective of the changes taking place in the industrial marketplace. As discussed above the industrial economy is transitioning from traditional manufacturing to more knowledge and information based economy which contains more office type uses and results in higher floor area ratios. A two percent adjustment to the commercial refill rate applied in the Employment UGR reduces the overall need for industrial land by 174 acres and reflects this change in the marketplace. An increase in the refill rate from 50 to 52 percent represents the observed refill rate. The observed rate was obtained from metroScope modeling work completed in 2002.

Table 1. Industrial Land Need Adjustments

Supply of Industrial Land	**Net Vacant Acres**
Industrial Deficit	1,968
Application of the commercial land surplus	393
Less adjustment based on increasing the commercial refill rate	174
Less adjustments:	
- City of Oregon City (Comprehensive plan industrial)	74
- City of Wilsonville (Comprehensive plan industrial)	127
- Re-instatement of area south of Gresham	20
Remaining Industrial Land Need	**1,180**

Employment UGR Conversion Rate

It was brought to Metro's attention by the City of Wilsonville has asserted that Metro has misapplied the commercial conversion rate in the 2002-2022 Employment UGR calculations to determine the need for industrial land. A discussion of the how a rate of 15-20 percent was derived begins on page 16 of the Employment UGR. The rate was developed by performing an analysis of the covered geocodes of commercial uses located on industrially zoned land. The study found that 2 out of 10 jobs in industrial areas had a commercial standard industrial code (SIC). The confusion lies in calculating a conversion rate of 44 percent by including the marginal increases of land instead of all of the industrially zoned land supply to compute the correct rate of 22 percent.

Adjustments Based on Zoning

Both the City of Wilsonville and Oregon City have brought to Metro's attention that several areas located within the current UGB have comprehensive plan designations of industrial but local zoning that does not reflect the future intent. Both cities use a two map system that anticipate rezoning of property consistent with the comprehensive plan. It is Metro's practice to assess land based on zoning, not comprehensive plan designation. It was determined that it was appropriate to count these acres as industrially zoned because of the legislative intent. Since Metro has a surplus of housing units based on the 2002 decision, this change does not affect the housing need. The addition of 201 net acres of industrial land shown in Table 1. Industrial Land Need Adjustments.

The area south of the City of Gresham (20 acres) is described as a re-instatement after its recommended removal by the COO. This acreage is part of the Springwater industrial area (designated as an RSIA) that is currently under concept planning. When this area was added to the UGB in 2002 it received a 2040 designation of inner neighborhood. The concept planning for the broader area indicated that this area

should be planned for industrial development and receive a 2040 designation of RSIA. The 20 year housing supply is not affected because Metro had a surplus of 666 net acres of residential land.

Completing Periodic Review

After adjustments the remaining industrial land need is 1,1180 net acres. The Metro Council expanded the UGB by adding 1,047 acres of land to substantially satisfy the need for Industrial land over the next 20 years. These lands area located in the following areas: Damascus West, Tulatin, Beavercreek, Quarry, Coffee Creek, Cornelius and Helvetia. The areas are shown in Table 3. Metro Council UGB Expansion Areas, were chosen because they meet the requirements in Goal 14 in the following order:

- Exception lands that meet the suitability factors identified for warehouse and distribution; general industrial and tech flex uses;
- Successively lowest capability farmlands which meet the suitability factors or;
- Located on lower priority farmland but are necessary to meet specific industry needs.

Specifics of the suitability factors are outlined in the April 5, 2004 staff report. Departure from either the COO recommendation or the MPAC recommendation is discussed below. Careful consideration was paid to the potential impacts on farmland and farm industry operations.

Table 2. Chief Operating Officer's Recommendation

				SUITABILITY FACTORS		
EXPANSION AREAS	**Total Acres**	**Net Acres**	**Dominant Earthquake Zone[4]**	**Access**	**Proximity**	**Slope less 10%**

**Areas shown in bold/ italics were included in MPAC's June 9th recommendation*

Soil Classifications of Areas Under Consideration

Soil classifications of all areas under study. The soils were mapped to facilitate studying and choosing appropriate lands for UGB expansion that conform to Oregon Revised Statute 197.298. ORS 197.298 establishes a hierarchy of lands based on soil quality which is divided into tiers. These tiers establish a priority for urbanizing land with exception land being the first priority followed successively by better quality soils. The tier system used for analysis examined the class of soils in each area and determined which soil class was most prominent. As study area boundaries have changed over the course of the analysis the predominant soil type changed in some cases. Table 3. Metro Council UGB Expansion Areas, shown on page 10 contains the predominant soil type unique to each area. Attachment 1 contains a complete discussion of the soil classes in all areas.

[4] Based on 1997 Department of Geology and Mineral Study. Rating of A-D with D being the lowest hazard area.

Industrial Land Supply Available to Meet Demand
The need for industrial land is classified by parcel size. The majority of the need for industrial land is contained in the smaller lot size categories that range from under 1 acre up to 25 acres. A need has been identified for large parcels to accommodate warehouse and distribution, general industrial and tech flex uses (25 acres up to 100 acres). Some of the areas under consideration due to their existing lotting patterns fulfill the large lot need better than other areas. Assembly of large lots can be reasonably accomplished if there are adjacent parcels of sufficient size or are under the same ownership. An aggregation study of these areas which is contained in the April 5, 2004 staff report, demonstrated that the need for large parcels can be met in the areas slated for UGB expansion. The best potential for addressing large lot needs can be found in Damascus West, Quarry, Coffee Creek, Helvetia and Cornelius areas.

Assessment of Earthquake Hazards
All of the areas included in the UGB were evaluated for their relative earthquake hazard potential. This evaluation was based on the 1997 Oregon Department of Geology and Minerals Study. The areas were ranked from A through with D being the lowest hazard potential. The western portion of the region that contains the Cornelius, Helvetia areas have the highest hazard potential. The higher hazard potential in these areas will be addressed during Title 11 concept planning by the responsible city or county pursuant to Metro Code 3.07.1120(G) and Statewide planning Goal 7. The hazard potential is shown in Table 2 and a full discussion of this study is included in Attachment 2.

COO Recommendation - Areas Excluded

Assessment of Areas Excluded from Consideration
A full discussion of this analysis of all lands under study that were excluded from consideration is included in the staff report dated April 15, 2004 and in the 2003 Alternatives Analysis and Addendum.

Borland Road Area- North of I-205
The Borland Road area has not been included in the UGB based on additional information contained in the record and further examination by staff. Although this area is composed entirely of exception land, a number of factors make it suitable for industrial use. The area previously under consideration contains 575 gross acres of land with a number of conflicting uses (schools, churches, rural residential uses) and slopes/natural resources and yields only 164 net developable acres of land. The developable land is insufficient to allow formation of a cohesive industrial neighborhood and too small and too far from the existing UGB to justify the extension of urban services (see “Formation of Industrial Neighborhoods”, Appendix A, Item (u) of Ordinance No. 04-1040B).

Previous work by staff to reduce the total number of acres under consideration from 68,334 acres of land to a more manageable 29,000 acre study area applied the following decision rules. The decision rules included: 1) non-contiguous to the UGB, 2) predominance of lots under 5 acres in size, 3) large areas of steep slopes and floodplains, 4) less that 300 acres and failure to meet both the proximity to other industry (1 mile) or access requirements (2 miles within an interchange). The Borland Road area has access to I-205 but is not located adjacent to a developed industrial area. Based on possible access to I-205 this area was thought to be suitable for warehouse and distribution uses. A baseline size was established for industrial neighborhoods of 300 acres. This 300 acre threshold was obtained by analyzing metroScope results and comparing the sizes of different industrial areas located within the UGB. The Borland Road area has little chance of forming a 300 acre industrial neighborhood due to the fragmented buildable lands available in this area.

On June 9, 2004 MPAC recommended that this area be removed from consideration for UGB expansion.

Wilsonville East
The Wilsonville East area which contains over 400 net acres was removed from consideration due to servicing concerns raised by the City of Wilsonville and impacts on an existing single family neighborhood located south of the site. This site contains class II agricultural land. The Metro Council chose the Helvetia study area which also contains class II soils and exception lands over the Wilsonville East area due to the serviceability and because the area contained exception lands. The Helvetia area is particularly well suited to satisfy the demand for tech flex or general industrial land.

On June 9, 2004 MPAC recommended that this area be removed from consideration for UGB expansion.

Additional Areas Added to the COO Recommendation
No additional areas were added to the COO recommendation.

On June 9, 2004 MPAC recommended that the Evergreen area be considered by the Metro Council to satisfy the need for industrial land.

The Metro Council considered the inclusion of the Evergreen site to meet the need for industrial land. Deliberations weighed the potential impacts on the farm economy and the issue of establishing logical boundaries between urban and farm uses in this area.

Expansion of the Cornelius Area
The Metro Council expanded the Cornelius area (206 to 262 gross acres) to provide an additional 36 net acres of industrial land. Inclusion of this area will provide for an orderly and efficient transition from rural to urban use. Approximately 56 percent of the area is designated for agricultural use in the Washington County Comprehensive Plan and it contains class II soils. A total of 56 gross acres are isolated from the agricultural lands located north of Council creek. The Council chose this land because a portion of this land is located adjacent to an existing industrial area located south of Council Creek and contains large flat parcels suitable for industry.

The Employment UGR identifies a specific need for large parcels (50 acres or larger) (Ordinance No. 02-969B, Appendix A, Item 4, page 25). The included portion of the study area contains one parcel between 50 and 100 acres (Appendix A, Item (a), p.30).

The Council also chose this area to help achieve Policies 1.2, 1.3.1 and 1.4 of the Regional Framework Plan (RFP), which call, among other things, for an equitable and balanced distribution of employment opportunities, income, investment and tax capacity throughout the region. The Council compared the fiscal and equity effects of including this area on the City of Cornelius. Given that the City of Cornelius has the highest poverty rate, the lowest property tax revenue per capita, the lowest land improvement market value and the longest average commute in the region, the Council concluded that industrial development in this area would help achieve these policies better than inclusion of any other Class II agricultural land.

On June 9, 2004 MPAC recommended that the expanded Cornelius area be considered by the Metro Council to satisfy the need for industrial land.

Other Changes to the COO Recommendation
The COO recommendation called for removal of a small area south of Gresham based upon impacts to the Green Corridor Agreement with the City of Sandy. This area includes 90 gross acres of land that was proposed in the 2002 UGB expansion for residential use. The area will remain in the UGB and be assigned a 2040 designation as RSIA consistent with the area north of the site (Springwater Industrial

Area) which was also added to the UGB in 2002. The area provides approximately 20 net acres of land for industrial purposes.

On June 9, 2004 MPAC did not recommend that this area remain in the UGB.

Assigning 2040 Design Types and Conditions

All areas included in the UGB must be assigned a 2040 design type of either Industrial or RSIA. Concept planning as required in Title 11 of the Functional Plan will determine the location and extent of the boundaries of all of the industrial areas. The 2040 design types are included on maps of all expansion areas in Ordinance No. 04-1040B in Exhibit E and the specific conditions are contained in Exhibit F.

Generalized and specific conditions pertaining to all areas included in the UGB are found in Exhibit F.

The Council added or revised conditions recommended by the COO to address concerns raised in testimony following the April 15, 2004, COO recommendation. New conditions address compatibility between industrial use and nearby residential use, coordination of the timing of comprehensive planning and transportation planning, and improved protection of the future right-of-way for the I-5/99W Connector.

The Oregon Department of Transportation (ODOT) submitted general information about the likely effects of new industrial development on lands added to the UGB on a number of state transportation facilities in the region. Of particular concern to ODOT are areas added in the vicinity of the North Wilsonville interchange on I-5 in Wilsonville and of the Shute Road interchange on U.S. Highway 26 at Hillsboro. ODOT believes that adoption of an "interchange area management plan"(IAMP), as described in the Oregon Highway Plan and outlined in ODOT rules (OAR 734-051-0125), would protect the capacity and function of the interchanges and improve their management. ODOT prefers adoption of an IAMP at the time of Title 11 planning, prior to urban development.

Local governments believe IAMPs are more likely to add value to what statewide planning Goal 12 (Transportation) and the Transportation Planning Rule (TPR) already require if the IAMPs are adopted at the time that plans and commitments are made for improvements to the interchanges. They worry that limitations on industrial development that might be written into an IAMP prior to commitment of funding for improvements to the interchanges might, in light of budgetary constraints, become permanent or long-range limitations, denying the region of the full benefits of industrial development near the interchanges.

The Council shares ODOT's concern that new industrial development in the region not cause the region's transportation system to fail or fall below standards. The Council understands that new development, without timely investment in the region's transportation system, will likely degrade the system. The Council expects, however, that, given the high priority state government places on making industrial sites ready for development, the region (Metro and other local governments), with the aid of state government, will find the resources to make the necessary improvements. In pursuit of those improvements, Metro will encourage and facilitate the adoption of IAMPs in cooperation with local governments at the earliest appropriate time in the process of approval of improvements to the Shute Road and North Wilsonville interchanges.

Policy Changes

Part of Metro's review of the UGB includes examining ways to obtain more efficient utilization of land currently inside of the UGB. The proposed Title 4 amendments are one way of demonstrating to LCDC that Metro is achieving efficiencies inside of the UGB to meet the need for land in addition to expanding the UGB. The Metro Council adopted new measures to protect and maintain the supply of industrial land for future industrial uses in Ordinance 02-969B, adopted December 5, 2002. Title 4 Industrial and Other

Employment Areas regulations were amended in order to increase the capacity of industrial areas for industrial uses and to encourage non-industrial uses to locate in Centers and other more appropriate 2040 design type areas.

Metro staff, after consulting with cities, counties and other interests, developed a set of factors to consider in the identification of RSIAs. Metro staff worked with cities and counties in the region to apply the proposed factors to designated Industrial Areas within their jurisdictions. Several local governments, Portland, Gresham, Wilsonville and Clackamas County, submitted recommended Industrial Areas for consideration as RSIAs. Striving for region-wide consistency, Metro staff also applied the factors to areas in cities and counties that chose not to submit candidate areas. The factors are:

- *Distribution* - Area serves as support industrial land for major regional transportation facilities such as marine terminals, airports and rail yards;
- *Services* - Availability and access to specialized utilities such as specialty gases, triple redundant power, abundant water, dedicated fire and emergency response services;
- *Access* - Within 3 miles of I-5, I-205, I-84 (within the UGB), State Route 224 (within the UGB);
- *Proximity* - Located within close proximity of existing like uses; and
- *Primary Use* - Predominantly industrial uses.

Considering these factors and much input from local governments, the Metro Council by Ordinance No. 04-1040B (Exhibit C) adopted a generalized map of RSIA areas. Title 4 is amended to include a limitation on retail uses for single users of 5,000 square feet in Industrial areas and 3,000 square feet in RSIA areas, and added a performance based transportation requirement for non-industrial offices. The 3,000 and 5,000 square foot limitations as it relates to commercial eating establishments refers to the size of the seating area and not to kitchen or storage areas. The Title 4 language changes are included in Exhibit B of Ordinance No. 04-1040B. The map depicting RSIA's is included in Attachment 3.

On April 14, 2004 MPAC recommended that Title 4 be amended to limit non-industrial retail uses to a maximum of 5,000 square foot for individual uses and 20,000 square foot for single buildings in both RSIA's and industrial areas. This recommendation was incorporated into ordinance No. 03-1021B for Metro Council consideration. Other provisions were consistent with the language in ordinance No. 04-1040B.

Regional Framework Plan Amendments

The Regional Framework Plan is amended to add policy language to guide UGB decisions and minimize impacts on the agricultural industry. Comments from participants at the symposium called "Agriculture at the Edge" spurred the proposed policy changes. Expansion of the UGB has different impacts on nursery operations, farm related businesses and individual operations. Changes to Chapter 1, Land Use Policy 1.12 provide greater certainty for farmers regarding urbanization and reduce potential conflicts between farm operations and urban uses. The changes the Regional Framework Plan provide the following policy guidance:

- When choosing land among lands with the same soil class, chose land less important for commercial agriculture, and
- Develop agreements with neighboring cities and counties to protect agriculture.

On April 24, 2004 MPAC recommended that the original proposal introduced by Councilor Hostica in Ordinance No. 04-1041 included defining the region's urbanizable area by restricting future urban growth boundary expansions to an area north of the Willamette River and east of Pudding River as well as containing the additional language to address the impacts on the agricultural industry and additional criteria to choose land for urbanization.

The Metro Council considered this recommendation to establish a hard boundary at the Willamette River and chose to defer this issue until a comprehensive region-wide discussion can take place to consider other areas that may be effected by similar circumstances. There are number of areas in the region where a policy of establishing a hard edge could be used effectively. The Metro Council expressed a desire to explore the use of this concept more fully in upcoming work that may take a longer view of planning for the region's growth.

Fulfilling The Remaining Periodic Review Requirements

Housing Needs Analysis
A revised Housing Needs Analysis report was prepared pursuant to the remand work order. The report addresses densities by housing type. The supplemental information provided in this report does not materially change the conclusions found in the UGR. The supplemental study does not change the overall density or mix of housing types needed for the next 20 years. Revised refill rates are in the range of 25-30 percent.

KNOWN OPPOSITION
The selection of lands for inclusion into the UGB has been hotly debated in a number of areas for both inclusion and exclusion from the UGB. Details of the comments received throughout the workshops and public hearing processes are detailed in the Public Comment reports, Volume I and II dated May 2004 and the addendums to the original reports dated June 2004 contain comments up through the final hearing on June 24, 2004.

LEGAL ANTECEDENTS
Title 4 is part of the adopted and acknowledged Urban Growth Management Functional Plan. Authority to amend the 2040 Growth Concept map comes from ORS 268.380 and ORS 268.390(5). UGB evaluation and amendment requirements are found in ORS 197.298 and 197.299.

ANTICIPATED EFFECTS
Adoption of Ordinance No. 04-1040B will result in fulfilling the requirements in Metro code section 3.07.420I, which requires Metro to adopt a map of Regionally Significant Industrial Areas with specific boundaries that is derived from the Generalized Map of Regionally Significant Industrial Areas adopted in Ordinance No. 02-969B. Amendments to Title 4 address implementation issues and provides local governments with clear instructions as to the Metro Council's policy intent on preserving industrial lands. This ordinance also satisfies the three requirements of LCDC's Partial Approval and Remand Order #03-WK Task 001524. The effective date of the new Title 4 regulations is September 24, 2004. Local governments will have two years following LCDC's acknowledgement to adopt a local map and make changes to their codes.

Adoption of amendments to the UGB provide the industrial land necessary for the continued economic growth over the next 20 years.

BUDGET IMPACTS
The UGB and Metro Code amendments become effective September 2004. Any additions to the UGB require FTE for monitoring and minor participation in Title 11 concept planning. Metro has a commitment of 1.43 FTE dedicated to ongoing concept planning in Hillsboro, Damascus, Gresham and the City of Tualatin. Additional FTE and potential grants to local governments may be needed to assist in the concept planning process. Implementation of Metro Code changes requires a corresponding amendment of local planning ordinances to implement the intent of these policies. Compliance monitoring is already included in the 2004/ 2005 budget. Community Development staff currently

monitors all ongoing zone, comprehensive plan and code changes at the jurisdictional level as well as other project responsibilities.

DECISION

The Metro Council expanded the UGB by adding 1,047 acres of land to substantially satisfy the need for Industrial land over the next 20 years. The removal of tax lots 1300, 1400 and 1500 adjacent to King City and the completion of the addendum to the Housing Needs Analysis addresses all of the outstanding issues in LCDC's Partial Approval and Remand Order #03-WK Task 001524.

Table 3. Metro Council UGB Expansion Areas

EXPANSION AREAS	Total Acres	Net Acres	2040 Design Type	Soil Class
Damascus West	102	69	Industrial	class II & III
Tualatin	646	339	Industrial	class IV & III
Quarry (partial)	354	236	Industrial	class VII
Beavercreek	63	30	Industrial	class IV & V
Coffee Creek (partial)	264	97	Industrial	exception land
Cornelius (partial)	262	127	RSIA	class II
Helvetia (partial)	249	149	RSIA	exception land & class II
TOTAL	1,940	1,047

Re: Dominant soil classifications for proposed UGB expansion areas

Background
The Metro Council is currently in the process of selecting land for inclusion in the urban growth boundary (UGB) for industrial use. The selection of appropriate land is dictated largely by Oregon Revised Statute (ORS) 197.298 that sets forth a hierarchical, tier-based system of land categorization, which indicates the order land should be considered for inclusion in the UGB based on comprehensive plan designations. Resource land is further prioritized on soil classification, which indicates the capability level of the farmland and ultimately its place in the hierarchy of land. The hierarchical tiers of land identified in ORS 197.298 are defined as follows:

- Tier 1 – exception land contiguous to the UGB and non-high value resource land completely surrounded by exception land.
- Tier 1a – exception land not contiguous to the UGB (within the one mile extent of study area boundaries).
- Tier 2 – marginal land, a unique classification of non-resource land in Washington County that allows dwelling units on EFU land.
- Tier 3 – resource land that may be needed to serve exception land.
- Tier 4 – resource land, majority of class III & IV soils, some class I & II soils.
- Tier 5 – resource land, majority class I & II soils, some class III & IV soils.

Purpose
The purpose of this memorandum is to identify the dominant soil classification and resulting tier category under ORS 197.298 for each of the resource land areas proposed for inclusion in the UGB for industrial use. The dominant soil classification has been determined using GIS soil data, displayed on a map dated October 30, 2002 in the record and was only undertaken for study areas identified as resource land. This information is presented in tabular form.

Soil Classifications by study area

Recommended Expansion Areas	Total Acres	Net Acres	Tier	Dominant Soil Classification
Damascus West	102	69	Tier 4	Class 3 & 4
Quarry (p)	354	236	Tier 4	Class 7
Beavercreek (p)	63	30	Tier 4	Class 4 & 6
Wilsonville East (p)	641	460	Tier 5	Class 2
Revised Wilsonville East	412	295	Tier 5	Class 2
Cornelius (p)	206	91	Tier 5	Class 2
Revised Cornelius	56	36	Tier 5	Class 2
Helvetia (p)	249	149	Tier 5	Class 2
West Union (p)	368	133	Tier 5	Class 2
Evergreen	985	730	Tier 5	Class 2
Noyer Creek	381	266	Tier 5	Class 2
Hillsboro South	791	695	Tier 5	Class 2

*Analysis was only undertaken for study areas identified as resource land.

RE: ***RELATIVE EARTHQUAKE HAZARD FOR PROPOSED INDUSTRIAL LAND EXPANSION AREAS***

Background

In 1997 the Oregon Department of Geology and Mineral Industries (DOGAMI) produced data on the relative earthquake hazard for land in the Portland metropolitan region including a significant portion of land outside the Urban Growth Boundary (UGB). The information included individual hazard factors of liquefaction, slope instability, and amplification, as well as a composite relative earthquake hazard map based on the individual factors. Metro's Data Resource Center (DRC) mapped the relative earthquake hazard data utilized in this analysis. The map information does not cover all of the potential expansion areas nor has the information been updated since 1997.

Analysis

The relative earthquake hazard composite map is separated into four zones, A, B, C, and D, with A being the highest hazard, and D the lowest hazard. The dominant zone for each of the proposed expansion areas is reported in the table below, along with additional comments.

Relative Earthquake Hazard

Expansion Area	Dominant Zone	Comments
Damascus	D	Small areas of C & B
Beavercreek	D	Significant portion of C and two pockets of B
Borland Road	A	One large area of B southeast of Borland Rd./Stafford Rd. intersection
Wilsonville East	B	Significant portions of C & D
Coffee Creek	D	Areas of A, B & C. No information for southwest corner of expansion area
Tualatin	D	Significant areas of B & C
Quarry	D	Pockets of C and minor area of B
Cornelius	B	A few pockets of A scattered throughout area
Helvetia	A	Two pockets of B, one in the center and one at the very top of the area
Evergreen	A	Some B, no information for northern portion of area
West Union	B & A	Some areas of C, area of A along stream corridor

RELATIVE EARTHQUAKE HAZARD…
June 16, 2004
Page 2

Summary
Information for two of the areas, Evergreen and Coffee Creek, is incomplete. In general the areas are either at the high or low hazard end of the range. The Borland Road North, Helvetia, Evergreen and West Union expansion areas contain the most Zone A classified land and thus have the highest earthquake hazard status. The Damascus, Beavercreek, Coffee Creek, Tualatin, and Quarry expansion areas contain mostly Zone D classified land and thus have the lowest earthquake hazard status.

The Council has decided not to include the North Borland, Evergreen or West Union Areas (areas with the highest hazard). The small hazard areas mapped in the Helvetia Area (also high) and other areas included in the UGB will be addressed in Title 11 planning by the responsible city or county, pursuant to Metro Code Section 3.07.1120G and statewide planning Goal 7.

Synopsis of Land Use Districts

Land Use District	Use/Share %				Jobs	
	Office	Industrial	Warehousing	Retail	Total	Per Gross Acre
High-Tech Employment	45%	38%	15%	1%	1916	20.28
Light Industrial	19%	69%	11%	1%	581	16.46
Craft Industrial	31%	44%	1%	24%	27	21.70

Concept Plan Guiding Principles

Market-driven:

- Meet regional responsibility for jobs.
- Maximize assessed property value.

Balanced:

- Capitalize on the area's unique assets and natural location.
- Explore creative approaches to integrate jobs and housing in the Craft Industrial land use type.
- Ensure appropriate transitions between land uses.
- Design cohesive and efficient transportation and utility systems.

Aspirational:

- Maintain and complement Wilsonville's unique identity.
- Create a uniquely attractive business community unmatched in the metropolitan region.
- Incorporate natural resource areas and provide recreational opportunities as community amenities and assets.

WORK SESSION [5:00 PM]

REVIEW OF AGENDA AND ITEMS ON CONSENT

There was none.

COUNCILORS' CONCERNS

It was shared that community members had expressed concerns about the RV's parked at Safeway.

PRE-COUNCIL WORK SESSION

1. City Manager Recruitment Process

Human Resources staff sought Council direction on how to proceed with a recruitment process for the City Manager position.

2. Wilsonville Industrial Land Readiness – Basalt Creek

Staff reviewed with Council the background information and regulatory context of the Basalt Creek industrial area.

3. Utilizing Opioid Settlement Funds for Mental Health and Addiction Peer Support Services

The Council heard about an option to pursue a pilot program for the provision of mental health and addiction peer support services funded through the City's opioid settlement funds.

ADJOURN [6:26 PM]

EXECUTIVE SESSION [6:34 PM]

4. ORS 192.660(2)(h) Legal Counsel/Litigation

ADJOURN [7:15 PM]

CITY COUNCIL MEETING [7:30 PM]

CALL TO ORDER

5. Roll Call

6. Pledge of Allegiance

7. Motion to approve the following order of the agenda.

MAYOR'S BUSINESS

8. Upcoming Meetings

Upcoming meetings were announced by the Mayor as well as the regional meetings he attended on behalf of the City.

The Mayor read proclamations recognizing the Rotary's 50th Anniversary, and June 2025 as Pride Month.

9. Boards/Commission Appointments/Reappointments

Arts, Culture, and Heritage Commission – Reappointment

Reappointment of Deborah Zundel and Susan Schenk to the Arts, Culture, and Heritage Commission for a term beginning 7/1/2025 to 6/30/2028. Passed 4-0.

Arts, Culture, and Heritage Commission – Appointment

Appointment of Douglas Parker to the Arts, Culture, and Heritage Commission for a term beginning 7/1/2025 to 6/30/2028. Passed 4-0.

Diversity, Equity and Inclusion Committee – Appointment

Appointment of Rick Wallace and Wilnise Jasmin to the Diversity, Equity and Inclusion Committee for a term beginning 5/19/2025 to 12/31/2026. Passed 4-0.

Diversity, Equity and Inclusion Committee – Appointment

Appointment of Mina Lemke to the Diversity, Equity and Inclusion Committee for a term beginning 5/19/2025 to 12/31/2027. Passed 4-0.

Kitakata Sister City Advisory Board – Appointment

Appointment of Wendy Hall to the Kitakata Sister City Advisory Board for a term beginning 5/19/2025 to 12/31/2026. Passed 4-0.

Kitakata Sister City Advisory Board – Appointment

Appointment of Theodore Russell to the Kitakata Sister City Advisory Board for a term beginning 5/19/2025 to 12/31/2027. Passed 4-0.

Library Board – Reappointment

Reappointment of Richard Spence to the Library Board for a term beginning 7/1/2025 to 6/30/2029. Passed 4-0.

Library Board – Appointment

Appointment of Sarah Ebersole to the Library Board for a term beginning 5/19/2025 to 6/30/2026. Passed 4-0.

Parks and Recreation Advisory Board – Appointment

Appointment of John West and Kristi Corno to the Parks and Recreation Advisory Board for a term beginning 5/19/2025 to 12/31/2028. Passed 4-0.

Tourism Promotion Committee – Reappointment

Reappointment of Elizabeth Crawford and Brandon Roben to the Tourism Promotion Committee for a term beginning 7/1/2025 to 6/30/2028. Passed 4-0.

Tourism Promotion Committee – Appointment

Appointment of Gus Castaneda to the Tourism Promotion Committee for a term beginning 5/19/2025 to 6/30/2026. Passed 4-0.

COMMUNICATIONS

There was none.

CITIZEN INPUT AND COMMUNITY ANNOUNCEMENTS

This is an opportunity for visitors to address the City Council on any matter concerning City's Business or any matter over which the Council has control. It is also the time to address items not on the agenda. It is also the time to address items that are on the agenda but not scheduled for a public hearing. Staff and the City Council will make every effort to respond to questions raised during citizen input before tonight's meeting ends or as quickly as possible thereafter. Please limit your comments to three minutes.

COUNCILOR COMMENTS, LIAISON REPORTS AND MEETING ANNOUNCEMENTS

Councilors announced prior and upcoming meetings and events.

CONSENT AGENDA

10. **Resolution No. 3197**
    A Resolution To Allocate Community Enhancement Funds For Fiscal Year 2025/2026.

The Consent Agenda was adopted 4-0.

NEW BUSINESS

There was none.

CONTINUING BUSINESS

There was none.

PUBLIC HEARING

There was none.

CITY MANAGER'S BUSINESS

The City Manager recognized Mark Ottenad, Public/Government Affairs Director who was scheduled to retire from the City of Wilsonville at the end of the month.

LEGAL BUSINESS

The Council moved to authorize the City Attorney to engage in affirmative litigation on behalf of the City to protect the City's ability to receive federal funding. Passed 4-0.

☒Council Goals/Priorities: Attract high-quality industry and support economic opportunity for all in Wilsonville	☒Adopted Master Plan(s): Basalt Creek Concept Plan	☐Not Applicable

ISSUE BEFORE COMMISSION

Staff seeks input from the Planning Commission about the Craft Industrial (CI) Zone, a proposed new zoning district designed to address the unique characteristics of the Craft Industrial land use type in the Basalt Creek Concept Plan with the potential for application in other areas of the City.

EXECUTIVE SUMMARY:

The Basalt Creek Concept Plan Map assigns the Craft Industrial land use type to eight properties west of SW Boones Ferry Road at the northern edge of the Basalt Creek Planning area (Attachment 1). These properties are unique in several ways: lot size ranges from 0.5 to 8 acres (with an average of roughly 5 acres); long narrow east-west lot configuration; the presence of large residential homes on the eastern developable part of each lot; Basalt Creek canyon occupying the western half or more of each lot; and proximity to residential development occurring to the north in Tualatin.

For these reasons, although intended for industrial use consistent with the purpose for which the land was added to the urban growth boundary, the City recognized the limitations and constraints for traditional industrial users on these properties and the opportunity to provide more flexibility and complement existing uses as these properties develop. Viewed as an "employment transition area" in the Concept Plan (Attachment 2), the evolution to Craft Industrial use is not expected to occur quickly. Rather the land is expected to experience two phases of development. During the early phase, existing residential uses will likely remain with some business development occurring in garages, converted portions of homes, and accessory buildings. During a later phase, perhaps 10 to 20 years in the future, use-specific buildings are anticipated that incorporate a variety of craft industries, maker spaces, and other complimentary employment uses. While the market will determine the timeline during which the area will transition from the early to later phase, the zoning needs to be flexible enough to allow both.

The Craft Industrial land use type is intended to allow residential uses even though it is not envisioned as the primary use (Attachment 2). Wilsonville Code has certain definitions related to dwellings associated with business uses. For instance, home occupations and home businesses are customarily carried on in a dwelling unit or premises where they are incidental to the primary residential use and are expected to occur without any exterior indication, such as signage or merchandise display. A live-work dwelling unit (LWDU) is specifically designed to accommodate a commercial or light industrial use, but residential and commercial uses are not required to be fully divided physically. A business-integrated dwelling unit (BIDU) also has residential use, but it is limited spatially and requires full structural division between the residential and non-residential uses.

Early Phase – Adaptation of Existing Development

In the early phase of development, the Craft Industrial area will be dominated by adaptation of existing uses by adding home businesses and cottage industries in accessory structures such as art and production studios, shop spaces, maker spaces, and small event spaces. Food-related micro-businesses, custom sign fabrication, production of artisan or specialty goods, or digital printing are examples of potential uses. As craft industrial uses become more established, they could transition to LWDUs or BIDUs over time. During this early phase, lot consolidation into larger properties suitable for use-specific buildings is not expected. Examples of this early phase of development are shown in Attachment 3.

Later Phase - Redevelopment

During concept planning, the Hood River waterfront and southeast Portland were identified as good examples of the Craft Industrial typology in the later phase. Examples of potential redevelopment are provided in Attachment 3. Southeast Portland, between OMSI and Ladd's Addition, blends residential with a variety of craft industrial and maker spaces, many in converted buildings. In Hood River, the Waterfront Overlay Zone features two- and three-story buildings used by craft industries with live-work spaces, adjacent to a park, natural areas, and other industrial uses. Hood River in particular was considered a model to follow during concept planning because of its intent to ensure an attractive, pedestrian-friendly streetscape, improved local access, and protecting public access to trails and natural areas-while accommodating new industrial and commercial development consistent with the desired character of the area.

Craft Industrial (CI) Zone

It is possible that early-phase adaptation will persist for some time, particularly in the north part of the Craft Industrial area, because of the limited developable area and natural resource constraints, until lot consolidation enables later-phase redevelopment. It also is possible that adaptation and redevelopment will coexist indefinitely as land ownership and development patterns evolve over time.

While some uses in Wilsonville's Planned Development Industrial (PDI) Zone may be appropriate for the Craft Industrial land use type as the area transitions to more urban industrial uses in the future, PDI lacks the flexibility needed to realize the Concept Plan vision for this unique area of Basalt Creek. Therefore, staff recommends amending the City's Development Code to establish a new Craft Industrial (CI) Zone. Beyond the subject location in Basalt Creek, the new Craft Industrial (CI) Zone has the potential for application in other areas of the City with similar characteristics such as limited developable area, existing nature of development, and to transition between industrial and other land uses.

Based on extensive research of craft industrial, maker manufacturing, artisanal business district, and similar zoning in several jurisdictions in Oregon and Washington, as well as analysis of Wilsonville's PDI Zone, staff has prepared a draft purpose statement and potential list of allowed uses for the new CI Zone for Planning Commission's review and discussion (Attachment 4).

Discussion Questions

During the work session the Planning Commission's input is requested about how best to achieve the intended vision for the Craft Industrial area in response to the questions below:

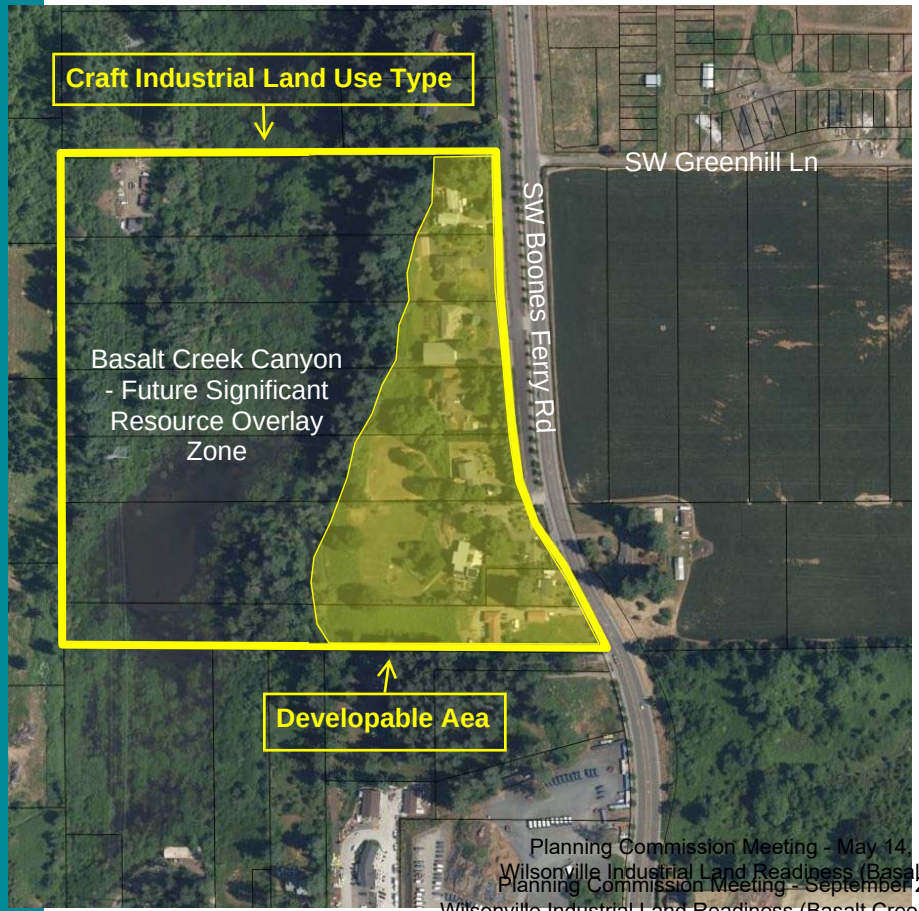
- Does the draft Purpose Statement for the new Craft Industrial (CI) Zone accurately reflect the intent of the Craft Industrial land use type as envisioned in the Basalt Creek Concept Plan? If not, what changes does the Planning Commission recommend to more closely align the statement with the intent?
- What feedback does the Planning Commission have about the potential uses in the Craft Industrial (CI) Zone? Are there uses that should be removed, added, or modified to fully capture the intent of the Craft Industrial land use type as envisioned in the Concept Plan?

EXPECTED RESULTS:
Feedback from Planning Commission will guide drafting of Development Code text to implement the new Craft Industrial (CI) Zone.

TIMELINE:
Additional work sessions with the Planning Commission and City Council are anticipated throughout 2025. Public hearings on related Development Code amendments are expected in late 2025, with concurrent work on the infrastructure funding plan and Phase 2 analyses occurring throughout the year.

CURRENT YEAR BUDGET IMPACTS:
Funding for the first phase of the WILR project is allocated in the FY2024-25 Planning Division budget and, for the second phase, will be allocated in the FY2025-26 budget. The first phase was primarily funded by a $100,000 grant from Business Oregon, which concluded at the end of 2024, with additional funding from a $290,000 Metro grant, which also is funding the second, citywide, project phase.

COMMUNITY INVOLVEMENT PROCESS:
The Basalt Creek Concept Plan review process included comprehensive community involvement to gather input. For the first phase of the WILR project, ECOnorthwest focused on gathering input from Business Oregon, Greater Portland Inc., property owners, and developers, to understand demand for industrial land in Wilsonville as well as property owners' current and future plans for their property. This informed the market, site suitability, and contractor establishment analyses and are being considered in determining appropriate zoning standards to apply and preparing needed Code amendments.



POTENTIAL IMPACTS OR BENEFIT TO THE COMMUNITY:
The new CI Zone addresses the unique characteristics of this part of Basalt Creek while enabling it to transition toward more urban industrial uses in the future, in alignment with the Concept Plan vision. By allowing a wide range of uses, from home businesses and the live-work dwelling units to small tenant spaces for creative industries and smaller-scale industrial users, the CI Zone encourages job creation and industrial innovation while providing the flexibility for long-established residents to decide when and how the area transitions and evolves over time, thus resulting in positive outcomes for the Wilsonville community.

ALTERNATIVES:
Alternatives to applying a new Craft Industrial (CI) Zone to the Craft Industrial area of Basalt Creek include applying the existing Planned Development Industrial (PDI) Zone, applying a modified PDI Zone, or taking no action addressing zoning for this area at this time.

Craft Industrial Area of Basalt Creek

Basalt Creek Concept Plan Map

Existing Residential Development in Eastern Developable Part of Craft Industrial Area

Craft Industrial Zone – Background Information

Objective/Vision for the Craft Industrial District from the Basalt Creek Concept Plan

Note: The Basalt Creek Concept Plan is available online at this link. See pages 32 and 33 of the PDF for a description of development types and Craft Industrial. In addition, the following bullet points summarize highlights from minutes of Planning Commission and City Council work session discussions of the Craft Industrial land use concept during Basalt Creek planning; available online at this link.

- Initially referred to as "Employment Transition Area"
  - Transitions to higher intensity employment uses to the south
  - Include business development over time while maintaining existing homes (e.g. live-work concept)
- Envisions a diverse mix of uses that blend well with adjacent neighborhoods
  - Small-scale tenant spaces tailored for creative industries such as: incubator spaces, craft food and beverage (e.g., breweries, wineries, tasting rooms, artisan and maker spaces (e.g., seamstresses, photography studios), and emerging tech and innovation hubs
  - Small-scale office, retail, and services
  - Flex space and live-work (expected to accommodate six live-work housing units, see related definitions later in this document)
  - Potential for supporting services and retail for broader Basalt Creek area
- Explore the creation of a dedicated innovation center or incubator space as part of Economic Development Strategy, with subsidized spaces for startups that could transition to market-rate spaces as they grow
- Long-term vision includes two- to three-story buildings featuring small tenant spaces for light industrial manufacturing, office, and limited retail uses
- Precedent examples of long-term vision:
  - Hood River waterfront:
    - Good example of redevelopment with industrial use
    - Features two- to three-story buildings with craft industrial live-work spaces adjacent to park, natural areas, and other industrial uses
  - Southeast Portland:
    - Illustrates a lower-density model, blending single-family residential with craft industrial spaces

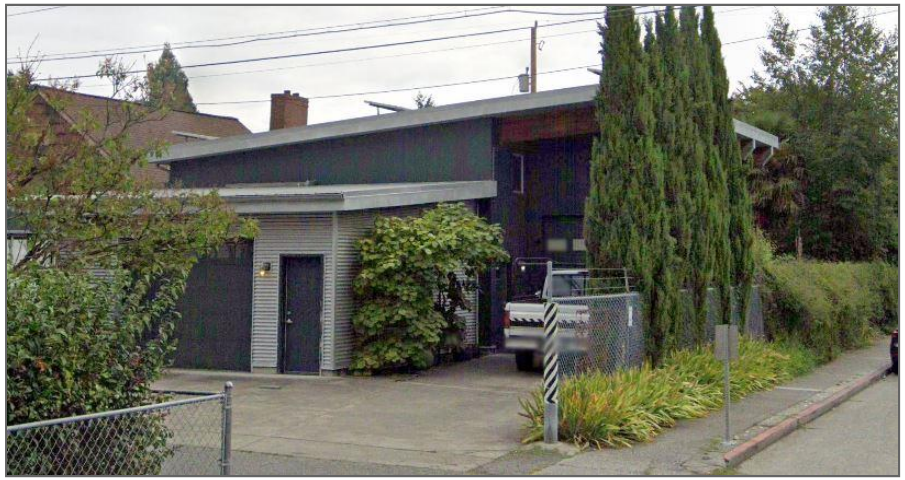
Key Definitions in Wilsonville Code Section 4.001 Related to the Mix of Residential and Non-residential Uses

45. *Business-Integrated Dwelling Unit(s) (BIDU):* A dwelling unit integrated with a nonresidential use where (1) the dwelling unit is the secondary use to the non-residential use, (2) the dwelling unit consists of a ground floor footprint less than or equal to 40 percent of the ground floor non-residential use, (3) the dwelling unit is separated from the non-residential use by a demising wall, and (4) the dwelling unit has direct interior entry from the non-residential use. This is differentiated from a Live-Work

Dwelling Unit in that the dwelling unit must be fully divided from the non-residential use and that the space designed to be non-residential cannot be used for residential.

132. *Home Business:* A business operating from a dwelling unit that does not meet the definition of a "Home Occupation" listed below. Short-term rental of a dwelling unit or portion thereof where the operator does not live on the same lot is a home business. A home business requires a conditional use permit. [*Note: This definition is likely to be modified to allow Home Businesses outright in the Craft Industrial (CI) Zone.*]

133. *Home Occupation:* An occupation, profession, or craft, which is customarily incidental to or carried on in a dwelling unit or premises and not one in which the use of the premises as a dwelling unit is largely incidental to the business use. A home occupation is carried on by a member of the household residing within the dwelling unit. A home occupation shall require no structural alteration or changes to the exterior of the dwelling unit, and shall include no display of merchandise on the premises which can be seen from the exterior of the dwelling unit. Any instruction shall be limited to one pupil at a time. Noise, odor, smoke, gases, fallout, vibration, heat or glare resulting from the use shall not be of the intensity as to be detected outside of the containing structure. Traffic and parking are to be such as to give no outward appearance that a business is being conducted on the premise. Short-term rental of a dwelling unit or portion thereof where the operator of the short-term rental lives on the same lot is a home occupation.



154. *Live-Work Dwelling Unit (LWDU):* A dwelling unit where (1) the ground-level front façade has a commercial-type store front determined by having at least sixty percent glazing and a permanent architectural cover over the entry (2) the interior along the building frontage is designed for workspace and no kitchen, bathroom, bedroom, closet, or storage is adjacent to the front façade and (3) all or a portion of the dwelling unit meets the commercial building code to support an accessory commercial or light industrial use. This is differentiated from a home occupation or home business in that the dwelling unit is specifically designed to accommodate a commercial or light industrial use, whereas a home occupation or home business takes place in a residential structure without such specific design. This is differentiated from a Business-Integrated Dwelling Unit in that in a Live-Work Dwelling Unit the residential and commercial uses are not required to be fully divided physically.

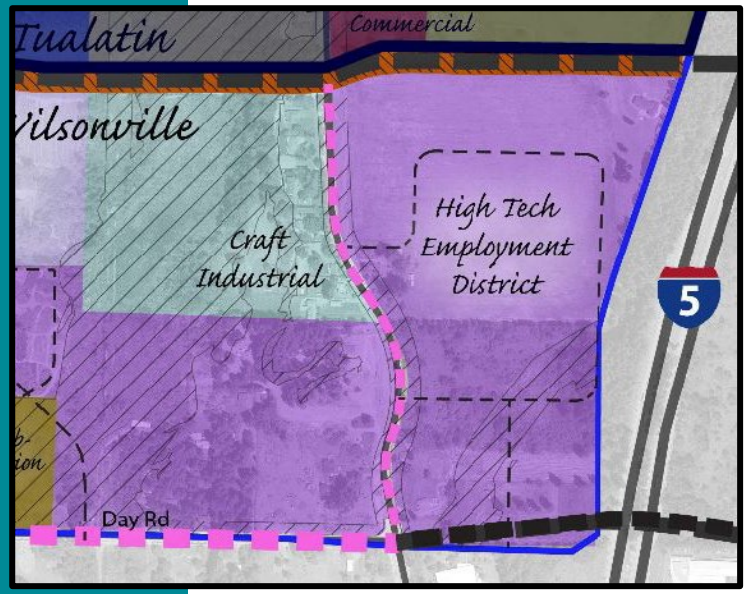
Craft Industrial Zone – Purpose and Potential Uses

Purpose Statement for Craft Industrial (CI) Zone - *DRAFT*

The purpose of the Craft Industrial (CI) zone is to support a diverse range of small-scale industrial and creative enterprises. This zone is intended to accommodate incubators, craft and artisan studios, innovation hubs, and maker spaces. It may also include limited residential and commercial uses that serve as a transition to and support more intense urban industrial uses nearby.

Potential Uses in Craft Industrial (CI) Zone - *DRAFT*



- Home Businesses that include any of the uses listed below.
- Business-Integrated Dwelling Units (BIDU) and Live-Work Dwelling Units (LWDU).
- Studios and Creative Workspaces, including but not limited to art and production studios, showrooms, maker spaces, and venues for small events.
- Artisan Food and Beverage Production, including small-scale operations such as distilleries, microbreweries, and wineries, with or without on-site tasting rooms or eateries, provided such uses are accessory to and supportive of on-site manufacturing and processing. This category also includes food-related micro-businesses such as catering services, bakeries, butcher shops, coffee roasters, and confectionary producers.
- Craft and Specialty Manufacturing, including the processing, packaging, and/or assembly of artisan or specialty goods such as textiles, fibers, woven and naturally dyed materials; leather goods; custom apparel; jewelry; lapidary work; metalwork; woodworking, furniture, cabinetry, sculpture, pottery, ceramics, glasswork, and other handcrafted items.
- Custom Fabrication and Printing Services, including sign fabrication, digital printing, graphics production, publishing, print shops, or binderies.
- Light Manufacturing and Assembly, including the production of small machinery, equipment, instruments (including musical instruments), micro-mobility vehicles (e.g, bicycles, e-bikes), small appliances, precision tools, or other electrical or mechanical items.
- Industrial Office and Laboratory Uses, including facilities focused on research, development, testing, or product training and support.
- Product Repair and Testing Services, limited to the repair, finishing, and testing of products manufactured or assembled within the zone.
- Professional Services, that cater to daily customers, such as financial, insurance, real estate, legal, medical or dental offices not to exceed 5,000 square feet of floor area in a single building, or 20,000 square feet of combined floor area within a multi-building development.
- Retail and Service Commercial Uses, limited to 5,000 square feet of indoor and outdoor sales, service or inventory storage area.
- Accessory Uses, including buildings and structures customarily incidental and subordinate to any permitted use.
- Other Similar Uses, as determined by the Planning Director to be consistent with the purpose of the CI Zone.

CI Zone Purpose Statement

Support a diverse range of small-scale industrial and creative enterprises

Intended to accommodate incubators, craft and artisan studios, innovation hubs, and maker spaces

May also include limited residential and commercial uses that serve as a transition to and support more intense urban industrial uses nearby.

CI Zone Potential Uses

Discussion

- Does the draft Purpose Statement for the new CI Zone accurately reflect the intent of this land use type as envisioned in the Concept Plan? If not, what changes does the Planning Commission recommend to more closely align the statement with the intent?

- What feedback does Planning Commission have about the potential uses in the CI Zone? Are there uses that should be removed, added, or modified to fully capture the intent of this land use type as envisioned in the Concept Plan?

City Attorney Guile-Hinman left the meeting at this time.

WORK SESSION

3. Wilsonville Industrial Land Readiness (Basalt Creek) (Luxhoj)

Associate Planner Luxhoj noted Staff sought the Planning Commission's input on the proposed new Craft Industrial (CI) Zone intended to reflect the Craft Industrial land use identified in the Basalt Creek Concept Plan. The zoning district could be applied in other parts of the city where similar uses were appropriate. She presented via PowerPoint details about the Craft Industrial Area and existing residential development, Craft Industrial examples that could be used as the area developed, as well as the purpose statement and some potential uses within the CI Zone. (Slides 2-8) Questions for the Planning Commission's consideration were displayed on Slide 9.

Commissioner comments and feedback were as follows along with Staff's responses to questions as noted:

- The Craft Industrial area was a great use of the space and a great bridge between what was zoned in Tualatin versus farther south in Wilsonville.
- CI Zoning would not prevent residential use in the Craft Industrial area currently or preclude those properties from being used exclusively residentially if sold. The zoning would not be applied until a property was annexed into city, and until then, the property would continue in the FD-20 Washington County Zone.
- The list of potential CI Zone uses captured what the Commission envisioned, but perhaps excluding contractor establishments as a use should be explored.
    - Some contractor establishments may be appropriate for very small contractors with an office and a couple trailers, but not a lay down yard. Limitations on outdoor storage could be considered given the mixed-use area. Balancing the flexibility of use while having strategic performance standards to prevent undesired portions of use would be key.
    - Because contractor establishments were not on the list of permitted uses, it was essentially not allowed and would require an exception, which may need further clarification.
- The potential list of uses was for discussion purposes. Like any zone, a list of potential uses would be compiled when the Craft Industrial area is assigned as a designated zone. That list would be part of the Development Code amendments and become the list of allowed uses within the zone.
    - While some of the listed uses were vague, some were very specific, making it hard to account for future growth of technologies, etc. and requiring a variance process for any uses not on the list.
        - One option was to include "other similar uses" in the language. The list could be further refined to ensure Staff was consistent with the level of specificity in the list of uses.

- Professional services and retail and service commercial uses were carried over from other Planned Development Industrial (PDI) zoning areas in the city that were limited to 5,000 sq ft per building. The City wanted to ensure opportunities for property owners to offer smaller scale retail and service uses, so the intent was centered on the physical size of the establishment, not the type of ore expectation around the establishment.
  - One reason the potential uses list was different was because the uses were substantially limited in footprint. The Craft Industrial area was a fairly inclusive zoning district, and excluded establishments should be incompatible in the zone or create demand that would remove land from the inventory for other intended uses. Small scale commercial establishments would fit the zone footprint, not take up a lot of land, and have the opportunity to serve the nearby commercial areas.
  - **Planning Director Bateschell** provided background for the size limitations included in the PDI Zone, some of which came from Metro Title IV requirements. The majority of the industrial land within the city, including the Craft Industrial area, was Title IV; therefore, certain restrictions like the size limitation applied. Given the uniqueness of the area, the City could attempt a Title IV Map amendment with Metro. However, because the area was highly parcelized and would likely have only small-scale buildings, the small-scale retail and service/commercial probably still fit with the character of the CI Zone, at least in Basalt Creek.
- While specifying prohibited uses might be easier than listing potential uses, the latter approach was used to achieve consistency across zones. Typically, people wanted to see what could be put in a zone, not what could not.
- When taken out of the subject context and applied citywide the last sentence of the Purpose Statement was concerning, "It may also include limited residential and commercial uses that serve as a transition to and support more intense urban industrial areas nearby." Did this mean the CI Zone could only apply when other large industrial areas were nearby? The sentence made sense with regard to the Craft Industrial area, but not in other parts of the city, perhaps.
  - Making the statement more generic so it applied generally to transition areas, while still being applicable to the subject context was acceptable.
- The Craft Industrial examples were more about aesthetics than building height and purpose. Given that the Craft Industrial area was seen as a transitional area, large buildings towering over private backyards would be awkward; however, as a true mixed-use area with residences added above businesses, building height provided flexibility to add more units and provide more housing.
  - Currently, the PDI had no height limitations. During concept planning, discussion centered around two- to three-story buildings in the Craft Industrial area. Building economics and development also needed considered as mixed-use buildings were often pushed to four stories for building economics.
  - Input from the Commission on building height was welcome since building height would be considered as Staff moved into drafting the Code.
- Defining “limited residential” was suggested.

  - Residential in the CI Zone would be limited to business-integrated or live/work dwelling units; some type of industrial use with a residential component. A lot of residential already existed, and perhaps those property owners would like to add some type of a craft industry to their home that would eventually transition into a business integrated unit. The intent was to acknowledge the existing and nearby residential and continue to allow it in some way within the Craft Industrial area.
  - Further consideration was needed about what would happen to existing residences that otherwise would not be allowed in the CI Zone when someone wanted to add a small business on their property. While live/work units and integrating living spaces into a business were anticipated in the future, in the interim, if someone wanted to develop half and keep a home on half of their site, would a detached home be a grandfathered use, legal conforming, or an outright allowed use still had to be determined.
  - Grandfathering uses on an existing property made sense, but new property owners might assume they could do the same thing as the existing landowners. Subdividing an eight-acre property into four detached homes should not be permitted, and Staff would look at making that language crisper.
- Key Development Code definitions written for Frog Pond were written with the CI Zone and potentially other zones in mind. Business-integrated, home business, home occupation, live/work dwelling unit would be specifically listed as permitted uses in the CI Zone; uses associated with any industrial/commercial uses allowed in the zone.
- The Basalt Creek Concept Plan seemed to emphasize small-scale commercial that may include live/work units, while the Purpose Statement emphasized industrial and creative enterprise that may include residential or commercial. Had the original emphasis on small-scale commercial in the Basalt Creek Concept Plan morphed into something a bit different with the Master Plan wanting more commercial development?
  - When analyzing development types, Concept Plan assumed six residential units in the Craft Industrial area, so very limited residential use.
  - The Purpose Statement would need reviewed further to address questions and be more specific about residential use because the City did not want additional residential coming into the area, which could happen due to its proximity to other residential development in Tualatin.
- **Planning Director Bateschell** noted that when the land use term Craft Industrial was first coined during the Concept Plan, no other examples of this type of adopted Code existed. She believed the Purpose Statement was consistent, adding it was a good question for the project team to ruminate on.
  - During the concept planning, a consultant looked at development typologies to run performance metrics to help determine the outcomes and performance in the area in terms of jobs, trips, etc. Performance metrics for different building types outside Wilsonville were used since Craft Industrial was not a land use Wilsonville had at the time.
    - These really small sites would require smaller-scale development and the building types that fit often had more commercial; examples included coffee-roasters, beer brewers, photographers, etc. that had a retail space to sell their products. In

recognizing that, primarily commercial was preferred, as opposed to primarily retail, like a retail strip. There had to be an enterprise component, which is why 'enterprise' was in the Purpose Statement, and it would be more commercial than more traditional large industrial type uses.

- The Craft Industrial area could be a destination, like the Hood River waterfront, and if the City wants those small craft businesses to be successful, some type of language had to be incorporated into the Purpose Statement to help build that visual.
  - While the area was not seen as a destination during concept planning, it was worth exploring. Property owners were already running businesses on their home sites, and the City recognized that and acknowledged the area would likely morph over time. It would not be the first area to develop in Basalt Creek and would not develop with large industrial uses like the flat vacant parcels on Green Hill Lane would.
- While food carts or trucks may not be appropriate within the Craft Industrial area, food being prepared onsite for food trucks to load and drive out to sell elsewhere in the city could fall under the Artisan Food and Beverage Production category.

4. CFEC Parking (Pauly)

Planning Manager Pauly noted the work done at prior work sessions on the CFEC Parking Compliance and Standards Reform project and presented on the Parking Lot Design Review Standards via PowerPoint, comparing the City's current and enhanced design standards to the CFEC compliance standards and providing the updated recommended Code amendments based on further analysis and feedback from both City Council and the Planning Commission. Questions for the Commission's consideration regarded design standards for the solar option and several questions to help finalize the draft Development Code amendments for the public hearing. (Slides 7-8)

Commissioner comments and feedback were as follows along with Staff's responses to questions as noted:

- The proposed language regarding the tree canopy and allowance of solar made sense, although the solar language was a bit wordy and confusing in terms of the calculations.
- In Section 4.A Internal Pedestrian Walkways, the existing language about walkways being designed to channel pedestrians to the building's front entrance would be changed to "main entrance", which would also be consistent with language in the ADA Parking Code.
- In Section 2.E.i, the purpose of parking areas with 40 or more spaces having at least 25% of the required trees planted in the interior of the parking area was either CFEC rules or the current Code. Staff would confirm and email the Commission.
- Section 4.B appeared to specify acreage not parking spaces. Because the CFEC rules and current Code did not align, Staff decided to go with spaces, which could vary as a 200-space Costco parking lot was bigger than a 200-space Wilsonville high school parking lot.
  - Most of the existing City Code language used spaces which would likely be used fairly often going forward, but this was the one existing Code standard that used acreage, which was intentional in the event a certain land area was dedicated to parking

PLANNING COMMISSION

WORK SESSION

2. Wilsonville Industrial Land Readiness (Basalt Creek) (Luxhoj)(90 Minutes)

PLANNING COMMISSION MEETING
STAFF REPORT

Meeting Date: March 12, 2025	**Subject: Wilsonville Industrial Land Readiness – Basalt Creek** **Staff Member:** Cindy Luxhoj AICP, Associate Planner, and Dan Pauly AICP, Planning Manager **Department:** Community Development
Action Required	**Advisory Board/Commission Recommendation**
☐ Motion ☐ Public Hearing Date: ☐ Ordinance 1st Reading Date: ☐ Ordinance 2nd Reading Date: ☐ Resolution ☒ Information or Direction ☐ Information Only ☐ Council Direction ☐ Consent Agenda	☐ Approval ☐ Denial ☐ None Forwarded ☒ Not Applicable **Comments:** N/A
Staff Recommendation: Staff recommends Planning Commission provide the requested feedback.	
Recommended Language for Motion: N/A	
Project / Issue Relates To: Basalt Creek Concept Plan area	

☒Council Goals/Priorities: Attract high-quality industry and support economic opportunity for all in Wilsonville	☒Adopted Master Plan(s): Basalt Creek Concept Plan	☐Not Applicable

ISSUE BEFORE COMMISSION

Staff is seeking input from the Planning Commission on industrial land use types in Basalt Creek based on the information provided, as well as prior work session discussions.

EXECUTIVE SUMMARY:
A number of the key reports and studies have been completed for Phase 1 of the WILR project, which focused on the Basalt Creek Planning Area (BCPA). At past work sessions, Planning Commission has provided input on the Economic Inventory and Land Use Analysis, Buildable Lands Inventory, Site Suitability Analysis, Analysis of Future Development of Contractor Establishments, Transportation System Plan Evaluation and Local Street Concept Map, Natural Resource Inventory, and Infrastructure Summary. All these documents will inform the remaining components of the Basalt Creek focused portion of the Wilsonville Industrial Land Readiness (WILR) project, including drafting of a Basalt Creek Master Plan and subsequent implementing Development Code.

At the work session on February 12, the Planning Commission indicated a desire for additional information to help inform the mix of planned uses in Basalt Creek. As follow-up, staff is providing background about the regulatory context that brought the BCPA into the Urban Growth Boundary (UGB) and how it relates to industrial land (Attachment 1), as well as a refocus on information about industrial land demand, current market conditions, and vacancy rates previously presented to the Commission (Attachment 2). Following the review and discussion of this information, staff requests continued input on two of the land use types envisioned in the BCCP, High-Tech Employment and Light Industrial, and how best to achieve the intended vision for these areas. Discussion of the third land use type, craft industrial, will be the focus of a future work session.

Discussion Questions

During the work session input is requested from the Planning Commission in response to the questions below:

- What input does Planning Commission have in response to the information attached pertaining to the regulatory context, industrial demand, and current market conditions?
    - In particular, considering the scale between market driven and aspirational land use choices, does Planning Commission lean to one end or the other and how far, or land in the middle?
- Regarding the High-Tech Employment and Light Industrial land use types:
    - Are there uses that should be avoided or discouraged in the areas designated for these land use types because they are counter to the intended industrial use?
    - Do the boundaries of these land use types continue to be appropriate, or should they potentially be adjusted?
    - Specifically related to the property shown on Attachment 3, which is all under one ownership, should it continue to be split between these two land use types, or wholly designated as one and, if so, which one?

EXPECTED RESULTS:
Feedback from Planning Commission will guide next steps in planning for the BCPA, including drafting of a Master Plan and package of proposed Code amendments, developing economic development strategies, and preparing an infrastructure funding plan.

TIMELINE:
Additional work sessions with the Planning Commission and City Council are anticipated throughout 2025. Public hearings on related Development Code amendments are expected in late 2025, with concurrent work on the infrastructure funding plan and Phase 2 analyses occurring throughout the year.

CURRENT YEAR BUDGET IMPACTS:
Funding for the first phase of the WILR project is allocated in the FY2024-25 Planning Division budget and, for the second phase, will be allocated in the FY2025-26 budget. The first phase was primarily funded by a $100,000 grant from Business Oregon, which concluded at the end of 2024, with additional funding from a $290,000 Metro grant, which also is funding the second, citywide, project phase.

COMMUNITY INVOLVEMENT PROCESS:
The Basalt Creek Concept Plan review process included comprehensive community involvement to gather input. For the first phase of the WILR project, ECOnorthwest focused on gathering input from Business Oregon, Greater Portland Inc., property owners, and developers, to understand demand for industrial land in Wilsonville as well as property owners' current and future plans for their property. This informed the market, site suitability, and contractor establishment analyses and will be considered in determining appropriate zoning standards to apply and preparing needed Code amendments.

POTENTIAL IMPACTS OR BENEFIT TO THE COMMUNITY:
Preparing a Basalt Creek Master Plan, adopting appropriate zoning standards, creating an infrastructure funding plan, and identifying and pursuing economic development strategies will remove barriers to development and enable implementation of the Basalt Creek Concept Plan and Master Plan. When developed, Basalt Creek will host hundreds of jobs, thus contributing to the income and property tax base, and support economic mobility for residents through family-wage employment in a highly livable, full-service City. The critical analysis and planning work completed as part of the WILR project will enable this industrial area to reach its full economic potential, resulting in positive impacts on the greater Wilsonville community and the region.

ALTERNATIVES:
As the Master Plan, zoning Code amendments, economic development strategies, and an infrastructure funding plan are developed, a number of alternatives will be explored and developed with the Planning Commission and City Council.

ATTACHMENTS:

1. Metro Ordinance No. 04-1040B
2. ECOnorthwest Recommendations Report
3. Location of Grahams Ferry Assemblage Property in the BCPA

BEFORE THE METRO COUNCIL

FOR THE PURPOSE OF AMENDING THE METRO URBAN GROWTH BOUNDARY, THE REGIONAL FRAMEWORK PLAN AND THE METRO CODE TO INCREASE THE CAPACITY OF THE BOUNDARY TO ACCOMMODATE GROWTH IN INDUSTRIAL EMPLOYMENT	))))))))	ORDINANCE NO. 04-1040B Introduced by the Metro Council

WHEREAS, by Ordinance No. 02-969B (For The Purpose Of Amending The Urban Growth Boundary, The Regional Framework Plan And The Metro Code In Order To Increase The Capacity Of The Boundary To Accommodate Population Growth To The Year 2022), the Council amended Title 4 (Industrial and Other Employment Areas) of the Urban Growth Management Functional Plan to increase the capacity of industrial land to accommodate industrial jobs; and

WHEREAS, the Metro Council adopted an Employment and Industrial Areas Map as part of Title 4 (Retail in Employment and Industrial Areas) in Ordinance No. 96-647C (For the Purpose of Adopting a Functional Plan for Early Implementation of the 2040 Growth Concept) on November 21, 1996; and

WHEREAS, the Council amended the Regional Framework Plan ("RFP") by Exhibit D to Ordinance No. 02-969B (For the Purpose of Amending the Metro Urban Growth Boundary, the Regional Framework Plan and the Metro Code in Order to Increase the Capacity of the Boundary to Accommodate Population Growth to the Year 2022), adopted on December 5, 2002, to establish a new 2040 Growth Concept design type entitled "Regionally Significant Industrial Area" ("RSIA") and to add Policies 1.4.1 and 1.4.2 to protect such areas by limiting conflicting uses; and

WHEREAS, by Exhibit F to Ordinance No. 02-969B the Council amended Title 4 (Industrial and Other Employment Areas) of the Urban Growth Management Functional Plan ("UGMFP") to implement Policies 1.4.1 and 1.4.2 of the RFP; and

WHEREAS, by Exhibit E of Ordinance No. 02-969B the Council adopted a "Generalized Map of Regionally Significant Industrial Areas" depicting certain Industrial Areas that lay within the UGB prior to its expansion as part of Task 2 of periodic review as RSIAs; and

m:\attorney\confidential\7.2.13\04-1040B.red.006
OMA/RPB/kvw (06/18/04)

WHEREAS, Title 4 calls upon the Council to delineate specific boundaries for RSIAs derived from the "Generalized Map of Regionally Significant Industrial Areas" after consultation with cities and counties; and

WHEREAS, by Ordinance No. 02-969B, the Council added capacity to the UGB but did not add sufficient capacity to accommodate the full need for land for industrial use; and

WHEREAS, the Metro Council submitted Ordinance No. 969B, in combination with other ordinances that increased the capacity of the UGB, to the Land Conservation and Development Commission (LCDC) as part of Metro's periodic review of the capacity of its UGB; and

WHEREAS, on July 7, 2003, LCDC issued its "Partial Approval and Remand Order 03-WKTASK-001524" that approved most of the Council's decisions, but returned the matter to the Council for completion or revision of three tasks: (1) provide complete data on the number, density and mix of housing types and determine the need for housing types over the next 20 years; (2) add capacity to the UGB for the unmet portion of the need for land for industrial use; and (3) either remove tax lots 1300, 1400 and 1500 in Study Area 62 from the UGB or justify their inclusion; and

WHEREAS, the Council completed its analysis of the number, density and mix of housing types and the need for housing over the planning period 2002-2022 and incorporated its conclusions in a revision to its Housing Needs Analysis; and

WHEREAS, the Council increased the capacity of the UGB both by adding land to the UGB and by revising the Regional Framework Plan and Title 4 of the UGMFP to meet the previously unmet portion of the need for land for industrial use; and

WHEREAS, a change in design type designation of a portion of Study Area 12 added to the UGB on December 5, 2002, by Ordinance No. 02-969B from residential to industrial will help the region accommodate the need for industrial use without reducing the region's residential capacity below the region's residential need; and

WHEREAS, the Council decided to remove tax lots 1300, 1400 and 1500 in Study Area 62 from the UGB; and

m:\attorney\confidential\7.2.13\04-1040B.red.006
OMA/RPB/kvw (06/18/04)

WHEREAS, the Council consulted its Metropolitan Policy Advisory Committee and the 24 cities and three counties of the metropolitan region and considered comments and suggestions prior to making this decision; and

WHEREAS, prior to making this decision, the Council sent individual mailed notification to more than 100,000 households in the region and held public hearings on Title 4 and the efficient use of industrial land on December 4 and 11, 2003, public workshops at six locations around the region in March, 2004, on possible amendments to the UGB, and public hearings on the entire matter on April 22 and 29, May 6, May 27, and June 10 and 24, 2004; now, therefore

THE METRO COUNCIL HEREBY ORDAINS AS FOLLOWS:

1. Policy 1.12 of the Regional Framework Plan is hereby amended, as indicated in Exhibit A, attached and incorporated into this ordinance, to guide the choice of farmland for addition to the UGB when no higher priority land is available or suitable.

2. Title 4 (Industrial and Other Employment Areas) of the Urban Growth Management Functional Plan is hereby amended, as indicated in Exhibit B, attached and incorporated into this ordinance, to improve implementation of Title 4 by cities and counties in the region.

3. The Employment and Industrial Areas Map is hereby amended, as shown in Exhibit C, attached and incorporated into this ordinance, to depict the boundaries of Regionally Significant Industrial Areas pursuant to Policy 1.4.1 of the Regional Framework Plan in order to ensure more efficient use of the areas for industries reliant upon the movement of freight and to protect the function and capacity of freight routes and connectors in the region.

4. The Revised Housing Needs Analysis, January 24, 2003, is hereby further revised, as indicated in Exhibit D, Addendum to Housing Needs Analysis, April 5, 2004, attached and incorporated into this ordinance, to comply with the first item in LCDC's "Partial Approval and Remand Order 03-WKTASK-001524."

5. The Metro UGB is hereby amended to include all or portions of the Study Areas shown on Exhibit E with the designated 2040 Growth Concept design type, ~~and more precisely identified in the Industrial Land Alternative Analysis Study, February, 2004, Item (c) in Appendix A,~~ subject to the conditions set forth in Exhibit F, and to exclude tax lots 1300, 1400 and 1500 in Study Area 62 ~~and the southeast portion of Study Area 9 from the UGB~~, also shown on Exhibit E and more precisely identified in the Staff Report, "In Consideration of Ordinance No. 04-1040, For the Purpose of Amending the Metro Urban Growth Boundary, the Regional Framework Plan and the Metro Code to increase the capacity of the Boundary to Accommodate Growth in Industrial Employment", Item (a) in Appendix A. Exhibits E and F are attached and incorporated into this ordinance to comply with the second and third items in LCDC's "Partial Approval and Remand Order 03-WKTASK-001524."

6. Ordinance No. 02-969B is hereby amended to change the 2040 Growth Concept design type designation for that 90-acre portion of Study Area 12 that projects from the rest of the study area to the southeast along Highway 26 from "Inner Neighborhood" to "Regionally Significant Industrial Area."

~~6~~7. The Appendix, attached and incorporated into this ordinance, is hereby adopted in support of the amendments to the UGB, the Regional Framework Plan and the Metro Code in sections 1 through 3 of this ordinance. The following documents comprise the Appendix:

a. Staff Report, "In Consideration of Ordinance No. 04-1040, For the Purpose of Amending the Metro Urban Growth Boundary, the Regional Framework Plan and the Metro Code to increase the capacity of the Boundary to Accommodate Growth in Industrial Employment", April 5, 2004.

REGIONAL FRAMEWORK PLAN POLICY 1.12
Protection of Agriculture and Forest Resource Land

~~1.12~~1.12.1 Agricultural and forest land outside the UGB shall be protected from urbanization, and accounted for in regional economic and development plans, consistent with this Plan. However, Metro recognizes that all the statewide goals, including Statewide Goal 10, and Goal 14, Urbanization, are of equal importance to Goals 3 and 4, which protect agriculture and forest resource lands. These goals represent competing and, some times, conflicting policy interests which need to be balanced.

~~**1.12.1 Rural Resource Lands**~~

~~Rural resource lands outside the UGB that have significant resource value should actively be protected from urbanization. However, not all land zoned for exclusive farm use is of equal agricultural value.~~

1.12.2 When the Council must choose among agricultural lands of the same soil classification for addition to the UGB, the Council shall choose agricultural land deemed less important to the continuation of commercial agriculture in the region.

~~**1.12.2 Urban Expansion**~~

~~Expansion of the UGB shall occur in urban reserves, established consistent with the urban rural transition objective. All urban reserves should be planned for future urbanization even if they contain resource lands.~~

1.12.3 Metro shall enter into agreements with neighboring cities and counties to carry out Council policy on protection of agricultural and forest resource policy through the designation of Rural Reserves and other measures.

~~**1.12.3 Farm and Forest Practices**~~

~~Protect and support the ability for farm and forest practices to continue. The designation and management of rural reserves by the Metro Council may help establish this support, consistent with the Growth Concept. Agriculture and forestry require long term certainty of protection from adverse impacts of urbanization in order to promote needed investments.~~

1.12.4 Metro shall work with neighboring counties to provide a high degree of certainty for investment in agriculture in agriculture and forestry and to reduce conflicts between urbanization and agricultural and forest practices.

Exhibit B to Ordinance No. 04-1040B

TITLE 4: INDUSTRIAL AND OTHER EMPLOYMENT AREAS

3.07.410 Purpose and Intent

A. The Regional Framework Plan calls for a strong economic climate. To improve the region's economic climate, **[the plan] Title 4** seeks to **provide and** protect **[the] a** supply of sites for employment by limiting **[incompatible uses within] the types and scale of non-industrial uses in Regionally Significant Industrial Areas (RSIAs),** Industrial Areas and Employment Areas. **Title 4 also seeks to provide the benefits of "clustering" to those industries that operate more productively and efficiently in proximity to one another than in dispersed locations. Title 4 further seeks [T]t**o protect the capacity and efficiency of the region's transportation system for **the** movement of goods and services, and to **[promote the creation of jobs within designated Centers and discourages certain kinds of commercial retail development outside Centers] encourage the location of other types of employment in Centers, Employment Areas, Corridors, Main Streets and Station Communities**. **[It is the purpose of Title 4 to achieve these policies.] The** Metro **Council** will **[consider amendments to this title in order to make the title consistent with new policies on economic development adopted] evaluate the effectiveness of Title 4 in achieving these purposes** as part of **its** periodic **[review] analysis of the capacity of the urban growth boundary**.

3.07.420 Protection of Regionally Significant Industrial Areas

A. Regionally Significant Industrial Areas (RSIA) are those areas **[that offer the best opportunities for family-wage industrial jobs] near the region's most significant transportation facilities for the movement of freight and other areas most suitable for movement and storage of goods**. Each city and county with land use planning authority over **[areas] RSIAs** shown on the **[Generalized Map of Regionally Significant Industrial Areas adopted in Ordinance No. 02-969] Employment and Industrial Areas Map** shall derive specific plan designation and zoning district boundaries of **[the areas] RSIAs within its jurisdiction** from the Map, taking into account the location of existing uses that would not conform to the limitations on non-industrial uses in **[subsection C, D and E]** this section, and **[its] the** need **[of individual cities and counties]** to achieve a mix of **[types of]** employment uses.

B. **[Each city and county with land use planning authority over an area designated by Metro on the 2040 Growth Concept Map, as amended by Ordinance No. 02-969, as a Regionally Significant Industrial Area shall, as part of compliance with section 3.07.1120 of the Urban Growth Management Functional Plan, derive plan designation and zoning district boundaries of the areas from the Growth Concept Map] Cities and counties shall review their land use regulations and revise them, if necessary, to include measures to limit the size and location of new buildings for retail commercial uses - such as stores and restaurants - and retail and professional services that cater to daily customers – such as financial, insurance, real estate, legal, medical and dental offices - to ensure that they serve primarily the needs of workers in the area. One such measure shall be that new buildings for stores, branches, agencies or other outlets for these retail uses and services shall not occupy more than 3,000 square feet of sales or service area in a single outlet, or multiple outlets that occupy more than 20,000 square feet of sales or service area in a single building or in multiple buildings that are part of the same development project, with the following exceptions:**

1. Within the boundaries of a public use airport subject to a facilities master plan, customary airport uses, uses that are accessory to the travel-related and freight movement activities of airports, hospitality uses, and retail uses appropriate to serve the needs of the traveling public; and

2. Training facilities whose primary purpose is to provide training to meet industrial needs.

C. **[After determining boundaries of Regionally Significant Industrial Areas pursuant to subsections A and B, the city or county]** **Cities and counties** shall **[adopt implementing ordinances that limit development in the areas to industrial uses, uses accessory to industrial uses, offices for industrial research and development and large corporate headquarters in compliance with subsection E of this section, utilities, and those non-industrial uses necessary to serve the needs of businesses and employees of the areas]** **review their land use regulations and revise them, if necessary, to include measures to limit the siting and location of new buildings for the uses described in subsection B and for non-industrial uses that do not cater to daily customers - such as bank or insurance processing centers - to ensure that such uses do not reduce off-peak performance on Main Roadway Routes and Roadway Connectors shown on Metro's Freight Network Map, November, 2003, below standards set in the 2004 Regional Transportation Plan or require added road capacity to prevent falling below the standards**.

D. **[Notwithstanding subsection C, a city or county shall not approve:**

1. A commercial retail use with more that 20,000 square feet of retail sales area in a single building or in multiple buildings that are part of the same development project;
or

2. Commercial retail uses that would occupy more than five percent of the net developable portion of all contiguous Regionally Significant Industrial Areas] **No city or county shall amend its land use regulations that apply to lands shown as RSIA on the Employment and Industrial Areas Map to authorize uses described in subsection B that were not authorized prior to July 1, 2004.**

E. **[As provided in subsection C of this section, a city or county may approve an office for industrial research and development or a large corporate headquarters if:**

1. The office is served by public or private transit; and

2. If the office is for a corporate headquarters, it will accommodate for the initial occupant at least 1,000 employees]

[F. A city or county] **Cities and counties** may allow division of lots or parcels into smaller lots or parcels as follows:

1. Lots or parcels **[less]** **smaller** than 50 acres may be divided into any number of smaller lots or parcels**[;].**

2. Lots or parcels **[50 acres or]** larger **than 50 acres** may be divided into smaller lots and parcels **pursuant to a master plan approved by the city or county** so long as the resulting division yields **[the maximum number of lots or parcels of]** at least **[50 acres]** **one lot or parcel of at least 50 acres in size[;].**

3. **Lots or parcels 50 acres or larger, including those created pursuant to paragraph (2) of this subsection, may be divided into any number of smaller lots or parcels pursuant to a master plan approved by the city or county so long as at least 40 percent of the area of the lot or parcel has**

been developed with industrial uses or uses accessory to industrial use, and no portion has been developed, or is proposed to be developed, with uses described in subsection B of this section.

4. Notwithstanding paragraphs 2**[,] and** 3 **[and]** of this subsection, any lot or parcel may be divided into smaller lots or parcels or made subject to rights-of-way for the following purposes:

a. To provide public facilities and services;

b. To separate a portion of a lot or parcel in order to protect a natural resource, to provide a public amenity, or to implement a remediation plan for a site identified by the Oregon Department of Environmental Quality pursuant to ORS 465.225;

c. To separate a portion of a lot or parcel containing a nonconforming use from the remainder of the lot or parcel in order to render the remainder more practical for a permitted use; **or**

d. **[To reconfigure the pattern of lots and parcels pursuant to subsection G or this section]**

[e.] To allow the creation of a lot for financing purposes when the created lot is part of a master planned development.

[G. A city or county may allow reconfiguration of lots or parcels less than 50 acres in area if the reconfiguration would be more conducive to a permitted use and would result in no net increase in the total number of lots and parcels. Lots or parcels 50 acres or greater in area may also be reconfigured so long as the resulting area of any such lot or parcel would not be less than 50 acres.]

[H] F. Notwithstanding subsections **[C and D] B** of this section, a city or county may allow the lawful use of any building, structure or land existing at the time of adoption of its ordinance to implement this section to continue and to expand to add up to 20 percent more floor area and 10 percent more land area. Notwithstanding subsection E of this section, a city or county may allow division of lots or parcels pursuant to a master plan approved by the city or county prior to **[December 31, 2003] July 1, 2004**.

3.07.430 Protection of Industrial Areas

A. **[In Industrial Areas mapped pursuant to Metro Code section 3.07.130 that are not Regionally Significant Industrial Areas, c] C**ities and counties shall **[limit new and expanded retail commercial uses to those appropriate in type and size to serve the needs of businesses, employees and residents of the Industrial Areas] review their land use regulations and revise them, if necessary, to include measures to limit new buildings for retail commercial uses - such as stores and restaurants - and retail and professional services that cater to daily customers – such as financial, insurance, real estate, legal, medical and dental offices - in order to ensure that they serve primarily the needs of workers in the area. One such measure shall be that new buildings for stores, branches, agencies or other outlets for these retail uses and services shall not occupy more than 5,000 square feet of sales or service area in a single outlet, or multiple outlets that occupy more than 20,000 square feet of sales or service area in a single building or in multiple buildings that are part of the same development project, with the following exceptions:**

1. Within the boundaries of a public use airport subject to a facilities master plan, customary airport uses, uses that are accessory to the travel-related and freight movement activities of airports, hospitality uses, and retail uses appropriate to serve the needs of the traveling public; and

2. Training facilities whose primary purpose is to provide training to meet industrial needs.

B. **[In an Industrial Area, a city or county shall not approve:**

1. A commercial retail use with more than 20,000 square feet of retail sales area in a single building or in multiple buildings that are part of the same development project; or

2. Commercial retail uses that would occupy more than ten percent of the net developable portion of the area or any adjacent Industrial Area] Cities and counties shall review their land use regulations and revise them, if necessary, to include measures to limit new buildings for the uses described in subsection A to ensure that they do not interfere with the efficient movement of freight along Main Roadway Routes and Roadway Connectors shown on Metro's Freight Network Map, November, 2003. Such measures may include, but are not limited to restrictions on access to freight routes and connectors, siting limitations and traffic thresholds. This subsection does not require cities and counties to include such measures to limit new other buildings or uses.

C. **No city or county shall amend its land use regulations that apply to lands shown as Industrial Area on the Employment and Industrial Areas Map to authorize uses described in subsection A of this section that were not authorized prior to July 1, 2004.**

D. Cities and counties may allow division of lots or parcels into smaller lots or parcels as follows:

1. Lots or parcels smaller than 50 acres may be divided into any number of smaller lots or parcels.

2. Lots or parcels larger that 50 acres may be divided into smaller lots and parcels pursuant to a master plan approved by the city or county so long as the resulting division yields at least one lot or parcel of at least 50 acres in size.

3. Lots or parcels 50 acres or larger, including those created pursuant to paragraph (2) of this subsection, may be divided into any number of smaller lots or parcels pursuant to a master plan approved by the city or county so long as at least 40 percent of the area of the lot or parcel has been developed with industrial uses or uses accessory to industrial use, and no portion has been developed, or is proposed to be developed with uses described in subsection A of this section.

4. Notwithstanding paragraphs 2 and 3 of this subsection, any lot or parcel may be divided into smaller lots or parcels or made subject to rights-of-way for the following purposes:

a. To provide public facilities and services;

b. To separate a portion of a lot or parcel in order to protect a natural resource, to provide a public amenity, or to implement a remediation plan for a site identified by the Oregon Department of Environmental Quality pursuant to ORS 465.225;

c. To separate a portion of a lot or parcel containing a nonconforming use from the remainder of the lot or parcel in order to render the remainder more practical for a permitted use; or

d. To allow the creation of a lot for financing purposes when the created lot is part of a master planned development.

E. Notwithstanding **[subsection B]** **subsection A** of this section, a city or county may allow the lawful use of any building, structure or land **existing** at the time of **[enactment of an]** **adoption of its** ordinance **[adopted pursuant to this section]** **to implement this section** to continue and to expand to add up to 20 percent more **[floorspace]** **floor area** and 10 percent more land area. **Notwithstanding subsection D of this section, a city or county may allow division of lots or parcels pursuant to a master plan approved by the city or county prior to July 1, 2004.**

3.07.440 Employment Areas

A. Except as provided in subsections C, D and E, in Employment Areas mapped pursuant to Metro Code Section 3.07.130, cities and counties shall limit new and expanded retail commercial uses to those appropriate in type and size to serve the needs of businesses, employees and residents of the Employment Areas.

B. Except as provided in subsections C, D and E, a city or county shall not approve a commercial retail use in an Employment Areas with more than 60,000 square feet of gross leasable area in a single building, or retail commercial uses with a total of more than 60,000 square feet of retail sales area on a single lot or parcel, or on contiguous lots or parcels, including those separated only by transportation right-of-way.

C. A city or county whose zoning ordinance applies to an Employment Area and is listed on Table 3.07-4 may continue to authorize retail commercial uses with more than 60,000 square feet of gross leasable area in that zone if the ordinance authorized those uses on January 1, 2003.

D. A city or county whose zoning ordinance applies to an Employment Area and is not listed on Table 3.07-4 may continue to authorize retail commercial uses with more than 60,000 square feet of gross leasable area in that zone if:

1. The ordinance authorized those uses on January 1, 2003;

2. Transportation facilities adequate to serve the retail commercial uses will be in place at the time the uses begin operation; and

3. The comprehensive plan provides for transportation facilities adequate to serve other uses planned for the Employment Area over the planning period.

E. A city or county may authorize new retail commercial uses with more than 60,000 square feet of gross leasable area in Employment Areas if the uses:

1. Generate no more than a 25 percent increase in site-generated vehicle trips above permitted non-industrial uses; and

2. Meet the Maximum Permitted Parking – Zone A requirements set forth in Table 3.07-2 of Title 2 of the Urban Growth Management Functional Plan.

Exhibit D to Ordinance No. 04-1040B
Addendum to Housing Needs Analysis
April 5, 2004

I. INTRODUCTION

The attached three Tables satisfy the requirements of ORS 197.298(5)(a)(E) to provide at least 3 years of data on the number, density and average mix of housing for vacant, partially vacant, redevelopment and infill (refill) and mixed use designated land. Table 5(a)(E) – 1 provides number, density and mix data on refill land for the period 1997 through 2001. Table 5(a)(E) – 2 provides the same data for development on vacant and partially vacant land for the period 1998 through 2001. Table 5(a)(E) – 3 displays the number, density and mix data for development on mixed use land for the period 1998 – 2001.

As noted in the original Housing Needs Analysis submission, the data in the attached Tables are subsets of more aggregated data contained in the original Housing Needs Analysis Report. While interesting and informative, the data in the attached Tables do not contradict the conclusions and actions taken in conjunction with the Urban Growth Report and periodic review. Nor do the data affect the determinations of the overall average density and overall mix of housing types at which residential development must occur in order to meet housing needs through 2022, as depicted in the original Housing Needs Analysis, pages 2 through 7 and Figures 3.1, 3.2, 3.3, 5.1 and 5.3.

The remainder of the report consists of an explanation of methodology and data sources and a synopsis of the data content of each of the tables.

II. METHODOLOGY AND DATA SOURCES

A. Data Sources

In order to retrospectively meet the requirements of State Statute we made maximum use of Metro's RLIS archived data that extend back in some degree to 1995. These data consist of the following elements:

1. Land use data at the tax lot level designating land by vacant, developed and zoning category.

2. County assessor tax lot data showing use, value, sales data, etc.

3. Geo-coded building permit data by building type.

4. Air photos for each year taken approximately in July of each year with a trend of improving resolution level over time.

B. Sampling Approach

We elected to measure the data using a 20% sampling approach so that we could manually audit each of the selected data points to insure accuracy. Machine processing of the data is not possible due to the following sources of measurement error.

1. Building permit geo-coding variability as approximately 70% of building permits actually geo-code exactly to the correct tax lot.

2. Building permit data error due to incomplete reporting, undetected duplicates and inaccurate descriptions of building type, work done and location.

3. Slight registration discrepancies between tax lot maps, air photos and archived land use coverages.

4. Variability between the time a building permit is issued, building takes place and the tax lot is created and enumerated in the County Assessor's tax lot coverage. The practical consequence of this is often that a row house constructed on a 2,500 sq. ft. lot appears to be on a 100,000 sq. ft. plus lot because the subdivision plat is not yet available in the data base.

For multi-family units we modified the 20% sample to include 100% of all building permits for 20 or more units and applied the 20% rate to permits of under 20 units. This avoided the potential sampling errors associated with having a few permits for multi-family of over 100 or more units.

C. Expansion Back to the Population Totals

Because we elected a 100% count of multi-family the sample was not self-weighting. As a consequence after the analysis was complete we used a two phase approach to estimate the building permit population. First, we expanded our sample by building type back to the totals reported in our building permit data base. Secondly, since our building permit data base is incomplete relative to the totals reported to the State and Federal Government, we expanded our building permit data base to match the County totals by building type.

D. Definition of Entities Being Measure

State Statute requires we report on the number and densities by building type of development on "refill", "vacant", "partly vacant" and "mixed use" land. These entities we define and discuss in the context of our RLIS data base and measurement protocols as follows:

1. Refill: Housing units developed on land that Metro already considers developed in its data base. Refill is further divided into redevelopment and infill. Redevelopment occurs after an existing building has been removed. Infill is additional building without removal of existing buildings.

   a. ***Method of Measurement***: We measure refill by counting the number of permits that locate on land Metro considers developed in the next fiscal year. For instance for the year "1998" we would compare the RLIS developed and vacant lands inventory for the year ending June 30, 1998 with all building permits issued beginning July 1, 1998 and ending June 30, 1999. Building permits located on land Metro classed vacant as of June 30, 1998 would be classed as development on vacant land and permits landing on land Metro classed as developed as of June 30, 1998 would be classed as refill.

   b. ***Measurement Protocols***: As noted earlier we select a 20% sample of all permits for new residential construction from the RLIS data base for the relevant years (with the exception of the 100% of multi-family permits equal to or exceeding 20 units). Each permit is scrutinized manually by a

trained intern using the RLIS data base and air photos to insure it is properly located and that the permit is for valid construction that did occur as the permit indicated. The analyst then determines whether the permit constitutes refill or vacant land development. Beginning with this study the analyst further classifies the permit to "legal – Urban Growth Report" refill and "economic – MetroScope" refill. This distinction results from the fact that RLIS analysts classify some individual lots in developing green field areas as developed prior to actual development occurring and also classify land cleared for urban renewal areas as vacant. In the former case the economic interpretation is development on new and in the latter case the economic interpretation is refill development. However, to be consistent with the RLIS land accounting system on which the Urban Growth Report is based we classify development the way RLIS accounts for it. On the other hand, the MetroScope land use model used for forecasting and policy evaluation counts green field development as vacant land consumption and urban renewal as refill (redevelopment). Consequently, we report refill data for both classifications.

2. Vacant and partially vacant: In RLIS tax lots that are "completely vacant" (90% vacant) are classed as totally vacant. If the unoccupied portion of a tax lot with development exceeds ½ acre, the unoccupied portion is classed a partially vacant. Green field sites under development may transition from vacant to partially vacant, back to totally vacant to developed and back again to totally vacant depending on the patterns of tax lot subdivision activity and zone changes. This also is true for urban renewal redevelopment sites. There are also a limited number of partially vacant sites in established residential areas where present zoning would allow further subdivision and development.

   a. ***Method of Measurement***: Using the audited building permit sample we machine processed the permits classed as legally vacant to fully vacant and partially vacant. Due to map registration discrepancies the RLIS developed lands coverage for 1997 could not be used so we dropped 600 observations for that year. In addition, another 1400 observations failed the machine screening in that they could not be conclusively classed as either vacant or partially vacant without manual auditing. The 2000 observations excluded from the vacant and partially vacant analysis resulting in the number of units developed on some type of vacant land dropping from 39,000 to 25,000. Though not relevant to the refill study or overall results, discussions with RLIS analysts indicated that the machine filtering process was more likely to exclude partially vacant than vacant tax lots. The bias, resulting from this procedure was minimized, by restating our inventory totals of vacant and partially vacant land using the same screening procedures.

   b. ***Measurement Protocols***: Once the refill data base was reclassed between vacant and partially vacant, we tabulated all the development on vacant land by the type of vacant land it fell on by building type (multi-family and single family) and by lot size.

3. Mixed use development: In our RLIS data base mixed use development is classed as MUC1, MUC2 and MUC3. From the original audited refill data base we selected all the records of building permits that fell on land classed as MUC1, MUC2 or MUC3 regardless of whether it was refill, vacant or partially vacant. Again matching the RLIS land use inventory for 1997 proved problematic for machine selection procedures and this year was excluded. The resulting selection process produced 402 observations representing over 4,600 units constructed from 1998 through 2001.

E. Years of Data Included in the Retrospective Analysis

We included building permit data from 12/97 through 6/2002 that could be reliably recovered and geo-coded from our existing RLIS data base. This time period allows us to evaluate 5 years of recent history in regard to "refill" and 4 years of history for "vacant", "partly vacant" and "mixed use" land.

III. SYNOPSIS OF RESULTS

A. Data Table 5E1: Refill Numbers by Type and Density 1997 – 2001

The data displayed on Table 5E1 show the amount of residential development of vacant and refill land that occurred during the period 1997 through 2001. During that period nearly 54,000 dwelling units located within the Metro region.[1] Of the 54,000 dwelling units, 26.5% occurred as refill according to the legal – Urban Growth Report definition. Using the economic-MetroScope definition 30.4% were refill reflecting the increasing importance of redevelopment in urban renewal areas and centers. Nearly 20,000 of the units constructed were multi-family with a legal refill rate of 31.5% and an economic rate of 40.2%. 34,000 units constructed were single family with a legal refill rate of 23.6% and an economic rate of 24.7%. Average lot sizes are also reported for every category.[2] For multi-family average lot sizes range from 1,800 to 2,000 sq. ft. depending on category. For single family average lot sizes range from 6,600 to 8,400 sq. ft. with refill development generally in the 6,500 – 7,000 sq. ft. range.

B. Table 5E1(a): Median Lot Size Data

This table provides additional and somewhat more meaningful weighted median lot size data. When we compare the average lot sizes in Table 5E1, we observe substantive differences in most cases. In general the median lot sizes are 30% less for vacant single family, 25% more for vacant multi-family, 25% less for refill single family and 30% less for refill multi-family. For all types combined the weighted median is 27% less for vacant and 26% less for refill. Assuming that the present median is a superior measure of long run average lot size, the combined weighted median of 4,417 sq. ft. should be used to determine vacant land consumption. This figure combined with the 39,619 units located on legally vacant land over the 5 year period implies a land consumption of slightly over 4,000 net buildable acres. Using a plausible range of gross to net conversion factors of .55 - .7 yields a gross buildable acre consumption of 1,150 to 1,450 acres per year, within the range estimated in the original Housing Needs Analysis.[3]

---

[1] **Real Estate Report for Metropolitan Portland, Oregon**, Spring 2003. Numbers are based on building permits summarized at the County level and only approximate the UGB. This procedure slightly overstates UGB land consumption.

[2] Average as contrasted to median inflates land consumption as the measure is substantially influenced by a few large lot single family permits on urban land still zoned RRFU that will subsequently be subdivided. RLIS procedure of assuming ½ acre of land consumption for permits on non-subdivided land also inflates average lot size.

[3] While appearing precise, attempting to estimate long run densities and land consumption from individual lot sizes involves substantial uncertainties. The most serious of these is the gross to net conversion factor as we only observe

C. Table 5E2: Housing on Fully Vacant and Partially Vacant Land

The accompanying table presents the required data on development on a subcategory of vacant land – fully vacant land and land partially vacant. As noted in the methods section, fully or partially vacant is classified relative to the tax lot existing at the time of the RLIS vacant and developed lands inventory. As also noted in the methods section, due to procedures and quirks of the land development and reporting process land may be fully vacant, partially vacant or developed refill land several times during the development process. In addition as a result of attempting to categorize and measure "partially vacant" we discover that the acreage totals are extremely volatile and sensitive to whatever criteria we use in the machine query process to differ partial from full. Very minor discrepancies between vacant land coverages and assessor's tax lot coverages can dramatically change the inventories of fully and partially vacant. In the methods section we note that we use the same selection criteria for both the inventory totals and the classification of the refill sample into fully and partially vacant.

Of the over 39,000 legal vacant units located in the Metro Region for the period 1997 – 2001 we were able to reliably classify 25,000 units covering the period 1998 – 2001. Of these 15,500 (62.6%) were on fully vacant land and 9,300 (37.4%) were on partially vacant land. Looking at *Table 5E2(a) Fully Vacant and Partially Vacant Land Inventory 1998 – 2001* (replacing Table 4.1AB in the original Housing Needs Analysis) that on average partially vacant comprised 34.3% of the vacant land inventory. In sum development on partially vacant land overall has been occurring at roughly the same rate as development on fully vacant land and appears to not be materially different.

At the same time we recognize that there are a number of instances where partially vacant land shares a tax lot with a high valued single family home. In order to better understand the likelihood of further development under these circumstances, we used our single family sales price study to estimate the "optimum lot size" by neighborhood and house size. We define optimum lot size as the lot size at which at the loss of value to a homeowner by selling off part of his lot just equals the amount he gains by selling the land. If the homeowner sells more land, the value of his house declines more than he gains by the sale. Conversely, if he sells less land, the land unsold contributes less to the value of his home than the amount he would receive were he to sell it. Making that calculation for Dunthorpe we found that a $1,000,000 home on 5 acres would have a positive incentive to sell off land down to about 1 – 1.5 acres. By comparison, a $600,000 home on 1 acre would have an incentive to sell off no more than ½ acre. Significantly, in 2000 the average Dunthorpe selling price was $590,000 for a 3,100 sq. ft. house on a 22,000 sq. ft. lot, almost exactly the optimum lot size determined from our estimates. On average then we would expect Dunthorpe to have no additional capacity other than that resulting from subdivision of lots at least 1 acre to sizes no smaller than ½ acre. Optimum lot size calculations vary dramatically by neighborhood. For instance, the average house in the Powellhurst-Gilbert neighborhood has a positive incentive to sell off land down to and sometimes below a 5,000 sq. ft. lot minimum. This is more often the case within the Metro region notwithstanding the exceptionally high value areas such as Dunthorpe.

D. Table 5E3: Housing on Mixed Use Designated Land

As required by statute the accompanying table shows development for the period 1998 – 2001 that occurred on land Metro considered at the time of development to be MUC1, MUC2 and MUC3. As pointed out in the methods section, the mixed use inventory includes refill, vacant and partially vacant

---

net buildable land consumption and cannot measure land lost to streets, parks, schools, freeways, etc. The second drawback is that average lot size measures are always exaggerated by a few large lot placements (often of manufactured homes) done by private individuals that will undoubtedly be further subdivided sometime in the future.

lands. Over the 4 year period we noted 4,600 housing units developed of which 3,000 were multi-family and 1,600 were single family. Average lot size for multi-family was 1,400 sq. ft. and single family lot size was 2,300 sq. ft. Table 5E3(a) depicts the 2040 Plan mixed use capacity as of 8/98. Total mixed use capacity at that time was roughly 23,000 units. Mixed use development constituted about 11% of residential development for the 4 year period 98 – 2001. As of 1998, mixed use capacity of 23,000 units constituted 12% of the capacity 193,000 dwelling unit capacity estimated at the time. As was the case with vacant and partially vacant, this sub-classification of land type seems to produce housing at a rate commensurate with its proportion of the land inventory.

Exhibit 5E1_: Housing on Vacant and Refill Land - Number, Type and Density 1997 Through 2001

Exhibit F to Ordinance No. 04-1040B
Conditions on Addition of Land to the UGB

I. GENERAL CONDITIONS APPLICABLE TO ALL LANDS ADDED TO THE UGB

A. The city or county with land use planning responsibility for a study area included in the UGB shall complete the planning required by Metro Code Title 11, Urban Growth Management Functional Plan ("UGMFP"), section 3.07.1120 ("Title 11 planning") for the area. Unless otherwise stated in specific conditions below, the city or county shall complete Title 11 planning within two years after the effective date of this ordinance. Specific conditions below identify the city or county responsible for each study area.

B. The city or county with land use planning responsibility for a study area included in the UGB, as specified below, shall apply the 2040 Growth Concept design types shown on Exhibit E of this ordinance to the planning required by Title 11 for the study area.

C. The city or county with land use planning responsibility for a study area included in the UGB shall apply interim protection standards in Metro Code Title 11, UGMFP, section 3.07.1110, to the study area until the effective date of the comprehensive plan provisions and land use regulations adopted to implement Title 11.

D. In Title 11 planning, each city or county with land use planning responsibility for a study area included in the UGB shall recommend appropriate long-range boundaries for consideration by the Council in future expansions of the UGB or designation of urban reserves pursuant to 660 Oregon Administrative Rules Division 21.

E. Each city or county with land use planning responsibility for an area included in the UGB by this ordinance shall adopt provisions – such as setbacks, buffers and designated lanes for movement of slow-moving farm machinery – in its land use regulations to enhance compatibility between urban uses in the UGB and agricultural practices on adjacent land outside the UGB zoned for farm or forest use.

F. Each city or county with land use planning responsibility for a study area included in the UGB shall apply Title 4 of the UGMFP to those portions of the study area designated Regionally Significant Industrial Area ("RSIA"), Industrial Area or Employment Area on the 2040 Growth Concept Map (Exhibit C). If the Council places a specific condition on a RSIA below, the city or county shall apply the more restrictive condition.

G. In the application of statewide planning Goal 5 (Natural Resources, Scenic and Historic Areas, and Open Spaces) to Title 11 planning, each city and county with land use responsibility for a study area included in the UGB shall comply with those provisions of Title 3 of the UGMFP acknowledged by the Land Conservation and Development Commission ("LCDC") to comply with Goal 5. If LCDC has not acknowledged those provisions of Title 3 intended to comply with Goal 5 by the deadline for completion of Title 11 planning, the city or county shall consider, in the city or county's application of Goal 5 to its Title 11 planning, any inventory of regionally significant Goal 5 resources and any preliminary decisions to allow, limit or prohibit conflicting uses of those resources that is adopted by resolution of the Metro Council.

H. Each city and county shall apply the Transportation Planning Rule (OAR 660 Div 012) in the planning required by subsections F (transportation plan) and J (urban growth diagram) of Title 11.

II. SPECIFIC CONDITIONS FOR PARTICULAR AREAS

A. Damascus Area

1. Clackamas County and Metro shall complete Title 11 planning requirements through the incorporation of this area into the greater Damascus/Boring Concept Plan planning effort currently underway. This planning shall be completed within the same time frame as specified in Ordinance No. 02-969B.

2. In the planning required by Title 11, subsections (A) and (F) of section 3.07.1120, Clackamas County or any future governing body responsible for the area shall provide for annexation of those portions of the area whose planned capacity is sufficient to support transit to the Tri-met District.

3. In the planning required by Title 11, subsections (A) and (F) of section 3.07.1120, Clackamas County or any future governing body responsible for the area shall provide for annexation of those portions of the area whose planned capacity is sufficient to support transit to the Tri-met District.

B. Beavercreek Area

1. Clackamas County or, upon annexation to Oregon City, the city and county, with Metro, shall complete Title 11 planning for the area.

2. This area shall be planned in conjunction with the adjoining tax lot added to the UGB in 2002, under Ordinance No. 02-969B.

~~C. Borland Area – North of I-205~~

~~1. Clackamas County or, upon annexation to the City of Tualatin, the city and county, in coordination with the Cities of Lake Oswego, Tualatin, and West Linn and Metro, shall complete Title 11 planning within four years following the effective date of Ordinance No. 04-1040. The county and city, in conjunction with Lake Oswego and West Linn and Metro shall recommend long-range boundaries in the Stafford Basin and general use designations for consideration by the Council in future expansions of the UGB.~~

~~2. Until the effective date of new regulations adopted pursuant to Title 11, the city or county with land use planning responsibility for the area shall not allow the division of a lot or parcel that is 50 acres or larger into lots or parcels smaller than 50 acres.~~

~~D~~C. Tualatin Area

1. Washington County or, upon annexation to the Cities of Tualatin or Wilsonville, the cities, in conjunction with Metro, shall complete Title 11 planning within ~~four~~ two years following the selection of the right-of-way alignment for the I-5/99W Connector, or within seven years of the effective date of Ordinance No. 04-1040, whichever occurs earlier.

2. Title 11 planning shall incorporate the general location of the projected right of way ~~location~~ alignment for the I-5/99W connector and the Tonquin Trail as shown on the 2004 Regional Transportation Plan. If the selected right-of-way for the connector follows the approximate course of the "South Alignment," as shown on the Region 2040 Growth Concept Map, as amended by Ordinance No. 03-1014, October 15, 2003, the portion of the Tualatin Area that lies north of the right-of-way shall be designated "~~Inner~~Outer Neighborhood" on the Growth Concept Map; the portion that lies south shall be designated "Industrial."

3. The governments responsible for Title 11 planning shall consider using the I-5/99W connector as a boundary between the city limits of the City of Tualatin and the City of Wilsonville in this area.

~~E~~D. Quarry Area

1. Washington County or, upon annexation to the cities of Tualatin or Sherwood, the cities**,** and Metro shall complete Title 11 planning for the area.

2. Title 11 planning shall, if possible, be coordinated with the adjoining area that was included in the UGB in 2002 under Ordinance No. 02-969B.

3. Until the effective date of new regulations adopted pursuant to Title 11, the city or county with land use planning responsibility for the area shall not allow the division of a lot or parcel that is 50 acres or larger into lots or parcels smaller than 50 acres.

4. Title 11 planning shall incorporate the general location of the projected right-of-way for the Tonquin Trail as shown on the 2004 Regional Transportation Plan.

~~F~~E. Coffee Creek Area

1. Washington and Clackamas Counties or, upon annexation of the area to the ~~City~~ cities of Tualatin or Wilsonville**,** the city, ~~and~~ in conjunction with Metro, shall complete the Title 11 planning for the area within ~~four~~ two years following the selection of the right-of-way alignment for the I-5/99W Connector, or within seven years of the effective date of Ordinance No. 04-1040B, whichever occurs earlier.

2. ~~The concept~~ Title 11 planning shall incorporate the general location of the projected right of way location for the I-5/99W connector and the Tonquin Trail as shown on the 2004 Regional Transportation Plan.

~~G. Wilsonville East Area~~

~~1. Clackamas County or, upon annexation of the area to the City of Wilsonville, the city, and Metro shall complete the Title 11 planning for the area within two years of the effective date of Ordinance No. 04-1040.~~

~~2. In the planning required by Title 11 a buffer shall be incorporated to mitigate any adverse effects of locating industrial uses adjacent to residential uses located southwest of the area.~~

~~3. Until the effective date of new regulations adopted pursuant to Title 11, the city or county with land use planning responsibility for the area shall not allow the division of a lot or parcel that is 50 acres or larger into lots or parcels smaller than 50 acres.~~

~~H~~F. Cornelius Area

1. Washington County, or, upon annexation of the area to the City of Cornelius, the city and Metro shall complete the Title 11 planning for the area.

~~I~~G. Helvetia Area

1. Washington County, or upon annexation of the area to the City of Hillsboro, the city, and Metro shall complete the Title 11 planning for the area.

2. Until the effective date of new regulations adopted pursuant to Title 11, the city or county with land use planning responsibility for the area shall not allow the division of a lot or parcel that is 50 acres or larger into lots or parcels smaller than 50 acres.

Exhibit G to Ordinance No. 04-1040B
Findings of Facts, Conclusions of Law

Introduction

The Metro Council adopted Ordinance 04-1040B in response to LCDC Partial Approval and Remand Order 03-WKTASK-001524, entered July 7, 2003. LCDC's order followed its review of seven ordinances (Nos. 02-969B, 02-983B, 02-984A, 02-985A, 02-986A, 02-987A and 02-990A) adopted by the Metro Council as part of Periodic Review Work Task 2. The findings of fact and conclusions of law that explained how those ordinances complied with state planning laws, together with the supplemental findings and conclusions set forth in this exhibit, are part of the explanation how Ordinance No. 04-1040B complies with those laws. These findings also explain how Ordinance No. 04-1040B complies with the three requirements of the remand order.

REQUIREMENT NO. 1:

REMAND ORDER ON SUBTASK 17: COMPLETE THE ACCOMMODATION OF THE NEED FOR THE INDUSTRIAL LAND NEED COMPONENT OF EMPLOYMENT LAND THAT REMAINS APPROVAL OF WORK TASK 2.

I. GENERAL FINDINGS FOR TASK 2 REMAND DECISION ON UGB

A. Coordination with Local Governments

Metro worked closely with the local governments and special districts that comprise the metropolitan region. The Metro Charter provides for a Metropolitan Policy Advisory Committee ("MPAC") composed generally of representatives of local governments, special districts and school districts in the region. MPAC reviewed all elements of this periodic review decision. MPAC made recommendations to the Metro Council on most portions of the decision. All recommendations were forwarded formally to the Council and the Council responded. Metro Councilors and staff held many meetings with local elected officials in the year since LCDC's remand (July 7, 2003).

The record of this decision includes correspondence between local governments and Metro, including Metro's responses to concerns and requests from local governments and local districts related to industrial land.

Metro accommodated the requests and concerns of local governments as much as it could, consistent with state planning laws and its own Regional Framework Plan (Policy 1.11) and Regional Transportation Plan (Policy 2.0).

B. Citizen Involvement

These findings address Goal 1 and Regional Framework Plan Policy 1.13.

To gather public input on this Task 2 remand decision, Metro conducted an extensive citizen involvement effort. The findings for Ordinance No. 02-969B set forth Metro's effort leading to adoption of that ordinance on December 5, 2002. Those findings are incorporated here. Since that time, the Metro notified by mail nearly 75,000 people of the pending decision to expand the UGB for industrial land. Metro also provided individual mailed notice to nearly 5,000 landowners of possible revisions to Title 4 (Industrial and Other Employment Areas) of the Urban Growth Management Functional Plan ("UGMFP"). In March, 2004, Metro held six workshops on industrial land throughout the region, attended by some 1,200 people. Finally, the Council held public hearings on the UGB expansion and Title 4 on December 4 and December 11 of 2003 and April 22 and 29, May 6 and 27, and June 10 and 24 of 2004.

m:\attorney\confidential\7.2.1.3\04-1040B.Ex G.002
OMA/RPB/kvw (06/22/04)

These efforts bring Metro into compliance with Goal 1 and Metro's Regional Framework Plan. More important, this work to involve Metro area citizens has contributed greatly to their understanding of the importance of this set of decisions for the region and have brought Metro invaluable comment on options available to it.

C. Need for Land

These findings address ORS 197.296; ORS 197.732(1)(c)(A); Goal 2, Exceptions, Criterion (c)(1); Oregon Administrative Rules 660-004-0010(1)(c)(B)(i) and 660-004-0020(2)(a); Goal 9 (local plan policies); Goal 10; Goal 14, Factors 1 and 2; Metro Regional Framework Plan ("RFP") Policies 1.2, 1.4, 1.4.1 and 1.4.2; and Metro Code 3.01.020(b)(1) and (2).

The findings for Ordinance No. 02-969B set forth Metro's analysis of the need for land for new jobs through the year 2022. The Urban Growth Report-Employment ("UGR-E") provides the details of that analysis. The analysis indicates that the region will need approximately 14,240 acres to accommodate an additional 355,000 jobs (all employment, commercial and industrial). Based upon new information that came to the Council during hearings on Title 4 revisions and UGB expansion, Metro completed a supplement (Ordinance No. 04-1040B, Appendix A, Item b) to the UGR-E that describes emerging trends in industrial use.

Leading to adoption of the ordinances that expanded the UGB in December, 2002, Metro analyzed the capacity of the existing UGB to accommodate this employment growth. The analysis determined that the UGB contained a surplus of land (759.6 acres) for commercial employment and a deficit of land (5,684.9 acres) for industrial development. The UGR-E provides the details of this analysis.

Following adoption of the December, 2002, ordinances, Metro analyzed the capacity of the expanded UGB. Those ordinances left Metro with a deficit of 1,968 acres of industrial land and a surplus of 393 acres of commercial land. From this analysis, the Council concluded that the UGB, as expanded by ordinances in December, 2002, did not have sufficient capacity to accommodate the remaining unmet need for industrial land. This deficit was one reason for LCDC's July 7, 2003, remand order directing Metro to complete the accommodation of this need for industrial land.

Based upon interviews with industrial developers, brokers and consultants, the Regional Industrial Land Survey ("RILS") and Metro's UGR-E, Metro refined the need for industrial land. Not just any land will satisfy the need for industrial use. Metro defined the need as 1,968 acres of land composed generally of less than 10 percent slope that lies either within two miles of a freeway interchange or within one mile of an existing industrial area. RILS and the UGR-E also calculate the need for parcels of varying sizes by sectors of the industrial economy. Table 13 of the UGR-E shows a need for 14 parcels 50 acres or larger for the warehouse and distribution and tech/flex sectors (page 25).

D. Alternatives: Increase Capacity of the UGB

These findings address ORS 197.732(c)(B); Goal 14, Factors 3 and 4; Goal 2, Exceptions, Criterion 2; OAR 660-004-0010(1)(B)(ii) and 660-004-0020(2)(b); Metro Code 3.01.020(b)(1)(E); and RFP Policies 1.2, 1.3, 1.4, 1.6, 1.7, 1.8 and 1.9.

To address the shortfall in employment capacity, Metro considered measures to increase the efficiency of land use within the UGB designated for employment. Metro's UGMFP Title 4, first adopted in 1996, limited non-employment uses in areas designated Industrial and Employment. Analysis of results of local implementation of Title 4 indicates that commercial uses and other non-industrial uses are converting land designated for industrial use to non-industrial use.

In response to this information, the Metro Council amended the RFP in Ordinance No. 02-969B in December, 2002, to improve the protection of the existing industrial land base. The Council created a new 2040 Growth Concept design type – "Regionally Significant Industrial Land" ("RSIA") – and revised Title 4 to establish new limitations on commercial office and commercial retail uses in RSIAs. Metro estimated that these new measures would reduce the shortfall in industrial land by 1,400 acres by reducing encroachment by commercial uses. The Council counted this "savings" of industrial land in its determination that the deficit of industrial land following the December, 2002, expansion of the UGB was 1,968 net acres.

Following adoption of the December ordinances, the Council began implementation of the new policy and code, including the mapping of RSIAs. The process of developing the map with cities and counties in the region uncovered implementation difficulties with the provisions of the new Title 4 that limited commercial retail and office uses. With Ordinance No. 04-1040B, the Council once again revised Title 4 with two objectives: greater flexibility for traded-sector companies and retention of the 1,400-acre "savings" estimated from the December, 2002, revisions. Based upon the analysis of Title 4 revisions in the supplement to the UGR-E (Ordinance No. 04-1040B, Appendix A, Item b), the Council estimates that the revisions, in combination with conditions placed upon areas added to the UGB for industrial use, will continue to "save" 1,400 acres of industrial land from intrusion by commercial uses.

During hearings on the remand from LCDC, the Council received testimony that an increasing number of industrial jobs is finding space in office buildings rather than in traditional industrial buildings. The Council relied upon this testimony to revise Title 4 limitations on offices in industrial areas. The Council also relied upon the testimony to apply the 393-acre surplus of commercial land taken into the UGB by the December, 2002, ordinances to the need for 1,968 acres of industrial land. The Council assumed that offices in the region's designated Employment Areas, Centers, Corridors, Station Communities and Mains Streets would absorb industrial jobs. This assumption reduced the need for industrial land from 1,968 to 1,575 net acres.

Also during the hearings, the cities of Wilsonville, Oregon City and Fairview brought news of recent plan amendments (adopted after completion of Metro's inventory of industrial land) adding land to the industrial land supply. The Council concluded that the land added by Wilsonville (127 acres) and Oregon City (74 acres) are actually available for industrial use, subject to timing and infrastructure requirements. The Council concluded that the Fairview land, though designation industrial in the city's comprehensive plan, is not yet appropriately zoned to make it available for industrial use. These actions reduced the need for industrial land from 1,575 to 1,374 net acres.

The City of Gresham requested a change to the 2040 Growth Concept Map and the Title 4 Employment and Industrial Areas map for a 90-acre tract that is part of Study Area 12 and adjacent to land added to the UGB in December, 2002, for industrial use. The city says further planning work on its part has revealed that some 20 acres of the tract are suitable for industrial use. The Council makes this change in Ordinance No. 04-1040B, reducing the need from 1,374 to 1,354.

In a further effort to accommodate industrial development more efficiently within the UGB, the Council discovered that it had assumed a commercial development refill rate of 50 percent, lower than the most recently observed rate of 52 percent. For the reasons stated above, the Council concludes that this infill and re-development of lands in designated Employment Areas, Centers, Corridors, Station Communities and Mains Streets will accommodate some of the increasing number of industrial jobs that is locating in offices rather than factories or other traditional industrial buildings. Correction of the commercial refill rate assumption reduces the need for industrial land from 1,354 to 1,180 acres.

E. Alternatives: Expand the UGB

These findings address ORS 197.732(c)(B), (C) and (D) and Goal 2, Exceptions; ORS 197.298(1); Goal 11; Goal 14, Factors 3-7; OAR 660-004-0010(1) and 660-004-0020(2); RFP Policies 1.2, 1.3.1, 1.4, 1.4.1, 1.7, 1.7.2, 1.9, 1.12.1, 1.12.2 and 5.1.1; Regional Transportation Plan Policy 3.0 and Metro Code 3.01.020(b)(3) through (7) and 3.01.020(d)

The measures taken by the Council to increase the capacity of the existing UGB for industrial use, described above leave an unmet need for industrial land of 1,180 acres.

Metro began the search for the most appropriate land for inclusion in the UGB by applying the priorities in ORS 197.298(1). Because Metro has not re-designated "urban reserve" land since its 1997 designation was invalidated on appeal, the highest priority for addition of land is exception land.

Metro first included for consideration all exception land that was studied for inclusion in the December, 2002, ordinances, but not included at that time (59,263 acres). Metro then expanded the search to consider all other land, resource land included, that met the siting characteristics that help define the need for industrial land (less than 10 percent slope and within two miles of a freeway interchange or one mile of an existing industrial area (9,071 acres). In all, Metro looked at approximately 68,000 acres to find the most appropriate land.

Once Metro mapped land by its statutory priority, Metro analyzed the suitability of the land for industrial use, considering the locational factors of Goal 14, the consequences and compatibility criteria of the Goal 2 and statutory exceptions process, the policies of the Regional Framework Plan (RFP) and the criteria in the Metro Code that are based upon Goal 14. This analysis is set forth in the Alternatives Analysis Study, Item (c) in Appendix A of Ordinance No. 04-1040B and subsequent staff reports [Appendix A, Items (a) and (y)].

The Alternatives Analysis and testimony from the hearings gave the Council few easy or obvious choices among the lands it considered. The land most suitable for the types of industrial use forecast in the region for the next 20 years is flat land near freeway interchanges or near existing industrial areas. In addition, the region needs parcels 50 acres or larger for the warehouse and distribution and tech/flex sectors. The land most likely to meet these needs at the perimeter of the UGB is agricultural land, the last priority for inclusion under ORS 197.298(1).

The highest priority for inclusion, under the priority statute, where no urban reserves have been designated, is exception land. But the character of most exception areas makes them unable to fill the region's needs for industrial use. The great majority of exception land outside the UGB is designated for residential use, and most of that is settled with residences. Parcels are generally small (five acres and smaller), the topography is usually rolling and often steep, and streams, small floodplains and wildlife habitat are common. And residents, as evidenced by testimony at Council hearings, are often vigorously opposed to industrial intrusions into what they consider their neighborhoods.

The Council excluded from further consideration those exception lands that lie further than two miles from a freeway interchange and more than one mile from existing industries for the reason that these areas cannot meet the identified need for industrial land. The Staff Report [Appendix A, Item (a)] describes these specific areas in detail at pages 13 to 18.

The Council excluded other study areas (or portions of them) from further consideration even though they could meet the identified need (less than 10 percent slope and either within two miles from a freeway interchange or within one mile from existing industries) because they are unsuitable for industrial use. Further analysis showed that some combination of parcelization, existing development, limitations on use

imposed by Title 3 of the UGMFP (Water Quality, Flood Management and Fish and Wildlife Conservation), poor road access, difficulty in providing public services and negative effects of urbanization on nearby agricultural practices renders the areas unsuitable for industrial use. Portions of the areas contain designated farm or forest land. The Staff Report [Appendix A, Item (a)] describes these specific areas in detail at pages 18 to 25 (and portions of other areas at pages 13 to 18).

The Council also excluded those exception areas that are not contiguous to the UGB, or to areas added to the UGB for industrial use, and do not contain enough suitable land to comprise a minimum of 300 gross acres. Based upon an analysis of industrial areas within the pre-expansion UGB and reasoning set forth in "Formation of Industrial Neighborhoods", memorandum from Lydia Neill to David Bragdon, October 24, 2003, the Council concludes that these small areas cannot satisfy the need for industrial land.

The Council looked next to resource land, beginning with land of lowest capability. The Council included 354 acres (236 net acres) designated for agriculture in the Quarry Study Area, composed predominantly of the poorest soils (Class VII) in the region. Other land with poor soils in the vicinity were rejected due to steep slopes. The Council included 63 acres (30 net acres) designated for forestry in the Beavercreek Study Area composed of Class IV and VI soils and 102 acres (69 net acres) of Class III and IV soils in the Damascus West Study Area. No other land with soil capability lower than Class II can meet the need for industrial use identified by the Council.

Finally, the Council turned to the many lands under consideration with predominantly Class II soils. To choose among thousands of acres of this flat farmland near urban industrial areas or near freeway interchanges, the Council considered the locational factors of Goal 14 and policies in its Regional Framework Plan ("RFP") and Regional Transportation Plan ("RTP"). Further, the Council sought advice from a group of farmers and agriculturalists in the three counties, assembled by the Oregon Department of Agriculture ("ODA"). This group submitted a report to the Council entitled "Limited Choices: The Protection of Agricultural Lands and the Expansion of the Metro Area Urban Growth Boundary for Industrial Use." [Appendix A, Item (i).)] Preliminary guidance from ODA led the Council to consider an amendment to Policy 1.12 of the RFP on agricultural land, adopted and applied in Ordinance No. 04-1040B: "When the Council must choose among agricultural lands of the same soil classification for addition to the UGB, the Council shall choose agricultural land deemed less important to the continuation of commercial agriculture in the region." (Exhibit A.)

The Council finds that the region will be able to urbanize the lands it has added to the UGB in an efficient and orderly fashion. The Council concludes that the overall consequences of urbanization of these lands are acceptable, especially given the protections in place in the RFP and Metro Code for sensitive resources. Through mitigation measures required by the conditions in Exhibit F, the Council believes it can achieve compatibility between urbanization of the land added to the UGB and adjacent land outside the UGB.

The Council also believes that it is able to maintain separations between communities at the urban fringe sufficient to allow each community to retain a sense of place. The Council chose ridgelines, streams, power lines, roads and property lines to define the boundaries of the UGB in an effort to provide a distinct boundary and a clear transition between urban and rural uses.

The Council also finds that the lands it added to the UGB for industrial use contribute to a compact urban form. The lands are adjacent to the existing UGB. Many involve exception lands that are already partially urbanized and contain some components of public facilities needed to serve urban industrial uses. The Council rejected some areas of exception land that extend far from the UGB and would require long extensions of linear services such as sewer, water and stormwater lines. The Council chose land that adheres closely to siting characteristics needed by the industries likely to grow during the planning period: proximity

to existing industrial areas and accessibility to freeway interchanges. These choices contribute to the region's urban form which, among other things, calls for siting uses with higher densities (commercial and residential) in Centers and other design types served by high-capacity public transit.

Combined with areas added to the UGB for employment in the December, 2002, periodic review ordinances, areas added by Ordinance No. 04-1040B for industrial use are distributed round the region. Most of the jobs land was added to the east side of the region in December, 2002. This ordinance adds industrial land mostly to the south and west sides of the region. In particular, addition of 262 acres north of Cornelius will add jobs, income, investment and tax capacity to a part of the region with disproportionately little of those resources.

F. Water Quality

Each local government responsible for an area added to the UGB must complete the planning requirements of Title 11, Urban Growth Management Functional Plan ("UGMFP"), including compliance with the water quality provisions of Title 3 of the UGMFP.

G. Areas Subject to Natural Disasters and Hazards

The Council has excluded environmentally constrained areas from the inventory of buildable land (see UGRs) and from its calculation of the housing and jobs capacity of each study area (see Alternatives Analysis). Each local government responsible for an area added to the UGB must complete the planning requirements of Title 11, Urban Growth Management Functional Plan ("UGMFP"), including compliance with Title 3 of the UGMFP on floodplains and erosion control.

The Council considered the best information available on known hazards, including earthquake hazard. The study areas with the highest earthquake hazard have been rejected. The are small portions of several study areas with known earthquake hazards added to the UGB. Local governments responsible for Title 11 planning are required by that title (and Goal 7) to take these portions into account in their comprehensive plan amendments.

H. Economic Development

As part of Task 2 of periodic review, Metro reviewed the economic development elements of the comprehensive plans of each of the 24 cities and three counties that comprise the metro area. Metro used the review in its determination of the region's need for employment land and for coordination with local governments of its choices to add land to the UGB for employment purposes.

Revisions to Title 4 (Industrial and Other Employment Areas) of the UGMFP and the conditions placed upon lands added to the UGB (Exhibit F of Ordinance No. 04-1040B and exhibits to December, 2002, ordinances) add significant protection to sites designated for industrial use, both those added to the UGB and those within the UGB prior to expansion, to help ensure their availability for that purpose.

Inclusion of these areas adds 1,920 acres (1,047 net acres) to the UGB for industrial use. Combined with the efficiency measures described in Section D of these Findings (Alternatives: Increase Capacity of the UGB), above, and actions taken in December, 2002, these additions to the UGB accommodate approximately 99 percent of the need for industrial land [identified in the 2002-2022 Urban Growth Report: An Employment Land Need Analysis (9,366 net acres)]. Given the unavoidable imprecision of the many assumptions that underlie the determination of need for industrial land – the population forecast; the employment capture rate; the industrial refill rate; employment density (particularly given changes in building types used by industry over time); the rate of encroachment by non-industrial uses; and the vintage

industrial relocation rate – the Council concludes that its actions in the December, 2002, ordinances and in this Ordinance No. 04-1040B provide a 20-year supply of industrial land for the region and comply with part 2 (periodic review Subtask 17) of LCDC's Partial Approval and Remand Order 03-WKTASK-001524, July 7, 2003.

II. SPECIFIC FINDINGS FOR PARTICULAR AREAS ADDED TO UGB IN TASK 2 REMAND DECISION

These findings address ORS 197.298; ORS 197.732(1)(c)(B), (C) and (D); Goal 2, Exceptions, Criteria (c)(2), (3) and (4); Oregon Administrative Rules (OAR) 660-004-0010(1)(B)(ii), (iii) and (iv); OAR 660-004-0020(2)(b), (c) and (d); Goal 5; Goal 11; Goal 12; Goal 14, Factors 3 through 7; Metro Code 3.01.020(b)(3) through (7) and 3.01.020(d); Metro RFP Policies 1.2, 1.3, 1.4, 1.6, 1.7, 1.11 and 1.12; and Regional Transportation Plan Policies 2.0, 3.0, 4.0 and 14.0.

A. Damascus West

The Council relies upon the facts and analysis in the Industrial Land Alternative Analysis Study [Appendix A, Item(c) in Ordinance No. 04-1040B, pp. 21-23; 111; A-1 – A-4] and the Staff Report [Appendix A, Item (a), p. 27] to support its conclusion that addition of a portion of Damascus West will provide for an orderly and efficient transition from rural to urban land use. The Council chose this area of resource land because it contains a concentration of larger parcels (five parcels between 10 and 20 acres). Parcels of this range are needed for the types of industries Metro expects will grow during the planning period (UGR-E, p. 25) and are generally unavailable in exception areas. Also, soils in the area are Class III and IV, of lower capability than other resource land under consideration. In addition, the area lies within a ground-water restricted area designated by the Oregon Department of Water Resources. Finally, it occupies a small notch that extends into land within the UGB and is relatively isolated by topography and forested land from other agricultural lands to the south, as noted in the report of the Metro Agricultural Lands Technical Workgroup led by the Oregon Department of Agriculture ["Limited Choices: The Protection of Agricultural Lands and the Expansion of the Metro Area Urban Growth Boundary for Industrial Use", Appendix A, Item (i)].

1. Orderly Services

The Council relies upon the Study Area Goal 14 Analysis Summary and the Ratings for Transportation Services Feasibility contained in its Alternative Analysis Study (Appendix A, Item 6, pages 111 and Table A-2, respectively) for its determination that these services can be provided to the Damascus West area in an orderly and economic manner by extending services from existing serviced areas. Condition IIA(1) of Exhibit F calls for transportation and public facility and service plans within the same four years allowed for Title 11 planning of the entire Damascus area by Condition IIA(1) of Exhibit M of Ordinance No. 02-969B.

The Alternative Analysis Study (p. 20) sets forth the likely service providers for sewer, water and storm-water services and assigns a serviceability rating for the larger Damascus Study Area. Serviceability generally ranges from "easy" to "difficult" to serve (Table 1, p. 111) and compares favorably with areas not included (such as Borland Road South, Norwood/Stafford and Wilsonville West). Transportation services will be only moderately difficult to provide for reasons set forth in the Alternative Analysis Study, p. 21.

2. Efficiency

The Council relies on the same information on provision of essential services mentioned above for its conclusion that the area can urbanize efficiently, particularly knowing that Damascus West will be planned in conjunction with the greater Damascus area added to the UGB in December, 2002. The Council

also relies upon its findings and conclusions above (part I, General Findings, section D, Alternatives: Increase Capacity of UGB) regarding actions it has taken to increase the efficiency of the use of employment land within the existing UGB.

3. Consequences

The Council relies upon the analysis of the consequences of urbanization on the Damascus West area set forth in the Alternative Analysis Study, pp. 21-22 and Table A-3. The analysis indicates that the consequences will be low, especially considering the requirements of Title 11 of the UGMFP that comprehensive planning and land use regulations for the area protect the portions (streams, wetlands, floodplains and steep slopes) of the area subject to Title 3 of the UGMFP and the conditions in Exhibit F of Ordinance No. 04-1040B.

The Council has placed a condition on comprehensive planning for the area that the local government responsible for planning considered Metro's adopted Goal 5 inventory during its planning (see Condition IG, Exhibit F). The local governments will eventually adopt provisions to implement Metro's Goal 5 program following the Council's adoption of that program, if the local government's ordinance do not already comply.

4. Compatibility

The Agricultural Analysis Consequences shows that urbanization of the Damascus West area would have low adverse consequences for nearby agriculture (Alternative Analysis Study, p. 21; Table A-4). This is, in part, due to the facts that the area occupies a small notch that extends into land within the UGB and is relatively isolated by topography and forested land from other agricultural lands to the south, as noted in the report of the Metro Agricultural Lands Technical Workgroup led by the Oregon Department of Agriculture ["Limited Choices: The Protection of Agricultural Lands and the Expansion of the Metro Area Urban Growth Boundary for Industrial Use", Appendix A, Item (i)]. Ordinance No. 04-1040B, Exhibit F, imposes Condition IE upon urbanization of Damascus West to reduce conflict and improve compatibility between urban use in the area and agricultural use on land to the south.

5. Natural and Cultural Resources

The Alternative Analysis Study addresses Goal 5 and 6 resources in the Damascus West area protected by Clackamas County in its acknowledged comprehensive plan (p. 22). The county will be responsible for protecting these resources in the area when it amends its comprehensive plan and zoning ordinance to implement expansion of the UGB. Condition IG of Exhibit F requires the county to consider Metro's inventory of Goal 5 resources in their application of Goal 5 to the Damascus area. Title 3 (Water Quality, Flood Management and Fish and Wildlife Conservation) of the UGMFP requires Clackamas County to protect water quality and floodplains in the area. Title 11 of the UGMFP, section 3.07.1120G, requires the county to protect fish and wildlife habitat and water quality. Title 11, section 3.07.1110, protects the status quo in the interim period of county planning for the area.

6. Public Utilities and Services

Under statewide Planning Goal 11, Metro is responsible for coordination of the preparation of public facility plans within the district. Metro will fulfill this responsibility through implementation of Title 11 of the UGMFP, which (1) prohibits Clackamas County from upzoning and from dividing land into resulting lots or parcels smaller than 20 acres until the county revises its comprehensive plan and zoning ordinances to authorize urbanization of land Metro brings into the UGB; and (2) requires the county to develop public facilities and services plans and urban growth diagrams with the general locations of necessary public

facilities such as sanitary sewers, storm sewers and water lines for the area. Metro and the county began this work with the evaluation of the serviceability of the Damascus area in the Alternative Analysis Study (pages 20-21 and 111).

7. Transportation

Metro shares responsibility to ensure that its Task 2 decision for the Damascus West area does not significantly affect a transportation facility or allow uses that are inconsistent with the identified function, capacity and performance standards of transportation facilities. Metro fulfills this responsibility through implementation of Title 11 of the UGMFP, which (1) prohibits Clackamas County from upzoning and from land divisions into resulting lots or parcels smaller than 20 acres in the area until the county revises its comprehensive plans and zoning ordinances to authorize urbanization of land Metro brings into the UGB; and (2) requires the county to develop conceptual transportation plans and urban growth diagrams with the general locations of arterial, collector and essential local streets for the area. Metro and Clackamas County began this work with the evaluation of the serviceability of the area in the Alternative Analysis Study (p. 21 and Table A-2) and consideration of how to provide services as part of the analysis required to satisfy Goal 14, factors 3 and 4.

Metro's 2000 Regional Transportation Plan (RTP) anticipated inclusion of the area within the UGB. The plan's "Priority System" of planned transportation facilities shows improvements planned for the area to serve anticipated growth. Among the improvements is the Sunrise Highway, a likely alignment for which (shown on the 2040 Growth Concept Map) borders the portion of the Damascus West Study Area included by this ordinance. The "Financially Constrained System" includes improvements that will add capacity to East Sunnyside Road near the included area (see discussion of RTP below).

8. Regional Framework Plan

The area lies within ½-mile of Damascus Town Center and will provide additional employment to support the center. The area will not only provide employment opportunities for new residents of the Damascus area, but also improve the ratio between jobs and housing in the east side of the region.

9. Regional Transportation Plan

Through its Joint Policy Advisory Committee on Transportation, Metro has coordinated transportation planning and funding of transportation improvements with local governments in the region. The Regional Transportation Plan adopted a "Priority System" of improvements through the year 2020. The Priority System includes the most critical improvements needed to implement the 2040 Growth Concept. Among the improvements are the "East Multnomah County Transportation Projects" and the "Pleasant Valley and Damascus Transportation Projects" that will provide the basic transportation services to the area (pages 5-49 to 5-57). Figures 1.4, 1.12, 1.16, 1.17, 1.18 and 1.19 of the RTP show how the region's street design, motor vehicle, public transportation, freight, bicycle and pedestrian systems will extend into the Damascus area.

B. Beavercreek

The Council relies upon the facts and analysis in the Alternative Analyses Study [2003 in Appendix A, Item(d) in Ordinance No. 04-1040B, pp. 32-34; 111; A-1 – A-4] and the Staff Report [Appendix A, Item (a), p. 25] to support its conclusion that addition of a portion of the Beavercreek area will provide for an orderly and efficient transition from rural to urban land use. The Council added this single tract, zoned for forest use but occupied by a portion of a larger golf course, in part because the Council included the other half of the golf course in the UGB by Ordinance No. 02-969B in December, 2002 (as part of Task 2), and

designated it for industrial use. The predominant soils on the tract are Class IV and VI. This parcel (63 acres; 30 net acres) helps satisfy the identified need for large parcels (see UGR-E, page 25), particularly in combination with the other part of the golf course included in December, 2002.

1. Orderly Services

The Council relies upon the Study Area Goal 14 Analysis Summary and the Ratings for Transportation Services Feasibility contained in its Alternative Analysis Study (Appendix A, Item 6, pages 111 and Table A-2, respectively) for its determination that these services can be provided to this portion of the Beavercreek area in an orderly and economic manner by extending services from existing serviced areas. Condition IA of Exhibit F calls for transportation and public facility and service plans within two years. Condition IIB(2) specifies that Title 11 planning of the area be done in conjunction with Title 11 planning for the adjoining area added to the UGB by Ordinance No. 02-969B.

The Alternative Analysis Study (p. 32-33) sets forth the likely service providers for sewer, water and storm-water services and assigns a serviceability rating for the larger Beavercreek area. The developable portion of the area included in the UGB adjoins and will be served by the same providers that will serve the area added to the UGB in December, 2002. Serviceability generally ranges from "easy" to "difficult" to serve (Table 1, p. 111) and compares favorably with areas not included (such as Borland Road South, Norwood/Stafford and Wilsonville West). Table A-2 shows transportation services for the larger Beavercreek area to be difficult. However, for the portion of Beavercreek added, transportation services will be the same as those provided to the adjoining property added to the UGB in December, 2002.

2. Efficiency

The Council relies on the same information on provision of essential services mentioned above for its conclusion that the area can urbanize efficiently, particularly knowing that this portion of the Beavercreek area will be planned in conjunction with the portion added to the UGB and designated for industrial use in December, 2002. Both portions can be urbanized more efficiently if the portions are planned and urbanized together.

The Council also relies upon its findings and conclusions above (part I, General Findings, section D, Alternatives: Increase Capacity of UGB) regarding actions it has taken to increase the efficiency of the use of employment land within the existing UGB.

3. Consequences

The Council relies upon the analysis of the consequences of urbanization on this portion of the Beavercreek area set forth in the Industrial Land Alternative Analysis Study, p. 34 and Table A-3). The analysis indicates that the consequences will be high if the Council were to include the entire Beavercreek study area (2,540 acres). But Ordinance No. 04-1040B includes only a single, 63-acre tract, half of a golf course the other half of which was included in the UGB by Ordinance No. 02-969B. Title 11 of the UGMFP requires that comprehensive planning and land use regulations for the area protect the portions (streams, wetlands, floodplains and steep slopes) of the tract subject to Title 3 of the UGMFP and the conditions in Exhibit F of this ordinance.

The Council has placed a condition on comprehensive planning for the area that the local government responsible for planning considered Metro's adopted Goal 5 inventory during its planning (see Condition IG, Exhibit F). The local governments will eventually adopt provisions to implement Metro's Goal 5 program following the Council's adoption of that program, if the local government's ordinance do not already comply.

4. Compatibility

The Agricultural Analysis Consequences shows that urbanization of the Beavercreek area would have moderate adverse consequences for nearby agriculture (p. 111). There will be little effect on agriculture from urbanization of this small portion of the area, however, because the tract itself is part of a golf course, and there are no nearby agricultural activities.

5. Natural and Cultural Resources

The Alternative Analysis Study addresses Goal 5 and 6 resources in the larger Beavercreek area protected by Clackamas County in its acknowledged comprehensive plan (page 34). The single portion of the larger area added to the UGB by this ordinance contains no inventoried Goal 5 sites protected by Clackamas County. Condition IG of Exhibit F requires the county to consider Metro's inventory of Goal 5 resources in their application of Goal 5 to the small portion of the Beavercreek area included in the UGB. Title 3 (Water Quality, Flood Management and Fish and Wildlife Conservation) of the UGMFP requires Clackamas County to protect water quality and floodplains in the area. Title 11 of the UGMFP, section 3.07.1120G, requires the counties to protect fish and wildlife habitat and water quality. Title 11, section 3.07.1110, protects the status quo in the interim period of county planning for the area.

6. Public Facilities and Services

Under statewide Planning Goal 11, Metro is responsible for coordination of the preparation of public facility plans within the district. Metro will fulfill this responsibility through implementation of Title 11 of the UGMFP, which (1) prohibits Clackamas County or Oregon City from upzoning and from dividing land into resulting lots or parcels smaller than 20 acres until the county or city revises its comprehensive plan and zoning ordinances to authorize urbanization of land Metro brings into the UGB; and (2) requires the county or city to develop public facilities and services plans and urban growth diagrams with the general locations of necessary public facilities such as sanitary sewers, storm sewers and water lines for the area. Metro, the county and the city began this work with the evaluation of the serviceability of the Beavercreek area in the Alternative Analysis Study done as part of Ordinance No.02-969B (pages 108-09; A-9, A-13;) and the Industrial Land Alternative Analysis Study done as part of Ordinance No. 04-1040A (pages 25, 32-33 and 111).

7. Transportation

Metro shares responsibility to ensure that its Task 2 decision for the Beavercreek area does not significantly affect a transportation facility or allow uses that are inconsistent with the identified function, capacity and performance standards of transportation facilities. Metro fulfills this responsibility through implementation of Title 11 of the UGMFP, which (1) prohibits Clackamas County or Oregon City from upzoning and from land divisions into resulting lots or parcels smaller than 20 acres in the area until the county or city revises its comprehensive plan and zoning ordinances to authorize urbanization of land Metro brings into the UGB; and (2) requires the county or city to develop a conceptual transportation plan and urban growth diagram with the general locations of arterial, collector and essential local streets for the area. Metro, the county and the city began this work with the evaluation of the serviceability of the Beavercreek area in the Alternative Analysis done as part of Ordinance No.02-969B (pages 108-09; A-9, A-15-19) and the Analysis done as part of Ordinance No. 04-1040B (pages 25 and 33 and A-2).

The City of Oregon City indicates that the Beavercreek area can be provided with transportation services. The small included portion adjoins an area that is more serviceable than other portions of the larger Beavercreek area considered by the Council. It is contiguous to the city and can be served in an orderly manner.

m:\attorney\confidential\7.2.1.3\04-1040B.Ex G.002
OMA/RPB/kvw (06/22/04)

8. Regional Framework Plan

This small addition of industrial land (63 acres) will be planned in combination with adjoining industrial land added by Ordinance No. 02-969B to comprise a more efficient industrial area. The area will provide employment to support the Oregon City Regional Center.

9. Regional Transportation Plan

Through its Joint Policy Advisory Committee on Transportation, Metro has coordinated transportation planning and funding of transportation improvements with local governments in the region. The Regional Transportation Plan adopted a "Priority System" of improvements through the year 2020. The Priority System includes the most critical improvements needed to implement the 2040 Growth Concept. Among the improvements is the "Highway 213 Corridor Study" to complete a long-term traffic management plan and identify projects to implement the plan (pages 5-59 to 5-61).

C. Quarry (Partial)

The Council relies upon the facts and analysis in the Industrial Land Alternative Analyses Study [Appendix A, Item(c) in Ordinance No. 04-1040B, pp. 64-66; 111; A-1 – A-4] and the Staff Report [Appendix A, Item (a), pp. 26-27] to support its conclusion that addition of a portion of the Quarry Study Area will provide for an orderly and efficient transition from rural to urban land use. The Council chose this area of resource land because it contains a concentration of larger parcels, relatively few of which are developed with residences. Parcels of this range are needed for the types of industries Metro expects will grow during the planning period (UGR-E, p. 25) and are generally unavailable in exception areas. Also, soils in the area are predominantly Class VII, of lower capability than other resource land under consideration. Significant portions are devoted to quarry operations, which have removed soils altogether. There are major quarry operations adjoining this area to the east and elsewhere nearby. There is also significant industrial development and zoning north and east of the Quarry area. See "Perfect for Industry", prepared by Davis, Wright, Tremaine, LLP, April 29, 2004. The Council included one of the quarry areas in the UGB in Ordinance No. 02-990A for industrial use. Some agricultural activity takes place in the northern section of this area, but it is isolated from other areas devoted to agriculture by quarry operations and other nonfarm activities [Tualatin Valley Sportsmens Club (gun club), for example].

1. Orderly Services

The Council relies upon the Quarry Study Area Goal 14 Analysis Summary and the Ratings for Transportation Services Feasibility contained in its Industrial Land Alternative Analysis Study (Appendix A, Item (c), pages 111 and Table A-2, respectively) for its determination that urban services can be provided to the Quarry area in an orderly and economic manner by extending services from existing serviced areas. Condition IIE(2) of Exhibit F calls for coordination of transportation and public facility and service planning for this area with the adjoining area added to the UGB for industrial use on December 12, 2002.

The Alternatives Analysis (p. 64-65) sets forth the likely service providers for sewer, water and storm-water services and assigns a serviceability rating for the Quarry Study Area. Serviceability ranges from "easy" to "moderately difficult" to serve (Table 1, p. 111) and compares favorably with areas not included (such as Borland Road South, Norwood/Stafford and Wilsonville West). Transportation services would be easy to provide for reasons set forth in the Alternative Analysis Study, p. 65.

2. Efficiency

The Council relies on the same information on provision of essential services mentioned above for its conclusion that the area can urbanize efficiently, particularly knowing that this portion of the Quarry Study Area will be planned in conjunction with the quarry area to the east, added to the UGB and designated for industrial use in December, 2002. This portion lies close to existing services and Tualatin-Sherwood and Oregon Roads. Both portions can be urbanized more efficiently if the portions are planned and urbanized together.

The Council also relies upon its findings and conclusions above (part I, General Findings, section D, Alternatives: Increase Capacity of UGB) regarding actions it has taken to increase the efficiency of the use of employment land within the existing UGB.

3. Consequences

The Council relies upon the analysis of the consequences of urbanization on this portion of the Quarry Study Area set forth in the Alternative Analysis Study, p. 65-66 and Table A-3). The analysis indicates that the environmental consequences will be low. In addition, Title 11 of the UGMFP requires that comprehensive planning and land use regulations for the area protect the portions (streams, wetlands, floodplains and steep slopes) of the area subject to Title 3 of the UGMFP and the conditions in Exhibit F of this ordinance.

The Council has placed a condition on comprehensive planning for the area that the local government responsible for planning considered Metro's adopted Goal 5 inventory during its planning (see Condition I G, Exhibit F). The local governments will eventually adopt provisions to implement Metro's Goal 5 program following the Council's adoption of that program, if the local government's ordinance do not already comply.

4. Compatibility

The Agricultural Analysis Consequences shows that urbanization of the Quarry Study Area would have few adverse consequences for nearby agriculture. The area has the UGB on three sides and quarry operations to the east and southeast. The portion devoted to agriculture is in the northwest portion, isolated from agricultural operations south of the quarries.

5. Natural and Cultural Resources

The Alternative Analysis Study addresses Goal 5 and 6 resources in the Quarry Study Area protected by Washington County in its acknowledged comprehensive plan (page 65-66). Significant portions of the area are identified as aggregate sites in the county's Goal 5 inventory and are protected by aggregate overlays. Under Metro's Title 11, current county land use regulations will remain in place until the county, or one of the cities (Tualatin or Sherwood), adopts new plan provisions and land use regulations to allow industrial uses in the area, at which time the county or city will apply Goal 5 to the area and re-consider the decision to protect the quarries under Goal 5.

Condition IG of Exhibit F requires the county or cities to consider Metro's inventory of Goal 5 resources in its application of Goal 5 to the Quarry area included in the UGB. Title 3 (Water Quality, Flood Management and Fish and Wildlife Conservation) of the UGMFP requires the county to protect water quality and wetlands in the area. Title 11 of the UGMFP, section 3.07.1120G, requires the county to protect fish and wildlife habitat and water quality. Title 11, section 3.07.1110, protects the status quo in the interim period of county or city planning for the area.

6. Public Facilities and Services

Under statewide Planning Goal 11, Metro is responsible for coordination of the preparation of public facility plans within the district. Metro will fulfill this responsibility through implementation of Title 11 of the UGMFP, which (1) prohibits Washington County or the City of Sherwood or Tualatin from upzoning and from dividing land into resulting lots or parcels smaller than 20 acres until the county or city revises its comprehensive plan and zoning ordinances to authorize urbanization of land Metro brings into the UGB; and (2) requires the county or city to develop public facilities and services plans and urban growth diagrams with the general locations of necessary public facilities such as sanitary sewers, storm sewers and water lines for the area. Metro, the county and the cities began this work with the evaluation of the serviceability of the Quarry Study Area in the Alternative Analysis done as part of Ordinance No.02-969B (pages 161-63; A-9) and the Analysis done as part of Ordinance No. 04-1040B (pages 64-65 and 111).

7. Transportation

Metro shares responsibility to ensure that its Task 2 decision for the Quarry Study Area does not significantly affect a transportation facility or allow uses that are inconsistent with the identified function, capacity and performance standards of transportation facilities. Metro fulfills this responsibility through implementation of Title 11 of the UGMFP, which (1) prohibits Washington County or the City of Sherwood or Tualatin from upzoning and from land divisions into resulting lots or parcels smaller than 20 acres in the area until the county or city revises its comprehensive plan and land use regulations to authorize urbanization of land Metro brings into the UGB; and (2) requires the county or city to develop a conceptual transportation plan and urban growth diagram with the general locations of arterial, collector and essential local streets for the area. Metro and the county and cities began this work with the evaluation of the serviceability of the area in the Alternatives Analysis done as part of Ordinances No.02-969B (pages 108-09; A-9, A-15-19) and 990A and the Analysis done as part of Ordinance No. 04-1040B (pages 64-65 and A-2). The cities indicate a willingness to serve the Quarry area with transportation services pending the determination of service boundaries.

8. Regional Framework Plan

This addition of industrial land will be planned in coordination with adjoining industrial land to the east added by Ordinance No. 02-990A to comprise a more efficient industrial area. The area will provide employment to support the Sherwood and Tualatin Town Centers. The Quarry area runs along the Tualatin-Sherwood Road within two miles of the two centers. Given that the added portion of the Quarry area is suitable for the types of industry likely to grow in the future, the Council includes the area notwithstanding that this part of the region is relatively well-endowed with employment.

By adding the Quarry area to the UGB, following addition of the quarry area to the east, Metro will be bringing a “notch” into the UGB that lies between the two cities of Sherwood and Tualatin. This keeps the form of the region compact and efficient.

9. Regional Transportation Plan

Through its Joint Policy Advisory Committee on Transportation, Metro has coordinated transportation planning and funding of transportation improvements with local governments in the region. The Regional Transportation Plan adopted a “Priority System” of improvements through the year 2020. The Priority System includes the most critical improvements needed to implement the 2040 Growth Concept. Among the improvements are the “The Tualatin-Sherwood Major Investment Study”, to complete environmental design for the I-5 to 99W principal arterial connector, and the “Tualatin-Sherwood

Connector", to construct the four-lane tollway connection (pages 5-65 to 5-67). Although a final corridor for this facility has not yet been chosen, it is almost certain that it will pass less than a mile from the south border of the Quarry area.

D. Coffee Creek (partial)

The Council relies upon the facts and analysis in the Alternatives Analyses [Appendix A, Item(c) in Ordinance No. 04-1040B, pp. 58-60; 111; A-1 – A-4] and the Staff Report [Appendix A, Item (a), pp. 26] to support its conclusion that addition of a portion of the Coffee Creek Study Area [264 acres (97 net acres) of 442 in the study area] will provide for an orderly and efficient transition from rural to urban land use. The Council chooses this portion because it is almost entirely exception land (there is a 4.6-acre tract of resource at the northern edge), it can be planned in conjunction with land added to the UGB in December, 2002, for industrial use, urban services are available in the vicinity, and urbanization will have no effect on agricultural practices on adjacent land due to its isolation from agricultural activities.

1. Orderly Services

The Council relies upon the Coffee Creek Study Area Goal 14 Analysis Summary and the Ratings for Transportation Services Feasibility contained in its Industrial Land Alternative Analysis Study (Appendix A, Item 6, pages 111 and Table A-2, respectively) for its determination that urban services can be provided to the Quarry area in an orderly and economic manner by extending services from existing serviced areas. Condition IIF(1) of Exhibit F allows four years for Title 11 planning for this area so that planning for urban services can be done in conjunction with such planning for the adjoining area added to the UGB for industrial use on December 5, 2002.

The Alternative Analysis Study sets forth the likely service providers for sewer, water and storm-water services and assigns a serviceability rating for the Coffee Creek area (p. 58-60; Table 1, p. 111). Serviceability ranges from "moderate" to "difficult" to serve and compares favorably with areas not included (such as Borland Road South and Wilsonville West).

2. Efficiency

The Council relies on the same information on provision of essential services mentioned above for its conclusion that the area can urbanize efficiently, knowing that this portion of the Coffee Creek Study Area will be planned in conjunction with the area to the east, added to the UGB and designated for industrial use in December, 2002. The area lies adjacent to a principal north-south rail line that will make industrial use and movement of freight more efficient.

The Council also relies upon its findings and conclusions above (part I, General Findings, section D, Alternatives: Increase Capacity of UGB) regarding actions it has taken to increase the efficiency of the use of employment land within the existing UGB.

3. Consequences

The Council relies upon the analysis of the consequences of urbanization on this portion of the Coffee Creek area set forth in the Alternative Analysis Study, p. 58-60 and Table A-3). Because the Council included only the easternmost portion of the study area – the portion that borders the UGB on the west – the adverse consequences will be reduced. Title 11 of the UGMFP requires that comprehensive planning and land use regulations for the area protect the portions (streams, wetlands, floodplains and steep slopes) of the area subject to Title 3 of the UGMFP and the conditions in Exhibit F of this ordinance.

The Council has placed a condition on comprehensive planning for the area that the local government responsible for planning considered Metro's adopted Goal 5 inventory during its planning (see Condition IG, Exhibit F, Ordinance No. 04-1040B). The local government will eventually adopt provisions to implement Metro's Goal 5 program following the Council's adoption of that program, if the local government's ordinance do not already comply.

4. Compatibility

The Agricultural Analysis Consequences shows that urbanization of the included portion of the Coffee Creek area would have no adverse consequences for nearby agriculture (p. 111). The area has quarry operations nearby and is isolated from commercial agricultural activity by stream drainages.

5. Natural and Cultural Resources

The Alternative Analysis Study addresses Goal 5 and 6 resources in the Coffee Creek Study Area protected by Washington County in its acknowledged comprehensive plan (p. 60). The quarries in the area are protected by aggregate overlays by Washington County. Under Metro's Title 11, current county land use regulations will remain in place until the county, or the City of Wilsonville or Tualatin, adopts new plan provisions and land use regulations to allow industrial uses in the area, at which time the county or city will apply Goal 5 to the area and re-consider the decision to protect the quarries under Goal 5.

Condition IG of Exhibit F requires the county or city to consider Metro's inventory of Goal 5 resources in its application of Goal 5 to the portion of Coffee Creek area included in the UGB. The area contains streams, wetlands and floodplains. Title 3 (Water Quality, Flood Management and Fish and Wildlife Conservation) of the UGMFP requires the county or city to protect water quality and wetlands in the area. Title 11 of the UGMFP, section 3.07.1120G, requires the county or city to protect fish and wildlife habitat and water quality. Title 11, section 3.07.1110, protects the status quo in the interim period of county or city planning for the area.

6. Public Facilities and Services

Under statewide Planning Goal 11, Metro is responsible for coordination of the preparation of public facility plans within the district. Metro will fulfill this responsibility through implementation of Title 11 of the UGMFP, which (1) prohibits Washington County or the City of Wilsonville or Tualatin from upzoning and from dividing land into resulting lots or parcels smaller than 20 acres until the county or city revises its comprehensive plan and zoning ordinances to authorize urbanization of the area; and (2) requires the county or city to develop public facilities and services plans and urban growth diagrams with the general locations of necessary public facilities such as sanitary sewers, storm sewers and water lines for the area.

7. Transportation

Metro shares responsibility to ensure that its Task 2 decision for the Coffee Creek Study Area does not significantly affect a transportation facility or allow uses that are inconsistent with the identified function, capacity and performance standards of transportation facilities. Metro fulfills this responsibility through implementation of Title 11 of the UGMFP, which (1) prohibits the county or city from upzoning and from land divisions into resulting lots or parcels smaller than 20 acres in the area until the county or city revises its comprehensive plan and zoning ordinance to authorize urbanization of the area; and (2) requires the county or city to develop conceptual transportation plans and urban growth diagrams with the general locations of arterial, collector and essential local streets for the area.

8. Regional Framework Plan

This addition of industrial land will be planned in combination with adjoining industrial land to the east added by Ordinance No. 02-969B to comprise a more efficient industrial area. The Coffee Creek Study Area will provide employment to support the Tualatin and Wilsonville Town Centers, to the north and south respectively. Given that the developable portion of the area is exception land and is suitable for the types of industry likely to grow in the future, the Council includes the Coffee Creek area notwithstanding that this part of the region is relatively well-endowed with employment.

Adding the Coffee Creek area to the UGB, lying between and adjacent to the Cities of Tualatin and Wilsonville, following addition of the area to the east, keeps the form of the region compact and efficient.

9. Regional Transportation Plan

Through its Joint Policy Advisory Committee on Transportation, Metro has coordinated transportation planning and funding of transportation improvements with local governments in the region. The Regional Transportation Plan ("RTP") adopted a "Priority System" of improvements through the year 2020. The Priority System includes the most critical improvements needed to implement the 2040 Growth Concept. Among the improvements are improvements to Boones Ferry Road from Durham Road in the north to Elligsen Road in the south, east of the Coffee Creek Study Area.

The RTP also includes "The Tualatin-Sherwood Major Investment Study", to complete environmental design for the I-5 to 99W principal arterial connector, and the "Tualatin-Sherwood Connector", to construct the four-lane tollway connection (pages 5-65 to 5-67). Although a final corridor for this facility has not yet been chosen, it is almost certain that it will pass through or just to the north of the Coffee Creek area, likely enhancing its access to I-5. Finally, the principal north-south rail line that lies along the eastern boundary of the area will offer an additional mode of transport for movement of freight in the area.

E. Tualatin

The Council relies upon the facts and analysis in the Industrial Land Alternative Analyses Study [Appendix A, Item(c) in Ordinance No. 04-1040B, pp. 61-63; 111; A-1 – A-4] and the Staff Reports [Appendix A, Item (a), pp. 27-28] to support its conclusion that addition of a portion of the Tualatin Study Area will provide for an orderly and efficient transition from rural to urban land use. The Council chose this area because it is exception land (rural residential and rural industrial) with characteristics that make it suitable for industrial use. It lies within two miles of the I-5 corridor and within one mile of an existing industrial area, and portions of the area are relatively flat. These characteristics render it the most suitable exception area under consideration for warehousing and distribution, a significant industrial need facing the region.

The City of Tualatin and many residents of the area expressed concern about compatibility between industrial use and residential neighborhoods at the south end of the city. They have also worried about preserving an opportunity to choose an alignment between Tualatin and Wilsonville for the I-5/99W Connector; the south alignment for this facility passes through the northern portion of the Tualatin Study Area.

In response to these concerns, the Council placed several conditions upon addition of this area to the UGB. First, the Council extended the normal time for Title 11 planning for the area: two years following the identification of a final alignment for the Connector, or seven years after the effective date of Ordinance No. 04-1040B, whichever comes sooner. This allows Title 11 planning by Washington County, the cities of Tualatin and Wilsonville and Metro to accommodate planning for the Connector alignment. Second, the

Council states that, so long as the alignment for the Connector falls close to the South Alignment shown on the 2040 Growth Concept Map, it will serve as the buffer between residential development to the north (the portion least suitable for industrial uses) and industrial development to the south (the portion of the area most suitable for industrial use)

1. Orderly Services

The Council relies upon the Tualatin Study Area Goal 14 Analysis Summary and the Ratings for Transportation Services Feasibility contained in its Industrial Land Alternative Analysis Study (Appendix A, Item (c), pages 111 and Table A-2, respectively) for its determination that urban services can be provided to the area in an orderly and economic manner by extending services from existing serviced areas.

The Alternatives Analysis (pp. 61-62) sets forth the likely service providers for sewer, water and storm-water services and assigns a serviceability rating for the Tualatin Study Area. Serviceability ranges from "easy" to "difficult" to serve (Table 1, p. 111). Throughout Task 2 of periodic review the Council has found, however, that provision of services to almost every exception area is difficult and expensive. The City of Wilsonville anticipates further industrial development in the portion of the study area north and northwest of the existing city, in part due to the siting of the Coffee Creek Correctional Facility, and expects to be the service provider over time. Given the critical need for sites proximate to interchanges on I-5 and the rarity of such sites, the Council has decided to include the Tualatin Study Area notwithstanding.

2. Efficiency

The Council relies on the same information on provision of essential services mentioned above (Orderly Services) for its conclusion that the area can urbanize efficiently. The Council also relies upon its findings and conclusions above (part I, General Findings, section D, Alternatives: Increase Capacity of UGB) regarding actions it has taken to increase the efficiency of the use of employment land within the existing UGB.

This area lies between two cities and among areas added to the UGB for industrial use in December, 2002, making urbanization of the area more efficient than projecting urbanization from the UGB into a rural area. Given the likelihood that the region will build the I-5/99W Connector through this area, industrial development in the area will ensure efficient use of that facility.

3. Consequences

The Council relies upon the analysis of the consequences of urbanization on the Tualatin Study Area set forth in the Alternative Analysis Study, pp. 62-63 and Table A-3). The analysis indicates that the consequences will be low to moderate, especially considering the requirements of Title 11 of the UGMFP that comprehensive planning and land use regulations for the area protect the portions (streams, wetlands, floodplains and steep slopes) of the area subject to Title 3 of the UGMFP and the conditions in Exhibit F of Ordinance No. 04-1040B.

The Council has placed a condition on comprehensive planning for the area that the local government responsible for planning considered Metro's adopted Goal 5 inventory during its planning (see Condition IG, Exhibit F). The local governments will eventually adopt provisions to implement Metro's Goal 5 program following the Council's adoption of that program, if the local government's ordinance do not already comply.

4. Compatibility

The Agricultural Analysis Consequences shows that urbanization of the Tualatin Study Area would have low adverse consequences for agriculture (Alternative Analysis Study, p. 62; Table A-4). Although there are a few agricultural uses in the study area itself, the area is designated entirely for rural residential and rural industrial uses, pursuant to exceptions from statewide planning Goals 3 and 4. The area is isolated from land designated for agriculture by the UGB, I-5 and mining operations to the west. Hence, it is unlikely that industrial use will conflict with agricultural activities on land designated for agricultural or forest use.

5. Natural and Cultural Resources

The Alternative Analysis Study addresses Goal 5 and 6 resources in the Tualatin Study Area protected by Washington County in its acknowledged comprehensive plan (pp. 62-63). There are aggregate mines in the vicinity; portions of Washington County's Mineral and Aggregate Overlay District B cover small portions of the study are in the northwest and southwest corners and the top central portion.

The county, or the City of Wilsonville or Tualatin upon annexation to one of the cities, will be responsible for protecting these resources when it amends its comprehensive plan and zoning ordinance to implement expansion of the UGB. Condition IG of Exhibit F requires the county or city to consider Metro's inventory of Goal 5 resources in their application of Goal 5 to the Tualatin Study Area. Title 3 (Water Quality, Flood Management and Fish and Wildlife Conservation) of the UGMFP requires the county or city to protect water quality and floodplains in the area. Title 11 of the UGMFP, section 3.07.1120G, requires the county or city to protect fish and wildlife habitat and water quality. Title 11, section 3.07.1110, protects the status quo in the interim period of county or city planning for the area.

6. Public Facilities and Service

Under statewide Planning Goal 11, Metro is responsible for coordination of the preparation of public facility plans within the district. Metro will fulfill this responsibility through implementation of Title 11 of the UGMFP, which (1) prohibits Washington County and the cities of Wilsonville and Tualatin from upzoning and from dividing land into resulting lots or parcels smaller than 20 acres until the county or city revises its comprehensive plan and zoning ordinances to authorize urbanization of the area; and (2) requires the county or city to develop public facilities and services plans and urban growth diagrams with the general locations of necessary public facilities such as sanitary sewers, storm sewers and water lines for the area.

7. Transportation

Metro shares responsibility to ensure that its Task 2 decision for the Tualatin Study Area does not significantly affect a transportation facility or allow uses that are inconsistent with the identified function, capacity and performance standards of transportation facilities. Metro fulfills this responsibility through implementation of Title 11 of the UGMFP, which (1) prohibits Washington County and the cities of Tualatin and Wilsonville from upzoning and from land divisions into lots or parcels smaller than 20 acres in the area until the county or city revises its comprehensive plan and zoning ordinances to authorize urbanization of land added to the UGB; and (2) requires the county or city to develop conceptual transportation plans and urban growth diagrams with the general locations of arterial, collector and essential local streets for the area. Metro began this work with the evaluation of the serviceability of the area in the Alternative Analysis Study (pp. 61-62 and Table A-2) and consideration of how to provide services as part of the analysis required to satisfy Goal 14, factors 3 and 4.

Table A-2 recognizes that provision of transportation to new industrial uses in the area will be difficult. The Oregon Department of Transportation, Region 1 ("ODOT"), expects the volume-to-capacity ratio on I-5 in the vicinity of the North Wilsonville interchange to be "extremely poor" by 2025, and states

that the interchange "may need to be reviewed for impact" if the Council adds land to the UGB dependent upon the interchange. The "Priority System" in Metro's RTP calls for improvement to Boones Ferry Road from Durham Road in Tualatin to Elligsen Road in Wilsonville and for construction of a four-lane tollway between I-5 and Highway 99W, the sourthern and most likely alignment of which passes through the study area. There is no planned improvement to the capacity of the freeway or the interchange in the RTP or either city's TSP. In 2002, however, a joint ODOT/Wilsonville study concluded that in 2030, widening of I-5 to eight lands would be required to meet interstate freeway capacity standards set by Metro and ODOT. This study will help Metro, ODOT, Wilsonville and Tualatin understand the improvements needed to accommodate industrial use in the study area. The 2004 Federal RTP also identifies a corridor refinement study for I-5 in the vicinity. These studies will inform Title 11 planning for the study area.

8. Regional Framework Plan

The Tualatin Study Area lies midway between the Tualatin and Wilsonville Town Centers, and is nearly as close to the Sherwood Town Center as to Tualatin and Wilsonville. Industrial development in the study area will provide additional employment to support businesses in those centers. The Council includes this area, notwithstanding that this part of the region is relatively well-endowed with employment, because it has more of the characteristics needed for warehousing and distribution than other areas considered. The Wilsonville South Area has many of the same characteristics. But it lies on the opposite side of the Willamette River and requires a trip on I-5 across the river to gain access to the Wilsonville Town Center. The Council concludes that addition of the north portion of the Tualatin Study Area provides better urban form to the city and the region than adding land on the south side of the Willamette River.

9. Regional Transportation Plan

Through its Joint Policy Advisory Committee on Transportation, Metro has coordinated transportation planning and funding of transportation improvements with local governments in the region. The Regional Transportation Plan adopted a "Priority System" of improvements through the year 2020. The Priority System includes the most critical improvements needed to implement the 2040 Growth Concept. Among the improvements in the vicinity of the Tualatin Study Area are improvement to Boones Ferry Road from Durham Road in Tualatin to Elligsen Road in Wilsonville and construction of a four-lane tollway between I-5 and Highway 99W, the southern and most likely alignment of which passes through the study area.

F. Helvetia (Partial)

The Council relies upon the facts and analysis in the Industrial Land Alternative Analyses Study [Appendix A, Item(c) in Ordinance No. 04-1040B, pp. 104-06; 111; A-1 to A-4] and the Staff Reports [Appendix A, Item (a), p. 28] to support its conclusion that addition of a 249-acre portion of the Helvetia Study Area will provide for an orderly and efficient transition from rural to urban land use. The Council chose this area because it has several characteristics that render it among the most suitable sites under consideration for industrial use: a large parcels; relatively flat land; and proximity to a freeway interchange. The Urban Growth Report-Employment (UGR-E) identifies a specific need for large parcels (50 acres or larger) (Ordinance No. 02-969B, Appendix A, Item 4, page 25). This portion of the Helvetia Study Area contains one parcel between 50 and 100 acres.

Two-thirds of this area (162 acres) is designated for agriculture in Washington County's comprehensive plan (predominantly Class II soil). The farmland portion lies between the existing UGB (to the south and east) and the exception land portion to the west. West Union Road separates the included farmland from excluded farmland to the north. The Council includes this farmland because the exception land portion (87 acres) contains some land suitable for industrial use. Also, among farmlands considered,

this farmland is already affected by nearby urban and rural residential use. Further, the Council found only two areas designated for agriculture of higher priority (Class IV or III soils) suitable for industrial use (Damascus West and Quarry Study Areas) (see discussion of West Union Study Area, below).

The Council considered including a portion of the Evergreen Study Area, which also contains a combination of exception land and Class II farmland, because it, too, contains several large parcels. The Council favored the Helvetia area because the farmland portion of the Evergreen area that lies between the UGB to the east, the exception land to the west and NW Meek Road to the north includes considerably more farmland than the included portion of the Helvetia Area (478 acres versus 162 acres in Helvetia). Further, unlike the exception land portion of Helvetia, the exception land portion of the Evergreen Study Area does not contain land suitable for industrial use.

The Council also considered inclusion of the West Union Study Area, which contains farmland of Class II and III soils. The Council chose the Helvetia area rather that the West Union area because the portion of the West Union area with higher-priority Class III soils is not suitable for industrial use (slopes greater than 10 percent), and this portion lies to the north of the portion with predominantly Class II soils (adjacent to the UGB). Also, the Council found no good barrier in the West Union area to separate farmland included from farmland excluded until Cornelius Pass Road to the north, which would enclose many more acres of farmland (862 acres) than the 162 acres in the Helvetia area.

The Council also considered Class II farmland in the Wilsonville East Study Area in order to find large parcels suitable for industrial use. The Council chose the Helvetia Study Area over the Wilsonville area because the former will be considerably easier to provide with public facilities and services (p. 111). As a result, inclusion of the Helvetia area has the support of the City of Hillsboro, while the City of Wilsonville opposes inclusion of the Wilsonville East area.

The Council considered two other study areas composed predominantly of Class II soils: the Noyer Creek and South Hillsboro areas. According to the report of the Metro Agricultural Lands Technical Workgroup led by the Oregon Department of Agriculture ["Limited Choices: The Protection of Agricultural Lands and the Expansion of the Metro Area Urban Growth Boundary for Industrial Use", Appendix A, Item (i)], both areas have higher value for commercial agriculture than the Helvetia area.

Finally, the Council considered Class II farmland south of Wilsonville, near the I-5 corridor on the south side of the Willamette River. The Council rejected this farmland because inclusion would constitute a projection away from the urbanization portion of the metropolitan region, toward Marion County to the south. Industrial development south of the river would also be separated from the services of the City of Wilsonville and the rest of the metropolitan region, connected only by a limited access (interstate highway) bridge across the river. Inclusion of the Helvetia area would better achieve the compact urban form sought by Policies 1 and 1.6 of the RFP and Policy 3 of the Regional Transportation Plan. The Oregon Department of Agriculture urged the Council not to add farmland south of the Willamette River because it would further introduce urban uses into that core area of the Willamette Valley's commercial agriculture. Although the department also expressed concern about inclusion of the Helvetia area, it placed a higher priority on protection of farmland south of the Willamette River. The Council concludes that inclusion of the Helvetia area rather than the Wilsonville South Study area farmland better achieves Policy 1.12.2 of the RFP.

In short, of the Class II farmlands considered by the Council, this portion of the Helvetia Study Area best meets the identified need for industrial land and is most separated from nearby agricultural lands. Other than the exception lands that are part of this study area, there are no other exception lands that can help the region meet its need for larger parcels for industrial use.

1. Orderly Services

The Council relies upon the Helvetia Study Area Goal 14 Analysis Summary and the Ratings for Transportation Services Feasibility contained in its Industrial Land Alternative Analysis Study (Appendix A, Item (c), pages 111 and Table A-2, respectively) for its determination that urban services can be provided to the area in an orderly and economic manner by extending services from existing serviced areas.

The Alternatives Analysis (pp. 104-05) sets forth the likely service providers for sewer, water and storm-water services and assigns a serviceability rating for the larger Helvetia Study Area. Serviceability ranges from "easy" to "moderate" to serve the entire area (Table 1, p. 111). It will be easier to serve the smaller portion of the study area included by the Council because it is the portion closest to the existing UGB (borders on east and south) and services just to the east.

2. Efficiency

The Council relies on the same information on provision of essential services mentioned above (Orderly Services) for its conclusion that the area can urbanize efficiently. The Council also relies upon its findings and conclusions above (part I, General Findings, section D, Alternatives: Increase Capacity of UGB) regarding actions it has taken to increase the efficiency of the use of employment land within the existing UGB.

This area borders the UGB on two sides, with employment and industrial uses on the urban sides of the UGB, making urbanization of the area for industrial use more efficient than projecting urbanization from the UGB into a rural area.

3. Consequences

The Council relies upon the analysis of the consequences of urbanization on the Helvetia Study Area set forth in the Alternative Analysis Study, pp. 105-06 and Table A-3). The analysis indicates that the consequences will be moderate. The requirements of Title 11 of the UGMFP that comprehensive planning and land use regulations for the area protect the portions (streams, wetlands, floodplains and steep slopes) of the area subject to Title 3 of the UGMFP and the conditions in Exhibit F of Ordinance No. 04-1040B will reduce adverse consequences from urbanization of the area.

The Council has placed a condition on comprehensive planning for the area that the local government responsible for planning consider Metro's adopted Goal 5 inventory during its planning (see Condition IG, Exhibit F). The local government will eventually adopt provisions to implement Metro's Goal 5 program following the Council's adoption of that program, if the local government's ordinance do not already comply.

4. Compatibility

The Agricultural Analysis Consequences shows that urbanization of the Helvetia Study Area would have high adverse consequences for nearby agriculture (Alternative Analysis Study, pp. 105-06; Table A-4). The analysis, however, is based urbanization of the entire Helvetia Study Area (1,339 acres) rather than just the portion included within the UGB (249 acres). Adverse consequences and incompatibility from urbanization of the included portion will be much reduced, given that the UGB borders this portion on the east and south sides, West Union Road borders the portion on the north side, and much of this portion (87 acres) is exception area lying between the included farmland portion and the excluded farmland portion to the west.

According to the report of the Metro Agricultural Lands Technical Workgroup led by the Oregon Department of Agriculture ["Limited Choices: The Protection of Agricultural Lands and the Expansion of the Metro Area Urban Growth Boundary for Industrial Use", Appendix A, Item (i)], the included portion of the Helvetia area is less important to commercial agriculture in the region than other agricultural areas under consideration because it lies amid urban and rural residential uses: "However, the workgroup could not ignore the land use pattern both within the area, the location of the area within a small notch of the current urban growth boundary and the two hard edges provided by Helvetia and West Union Roads" (p. 11).

Ordinance No. 04-1040B, Exhibit F, imposes Condition IE upon urbanization of the area to reduce conflict and improve compatibility between urban use in the area and agricultural use on land to the north and west.

5. Natural and Cultural Resources

The Alternative Analysis Study addresses Goal 5 and 6 resources in the Helvetia Study Area protected by Washington County in its acknowledged comprehensive plan (p. 106). The county, or the City of Hillsboro upon annexation to the city, will be responsible for protecting these resources in the area when it amends its comprehensive plan and zoning ordinance to implement expansion of the UGB. Condition IG of Exhibit F requires the county or the City of Hillsboro to consider Metro's inventory of Goal 5 resources in their application of Goal 5 to the Helvetia area. Title 3 (Water Quality, Flood Management and Fish and Wildlife Conservation) of the UGMFP requires the county or city to protect water quality and floodplains in the area. Title 11 of the UGMFP, section 3.07.1120G, requires the county or city to protect fish and wildlife habitat and water quality. Title 11, section 3.07.1110, protects the status quo in the interim period of county or city planning for the area.

6. Public Facilities and Services

Under statewide Planning Goal 11, Metro is responsible for coordination of the preparation of public facility plans within the district. Metro will fulfill this responsibility through implementation of Title 11 of the UGMFP, which (1) prohibits Washington County or the City of Hillsboro from upzoning or from dividing land into resulting lots or parcels smaller than 20 acres until the county or city revises its comprehensive plan and zoning ordinances to authorize urbanization of land Metro brings into the UGB; and (2) requires the county or city to develop public facilities and services plans and urban growth diagrams with the general locations of necessary public facilities such as sanitary sewers, storm sewers and water lines for the area.

7. Transportation

Metro shares responsibility to ensure that its Task 2 decision for the Helvetia Study Area does not significantly affect a transportation facility or allow uses that are inconsistent with the identified function, capacity and performance standards of transportation facilities. Metro fulfills this responsibility through implementation of Title 11 of the UGMFP, which (1) prohibits Washington County or the City of Hillsboro from upzoning and from land divisions into resulting lots or parcels smaller than 20 acres in the area until the county or city revises its comprehensive plan and zoning ordinances to authorize urbanization of land Metro brings into the UGB; and (2) requires the county or city to develop conceptual transportation plans and urban growth diagrams with the general locations of arterial, collector and essential local streets for the area. Metro began this work with the evaluation of the serviceability of the area in the Alternative Analysis Study (pp. 104-05 and Table A-2) and consideration of how to provide services as part of the analysis required to satisfy Goal 14, factors 3 and 4.

The Oregon Department of Transportation ("ODOT"), Region 1, notes that the Shute Road interchange on Hwy. 26, to which most of the trips generated by development in the Helvetia area will go, "is already inadequate to accommodate the 2003 Urban Growth Boundary ("UGB") expansion in this area." Metro's 2004 RTP includes an interchange improvement to serve the industrial land added to the UGB for industrial use in December, 2002, with partial funding. The RTP also identifies the need to widen several stretches of Hwy. 26 from four to six lanes. The county or city, together with Metro, will fully assess the effects of development on these facilities during Title 11 planning. Title 11 calls for a conceptual transportation plan as part of amendment of city or county comprehensive plans and land use regulations, to which statewide planning Goal 12 and the Transportation Planning Rule apply.

8. Regional Framework Plan

The Helvetia Study Area lies adjacent to, and will likely become part of the North Hillsboro Industrial Area. This industrial area is the anchor of the high tech cluster that runs from this tract to Wilsonville. It contains the largest concentration of high technology firms in the state. The area supports businesses in the Hillsboro Regional Center, other Centers on the west side of the region, and the Central City. Industrial development in the Helvetia Study Area will provide additional employment to support those centers. The Council includes this area, notwithstanding that this part of the region is relatively well-endowed with employment, because, as noted above, it the characteristics needed for the industrial sectors likely to grow during the planning period.

9. Regional Transportation Plan

Through its Joint Policy Advisory Committee on Transportation, Metro has coordinated transportation planning and funding of transportation improvements with local governments in the region. The Regional Transportation Plan ("RTP") adopted a "Priority System" of improvements through the year 2020. The Priority System includes the most critical improvements needed to implement the 2040 Growth Concept. Among the improvements in the vicinity of the Helvetia Study Area in Metro's 2004 RTP is an interchange improvement to serve the industrial land added to the UGB for industrial use in December, 2002, with partial funding.

G. Cornelius

The Council relies upon the facts and analysis in the Industrial Land Alternative Analyses Study [Appendix A, Item(c) in Ordinance No. 04-1040B, pp. 84-87; 111; A-1 to A-4] and the Staff Reports [Appendix A, Item (a), p. 27] to support its conclusion that addition of this 262-acre portion of the Cornelius Study Area will provide for an orderly and efficient transition from rural to urban land use. Slightly more than half (56 percent) of the included portion is designated for agriculture in Washington County's comprehensive plan (predominantly Class II soil). The farmland portion lies in two tracts separated by an exception area. A second tract of exception land borders the farmland on the east side. Together, these four adjacent tracts comprise the portion of the study area included in the UGB.

The Council chose this portion of the study area because it has characteristics that render it suitable for industrial use: large and mid-sized parcels and relatively flat land. The Urban Growth Report-Employment (UGR-E) identifies a specific need for large parcels (50 acres or larger) (Ordinance No. 02-969B, Appendix A, Item 4, page 25). The included portion of the study area contains one parcel between 50 and 100 acres [Appendix A, Item (a), p.30].

The Council also chose this area to help achieve Policies 1.2, 1.3.1 and 1.4 of the Regional Framework Plan (RFP), which call, among other things, for an equitable and balanced distribution of employment opportunities, income, investment and tax capacity throughout the region. The Council considered the fiscal and equity effects of including this area on the City of Cornelius. Given that the city

has the highest poverty rate, the lowest property tax revenue per capita, the lowest land improvement market value and the longest average commute in the region, the Council concluded that industrial development in this area would help achieve these policies better than inclusion of any other Class II agricultural land.

The Council considered including a portion of the Evergreen Study Area, which also contains a combination of exception land and Class II farmland, because it, too, contains several large parcels. The Council favored the Cornelius area for the reasons stated above, and because the farmland portion of the Evergreen area that lies between the UGB to the east, the exception land to the west and NW Meek Road to the north includes considerably more farmland than the included portion of the Cornelius Study Area (478 acres versus 147 acres in the Cornelius area).

The Council also considered inclusion of the West Union Study Area, which contains farmland of Class II and III soils. The Council chose the Cornelius area rather that the West Union area because the portion of the West Union area with higher-priority Class III soils is not suitable for industrial use (slopes greater than 10 percent), and this portion lies to the north of the portion with predominantly Class II soils (adjacent to the UGB).

The Council also considered Class II farmland in the Wilsonville East Study Area in order to find large parcels suitable for industrial use. The Council chose the Cornelius area over the Wilsonville area for the reasons stated above, and because the former will be considerably easier to provide with public facilities and services (p. 111). As a result, inclusion of the Cornelius area has the support of the City of Cornelius, while the City of Wilsonville opposes inclusion of the Wilsonville East area.

The Council considered two other study areas composed predominantly of Class II soils: the Noyer Creek and South Hillsboro areas. The Cornelius area is easier to provide with public services than either Noyer Creek or South Hillsboro. Inclusion of industrial land in the Cornelius area will better accomplish Policies 1.2, 1.3.1 and 1.4 of the RFP than inclusion of Noyer Creek or South Hillsboro.

Finally, the Council considered Class II farmland south of Wilsonville, near the I-5 corridor on the south side of the Willamette River. The Council rejected this farmland because inclusion would constitute a projection away from the urbanization portion of the metropolitan region, toward Marion County to the south. Industrial development south of the river would also be separated from the services of the City of Wilsonville and the rest of the metropolitan region, connected only by a limited access (interstate highway) bridge across the river. Inclusion of the Cornelius area would better achieve the compact urban form sought by Policies 1 and 1.6 of the RFP and Policy 3 of the Regional Transportation Plan. The Oregon Department of Agriculture urged the Council not to add farmland south of the Willamette River because it would further introduce urban uses into that core area of the Willamette Valley's commercial agriculture. Although the department also expressed concern for expansion of the UGB north of Council Creek in the Cornelius area (part of the included area lies north of Council Creek; part lies south), it placed a higher priority on protection of farmland south of the Willamette River. The Council concludes that inclusion of the Cornelius area rather than the Wilsonville South Study Area farmland better achieves Policy 1.12.2 of the RFP.

1. Orderly Services

The Council relies upon the Cornelius Study Area Goal 14 Analysis Summary and the Ratings for Transportation Services Feasibility contained in its Industrial Land Alternative Analysis Study (Appendix A, Item (c), pages 111 and Table A-2, respectively) for its determination that urban services can be provided to the area in an orderly and economic manner by extending services from the City of Cornelius.

The Alternatives Analysis (pp. 84-85) sets forth the likely service providers for sewer, water and storm-water services and assigns a serviceability rating for the entire Cornelius Study Area. Serviceability ranges from "easy" to "moderate" to serve the entire area (Table 1, p. 111). It will be easier to serve the portion of the study area included by the Council because it is the portion closest to the existing UGB (borders on south) and existing services.

2. Efficiency

The Council relies on the same information on provision of essential services mentioned above (Orderly Services) for its conclusion that the area can urbanize efficiently. The Council also relies upon its findings and conclusions above (part I, General Findings, section D, Alternatives: Increase Capacity of UGB) regarding actions it has taken to increase the efficiency of the use of employment land within the existing UGB.

This area borders the UGB to the south, with employment and industrial uses along a portion of the urban side of the UGB. The included portion also includes two exception area of predominantly rural residential use. Inclusion of the exceptions areas will, over time, lead to more efficient use of the areas.

3. Consequences

The Council relies upon the analysis of the consequences of urbanization on the Cornelius Study Area set forth in the Alternative Analysis Study, pp. 86-87 and Table A-3). The analysis indicates that the consequences will be moderate. The requirements of Title 11 of the UGMFP that comprehensive planning and land use regulations for the area protect the portions (streams, wetlands, floodplains and steep slopes) of the area subject to Title 3 of the UGMFP and the conditions in Exhibit F of Ordinance No. 04-1040B will reduce adverse consequences from urbanization of the area.

The Council has placed a condition on comprehensive planning for the area that the local government responsible for planning consider Metro's adopted Goal 5 inventory during its planning (see Condition IG, Exhibit F). The local government will eventually adopt provisions to implement Metro's Goal 5 program following the Council's adoption of that program, if the local government's ordinance do not already comply.

4. Compatibility

The Agricultural Analysis Consequences shows that urbanization of the Cornelius Study Area would have high adverse consequences for nearby agriculture (Alternative Analysis Study, pp. 84-85; Table A-4). The analysis, however, is based urbanization of the entire study area (1,154 acres) rather than just the portion included within the UGB (262 acres). Adverse consequences and incompatibility from urbanization of the included portion will be much reduced, given that the UGB borders this portion on the south side, and that the farmland portions of the included area border two exception areas, also included.

Ordinance No. 04-1040B, Exhibit F, imposes Condition IE upon urbanization of the area to reduce conflict and improve compatibility between urban use in the area and agricultural use on land to the north and west.

5. Natural and Cultural Resources

The Alternative Analysis Study addresses Goal 5 and 6 resources in the Cornelius Study Area protected by Washington County in its acknowledged comprehensive plan (p. 86). The county, or the City of Cornelius upon annexation to the city, will be responsible for protecting these resources in the area when it amends its comprehensive plan and zoning ordinances to implement expansion of the UGB. Condition IG of

Exhibit F requires the county or the city to consider Metro's inventory of Goal 5 resources in their application of Goal 5 to the area. Title 3 (Water Quality, Flood Management and Fish and Wildlife Conservation) of the UGMFP requires the county or city to protect water quality and floodplains in the area. Title 11 of the UGMFP, section 3.07.1120G, requires the county or city to protect fish and wildlife habitat and water quality. Title 11, section 3.07.1110, protects the status quo in the interim period of county or city planning for the area.

6. Public Facilities and Services

Under statewide Planning Goal 11, Metro is responsible for coordination of the preparation of public facility plans within the district. Metro will fulfill this responsibility through implementation of Title 11 of the UGMFP, which (1) prohibits Washington County or the City of Cornelius from upzoning or from dividing land into resulting lots or parcels smaller than 20 acres until the county or city revises its comprehensive plan and zoning ordinances to authorize urbanization of land Metro brings into the UGB; and (2) requires the county or city to develop public facilities and services plans and urban growth diagrams with the general locations of necessary public facilities such as sanitary sewers, storm sewers and water lines for the area.

7. Transportation

Metro shares responsibility to ensure that its Task 2 decision for the Cornelius Study Area does not significantly affect a transportation facility or allow uses that are inconsistent with the identified function, capacity and performance standards of transportation facilities. Metro fulfills this responsibility through implementation of Title 11 of the UGMFP, which (1) prohibits Washington County or the City of Cornelius from upzoning and from land divisions into resulting lots or parcels smaller than 20 acres in the area until the county or city revises its comprehensive plan and zoning ordinances to authorize urbanization of land Metro brings into the UGB; and (2) requires the county or city to develop conceptual transportation plans and urban growth diagrams with the general locations of arterial, collector and essential local streets for the area. Metro began this work with the evaluation of the serviceability of the area in the Alternative Analysis Study (pp. 85 and Table A-2) and consideration of how to provide services as part of the analysis required to satisfy Goal 14, factors 3 and 4.

The Oregon Department of Transportation ("ODOT"), Region 1, notes that industrial development in the Cornelius area will worsen the level of service on the Tualatin Valley Highway between Cornelius and Hilslboro. The "Financially Constrained" and "Priority System" in Metro's Regional Transportation Plan ("RTP") include several projects that will address congestion in the corridor (Projects 3156, 3164, 3166, 3167, 3168 and 3171). The county or city, together with Metro, will fully assess the effects of development on these facilities during Title 11 planning. Title 11 calls for a conceptual transportation plan as part of amendment of city or county comprehensive plans and land use regulations, to which statewide planning Goal 12 and the Transportation Planning Rule apply.

8. Regional Framework Plan

The included portion of the Cornelius Study Area lies directly north of and adjacent to the City of Cornelius. The area is within one mile of the designated Main Street of Cornelius (there is no designated Town Center). Industrial development in the included area will provide additional employment to support the businesses on Main Street, and provide employment opportunities for the many residents of Cornelius who now travel to other parts of the region for work. As stated above, industrial development in this area will help achieve Policies 1.2, 1.3.1 and 1.4 of the RFP better than inclusion of any other land, including other farmland.

9. Regional Transportation Plan

Through its Joint Policy Advisory Committee on Transportation, Metro has coordinated transportation planning and funding of transportation improvements with local governments in the region. The Regional Transportation Plan ("RTP") adopted a "Priority System" of improvements through the year 2020. The Priority System includes the most critical improvements needed to implement the 2040 Growth Concept. Among the improvements in the vicinity of the included portion of the Cornelius Study Area in Metro's RTP are intersection safety improvements on the TV Highway couplet and improved transit service (see list of projects noted in section 8, above).

REQUIREMENT NO. 2:

REMAND ORDER ON SUBTASK 17: EITHER REMOVE TAX LOTS 1300, 1400 AND 1500 FROM THE BOUNDARY OF EXPANSION AREA 62, OR JUSTIFY THEIR INCLUSION UNDER GOAL 14.

Ordinance No. 04-1040A amends the UGB to remove Tax Lots 1300, 1400 and 1500, all in Study Area 62, from the UGB (Exhibit E). The Council concludes that there is no need to include these lots given the small surplus of land for residential use that resulted from expansion of the UGB by Ordinance No. 02-969B.

REQUIREMENT NO. 3:

REMAND ORDER ON SUBTASK 12B: PROVIDE DATA ON THE ACTUAL NUMBER DENSITY AND AVERAGE MIX OF HOUSING TYPES AS REQUIRED BY ORS 197.296(5) AND DETERMINE THE OVERALL AVERAGE DENSITY MUST OCCUR IN ORDER TO MEET HOUSING NEEDS OVER THE NEXT 20 YEARS AS REQUIRED BY ORS 197.296(7)

Ordinance No. 04-1040A further revises the Revised Housing Needs Analysis ("HNA") to display data required by ORS 197.296(5) (Exhibit D). The data show the number, density and average mix of housing types arranged by type of buildable land (vacant, partially vacant, redevelopment and infill and mixed-use land). These data were subsets of aggregated data in the HNA, but were not displayed in the Revised HNA submitted to LCDC with the Task 2 Submittal on January 24, 2003.

The purpose for collecting the data is to help determine "the overall average density and overall mix of housing types at which residential development of needed housing types must occur in order to meet housing needs over the next 30 years." ORS 197.296(7). Metro determined the overall density and mix of needed housing types in the Revised HNA submitted on January 24, 2003 (see pages 2-7, Figures 3.1, 3.2, 3.3, 5.1 and 5.3). [add text and explanation from earlier HNA] The data newly displayed in this revision do not affect Metro's earlier determination.

SUPPLEMENTAL STAFF REPORT

IN CONSIDERATION OF ORDINANCE NO. 04-1040B, FOR THE PURPOSE OF AMENDING THE METRO URBAN GROWTH BOUNDARY, THE REGIONAL FRAMEWORK PLAN AND THE METRO CODE TO INCREASE THE CAPACITY OF THE BOUNDARY TO ACCOMMODATE GROWTH IN INDUSTRIAL EMPLOYMENT

ORDINANCE NO. 04-1040B

Date: June 21, 2004 **Prepared by: Lydia Neill**

INTRODUCTION

This staff report is intended to summarize the deliberations by the Metro Council and the Metropolitan Policy Advisory Committee (MPAC) that have taken place since April 2004. Discussions and recommendations by MPAC are highlighted in italics. This report will also introduce several technical memorandums that address issues raised during testimony at public hearings in May and June 2004. Discussions in this supplemental staff report will address the Metro Council's revision to the Chief Operating Officer's (COO) recommendation. The primary staff report dated April 5, 2004 contains information that formed the basis for the COO recommendation.

BACKGROUND

Metro is required to assess the capacity of the urban growth boundary (UGB) every five years under ORS 197.299(1). Metro is currently in Periodic Review with the Department of Land Conservation and Development (DLCD) under work program approval order #001243. As part of this review Metro is required to forecast and provide a 20-year land supply for residential, commercial and industrial uses inside the UGB. The Metro Council had forecasted a shortage of 38,700 dwelling units, 140 acres of commercial land and 4,285 acres of industrial land for the period 2002 to 2022. In December 2002 the Metro Council added 18,638 acres of land to the UGB that satisfied all of the demand for residential and commercial uses but only a portion of the overall need for industrial land.

A remand work order was issued by the Land Conservation and Development Commission (LCDC) due to the incomplete actions on industrial lands and several other issues. The remand order 03-WK Task 001524 requires Metro to fulfill the industrial land need, complete the Housing Needs Analysis by providing data on the number mix and housing types required by ORS 197.296(5), and either remove tax lots 1300, 1400 and 1500 adjacent to King City or provide a justification for their inclusion in the UGB by June 2004.

The 2002-2022 Urban Growth Report: An Employment Land Need Analysis Updated December 2002 (Employment UGR), identified a demand for 4,285 net acres of industrial land and a demand for 140 net acres of commercial land. The Metro Council's December expansion decision included roughly half of the industrial land need. The 2002 UGB decision added 2,850 net acres of job land to the UGB that is divided among three 2040 design types; 533 net acres of employment land, 818 net acres of industrial land and 1,499 net acres of Regionally Significant Industrial Area (RSIA) land.[1] Thus, within the 2002 UGB expansion there is a current industrial land need of 1,968 net acres and a commercial land surplus of 393 net acres.

[1] RSIAs are a 2040 design type that identifies industrial areas that have regional significance because of their location near the region's most important transportation facilities for the movement of traded sector freight.

The Employment UGR identified the demand for vacant industrial land by employment sector and distributed the demand by parcel size. These sectors represent the industries that are expected to grow over the next 20 years and include their associated demand for land. This demand allocation reflects past demand, development practices and existing land use policies. The general demand for vacant industrial land is distributed as follows:

- 70 percent warehouse and distribution
- 13 percent general industrial
- 17 percent tech/flex[2]

Fulfilling the Need for Industrial Land

Adopting Efficiency Measures- Title 4

As part of the tasks to complete Periodic Review, Metro examined ways to use land more efficiently and adopted policies to maximize the use of land within the UGB. In 2002, Metro adopted provisions in the Urban Growth Management Functional Plan, Title 4, that limits non-industrial uses in industrial areas. Subsequent to its adoption, local governments and industry representatives have come before the Metro Council to make the case that traditional land use categories are now less relevant to understanding industrial uses because many industrial activities including research and development, office and manufacturing often occur in the same facility. Amendments to Title 4 are intended to preserve land for industrial uses by restricting the amount and types of commercial uses that currently locate on industrial land.

Changes to Title 4 will preserve the transportation capacity for the movement of goods and services and direct other types of employment to centers, employment areas, corridors, main streets and station communities. Both RSIA's and industrial areas place limitations on the size of the retail commercial uses not serving the industrial area. Allowances are made for locating training facilities in industrial areas and commercial uses in airport locations. A discussion of the legislative changes to Title 4 are included on pages 7 and 8.

Impacts of Adopting Title 4 on the UGR

New Title 4 regulations specifically limit the amount and square footage of retail and office uses justify the savings of industrial land discussed in the Employment UGR. The Employment UGR estimates a savings of 1,400 acres of industrial land from implementing new measures and mapping of RSIA lands.[3] Table 1 discusses the supply of industrial land and the impact of the Title 4 policy changes to reduce the deficit of industrial land.

Reductions to the Industrial Land Need

Commercial Land Surplus

The Employment UGR identified a commercial land surplus of 393 acres. The surplus is based upon the available supply of land for commercial purposes and an assumption that a percentage of commercial activities would continue to take place on industrially zoned lands. Testimony received during the discussion of revisions to Title 4, argued the traditional building types accommodating office and industrial uses are merging based on the needs of a knowledge-based economy. Approximately 30 percent of the land need identified in the Employment UGR is for tech-flex and general industrial uses. These uses have higher job densities that are consistent with office type buildings. Based on this fact additional

[2] Tech-flex development is a building type that provides flexible space to accommodate a variety of users from light assembly, product storage and research.
[3] Employment UGR, page 46.

flexibility has been incorporated into Title 4 regulations to accommodate the need for industrial office uses. Concurrently, these same types of office, industrial uses, (i.e. software development etc.) could also locate on commercial land in traditional office building types. Therefore, the surplus of commercial land is being applied to help satisfy the overall need for industrial lands.

Adjustments to the Commercial Refill Rate

This adjustment to the refill rate is reflective of the changes taking place in the industrial marketplace. As discussed above the industrial economy is transitioning from traditional manufacturing to more knowledge and information based economy which contains more office type uses and results in higher floor area ratios. A two percent adjustment to the commercial refill rate applied in the Employment UGR reduces the overall need for industrial land by 174 acres and reflects this change in the marketplace. An increase in the refill rate from 50 to 52 percent represents the observed refill rate. The observed rate was obtained from metroScope modeling work completed in 2002.

Table 1. Industrial Land Need Adjustments

Supply of Industrial Land	**Net Vacant Acres**
Industrial Deficit	1,968
Application of the commercial land surplus	393
Less adjustment based on increasing the commercial refill rate	174
Less adjustments:	
- City of Oregon City (Comprehensive plan industrial)	74
- City of Wilsonville (Comprehensive plan industrial)	127
- Re-instatement of area south of Gresham	20
Remaining Industrial Land Need	**1,180**

Employment UGR Conversion Rate

It was brought to Metro's attention by the City of Wilsonville has asserted that Metro has misapplied the commercial conversion rate in the 2002-2022 Employment UGR calculations to determine the need for industrial land. A discussion of the how a rate of 15-20 percent was derived begins on page 16 of the Employment UGR. The rate was developed by performing an analysis of the covered geocodes of commercial uses located on industrially zoned land. The study found that 2 out of 10 jobs in industrial areas had a commercial standard industrial code (SIC). The confusion lies in calculating a conversion rate of 44 percent by including the marginal increases of land instead of all of the industrially zoned land supply to compute the correct rate of 22 percent.

Adjustments Based on Zoning

Both the City of Wilsonville and Oregon City have brought to Metro's attention that several areas located within the current UGB have comprehensive plan designations of industrial but local zoning that does not reflect the future intent. Both cities use a two map system that anticipate rezoning of property consistent with the comprehensive plan. It is Metro's practice to assess land based on zoning, not comprehensive plan designation. It was determined that it was appropriate to count these acres as industrially zoned because of the legislative intent. Since Metro has a surplus of housing units based on the 2002 decision, this change does not affect the housing need. The addition of 201 net acres of industrial land shown in Table 1. Industrial Land Need Adjustments.

The area south of the City of Gresham (20 acres) is described as a re-instatement after its recommended removal by the COO. This acreage is part of the Springwater industrial area (designated as an RSIA) that is currently under concept planning. When this area was added to the UGB in 2002 it received a 2040 designation of inner neighborhood. The concept planning for the broader area indicated that this area

should be planned for industrial development and receive a 2040 designation of RSIA. The 20 year housing supply is not affected because Metro had a surplus of 666 net acres of residential land.

Completing Periodic Review

After adjustments the remaining industrial land need is 1,1180 net acres. The Metro Council expanded the UGB by adding 1,047 acres of land to substantially satisfy the need for Industrial land over the next 20 years. These lands area located in the following areas: Damascus West, Tulatin, Beavercreek, Quarry, Coffee Creek, Cornelius and Helvetia. The areas are shown in Table 3. Metro Council UGB Expansion Areas, were chosen because they meet the requirements in Goal 14 in the following order:

- Exception lands that meet the suitability factors identified for warehouse and distribution; general industrial and tech flex uses;
- Successively lowest capability farmlands which meet the suitability factors or;
- Located on lower priority farmland but are necessary to meet specific industry needs.

Specifics of the suitability factors are outlined in the April 5, 2004 staff report. Departure from either the COO recommendation or the MPAC recommendation is discussed below. Careful consideration was paid to the potential impacts on farmland and farm industry operations.

Table 2. Chief Operating Officer's Recommendation

				SUITABILITY FACTORS		
EXPANSION AREAS	**Total Acres**	**Net Acres**	**Dominant Earthquake Zone[4]**	**Access**	**Proximity**	**Slope less 10%**

**Areas shown in bold/ italics were included in MPAC's June 9th recommendation*

Soil Classifications of Areas Under Consideration

Soil classifications of all areas under study. The soils were mapped to facilitate studying and choosing appropriate lands for UGB expansion that conform to Oregon Revised Statute 197.298. ORS 197.298 establishes a hierarchy of lands based on soil quality which is divided into tiers. These tiers establish a priority for urbanizing land with exception land being the first priority followed successively by better quality soils. The tier system used for analysis examined the class of soils in each area and determined which soil class was most prominent. As study area boundaries have changed over the course of the analysis the predominant soil type changed in some cases. Table 3. Metro Council UGB Expansion Areas, shown on page 10 contains the predominant soil type unique to each area. Attachment 1 contains a complete discussion of the soil classes in all areas.

[4] Based on 1997 Department of Geology and Mineral Study. Rating of A-D with D being the lowest hazard area.

Industrial Land Supply Available to Meet Demand
The need for industrial land is classified by parcel size. The majority of the need for industrial land is contained in the smaller lot size categories that range from under 1 acre up to 25 acres. A need has been identified for large parcels to accommodate warehouse and distribution, general industrial and tech flex uses (25 acres up to 100 acres). Some of the areas under consideration due to their existing lotting patterns fulfill the large lot need better than other areas. Assembly of large lots can be reasonably accomplished if there are adjacent parcels of sufficient size or are under the same ownership. An aggregation study of these areas which is contained in the April 5, 2004 staff report, demonstrated that the need for large parcels can be met in the areas slated for UGB expansion. The best potential for addressing large lot needs can be found in Damascus West, Quarry, Coffee Creek, Helvetia and Cornelius areas.

Assessment of Earthquake Hazards
All of the areas included in the UGB were evaluated for their relative earthquake hazard potential. This evaluation was based on the 1997 Oregon Department of Geology and Minerals Study. The areas were ranked from A through with D being the lowest hazard potential. The western portion of the region that contains the Cornelius, Helvetia areas have the highest hazard potential. The higher hazard potential in these areas will be addressed during Title 11 concept planning by the responsible city or county pursuant to Metro Code 3.07.1120(G) and Statewide planning Goal 7. The hazard potential is shown in Table 2 and a full discussion of this study is included in Attachment 2.

COO Recommendation - Areas Excluded

Assessment of Areas Excluded from Consideration
A full discussion of this analysis of all lands under study that were excluded from consideration is included in the staff report dated April 15, 2004 and in the 2003 Alternatives Analysis and Addendum.

Borland Road Area- North of I-205
The Borland Road area has not been included in the UGB based on additional information contained in the record and further examination by staff. Although this area is composed entirely of exception land, a number of factors make it suitable for industrial use. The area previously under consideration contains 575 gross acres of land with a number of conflicting uses (schools, churches, rural residential uses) and slopes/natural resources and yields only 164 net developable acres of land. The developable land is insufficient to allow formation of a cohesive industrial neighborhood and too small and too far from the existing UGB to justify the extension of urban services (see “Formation of Industrial Neighborhoods”, Appendix A, Item (u) of Ordinance No. 04-1040B).

Previous work by staff to reduce the total number of acres under consideration from 68,334 acres of land to a more manageable 29,000 acre study area applied the following decision rules. The decision rules included: 1) non-contiguous to the UGB, 2) predominance of lots under 5 acres in size, 3) large areas of steep slopes and floodplains, 4) less that 300 acres and failure to meet both the proximity to other industry (1 mile) or access requirements (2 miles within an interchange). The Borland Road area has access to I-205 but is not located adjacent to a developed industrial area. Based on possible access to I-205 this area was thought to be suitable for warehouse and distribution uses. A baseline size was established for industrial neighborhoods of 300 acres. This 300 acre threshold was obtained by analyzing metroScope results and comparing the sizes of different industrial areas located within the UGB. The Borland Road area has little chance of forming a 300 acre industrial neighborhood due to the fragmented buildable lands available in this area.

On June 9, 2004 MPAC recommended that this area be removed from consideration for UGB expansion.

Wilsonville East
The Wilsonville East area which contains over 400 net acres was removed from consideration due to servicing concerns raised by the City of Wilsonville and impacts on an existing single family neighborhood located south of the site. This site contains class II agricultural land. The Metro Council chose the Helvetia study area which also contains class II soils and exception lands over the Wilsonville East area due to the serviceability and because the area contained exception lands. The Helvetia area is particularly well suited to satisfy the demand for tech flex or general industrial land.

On June 9, 2004 MPAC recommended that this area be removed from consideration for UGB expansion.

Additional Areas Added to the COO Recommendation
No additional areas were added to the COO recommendation.

On June 9, 2004 MPAC recommended that the Evergreen area be considered by the Metro Council to satisfy the need for industrial land.

The Metro Council considered the inclusion of the Evergreen site to meet the need for industrial land. Deliberations weighed the potential impacts on the farm economy and the issue of establishing logical boundaries between urban and farm uses in this area.

Expansion of the Cornelius Area
The Metro Council expanded the Cornelius area (206 to 262 gross acres) to provide an additional 36 net acres of industrial land. Inclusion of this area will provide for an orderly and efficient transition from rural to urban use. Approximately 56 percent of the area is designated for agricultural use in the Washington County Comprehensive Plan and it contains class II soils. A total of 56 gross acres are isolated from the agricultural lands located north of Council creek. The Council chose this land because a portion of this land is located adjacent to an existing industrial area located south of Council Creek and contains large flat parcels suitable for industry.

The Employment UGR identifies a specific need for large parcels (50 acres or larger) (Ordinance No. 02-969B, Appendix A, Item 4, page 25). The included portion of the study area contains one parcel between 50 and 100 acres (Appendix A, Item (a), p.30).

The Council also chose this area to help achieve Policies 1.2, 1.3.1 and 1.4 of the Regional Framework Plan (RFP), which call, among other things, for an equitable and balanced distribution of employment opportunities, income, investment and tax capacity throughout the region. The Council compared the fiscal and equity effects of including this area on the City of Cornelius. Given that the City of Cornelius has the highest poverty rate, the lowest property tax revenue per capita, the lowest land improvement market value and the longest average commute in the region, the Council concluded that industrial development in this area would help achieve these policies better than inclusion of any other Class II agricultural land.

On June 9, 2004 MPAC recommended that the expanded Cornelius area be considered by the Metro Council to satisfy the need for industrial land.

Other Changes to the COO Recommendation
The COO recommendation called for removal of a small area south of Gresham based upon impacts to the Green Corridor Agreement with the City of Sandy. This area includes 90 gross acres of land that was proposed in the 2002 UGB expansion for residential use. The area will remain in the UGB and be assigned a 2040 designation as RSIA consistent with the area north of the site (Springwater Industrial

Area) which was also added to the UGB in 2002. The area provides approximately 20 net acres of land for industrial purposes.

On June 9, 2004 MPAC did not recommend that this area remain in the UGB.

Assigning 2040 Design Types and Conditions

All areas included in the UGB must be assigned a 2040 design type of either Industrial or RSIA. Concept planning as required in Title 11 of the Functional Plan will determine the location and extent of the boundaries of all of the industrial areas. The 2040 design types are included on maps of all expansion areas in Ordinance No. 04-1040B in Exhibit E and the specific conditions are contained in Exhibit F.

Generalized and specific conditions pertaining to all areas included in the UGB are found in Exhibit F.

The Council added or revised conditions recommended by the COO to address concerns raised in testimony following the April 15, 2004, COO recommendation. New conditions address compatibility between industrial use and nearby residential use, coordination of the timing of comprehensive planning and transportation planning, and improved protection of the future right-of-way for the I-5/99W Connector.

The Oregon Department of Transportation (ODOT) submitted general information about the likely effects of new industrial development on lands added to the UGB on a number of state transportation facilities in the region. Of particular concern to ODOT are areas added in the vicinity of the North Wilsonville interchange on I-5 in Wilsonville and of the Shute Road interchange on U.S. Highway 26 at Hillsboro. ODOT believes that adoption of an "interchange area management plan"(IAMP), as described in the Oregon Highway Plan and outlined in ODOT rules (OAR 734-051-0125), would protect the capacity and function of the interchanges and improve their management. ODOT prefers adoption of an IAMP at the time of Title 11 planning, prior to urban development.

Local governments believe IAMPs are more likely to add value to what statewide planning Goal 12 (Transportation) and the Transportation Planning Rule (TPR) already require if the IAMPs are adopted at the time that plans and commitments are made for improvements to the interchanges. They worry that limitations on industrial development that might be written into an IAMP prior to commitment of funding for improvements to the interchanges might, in light of budgetary constraints, become permanent or long-range limitations, denying the region of the full benefits of industrial development near the interchanges.

The Council shares ODOT's concern that new industrial development in the region not cause the region's transportation system to fail or fall below standards. The Council understands that new development, without timely investment in the region's transportation system, will likely degrade the system. The Council expects, however, that, given the high priority state government places on making industrial sites ready for development, the region (Metro and other local governments), with the aid of state government, will find the resources to make the necessary improvements. In pursuit of those improvements, Metro will encourage and facilitate the adoption of IAMPs in cooperation with local governments at the earliest appropriate time in the process of approval of improvements to the Shute Road and North Wilsonville interchanges.

Policy Changes

Part of Metro's review of the UGB includes examining ways to obtain more efficient utilization of land currently inside of the UGB. The proposed Title 4 amendments are one way of demonstrating to LCDC that Metro is achieving efficiencies inside of the UGB to meet the need for land in addition to expanding the UGB. The Metro Council adopted new measures to protect and maintain the supply of industrial land for future industrial uses in Ordinance 02-969B, adopted December 5, 2002. Title 4 Industrial and Other

Employment Areas regulations were amended in order to increase the capacity of industrial areas for industrial uses and to encourage non-industrial uses to locate in Centers and other more appropriate 2040 design type areas.

Metro staff, after consulting with cities, counties and other interests, developed a set of factors to consider in the identification of RSIAs. Metro staff worked with cities and counties in the region to apply the proposed factors to designated Industrial Areas within their jurisdictions. Several local governments, Portland, Gresham, Wilsonville and Clackamas County, submitted recommended Industrial Areas for consideration as RSIAs. Striving for region-wide consistency, Metro staff also applied the factors to areas in cities and counties that chose not to submit candidate areas. The factors are:

- *Distribution* - Area serves as support industrial land for major regional transportation facilities such as marine terminals, airports and rail yards;
- *Services* - Availability and access to specialized utilities such as specialty gases, triple redundant power, abundant water, dedicated fire and emergency response services;
- *Access* - Within 3 miles of I-5, I-205, I-84 (within the UGB), State Route 224 (within the UGB);
- *Proximity* - Located within close proximity of existing like uses; and
- *Primary Use* - Predominantly industrial uses.

Considering these factors and much input from local governments, the Metro Council by Ordinance No. 04-1040B (Exhibit C) adopted a generalized map of RSIA areas. Title 4 is amended to include a limitation on retail uses for single users of 5,000 square feet in Industrial areas and 3,000 square feet in RSIA areas, and added a performance based transportation requirement for non-industrial offices. The 3,000 and 5,000 square foot limitations as it relates to commercial eating establishments refers to the size of the seating area and not to kitchen or storage areas. The Title 4 language changes are included in Exhibit B of Ordinance No. 04-1040B. The map depicting RSIA's is included in Attachment 3.

On April 14, 2004 MPAC recommended that Title 4 be amended to limit non-industrial retail uses to a maximum of 5,000 square foot for individual uses and 20,000 square foot for single buildings in both RSIA's and industrial areas. This recommendation was incorporated into ordinance No. 03-1021B for Metro Council consideration. Other provisions were consistent with the language in ordinance No. 04-1040B.

Regional Framework Plan Amendments

The Regional Framework Plan is amended to add policy language to guide UGB decisions and minimize impacts on the agricultural industry. Comments from participants at the symposium called "Agriculture at the Edge" spurred the proposed policy changes. Expansion of the UGB has different impacts on nursery operations, farm related businesses and individual operations. Changes to Chapter 1, Land Use Policy 1.12 provide greater certainty for farmers regarding urbanization and reduce potential conflicts between farm operations and urban uses. The changes the Regional Framework Plan provide the following policy guidance:

- When choosing land among lands with the same soil class, chose land less important for commercial agriculture, and
- Develop agreements with neighboring cities and counties to protect agriculture.

On April 24, 2004 MPAC recommended that the original proposal introduced by Councilor Hostica in Ordinance No. 04-1041 included defining the region's urbanizable area by restricting future urban growth boundary expansions to an area north of the Willamette River and east of Pudding River as well as containing the additional language to address the impacts on the agricultural industry and additional criteria to choose land for urbanization.

The Metro Council considered this recommendation to establish a hard boundary at the Willamette River and chose to defer this issue until a comprehensive region-wide discussion can take place to consider other areas that may be effected by similar circumstances. There are number of areas in the region where a policy of establishing a hard edge could be used effectively. The Metro Council expressed a desire to explore the use of this concept more fully in upcoming work that may take a longer view of planning for the region's growth.

Fulfilling The Remaining Periodic Review Requirements

Housing Needs Analysis
A revised Housing Needs Analysis report was prepared pursuant to the remand work order. The report addresses densities by housing type. The supplemental information provided in this report does not materially change the conclusions found in the UGR. The supplemental study does not change the overall density or mix of housing types needed for the next 20 years. Revised refill rates are in the range of 25-30 percent.

KNOWN OPPOSITION
The selection of lands for inclusion into the UGB has been hotly debated in a number of areas for both inclusion and exclusion from the UGB. Details of the comments received throughout the workshops and public hearing processes are detailed in the Public Comment reports, Volume I and II dated May 2004 and the addendums to the original reports dated June 2004 contain comments up through the final hearing on June 24, 2004.

LEGAL ANTECEDENTS
Title 4 is part of the adopted and acknowledged Urban Growth Management Functional Plan. Authority to amend the 2040 Growth Concept map comes from ORS 268.380 and ORS 268.390(5). UGB evaluation and amendment requirements are found in ORS 197.298 and 197.299.

ANTICIPATED EFFECTS
Adoption of Ordinance No. 04-1040B will result in fulfilling the requirements in Metro code section 3.07.420I, which requires Metro to adopt a map of Regionally Significant Industrial Areas with specific boundaries that is derived from the Generalized Map of Regionally Significant Industrial Areas adopted in Ordinance No. 02-969B. Amendments to Title 4 address implementation issues and provides local governments with clear instructions as to the Metro Council's policy intent on preserving industrial lands. This ordinance also satisfies the three requirements of LCDC's Partial Approval and Remand Order #03-WK Task 001524. The effective date of the new Title 4 regulations is September 24, 2004. Local governments will have two years following LCDC's acknowledgement to adopt a local map and make changes to their codes.

Adoption of amendments to the UGB provide the industrial land necessary for the continued economic growth over the next 20 years.

BUDGET IMPACTS
The UGB and Metro Code amendments become effective September 2004. Any additions to the UGB require FTE for monitoring and minor participation in Title 11 concept planning. Metro has a commitment of 1.43 FTE dedicated to ongoing concept planning in Hillsboro, Damascus, Gresham and the City of Tualatin. Additional FTE and potential grants to local governments may be needed to assist in the concept planning process. Implementation of Metro Code changes requires a corresponding amendment of local planning ordinances to implement the intent of these policies. Compliance monitoring is already included in the 2004/ 2005 budget. Community Development staff currently

monitors all ongoing zone, comprehensive plan and code changes at the jurisdictional level as well as other project responsibilities.

DECISION

The Metro Council expanded the UGB by adding 1,047 acres of land to substantially satisfy the need for Industrial land over the next 20 years. The removal of tax lots 1300, 1400 and 1500 adjacent to King City and the completion of the addendum to the Housing Needs Analysis addresses all of the outstanding issues in LCDC's Partial Approval and Remand Order #03-WK Task 001524.

Table 3. Metro Council UGB Expansion Areas

EXPANSION AREAS	Total Acres	Net Acres	2040 Design Type	Soil Class
Damascus West	102	69	Industrial	class II & III
Tualatin	646	339	Industrial	class IV & III
Quarry (partial)	354	236	Industrial	class VII
Beavercreek	63	30	Industrial	class IV & V
Coffee Creek (partial)	264	97	Industrial	exception land
Cornelius (partial)	262	127	RSIA	class II
Helvetia (partial)	249	149	RSIA	exception land & class II
TOTAL	1,940	1,047

Re: Dominant soil classifications for proposed UGB expansion areas

Background
The Metro Council is currently in the process of selecting land for inclusion in the urban growth boundary (UGB) for industrial use. The selection of appropriate land is dictated largely by Oregon Revised Statute (ORS) 197.298 that sets forth a hierarchical, tier-based system of land categorization, which indicates the order land should be considered for inclusion in the UGB based on comprehensive plan designations. Resource land is further prioritized on soil classification, which indicates the capability level of the farmland and ultimately its place in the hierarchy of land. The hierarchical tiers of land identified in ORS 197.298 are defined as follows:

- Tier 1 – exception land contiguous to the UGB and non-high value resource land completely surrounded by exception land.
- Tier 1a – exception land not contiguous to the UGB (within the one mile extent of study area boundaries).
- Tier 2 – marginal land, a unique classification of non-resource land in Washington County that allows dwelling units on EFU land.
- Tier 3 – resource land that may be needed to serve exception land.
- Tier 4 – resource land, majority of class III & IV soils, some class I & II soils.
- Tier 5 – resource land, majority class I & II soils, some class III & IV soils.

Purpose
The purpose of this memorandum is to identify the dominant soil classification and resulting tier category under ORS 197.298 for each of the resource land areas proposed for inclusion in the UGB for industrial use. The dominant soil classification has been determined using GIS soil data, displayed on a map dated October 30, 2002 in the record and was only undertaken for study areas identified as resource land. This information is presented in tabular form.

Soil Classifications by study area

Recommended Expansion Areas	Total Acres	Net Acres	Tier	Dominant Soil Classification
Damascus West	102	69	Tier 4	Class 3 & 4
Quarry (p)	354	236	Tier 4	Class 7
Beavercreek (p)	63	30	Tier 4	Class 4 & 6
Wilsonville East (p)	641	460	Tier 5	Class 2
Revised Wilsonville East	412	295	Tier 5	Class 2
Cornelius (p)	206	91	Tier 5	Class 2
Revised Cornelius	56	36	Tier 5	Class 2
Helvetia (p)	249	149	Tier 5	Class 2
West Union (p)	368	133	Tier 5	Class 2
Evergreen	985	730	Tier 5	Class 2
Noyer Creek	381	266	Tier 5	Class 2
Hillsboro South	791	695	Tier 5	Class 2

*Analysis was only undertaken for study areas identified as resource land.

RE: ***RELATIVE EARTHQUAKE HAZARD FOR PROPOSED INDUSTRIAL LAND EXPANSION AREAS***

Background

In 1997 the Oregon Department of Geology and Mineral Industries (DOGAMI) produced data on the relative earthquake hazard for land in the Portland metropolitan region including a significant portion of land outside the Urban Growth Boundary (UGB). The information included individual hazard factors of liquefaction, slope instability, and amplification, as well as a composite relative earthquake hazard map based on the individual factors. Metro's Data Resource Center (DRC) mapped the relative earthquake hazard data utilized in this analysis. The map information does not cover all of the potential expansion areas nor has the information been updated since 1997.

Analysis

The relative earthquake hazard composite map is separated into four zones, A, B, C, and D, with A being the highest hazard, and D the lowest hazard. The dominant zone for each of the proposed expansion areas is reported in the table below, along with additional comments.

Relative Earthquake Hazard

Expansion Area	Dominant Zone	Comments
Damascus	D	Small areas of C & B
Beavercreek	D	Significant portion of C and two pockets of B
Borland Road	A	One large area of B southeast of Borland Rd./Stafford Rd. intersection
Wilsonville East	B	Significant portions of C & D
Coffee Creek	D	Areas of A, B & C. No information for southwest corner of expansion area
Tualatin	D	Significant areas of B & C
Quarry	D	Pockets of C and minor area of B
Cornelius	B	A few pockets of A scattered throughout area
Helvetia	A	Two pockets of B, one in the center and one at the very top of the area
Evergreen	A	Some B, no information for northern portion of area
West Union	B & A	Some areas of C, area of A along stream corridor

RELATIVE EARTHQUAKE HAZARD…
June 16, 2004
Page 2

Summary
Information for two of the areas, Evergreen and Coffee Creek, is incomplete. In general the areas are either at the high or low hazard end of the range. The Borland Road North, Helvetia, Evergreen and West Union expansion areas contain the most Zone A classified land and thus have the highest earthquake hazard status. The Damascus, Beavercreek, Coffee Creek, Tualatin, and Quarry expansion areas contain mostly Zone D classified land and thus have the lowest earthquake hazard status.

The Council has decided not to include the North Borland, Evergreen or West Union Areas (areas with the highest hazard). The small hazard areas mapped in the Helvetia Area (also high) and other areas included in the UGB will be addressed in Title 11 planning by the responsible city or county, pursuant to Metro Code Section 3.07.1120G and statewide planning Goal 7.

Wilsonville Industrial Land Readiness Phase 1: Basalt Creek Recommendations Report

City of Wilsonville

Prepared for: City of Wilsonville

ECOnorthwest
222 SW Columbia Street • Suite 1600 • Portland, OR 97201 • 503-222-6060

Acknowledgments

ECOnorthwest prepared this report with support from the guidance and input of several partners, including members, staff, and leadership of the ***City of Wilsonville***. Most notably we are appreciative of the involvement and input of ***Cindy Luxhoj, Daniel Pauly, Miranda Bateschell, and Matt Lorenzen***. This work was financially supported by grants from ***Business Oregon and Metro.***

That assistance notwithstanding, ECOnorthwest is responsible for the content of this report. The staff at ECOnorthwest prepared this report based on their general knowledge of the economics of regional economies. ECOnorthwest staff contributing to this study included ***Bob Parker, Nicole Underwood, Barrett Lewis, and Michelle Anderson.*** ECOnorthwest also relied on information derived from government agencies, private statistical services, the reports of others, interviews of individuals, or other sources believed to be reliable. ECOnorthwest has not independently verified the accuracy of all such information and makes no representation regarding its accuracy or completeness. Any statements nonfactual in nature constitute the authors' current opinions, which may change as more information becomes available.

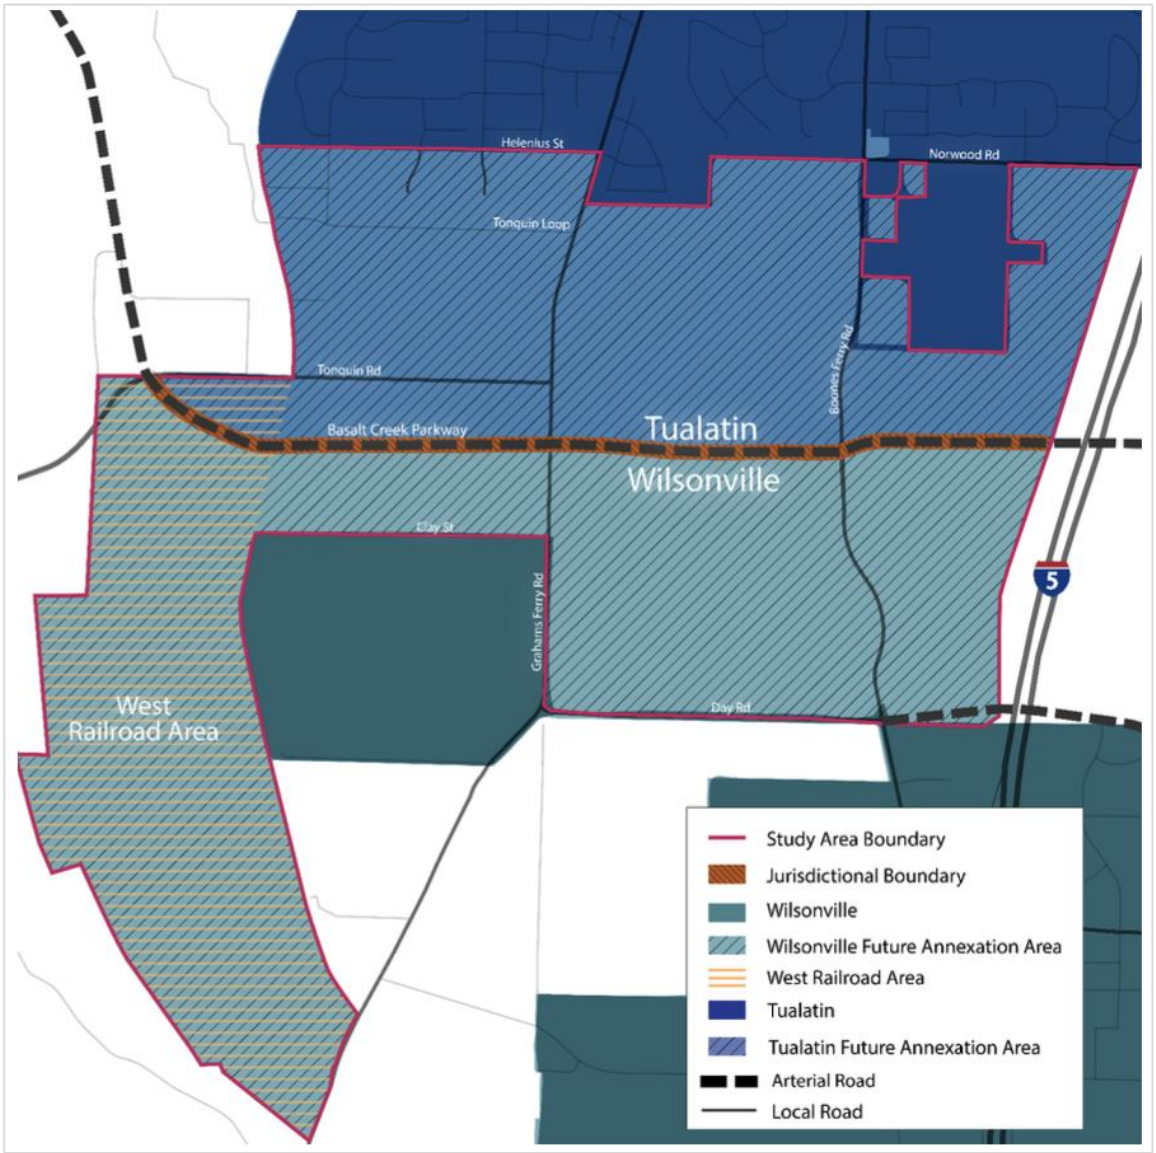
Conclusion and Recommendations..... 11
Appendix A: Economic Inventory and Basalt Creek Concept Plan Land Use Analysis 17
Appendix B: Buildable Lands Inventory and Site Suitability Analysis 60
Appendix C: Redevelopment Feasibility of Contractor Establishments 102

Purpose and Background

The Cities of Tualatin and Wilsonville adopted the Basalt Creek Concept Plan (BCCP) in 2018 after a lengthy joint planning process. Now, in 2024-25, the City of Wilsonville is working to advance the Basalt Creek Planning Area (BCPA) beyond the concept plan to a development-ready status by designating zoning and refining infrastructure plans. However, since adoption of the BCCP, economic conditions at national, state, regional, and local levels have shifted significantly and must now be considered.

To address these evolving conditions, the City hired ECOnorthwest to conduct a market assessment and industrial lands study focused on Wilsonville's portion of the BCPA. This study is comprised of several interconnected tasks:



- An **Economic Inventory** that evaluates current market trends and identifies industries suitable for the area (Appendix A).
- A **Buildable Lands Inventory (BLI)** that reflects recent land developments, adjusted constraints, and revised capacity estimates (Appendix B).
- A **Site Suitability Analysis** that evaluates three key opportunity sites for their potential to support target industries based on attributes like size, location, and constraints (Appendix B).
- An **Analysis of Future Development of Contractor Establishments in the BCPA** given prevailing lease rates and market conditions (Appendix C).

This report summarizes the key findings from each task and outlines recommended policy interventions and strategic actions for the City. By addressing challenges and leveraging opportunities, these efforts aim to establish Basalt Creek as a vital hub for regional job growth and long-term economic vitality.

Basalt Creek Planning Area Overview

The Basalt Creek Planning Area (BCPA) is an 847-acre area located between southern Tualatin and northern Wilsonville. This report focuses on the Wilsonville section, which includes 453 acres in the main portion of the BCPA south of the Basalt Creek Parkway and land west of the railroad known as West Railroad (as depicted in Figure 1*). For the remainder of this report, references to the BCPA specifically refer to the Wilsonville portion.* The BCPA is centrally located in the southern portion of the Portland Metro, adjacent to Interstate-5, and easily accessible and connected to other growing industrial areas (including Sherwood and Tualatin). It has access to the Portland Metro and Mid-Valley labor sheds, making it well positioned to attract various types of industry.

Figure 1: Basalt Creek Planning Area

Source: Basalt Creek Concept Plan, 2018. Note: Wilsonville's portion of the Basalt Creek Planning Area (BCPA) is inclusive of the Wilsonville Future Annexation Area and West Railroad Area.

What is Wilsonville's portion of Basalt Creek Like today?

The Wilsonville portion of the BCPA is currently zoned under Washington County's FD-20 designation (Future Development, 20-acre minimum lot size), which permits low-intensity uses. Since the adoption of the BCCP, Washington County has continued to approve developments consistent with its zoning, resulting in much of the land now being used for contractor establishments. These establishments—used for storing tools, equipment, and vehicles—provide jobs and economic activity. But they fall short of the employment densities and development envisioned in the Concept Plan, and which are typical of land within the Metro urban growth boundary (UGB) and incorporated City limits.

Contractor establishment (above) and railroad crossing near West Railroad.

KEY STATISTICS

The Wilsonville portion of the BCPA spans 453 acres and includes 85 tax lots, with only 10 tax lots hosting covered employment. Some areas in the BCPA have a high degree of parcelization, while others are less fragmented. There are a handful of large contiguous landholdings by single ownership.

From 2012 to 2022, covered employment grew from 194 to 275 employees in the BCPA, with an average wage of $85,863—higher than the tri-county average ($73,995) and City average ($74,252)—indicating well-paying jobs. However, employment density remains low at 4.4 employees per acre (on parcels with covered employment), far below the BCCP vision of 18.5 employees per acre. It is important to note that these figures only account for covered employees.[1]

Some of the land in the BCPA is actively used despite minimal reported employment. The area is primarily used for contractor establishments, including storage yards for various businesses, which typically require fewer employees. It is likely that additional workers are present but not included in the covered employment estimates, such as sole proprietors or other types of uncovered contractors.

[1] Covered employment refers to employees covered by unemployment insurance. It *excludes* sole proprietors, certain contractors ("1099 employees"), and some railroad workers.

Due to the prevalence of storage-focused contractor establishments, many lots have minimal building improvements. The improvement-to-land-value ratio is low and has changed little over the past decade.

- 453 acres
- 85 tax lots
- 275 covered employees
- $86,000 average wage
- 4.4 employees per acre in areas with employment
- Little change in improvement-to-land value since 2012
- Areas of high and low parcelization

Key Components of This Study

Economic Inventory: Basalt Creek's Market Context

The Economic Inventory provides a detailed analysis of market trends and industry opportunities for the BCPA, emphasizing its potential as a regional hub for industrial development (see Appendix A for the full inventory). Since adoption of the BCCP in 2018, economic conditions have been shifting considerably. Nationally, the industrial sector continues to experience robust demand fueled by e-commerce growth, reshoring efforts, and federal investments like the CHIPS Act, which supports semiconductor manufacturing. In the Portland Metro area, industrial trends mirror national patterns, with low vacancy rates and rising rents. While demand for industrial space has slowed from the highs of 2021–2023, it is expected to remain strong in the near term.

Locally, Wilsonville's industrial sector plays a crucial role in the City's economy, with manufacturing, wholesale trade, and construction accounting for 43 percent of employment compared to 22 percent regionally. Despite this strength, industrial growth in neighboring Sherwood and Tualatin has outpaced Wilsonville, primarily due to their supply of large, development-ready parcels. In the Portland Metro area, industrial demand is primarily driven by businesses expanding or upgrading facilities rather than businesses locating from out of state. To remain competitive, Basalt Creek must be prepared to accommodate these businesses' evolving needs.

Originally, the BCCP envisioned a mix of industrial and office uses, with the High-Tech Employment District assuming 45 percent of development in the area would be office. However, the demand for office space has declined regionally and nationally, driven by the rise of remote and hybrid work. While office space will likely remain part of the BCPA, its footprint may be smaller than originally planned.

Wilsonville is well positioned to capture industrial growth, particularly in key sectors such as semiconductor supply chain, cleantech, advanced manufacturing, and logistics. Basalt Creek's proximity to major transportation networks, its skilled labor force, and its location near established industrial clusters enhance its attractiveness. However, several challenges must be addressed to realize this potential. Fragmented land ownership, existing contractor establishments, and rural infrastructure that does not meet urban standards remain key barriers to high-intensity industrial uses.[2] Addressing these obstacles will be vital to unlocking Basalt Creek's capacity to compete for its commensurate share of regional economic growth.

[2] The City is refining its infrastructure plans for the BCPA. While plans exist, the infrastructure has not yet been built and will require funding for improvements.

Buildable Lands Inventory: Measuring Land Capacity and Development Potential

The updated Buildable Lands Inventory (BLI) revises the 2014 inventory from the BCCP, providing an updated assessment of Wilsonville's portion of the BCPA for employment-related growth (see Appendix B). It identifies developable land and highlights areas with existing economic uses that offer redevelopment potential due to low improvement values and/or low employment density.

Of the 453 acres in Wilsonville's portion of the BCPA:[3]

- **173 acres** are currently in active use and considered developed.
- **129 acres** are constrained by physical or environmental factors.
- **150 acres** are considered buildable and available for development.

This buildable land supply is distributed across a range of parcel sizes, from small lots under 5 acres to larger parcels exceeding 25 acres, offering flexibility to meet diverse industrial and employment needs. Given the 150 acres of buildable land and the expectation of employment densities between 10 and 18.5 employees per gross acre, the BCPA is expected to accommodate between 1,500 and 2,780 jobs. The BCCP estimated employment capacity at about 2,500 jobs in Wilsonville's portion of Basalt Creek in 2018.

The updated BLI provides a clearer understanding of the land available to attract industries and support future employment growth. It emphasizes the BCPA's potential to support a variety of industrial and employment uses aligned with Wilsonville's economic development goals. However, it also reveals an increase in land used for contractor establishments since the previous BLI, highlighting the decreasing supply of land for urban industrial development. This trend is likely to continue if the area remains outside the city and unprepared for urban growth.

CHANGES FROM THE 2014 BLI

Buildable Acres

The BCCP identified 130 buildable acres whereas the updated BLI shows 150 buildable acres. This 20-acre increase is primarily due to a revised assessment of constraints in West Railroad. The 2014 BLI classified much of West Railroad as constrained, but updated constraints data show more development capacity. However, this gain was partially offset by land now occupied by contractor establishments, which has been reclassified as developed, reducing buildable acres elsewhere.

Employment Density

ECOnorthwest applied the BCCP's assumption of 18.5 jobs per gross acre to model a high-density employment growth scenario. However, shifting market conditions—such as reduced demand for office space and increased demand for industrial and flex space (which typically have lower employment densities)—led ECOnorthwest to also model medium- and low-employment density growth scenarios. This approach provides a range of potential employment densities that more accurately reflect evolving market conditions.

[3] Note that the acres do not total to 453 due to rounding.

Site Suitability: Aligning Market Potential

The Site Suitability Analysis assesses the competitiveness of three opportunity sites (Figure 2) within the BCPA to host key industries identified in the Economic Inventory (Appendix B includes the full site suitability analysis). This high-level evaluation focused on physical site characteristics—such as size, location, and constraints—without factoring in the likelihood of redevelopment. It provides a broad understanding of site benefits, barriers, and potential industry suitability, serving as a foundation for planning and zoning rather than a definitive assessment of development feasibility, building configurations or sizes.

Figure 2. Opportunity Sites

Source: ECOnorthwest Analysis, City of Wilsonville, Washington County, Metro

Infrastructure will be pivotal in shaping the types of industries and scale of development suitable for the area. This analysis incorporated available information on infrastructure elements such as water, wastewater, and roads, and planned urban improvements with development; however, detailed system capacities, final road alignments, and the timing of improvements—particularly in areas like West Railroad—remain uncertain. These factors will play a significant role in determining the market competitiveness and potential development timeline for a site.

Water and wastewater systems are expected to meet most demands, though high-water users may require additional capacity. Similarly, industries with high electricity demands, such as those requiring five megawatts or more, may necessitate infrastructure upgrades. Road alignments will impact parcel configurations, building sizes, and overall development potential. While these elements are critical to understanding site suitability, they are not yet classified as definitive constraints or advantages.

- **The SW Greenhill** site spans 57 acres, with 91 percent (52 acres) of the land unconstrained. Minimal slopes (affecting 11 percent of the site), a high proportion of undeveloped land, consolidated land ownership (two owners), and proximity to existing infrastructure make it one of the most development-ready locations in Basalt Creek. The site could be physically suitable for high-tech supply chain, cleantech industries, advanced manufacturing, food processing, warehousing and distribution, and industrial business parks or R&D campuses. Its proximity to transportation networks and regional workforce access further enhances its competitiveness.
- **The Craft Industrial** area is split into eastern and western portions by site constraints and consists of seven tax lots with fragmented ownership, most under five acres. Only 14 acres are unconstrained, and its proximity to residential areas limits its suitability for high-intensity industrial uses. Instead, the area aligns with the BCCP's vision for small scale or micro-industrial uses, such as live-work spaces or makerspaces.

  With site aggregation, the southeastern portion could accommodate small-scale industrial or office users on up to five acres. These uses could resemble industrial condo developments like the Commerce Circle Business Park or Riverwood Business Center in Wilsonville, which integrate office and small-scale production spaces. The northeastern portion, while it could also redevelop, is likely less appealing due to its irregular shape and nearby high-value residences. The presence of existing residences, including some high-value homes, are likely to delay redevelopment timelines compared to other opportunity sites.
- **The West Railroad** site spans 165 acres, with 55 percent (90 acres) of the land unconstrained. Its large parcels and access to regional transportation networks could make it physically suitable for uses such as general manufacturing, food processing, and warehousing or distribution. Proximity to Coffee Creek's industrial area further enhances its appeal to businesses providing support services to neighboring industries. However, significant infrastructure upgrades are required, and access is limited by only one established point of vehicular ingress and egress, as well as the low railroad undercrossing on SW Grahams Ferry Road, which does not currently allow passage by standard-height semi-trucks. Additionally, the site's proximity to a rail line and a mining operation could make the site less attractive to advanced manufacturing or other industries sensitive to vibration. Ongoing infrastructure alignment and capacity studies will provide further clarity on the site's suitability for targeted industries.

Contractor Establishments: Redevelopment Opportunities and Challenges

Contractor establishments have a substantial presence in Basalt Creek, particularly in West Railroad and along SW Day Road (Appendix C includes the full analysis of contractor establishments). These properties—often comprising small offices, storage buildings, and laydown yards—contribute limited employment and yield lower property values compared to urbanized industrial land. Figure 3 identifies the current land use categories and highlights areas occupied by contractor establishments.

While the Site Suitability Analysis assessed opportunity sites based on physical characteristics and their potential to support target industries should landowners opt to develop or redevelop, this analysis evaluates the redevelopment potential of contractor establishments under current market conditions.

Figure 3. Land Use Categories with Constraints, BCPA, 2024

Source: ECOnorthwest Analysis, City of Wilsonville, Washington County, Metro

Key Findings

Existing contractor establishments generate substantial income for property owners, reducing their motivation to sell or redevelop. For redevelopment to be financially viable, urban industrial rents would need to increase by 60 percent or more to justify the investment. Developers assess property value based on what remains after accounting for construction, entitlement, and operational costs, as well as conservative revenue assumptions. In Basalt Creek this is likely to result in developers offering less than what existing owners value their property for, especially when they are already hosting or running successful contractor establishments.

Relocation options for businesses currently occupying these sites are limited, creating additional challenges. Owner-occupied properties are even less likely to redevelop, as owners face relocation costs and potential increases in operational expenses. With limited regional industrial land, relocation could push these businesses farther from their markets, increasing costs for labor, transportation, and operations. Without considerable increases in urban industrial rents or land values, redevelopment for these properties remains unlikely.

Contractor establishments are unlikely to transition to higher intensity uses without City intervention. The gap between property values expected by owners and what developers can pay is unlikely to close naturally, as rising rents for industrial uses will likely coincide with increased contractor establishment rents. If the City seeks to promote urban industrial development in these areas, a more proactive approach will be necessary, including targeted incentives and policies to encourage redevelopment.

Conclusion and Recommendations

The BCPA offers a unique opportunity for Wilsonville to support regional economic growth and industrial development. Its strategic location near transportation networks, access to a skilled labor force, and proximity to established industrial clusters position the area as a strong candidate for attracting businesses supporting semiconductor supply chain, cleantech, advanced manufacturing, and logistics. However, realizing this potential will require addressing critical challenges and capitalizing on existing opportunities.

Fragmented land ownership and contractor establishments, which continue to be approved under Washington County's jurisdiction, remain barriers to the higher-intensity urban industrial uses envisioned in the BCCP. These establishments generate substantial revenue for property owners, reducing the incentive to sell or redevelop. For redevelopment to occur, urban industrial rents would need to rise substantially to bridge the gap between property owners' expectations and what developers are willing to pay. However, this gap is unlikely to close in the near term because as urban industrial rents rise, contractor establishment rents are also likely to increase. Additionally, relocation options for contractor establishment businesses, especially for owner-occupied properties, are limited, creating further challenges.

Rural infrastructure that does not meet urban standards also remains a key barrier to industrial development. This issue affects the feasibility of both immediate development and long-term growth, particularly in West Railroad where access is limited and the railroad undercrossing on SW Grahams Ferry Road precludes truck passage. Addressing these constraints is essential to unlocking the area's potential for higher-density employment uses.

Despite these challenges, there are clear opportunities. Development-ready sites and engaged property owners provide a strong starting point. Stakeholders have expressed a willingness to invest in infrastructure improvements if given access to large unconstrained sites, creating potential for catalytic projects that could spur additional development.

Wilsonville must balance its development goals with market realities. The Portland Metro area's industrial demand is driven by businesses expanding or upgrading facilities. Imposing restrictive requirements, such as mandating a high share of manufacturing, could deter development and drive users to more accommodating locations. Additionally, declining demand for office space nationally and regionally, driven by remote and hybrid work trends, suggests a reduced role for office uses compared to the original BCCP. While there are some exceptions to weak demand for suburban office space, our assessment is that the Portland Metro market dynamics are more consistent with national trends.

In conclusion, Basalt Creek presents a strong opportunity for Wilsonville to foster economic growth and industrial expansion. However, achieving this vision requires overcoming substantial challenges related to land use, infrastructure, and market dynamics. These findings provide the foundation for identifying actionable steps to unlock the area's full potential and align development with the City's long-term goals.

Recommendations

The recommendations for the BCPA are structured into four categories: **Further Exploration, Planning, Funding, and Investment.** These strategies address zoning, infrastructure, and development challenges while providing a phased approach for implementation. Central to these recommendations is the recognition that the status quo is unlikely to change without the City taking a more direct approach to encouraging development. Challenges such as fragmented ownership, the presence (and continued growth) of contractor establishments, and substantial needed infrastructure upgrades to serve urban developments are unlikely to resolve without City intervention.

Wilsonville can approach Basalt Creek's development with varying levels of involvement. A conservative approach would prioritize zoning and regulation, planning control, and limited infrastructure investments to guide development. A more proactive approach would accelerate the BCPA's vision by supporting relocation of contractor establishments, acquiring and aggregating land, and investing in additional infrastructure needs in areas like West Railroad. Which strategy the City chooses will ultimately depend on balancing risks with the desire to unlock the area's potential.

FURTHER EXPLORATION

This category focuses on gathering data, engaging stakeholders, and building a foundation of knowledge to support strategic decisions.

- **Outreach to Property Owners**: Engage with property owners to understand their development plans, challenges, and willingness to participate in redevelopment efforts. Explore opportunities for land assembly and redevelopment partnerships.
    - *Craft Industrial Opportunity:* Engage with landowners in the Craft Industrial area to explore dividing the site into east and west portions (by partitioning lots), focusing on creating developable parcels that align with the area's potential and constraints.
- **Coordinate with Portland General Electric (PGE) on Power Needs**: Collaborate with PGE to evaluate existing and future power requirements for industries such as advanced manufacturing and semiconductor supply chains, as identified in the Economic Inventory.
- **Explore Partnerships**: Identify opportunities to work with public entities (e.g., Port of Portland, Business Oregon, Greater Portland Inc.) and private partners to align resources and attract desired industries.
- **Support Contractor Establishment Relocation or Compliance:** Develop strategies to help contractor establishments relocate or consolidate or conform with City standards. This could involve creating incentives for relocation or, if necessary, working with them to bring existing operations into compliance with City service and land use standards.

PLANNING

Strategic planning ensures the alignment of zoning, policies, and infrastructure with long-term economic goals.

- **Apply the Planned Development Industrial (PDI) Zone across Basalt Creek with Modifications.** This approach would support a wide range of industrial and office uses consistent with the BCCP and the Economic Inventory. It allows the market to determine the most appropriate locations for various business types while still prioritizing industries aligned with the City's employment and wage goals.
  - *Prohibit Low-Intensity Uses and Address Existing Contractor Establishments.* Establish zoning prohibitions or limitations on low-intensity uses, such as contractor establishments, that do not meet long-term employment density goals. For existing contractor establishments, determine the appropriate regulatory approach, such as designating them as conditional, nonconforming, or prohibited uses.
  - *Evaluate Additional Standards or Allowances for the Craft Industrial Area.* Given the site's constraints and proximity to residential development, the Craft Industrial Area has limited development potential. To maximize its utility, consider allowing additional uses—such as live-workspaces, small-scale offices, and small-scale production facilities—that may not fully align with the current PDI zone. This could involve creating a separate zoning designation or an overlay to expand the range of permitted uses within the PDI zone.
- **Update Urban Planning Area Agreement (UPAA)**: Amend agreement with Washington County to transfer planning authority for Basalt Creek to the City, ensuring alignment with Wilsonville's long-term vision. This would reduce the risk of continued low-intensity uses, alleviate staffing burdens at the County level, and reduce future pressures to expand the urban growth boundary (UGB).
  - *Example*: Troutdale has an Intergovernmental Agreement with Multnomah County that transfers planning authority to the City for areas within its UGB.
- **Preliminary Urban Renewal Area (URA) Analysis**: Evaluate the feasibility of establishing a URA or expanding the Coffee Creek URA to help fund infrastructure improvements and catalyze development. NOTE: The City already has funding for this task as part of the Wilsonville Industrial Land Readiness project.
- **Consider a Development Plan for West Railroad**: Develop a plan for West Railroad that balances industrial development with community priorities. While the BCCP deemed much of the site unbuildable and omitted detailed future use recommendations, the City has continued to address the area in broader land use and infrastructure planning. Building on these efforts, the plan should involve input from landowners, potential users, and ideally a master developer to ensure alignment with stakeholder needs and market trends. Importantly, creating this plan would not preclude zoning the area to guide immediate development efforts.

FUNDING

Identifying and securing funding sources will be critical to addressing infrastructure needs and supporting redevelopment.

- **Explore and Establish Funding Mechanisms such as:**
  - Use Urban Renewal to finance infrastructure improvements and reduce barriers for developers pending the results of the URA feasibility study.
  - Explore the potential for Local Improvement Districts (LIDs) and/or public-private partnerships to share costs and responsibilities. NOTE: Cost sharing mechanisms of owners of contractor establishments may be less attractive if they do not need the infrastructure improvements or connections to continue business operations.
- **Explore and Leverage State and Federal Funding:** Leverage grants, loans, and other funding programs to support infrastructure upgrades and attract investment. These could include, but are not limited to:[4]
  - Statewide Transportation Improvement Program (STIP)
  - Immediate Opportunity Fund (IOF)
  - Oregon Transportation Infrastructure Bank (OTIB).
  - Safe Drinking Water Revolving Fund (SDWRLF).
  - Water Wastewater Fund (W/W).
  - Special Public Works Fund (SPWF).
  - U.S. Economic Development Association (EDA) Public Works Program

INVESTMENTS

Targeted investments will help unlock development opportunities and create momentum for future growth.

- **Develop Infrastructure**: Focus early infrastructure improvements on properties that are cost-effective to serve and likely to develop in alignment with the BCPA vision, such as the SW Greenhill Road site. These early investments can demonstrate feasibility and attract additional development.
  - The City could collaborate with property owners, Greater Portland Inc. (GPI), and Business Oregon to attract a catalytic user that could justify and accelerate infrastructure development for the site. Combining this strategy with site acquisition efforts and development planning for West Railroad would further enhance its effectiveness and overall development potential.
- **Provide Development Incentives such as**:

[4] As a first step, the City should draft a list of potential projects and evaluate eligibility for funding programs; ECOnorthwest did not evaluate eligibility for these funding programs.

- Consider system development charge (SDC) adjustments or deferrals for targeted developments that support the city's vision for BCCP and where it would not place undue burdens on funds available for capital improvements.
- Market the City's "WIN" (Wilsonville Investment Now) program in conjunction with Basalt Creek development opportunities. NOTE: This urban renewal program would no longer be available if an area-wide urban renewal area is established.
- Provide relocation assistance to contractor establishments to enable redevelopment. This could include support identifying alternative sites and streamlining permitting processes if those sites are in Wilsonville.

- **Site Acquisition and Aggregation**: Partner with public or private entities to assemble large, contiguous parcels that can support high-value industrial users. Consider using Urban Renewal funds and public partner contributions to facilitate these efforts.
  - The City could explore securing **purchase options** on key parcels to facilitate land assembly. A purchase option allows the City the right to buy property within a specified timeframe, offering flexibility without the immediate cost of full acquisition. This proactive approach provides leverage and control over future development while allowing the City to decline the purchase if circumstances change or acquisition becomes unfeasible. To advance this strategy, the City should identify and prioritize purchase option agreements with property owners of high-opportunity sites, building momentum for collaboration and development.

Phasing

The implementation of the BCPA recommendations is structured into three phases: Immediate (0–3 years), Midterm (3–7 years), and Long-Term (7–15 years). Each phase focuses on actionable steps to address development challenges, align infrastructure, and catalyze economic growth while adapting to market trends.

IMMEDIATE ACTIONS (0–3 YEARS)

The initial phase establishes the foundational elements for Basalt Creek's development by addressing zoning, engaging stakeholders, and identifying funding strategies. Key priorities include:

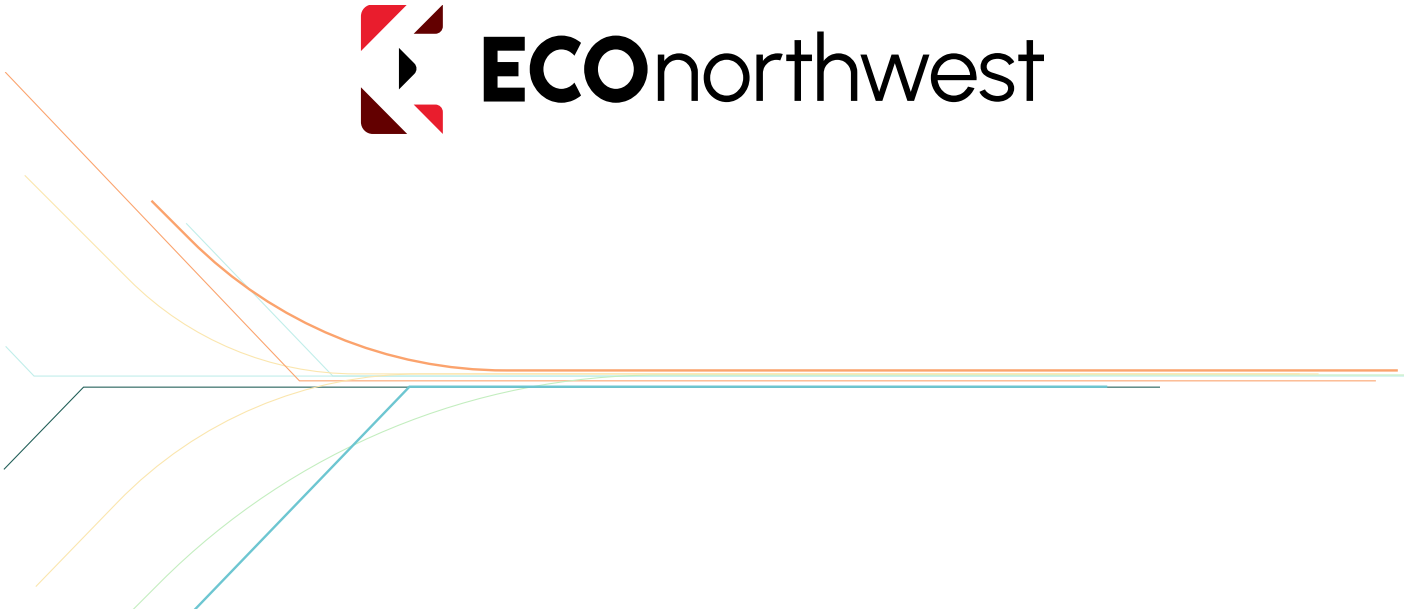
- Establish zoning
- Amend UPAA with Washington County
- Engage property owners to discuss future plans, development potential, and incentives
- Explore ways to support contractor establishment relocation and/or accommodate and bring them to City standards (urban industrial development)

- Analyze funding needs and sources and develop funding strategy to support infrastructure investments and other priorities such as land acquisition and developer incentives
- Explore partnerships
- Coordinate with PGE on anticipated power needs
- Prioritize infrastructure to properties that are both high opportunity and "low-cost-to-serve," to showcase early wins

MIDTERM ACTIONS (3–7 YEARS)

This phase builds on early successes by advancing funding mechanisms, solidifying plans for key areas, and fostering development agreements. Major actions include:

- Adopt funding mechanisms to support infrastructure investments and other priorities (this is a likely prerequisite to land acquisition)
- Acquire key parcels (or purchase options) as opportunity and funding allows
- Develop West Railroad's development plan with input from landowners, potential users, and preferably a master developer
- Secure initial development agreements and fund major infrastructure upgrades through URA or other funding mechanism
- Continue to coordinate with PGE



LONG-TERM ACTIONS (7–15 YEARS)

The final phase focuses on sustaining Basalt Creek's momentum by adapting to market trends and completing infrastructure build-out to support full site utilization. Long-term priorities include:

- Monitor market trends and adjust zoning or policies to accommodate emerging industries
- Complete phased infrastructure build-out to support full site utilization

This phased approach ensures that Basalt Creek's development progresses systematically, balancing immediate actions with long-term investments to achieve the City's vision for economic growth and industrial expansion.

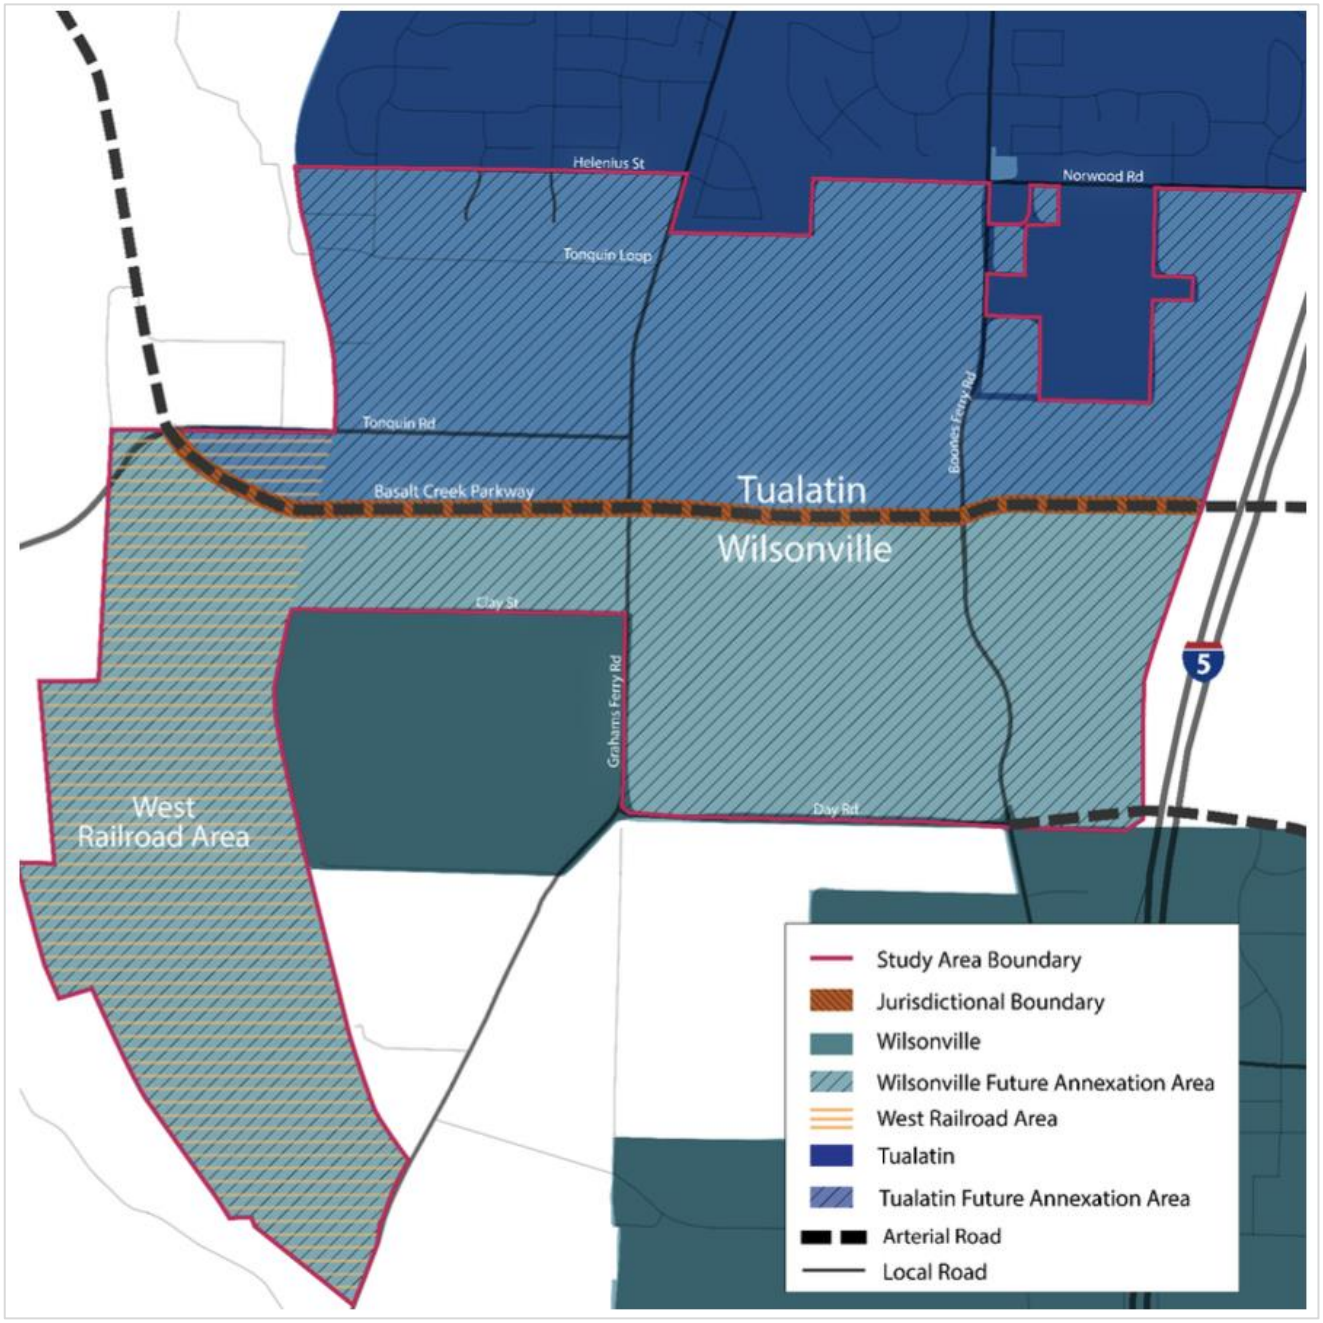
1. Introduction

Purpose and Background

After a multiyear planning process, Wilsonville, in partnership with Tualatin, developed and adopted the Basalt Creek Concept Plan (BCCP) in 2018. The BCCP established a framework for development in the area over the next twenty years. Wilsonville is planning for the development of its portion of the Basalt Creek Planning Area (BCPA), located in unincorporated Washington County.

The City adopted the BCCP in anticipation of future industrial development. However, at the time of adoption, a number of implementation steps remained. In the years following the adoption of the BCCP, Washington County has approved development consistent with County zoning. The BCPA now hosts several contractor establishments that, while providing jobs and economic activity, are not the type of development or commerce envisioned in the Concept Plan.

The City is currently working on the final implementation steps to make the BCPA development ready. These steps include designating the zoning to be used in the area as well as refining infrastructure funding plans. Since adoption of the BCCP in 2018, significant economic shifts have occurred at national, state, regional, and local levels to be considered during the current implementation steps. Given these economic shifts, reassessing Basalt Creek's market conditions is crucial for Wilsonville's implementation process. This reassessment will help ensure that development plans align with current economic realities and future projections.



To understand the changing market conditions, Wilsonville engaged ECOnorthwest to conduct an updated market assessment and industrial lands study for Wilsonville’s portion of Basalt Creek. This Economic Inventory report is a key component of that study, providing an overview of the current economic conditions and trends affecting the BCPA. The findings from this analysis will inform recommendations on how to translate the BCCP’s land use concepts into zoning designations and inform infrastructure planning to support economic development opportunities in the area.

Basalt Creek Planning Area Overview

The Basalt Creek Planning Area (BCPA) is an 847-acre area located in unincorporated Washington County between the southern border of incorporated Tualatin and the northern border of incorporated Wilsonville. This report focuses on the Wilsonville section, which includes 480 acres within the designated Wilsonville Future Annexation Area and West Railroad Area (as depicted in Figure 1). The BCPA is centrally located in the southern portion of the Portland metro, easily accessible and connected to other growing industrial areas, including Sherwood and Tualatin. It has access to the Portland metro and Mid-Valley labor sheds, making it well positioned to attract various types of industry.

Currently, the Wilsonville portion of the BCPA falls under Washington County's Future Development 20-Acre District (FD-20) zoning, which allows a variety of low-intensity uses. The area has limited development, with much of the developed land used for contractor establishments, including storage of equipment and vehicles. A contractor establishment is a facility where contractors and/or subcontractors store and organize their tools, equipment, supplies, and materials. These facilities can include buildings, grounds, or structures, and often have outdoor storage and assembly areas. While important uses, these lands host limited employment and assessed property value, much less than the employment densities and development typologies envisioned in the BCCP and typical of land within the metro urban growth boundary (UGB) and incorporated City limits.

Figure 1: Basalt Creek Planning Area

Source: Basalt Creek Concept Plan, 2018. Note: Wilsonville's portion of the Basalt Creek Planning Area (BCPA) is inclusive of the Wilsonville Future Annexation Area and West Railroad Area.

How does the Basalt Creek Concept Plan guide development?

After a multiyear planning process, Wilsonville, in partnership with Tualatin, developed and adopted the Basalt Creek Concept Plan (BCCP) in 2018. The BCCP established a framework for development in the area over the next 20 years. The BCCP identifies preferred land uses across the area and strives to coordinate future land use, transportation, and infrastructure investments between Tualatin, Wilsonville, and Washington County. In particular, the BCCP:

- Established a vision for urbanization of the Basalt Creek Planning Area
- Established a new jurisdictional boundary between Tualatin and Wilsonville (to determine which parts of the Planning Area may be annexed into and served by each City)
- Identified conceptual land uses across the area
- Recommended high-level designs for transportation and infrastructure systems to support future development
- Set specific action items and implementation measures

GUIDING PRINCIPLES

Guiding Principles represent the collective interests and goals for the Basalt Creek Planning Area, as agreed to and established by the Joint Councils of Tualatin and Wilsonville.

- **Maintain and complement the Cities' unique identities.**
- **Capitalize on the area's unique assets and natural location.**
- **Explore creative approaches to integrate jobs and housing.**
- **Create a uniquely attractive business community unmatched in the metropolitan region.**
- **Ensure appropriate transitions between land uses.**
- **Meet region responsibility for jobs and housing.**
- **Design cohesive and efficient transportation and utility systems.**
- **Maximize assessed property value.**
- **Incorporate natural resource areas, and provide recreational opportunities as community amenities and assets.**

Land Use Designations

The BCCP identified a mix of land use designations for the area based on its land suitability analysis and adjacent land uses. For Wilsonville, the BCCP proposed four main land use designations. However, West Railroad did not include a specific concept because it was viewed as having lower development potential and was slated for future study and consideration. These designations, as defined in the BCCP, are:

HIGH-TECH EMPLOYMENT DISTRICT

Most of the buildable acres in the Planning Area south of the proposed Basalt Creek Parkway are devoted to a mix of higher-density employment land. The High-Tech Employment District is expected to accommodate the largest number of jobs (1,916) with a mix of warehousing, manufacturing, and office buildings. This land use is in the southern and eastern sections of the Planning Area, covering all Wilsonville land east of SW Boones Ferry Road and most of the land south of SW Clay Street, which extends to SW Day Road and is bordered to the west by Coffee Creek Correctional Facility.

The BCCP assumed the following breakdown of uses for the High-Tech Employment District, which helped estimate the amount of traffic the development would generate.

Table 1. BCCP Assumed Breakdown of Uses for the High-Tech Employment District

USE	SHARE
Retail	1%
Office	45%
Industrial	38%
Warehousing	15%
TOTAL	**100%**

Source: Basalt Creek Concept Plan, 2018. Note: Share may not equal 100% due to rounding.

CRAFT INDUSTRIAL

The southwest corner of the intersection of SW Boones Ferry Road and the new Basalt Creek Parkway is planned as Craft Industrial, which allows for a mix of smaller-scale commercial uses and may include live-work units. These envisioned development types respond to the topography on those parcels and their location directly south across the Parkway from residential land and southwest of the neighborhood commercial node across the Parkway in Tualatin. Craft Industrial is a better fit with those surrounding uses, providing a transition to the higher-intensity employment uses to the south. This area allows less than 20 percent residential use and is expected to accommodate 27 new jobs and 6 new housing units in the form of live-work units.

The BCCP assumed the following breakdown of uses for the Craft Industrial District, which helped estimate the amount of traffic the development would generate.

Table 2. BCCP Assumed Breakdown of Uses for the Craft Industrial District

USE	SHARE
Retail	24%
Office	31%
Industrial	44%
Warehousing	1%
TOTAL	100%

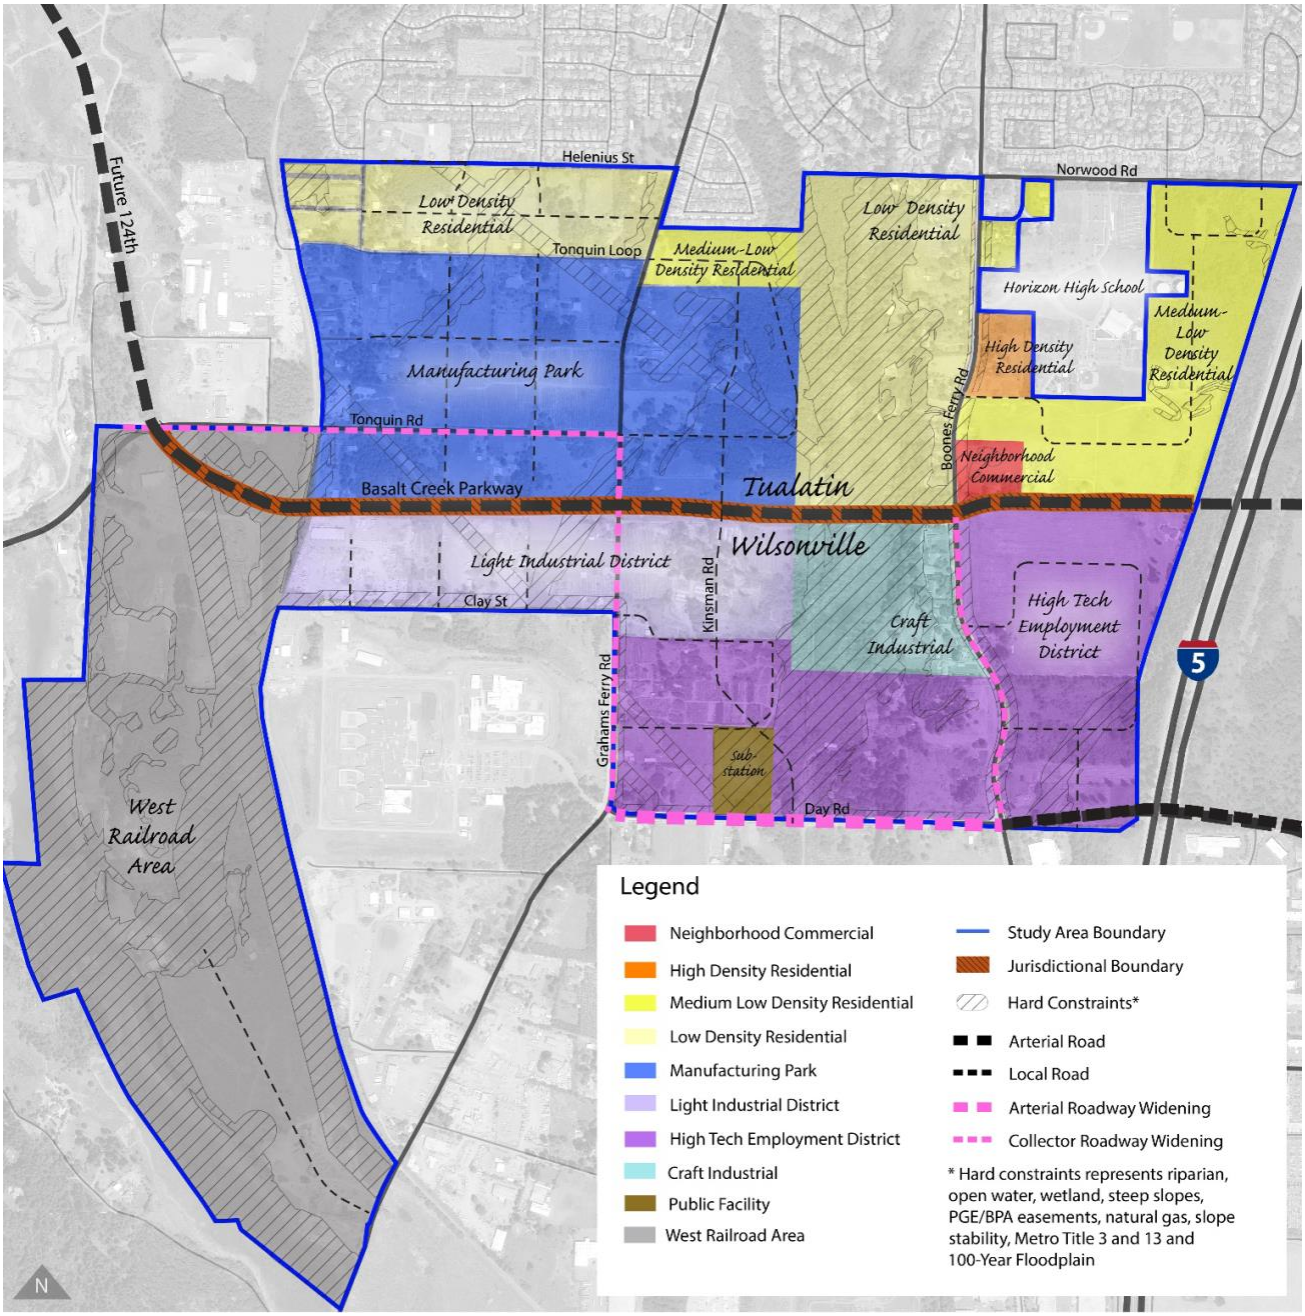
Source: Basalt Creek Concept Plan, 2018. Note: Share may not equal 100% due to rounding.

LIGHT INDUSTRIAL DISTRICT

This land is located across the southern edge of Basalt Creek Parkway and its future extension just north of Coffee Creek Correctional Facility, and it will be able to accommodate 581 new jobs, primarily in warehousing and light manufacturing.

The BCCP assumed the following breakdown of uses for the Light Industrial District, which helped estimate the amount of traffic the development would generate.

Table 3. BCCP Assumed Breakdown of Uses for the Light Industrial District



USE	SHARE
Retail	1%
Office	19%
Industrial	69%
Warehousing	11%
TOTAL	100%

Source: Basalt Creek Concept Plan, 2018. Note: Share may not equal 100% due to rounding.

WEST RAILROAD AREA

The West Railroad Area is divided from the rest of the Planning Area by the Portland and Western Railroad (PNWR) and the Coffee Creek Correctional Facility. When the BCCP was adopted, the area was heavily constrained by wetlands habitat, steep slopes, and fragmented property ownership. Initial estimates indicated that it would be costly to serve this area with adequate infrastructure due to its location. However, it was identified as having potential for resource conservation, future public access to nature, and possibly additional land uses. Because it was considered to have much lower development potential than the rest of the Planning Area, a future land use scenario was not created. Additional analysis on infrastructure funding and appropriate land uses was recommended once development and extension of infrastructure occurred in the rest of Basalt Creek.

Figure 2. Basalt Creek Land Use Concept Map

Source: Basalt Creek Concept Plan, 2018.

Note: West Railroad did not include a specific concept because it was viewed as having lower development potential and was slated for future study and consideration.

Implementation Measures

The BCCP also outlined the following implementation measures for the Cities:

1. **Update Urban Planning Area Agreements (UPAAs)** to acknowledge the future jurisdictional boundary and outline what areas may be annexed by each City, as well as transfer planning authority to the Cities.
2. **Amend Comprehensive Plans** to include the adoption of the Concept Plan.
3. **Assess zoning** and make sure it is compatible with anticipated land uses in the area and special design elements in the Concept Plan. The Concept Plan suggested Wilsonville consider applying the Coffee Creek Industrial Design Overlay District (form-based code) in the area.
4. **Annex as demand occurs** based on the pace of development and begin to make utility improvements adjacent to existing City services.
5. **Consider capital improvements** to spur development via financing the infrastructure themselves for reimbursement, creating a cooperative financing district, or developing the infrastructure to induce desired development.
6. **Consider master planning** in the area.

Wilsonville updated its UPAA in 2019 and amended its Comprehensive Plan after the Concept Plan was adopted. The City is now working on developing zoning and evaluating infrastructure needs as a part of this project.

Basalt Creek Concept Plan Proposed Employment Densities

The BCCP assigned employment densities to each land use designation to align with the regional employment capacity and traffic counts. According to the Concept Plan, the Wilsonville portion of the BCPA could support 2,524 jobs across 136.6 buildable acres, for an average employment density of 18.5 employees per gross buildable acre. The specific land use designations and respective employment densities are shown below. Note: West Railroad did not include a specific concept because it was viewed as having lower development potential in the near term and was slated for future study and consideration.

Table 4: Basalt Creek Concept Plan Land Use Designations

LAND USE DESIGNATION	BUILDABLE ACRES	TOTAL JOBS	JOBS PER GROSS BUILDABLE ACRE
Craft Industrial	1.3	27	21.7
Light Industrial District	35.3	581	16.5
High Tech Employment District	94.5	1,916	20.3
Functionally Unbuildable	5.6	0	0
TOTAL	**136.6**	**2,524**	**18.5**

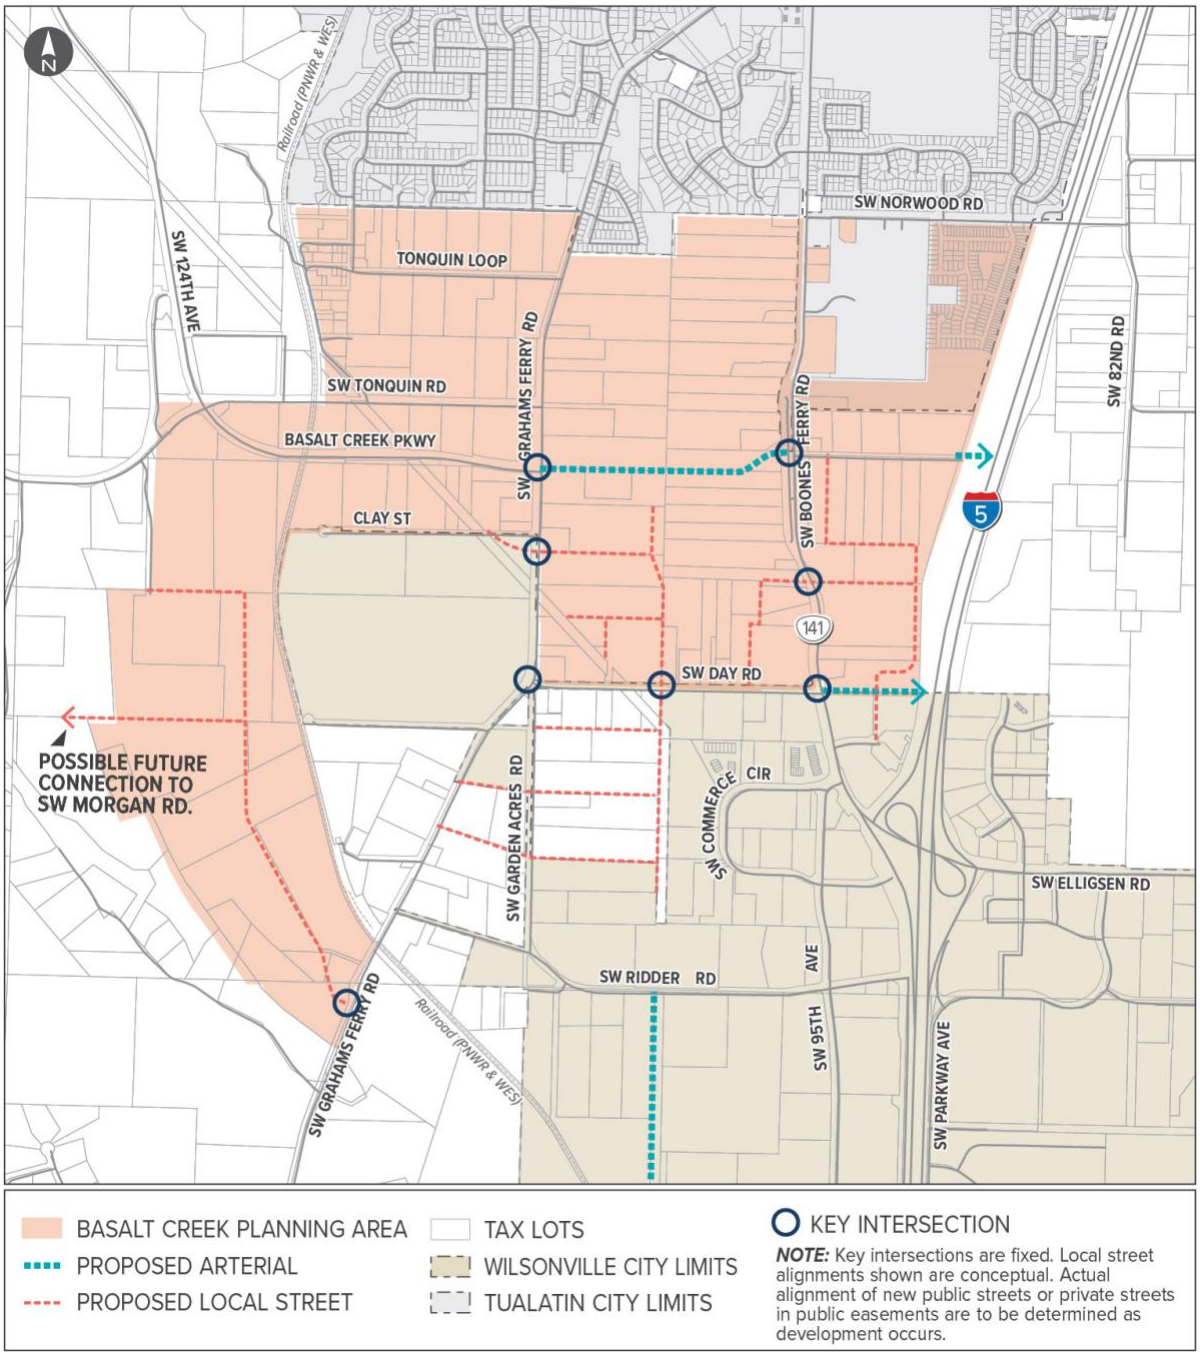
Other Guiding Plans and Documents

WILSONVILLE COMPREHENSIVE PLAN

Wilsonville's Comprehensive Plan, updated in 2024, designates Basalt Creek and West Railroad as areas of special concern (M and N), and it describes special considerations that must be addressed in development of these areas. Design objectives established for Area of Special Concern M, Basalt Creek, include:

- Consider adopting a form-based code similar to that adopted in the Coffee Creek Industrial Area for new industrial development in Basalt Creek.
- Protect key natural resources and sensitive areas while making recreational opportunities accessible by integrating the new parkland, open spaces, natural areas, and trails in Basalt Creek into existing regional networks. Development should protect, enhance, and provide access to these natural resources.
- Locate north-to-south trails near the Basalt Creek Canyon and provide bicycle connections that would connect to other cities and trail systems, serving as an asset for both residents and employees in the area.
- Provide strong transit access to support employment within Basalt Creek. Integrate transit access with the bike, pedestrian, and trail services at key access points along SW Grahams Ferry Road, SW Boones Ferry Road, SW Day Road, SMART Central, and the Coffee Creek Correctional Facility.

No design objectives were included for Area of Special Concern N, West Railroad; however, it is noted that the area will require additional planning before any development occurs.



BASALT CREEK TRANSPORTATION REFINEMENT PLAN

The 2013 Basalt Creek Transportation Refinement Plan (TRP) set the layout of major new roads and improvements for the area, including enhanced bike and pedestrian facilities and connections to the future SMART transit system. The TRP included an Action Plan that consisted of 18 transportation investments, which were prioritized according to short-term, medium-term, and long-term projects.

ONGOING INFRASTRUCTURE AND NATURAL RESOURCE PLANNING

The City is currently collaborating with several consultants to update its understanding of infrastructure needs, natural resources, and hazards in the BCPA. The City is working with DKS Associates to refine the street alignment in the BCPA. A preliminary street alignment, provided below, may undergo further changes in future iterations.

Figure 3. Proposed BCPA Street Plan

Source: DKS Associates

Simultaneously, Pacific Habitat Services is assisting the City in updating and refining natural hazard and resource maps of the area. For utility infrastructure, the City has engaged Consor to help with assessing water, wastewater, and stormwater needs, as well as with determining the costs of necessary upgrades. These collaborative efforts aim to provide a comprehensive and up-to-date overview of the area's development requirements and environmental considerations. These simultaneous projects will be incorporated and inform this planning process as information becomes available.

What has happened since the Basalt Creek Concept Plan was adopted?

Since adoption of the BCCP, significant shifts have occurred in the office and industrial real estate markets. The pandemic accelerated the trend toward remote work, leading to higher office vacancy rates and a redefinition of office space needs. Conversely, the industrial sector experienced strong growth characterized by high demand, rising rents, and robust development, which was driven in part by the federal Creating Helpful Incentives to Produce Semiconductors (CHIPS) and Science Act. National trends in these industries are detailed in Section 2, while regional and Wilsonville-specific trends are covered in Section 3.

The City of Wilsonville has not annexed any of Basalt Creek since the BCCP was adopted in 2018. As a result, the BCPA has remained under Washington County's jurisdiction and zoning. Some development has occurred at much lower densities than envisioned in the BCCP, which is allowed under the more permissive County zoning code. Many existing businesses, including contractor establishments, have few employees and are using large areas of land for equipment storage, which conflicts with the City's vision for higher employment density. These uses are permitted under Washington County zoning but do not align with Wilsonville's goals for the area, or with the goals, priorities, and industrial land needs within the greater Portland metro area. Wilsonville's portion of the BCPA consisted of 90 tax lots in 2022. Some areas have a high degree of parcelization, while others are less fragmented. There are a handful of large contiguous landholdings by single ownership. While there has been growth in contractor establishments, many of them existed before the BCCP was in place. These trends are discussed in more detail in Section 3.

The City is interested in future development in Basalt Creek that better aligns with its vision for higher industrial employment density. To make meaningful progress, the City must first establish appropriate zoning designations and plan for necessary infrastructure—key objectives of this project.

2. Changes in Market Conditions

Following the COVID-19 pandemic, office and industrial real estate markets faced challenging development conditions, particularly due to high interest rates, significantly slowing commercial real estate development activity. The increased cost of capital has made many projects economically unfeasible, especially speculative projects that rely on debt financing and those with longer loan payback periods.[1] Higher interest rates have also reduced property valuations, complicating the ability of developers to secure construction financing and attract equity investments.[2] Additionally, rising construction costs—driven by inflation and supply chain disruptions—have further complicated development efforts across these sectors.

This section examines national trends that have shaped office and industrial real estate markets in recent years. It compares these trends to projections from the 2014 Market Analysis by Leland Consulting Group, which informed the BCCP. Understanding the broader national context is crucial for several reasons: It provides a benchmark for comparing local performance. National trends often influence regional and local markets, albeit sometimes with a delay. This understanding helps identify potential opportunities or challenges that may affect Wilsonville and Basalt Creek in the future. It also allows for more informed decision-making and strategic planning at the local level.

Regional and Wilsonville-specific trends are addressed separately in Section 3, building upon this national overview.

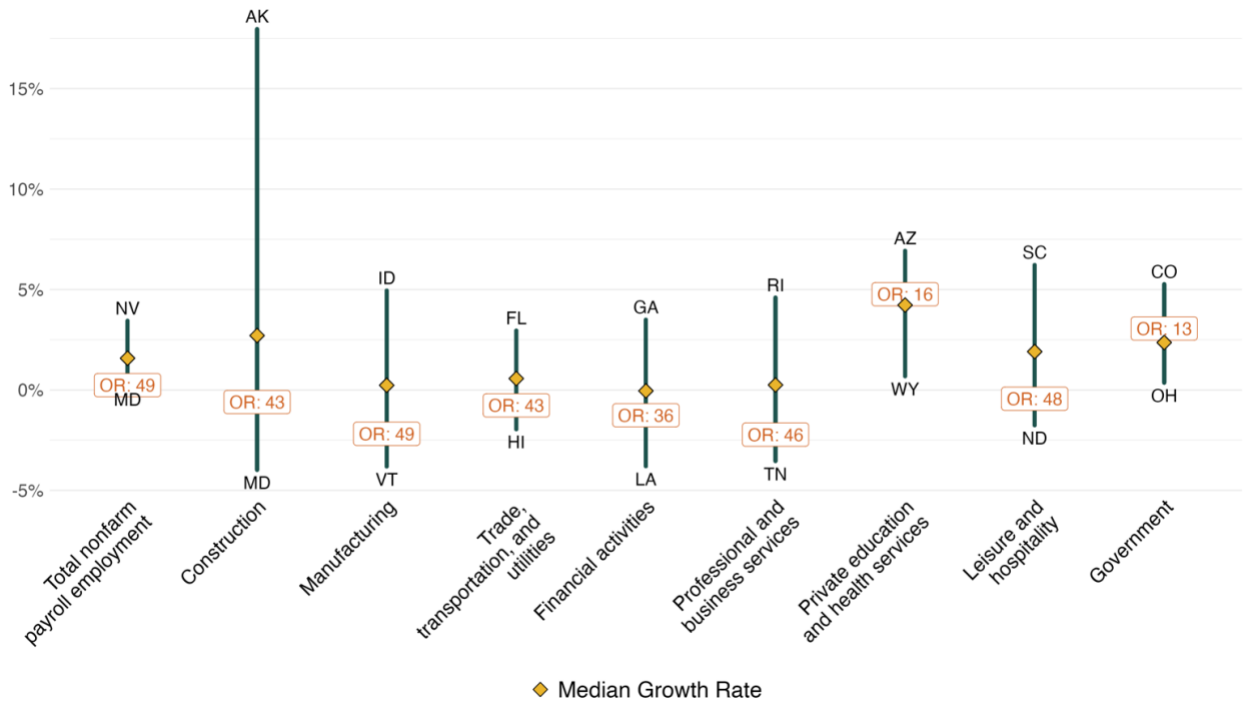
National and State Employment Trends

National Employment

The United States has seen robust employment growth since the COVID-19 pandemic. National employment increased by 21 percent between April 2020 and April 2024, surpassing prepandemic levels. The most recent year (April 2023 to April 2024) saw total nonfarm employment grow by 1.8 percent.[3]

Oregon Employment

Oregon's employment recovery, while positive overall since 2020, has fallen behind the national trend. From April 2020 to April 2024, the state's employment grew by 17 percent.



---

[1] If developers take on debt to finance a project, the longer they take to repay the loan, the more interest will accrue.
[2] In addition to loans, developers will typically finance projects in part with equity investments, in which investors become shareholders in the project.
[3] U.S. Bureau of Labor Statistics, Total Nonfarm Employment (not seasonally adjusted), 2020-2024.

However, in contrast to national growth, Oregon experienced a slight decline of 0.1 percent in employment between April 2023 and April 2024.[4]

The state's recent economic performance is concerning across multiple sectors. Oregon ranked 49th out of all states in nonfarm employment growth rate between April 2023 and April 2024. During this period, the state was among the bottom ten for employment growth (losing jobs while other states saw gains) in manufacturing, construction, trade, transportation and utilities, professional and business services, and leisure and hospitality.

Figure 4. Employment Growth Rates for All States by Sector (April 2023 to April 2024)

Source: U.S. Bureau of Labor Statistics Current Employment Survey, April 2024. Note: This figure compares Oregon's employment growth rate to all other states. For example, "OR: 49" for total nonfarm payroll employment means Oregon ranked 49th out of all states in employment growth rate between April 2023 and April 2024.

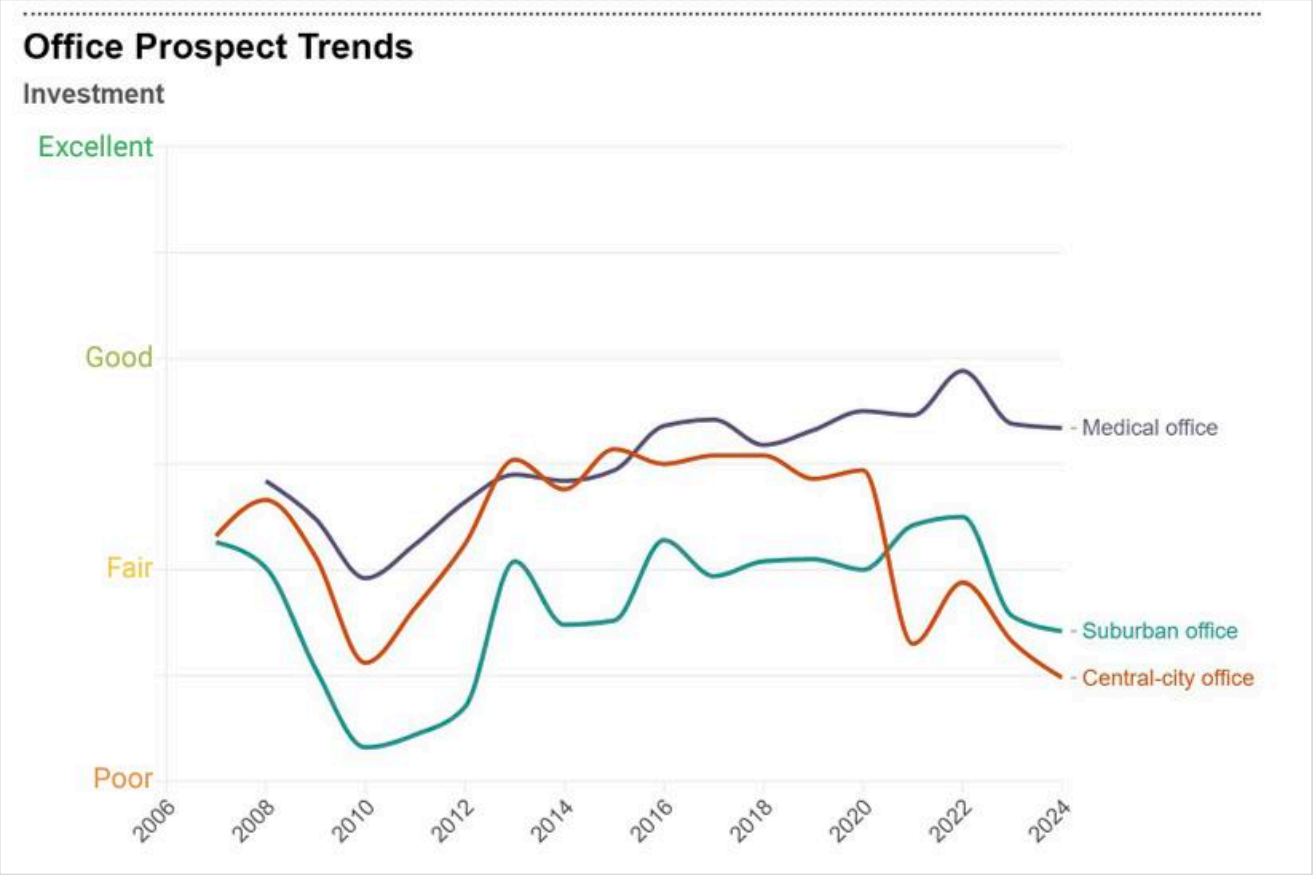
[4] U.S. Bureau of Labor Statistics, Total Nonfarm Employment (not seasonally adjusted), 2020-2024

National Office Trends

This section describes national trends for office space excluding industrial, manufacturing, or flex space, which is discussed in the following subsection. The 2014 Market Analysis, which informed the Basalt Creek concept planning process, highlighted a reduced demand for office space and a less robust market, predicting a slower pace for office development. This outlook was based on the fact that regional employment levels in Portland had only recently returned to their prerecession levels of 2008.

These trends have been further exacerbated by the COVID-19 pandemic and resulting market shifts toward remote work. According to the Bureau of Labor Statistics' American Time Use Survey, the share of employees working from home rose from 24 percent in 2019 to 34 percent in 2022.[5] Nationally, the office market as a whole is declining, although high-quality office space remains in relatively strong demand. Key findings include:

- **Negative net absorption:** National net absorption for office space came in negative (at negative 18.2 million square feet) for the tenth quarter in a row.[6] However, this trend is not uniform across U.S. markets, with a third of U.S. office markets having positive net absorption. JLL, a global commercial real estate and investment management company that tracks and reports on commercial real estate dynamics, noted that many properties and markets with high negative net absorption are earmarked for conversion to other uses.[7]
- **Shrinking inventory:** The construction pipeline has decreased by 67 percent since early 2020. As of Q2, 2024 office deliveries (referring to new construction added to the market) were 27 percent below the average since 2020, and the current pipeline is at its lowest point in a decade.[8] As office inventory removals outpace market deliveries, overall office market inventory has declined.[9]
- **Favored product types:** Certain types of office space are outperforming others, with tenants favoring high-quality buildings, such as those in attractive locations or featuring additional amenities. With new construction slowing down, existing high-quality assets will likely continue to see demand as competition decreases. In contrast, older and obsolete spaces may require investment or conversion, and the performance of middle-market spaces will vary depending on factors like location, space type, and submarket.[10]



Looking ahead, the office sector is expected to adjust to a hybrid work model, with peak attendance levels stabilizing at around 60 to 70 percent. This shift will set a new baseline for office space requirements. Cushman & Wakefield predicts that office occupancy will start to stabilize in the latter half of 2025 as the pace of adjustments to hybrid spaces

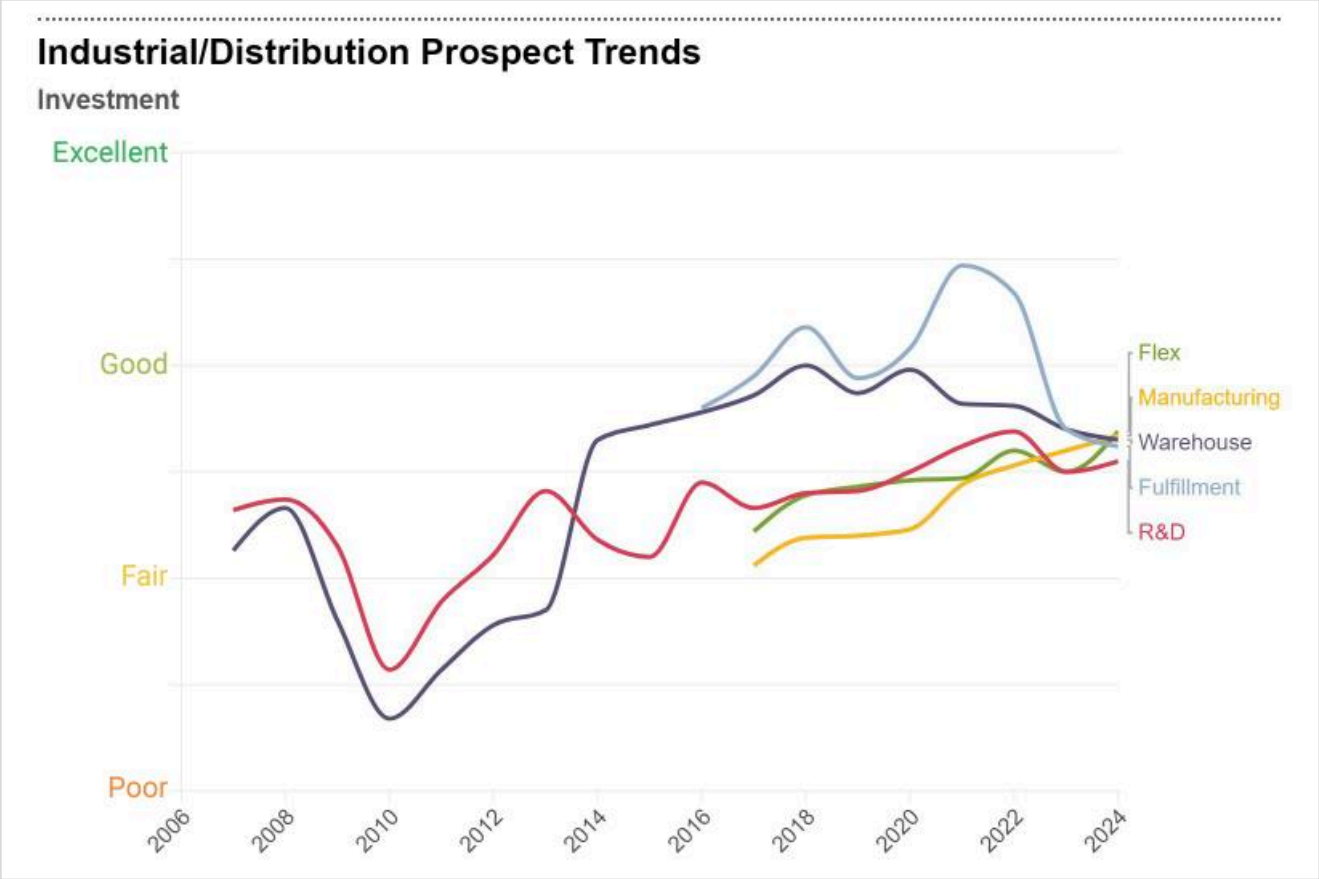
[5] BLS, American Time Use Survey, 2023; does not differentiate between part- and full-time workers
[6] Cushman & Wakefield, U.S. Office Marketbeat Q2 2024
[7] JLL, JLL U.S. Office Outlook Q1 2024
[8] Cushman & Wakefield, U.S. Office Marketbeat Q2 2024
[9] JLL, JLL U.S. Office Outlook Q1 2024
[10] Cushman & Wakefield, U.S. Office Marketbeat Q2 2024

slows down and growth in both employees and new businesses generate demand for office space.[11]

Figure 5 shows the Urban Land Institute's national office market investment prospect trends by secondary market type. While the investment prospect for suburban and central city office space has fallen between "poor" and "fair" in recent years, the investment prospect for medical office space has risen relatively steadily and is rated just below "good."

Figure 5: Urban Land Institute National Office Investment Prospect Trends

Source: Urban Land Institute 2024 Emerging Trends in Real Estate, United States and Canada



[11] Cushman & Wakefield, U.S. Office Marketbeat Q2 2024

National Industrial Trends

The 2014 Market Analysis, which informed the Basalt Creek concept planning process, reported that industrial space demand was likely to surge as the economy continued to recover from the 2008 recession, citing significant industrial space in the Portland region's development pipeline. It also highlighted that the I-5 South submarket would see some of the greatest demand, predicting that industrial development would continue to outpace office development—an accurate forecast.

The 2014 Market Analysis also correctly predicted stronger markets for research and development, advanced manufacturing, general manufacturing, and warehousing space. Figure 6 shows the Urban Land Institute's trends in investment prospects for industrial and distribution space nationally, showing increased development prospects for these space types from 2014 to around 2021. Historically, fulfillment and warehouse space were rated as better investment prospects than research and development, manufacturing, and flex space. However, in recent years the investment prospects for the various secondary market types have coalesced toward a similar prospect rating, just below "good."

Figure 6: Urban Land Institute National Industrial and Distribution Prospect Trends

Source: Urban Land Institute 2024 Emerging Trends in Real Estate, United States and Canada

In recent years, the industrial real estate market has shown strong performance, particularly in 2022 and 2023, though growth has started to slow in 2024. Despite this slowdown, the national industrial market remains relatively robust overall. Key trends include:[12]

- **Stabilizing vacancy rates:** Since mid-2022, vacancy rates have been rising, but the pace of increase has slowed. As of Q2 2024, the national vacancy rate stands at 6.1 precent and is expected to continue increasing. However, it remains below the 10-year prepandemic average (2010-2019) of 7 percent.
- **Positive net absorption:** Industrial market demand remains strong, with positive net absorption and rising rents. However, the rate of change has slowed compared to previous years. For instance, rents rose by 3.7 percent year over year since 2023 Q2, marking the slowest growth rate since 2020.
- **Slowing construction:** One reason for rising vacancy rates is the influx of new supply, with over 1.2 billion square feet delivered nationally in 2022 and 2023. However, the construction of new industrial projects has slowed significantly, decreasing by 46 percent from Q2 2023, reaching its lowest point in four years.

Nationally, the market is expected to stabilize over the next year as the shrinking construction pipeline and positive net absorption limit the available supply of industrial space. However, Cushman & Wakefield report that "the tailwinds of e-commerce growth, onshoring and nearshoring, and a resilient consumer all set the stage for fundamentals to trend positively going forward, albeit at a pace below 2021 and 2022 highs."[13,14] Key forecasted trends include:

- **Decreasing vacancy rates:** While vacancy rates are expected to continue to rise until early 2025, they are expected to peak at around 6.7 percent and then begin to decrease in the second half of 2025. In conjunction with this trend, annual net absorption is expected to increase through 2025.[15]
- **Increasing rents:** Although the rate of rent increase is expected to slow, asking rents for industrial space are anticipated to continue growing through 2025.[16]
- **Manufacturing growth:** According to JLL, the sustained growth in manufacturing due to reshoring trends (returning production to the United States) will likely continue to drive industrial demand nationally. Supply chains will seek strategically located facilities that can accommodate localized manufacturing, efficient distribution, and resilient inventory management systems.[17]

3. Wilsonville Basalt Creek Updated Market Assessment

The Basalt Creek Concept Plan (BCCP) was based on a market assessment conducted in 2014. In the decade since, significant changes have occurred in employment patterns and market conditions. This section provides an updated analysis of regional and Wilsonville-specific employment trends, current forecasts, and present market dynamics, building on the national overview in Section 2.

This updated information establishes a new baseline for understanding Basalt Creek's current market context. Additionally, this section evaluates Basalt Creek's competitive strengths and weaknesses and identifies industries most likely to establish a presence in the area.

Employment Trends and Forecast

In 2022, Wilsonville's employment landscape was characterized by a strong concentration in industrial sectors, with manufacturing, wholesale trade, and construction making up 43 percent of the City's total employment—a much higher share compared to the broader tri-county region. This focus on industrial jobs sets Wilsonville apart, highlighting its distinct role in the regional economy.

Employment Trends

In 2022, Wilsonville had 21,383 covered employees, representing 2.2 percent of the region's covered employment.[18] The City's top three sectors are manufacturing (17.8 percent, 3,796 jobs), wholesale trade (14.4 percent, 3,083 jobs), and construction (10.5 percent, 2,248 jobs). These three industries combined represent 43 percent of Wilsonville's total employment, nearly double the 22 percent share these sectors hold in the broader tri-county region (Clackamas, Multnomah, and Washington Counties).

This concentration in industrial jobs sets Wilsonville apart from the surrounding area. While Wilsonville's top sectors are manufacturing, wholesale trade, and construction, the tri-county region's largest employers are in health care and social assistance, government, and manufacturing.

Table 5: Industry Distribution, Wilsonville and Tri-County Region, 2022

SECTOR	WILSONVILLE		TRI-COUNTY	
	2022 COVERED EMPLOYMENT	SHARE OF EMPLOYMENT	2022 COVERED EMPLOYMENT	SHARE OF EMPLOYMENT

[18] **Covered** employment includes employees covered by unemployment insurance. Examples of workers not included in covered employment are sole proprietors, some types of contractors (often referred to as "1099 employees"), or some railroad workers. Covered employment data is from the Oregon Employment Department.

Over the past decade, Wilsonville's employment grew slightly faster than that of the tri-county region. This growth was largely driven by an increase in construction jobs, which more than tripled during this period. Although the tri-county region also experienced growth in construction jobs, Wilsonville's rate of growth was considerably higher. Wilsonville also had strong employment growth in wholesale trade. Notably, while wholesale employment rose in Wilsonville, it declined across the broader tri-county region.

In contrast, Wilsonville experienced a decline in manufacturing employment, even as the region saw growth in this sector. Wilsonville maintained stable employment in the transportation and warehousing sector, while the tri-county region grew substantially.

Table 6: Change in Employment, Wilsonville and Tri-County Region (2012 to 2022)

SECTOR	CHANGE 2012-2022			
	NUMBER		PERCENT

BASALT CREEK PLANNING AREA EMPLOYMENT

The BCPA (Wilsonville portion only) grew in employment from 2012 to 2022, with 275 covered employees reported as of 2022. The average wage in the BCPA was $85,863, which is higher than both the tri-county ($73,995) and City average wages ($74,252), suggesting these are relatively well-paying jobs.

Table 7. Change in Employment and Wage, BCPA 2012-2022

YEAR	TAX LOTS	ESTABLISHMENTS	EMPLOYMENT	TOTAL PAY*	AVERAGE WAGE*
2012	80	11.0	194	$9,593,330	$49,450
2022	90	10.0	275	$23,612,269	$85,863
CHANGE	**10**	**-1**	**81**	**$14,018,939**	**$36,413**

Source: QCEW
*not inflation adjusted

Wilsonville's portion of the BCPA consisted of 80 tax lots in 2012 and 90 tax lots in 2022. Some areas in the BCPA have a high degree of parcelization, while others are less fragmented. There are a handful of large contiguous landholdings by single ownership. In 2012, 8 tax lots had businesses with covered employment, increasing slightly to 10 tax lots in 2022. Employment density on lots with covered employment remains low at 4.4 employees per acre as of 2022, with most tax lots having no covered employment at all.

Table 8. Lots with and without Covered Employment in the BCPA, 2012-2022

	2012			2022		
	TAX LOTS	ACRES	EMPLOYMENT DENSITY	TAX LOTS	ACRES	EMPLOYMENT DENSITY
With Employment	8	62	3.1	10	63	4.4
Without Employment	72	410	n/a	80	406	n/a
Total	**80**	**472**	**0.4**	**90**	**469**	**0.6**

Source: QCEW Note: The minor change in acreage from 2012 to 2022 resulted from constructing of the Basalt Creek Parkway and small adjustments in the recording of tax lots over that period.

It is important to note that these figures only account for covered employees.[19] Some of the land in the BCPA is actively used despite minimal reported employment. The area is primarily used for contractor establishments, including storage yards for various businesses, which typically require fewer employees. It is likely that additional workers are present but not included in the covered employment estimates, such as sole proprietors or other types of uncovered contractors. Due to the prevalence of storage-focused contractor establishments, many lots have minimal building improvements. The improvement-to-land-value ratio is low and has changed little over the past decade.

Table 9. Improvement to Land Value, BCPA, 2012-2022

	LAND VALUE	BUILDING VALUE	IMPROVEMENT TO LAND VALUE
2012	$16,577,800	$6,738,020	0.41
2022	$32,892,790	$16,996,440	0.52

[19] **Covered** employment includes employees covered by unemployment insurance. Examples of workers not included in covered employment are sole proprietors, some types of contractors (often referred to as "1099 employees"), or some railroad workers. Covered employment data is from the Oregon Employment Department.

Employment Forecast

Between 2020 and 2045, the City is projected to grow by 3,471 employees at an average annual growth rate of 0.7 percent. This rate is faster than Tualatin but slightly slower than Sherwood and the region overall. Washington County is projected to grow the fastest of the three counties in the region.

Table 10: Metro Employment Forecast, 2020 to 2045

			CHANGE 2020-2045		
	2020	2045	NUMBER	PERCENT	AAGR
Tualatin	34,115	36,792	2,677	8%	0.3%

AAGR = Annual Average Growth Rate

For 2022 to 2032, the Oregon Employment Department (OED) forecasts the strongest growth for the Portland tri-county region in commercial sectors, led by information, leisure and hospitality, and private education and health services. However, OED also predicts growth in industrial sectors, with the strongest relative growth in the construction industry followed by transportation, warehousing, and utilities.

Table 11: Portland Tri-County Industry Projections, 2022 to 2032

INDUSTRY	EMPLOYMENT		CHANGE	
	2022	2032	NUMBER	PERCENT

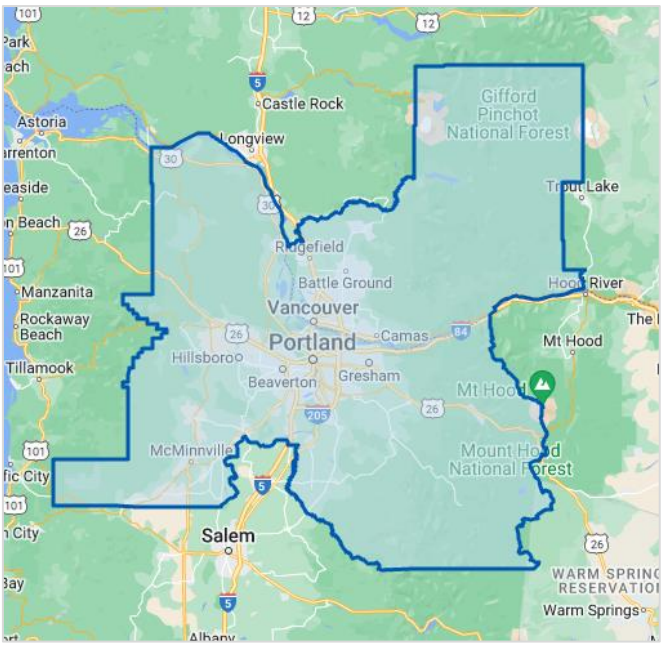
Real Estate Market Trends

The real estate market trends in Wilsonville and the Portland region generally align with the national trends outlined in Section 2. While Wilsonville's office market typically has a lower vacancy rate compared to the broader region, it has had consistently negative net absorption and recent spikes in the vacancy rate, reaching over 12 percent in 2024.

More positively, Wilsonville's industrial market has a relatively low vacancy rate, large average building sizes, and a variety of industrial space types that could appeal to a mix of tenants. Wilsonville is also well positioned to benefit from promising industrial trends in the broader region, including investments in semiconductor manufacturing and market growth that could attract tenants to the area. However, industrial development in Wilsonville has been limited over the past decade. Only 1.7 percent of its total industrial space has been built in the last 10 years, compared to 11 percent in the broader Portland metro area. According to CoStar, in the past five years, three buildings have been under construction in Wilsonville: one completed in 2022 and two slated to be completed in 2025.

NOTE ON COSTAR DATA

While CoStar data provides valuable, up-to-date data across a wide range of metrics, data quality is more limited in smaller markets and at the property level. The data here should be read as an indication of overall market statistics and trends, rather than an exact reflection of all properties in a given market.



This section analyzes real estate market trends for various submarkets encompassing the BCPA, including the I-5 South submarket (Figure 7) and the Portland metro area (Figure 8).

Figure 7: I-5 South Submarket Boundary

Source: CoStar

Figure 8: Portland Metro CoStar Boundary

Source: CoStar

Office Market Trends

Portland Metro Regional Trends

Like the national office space market, office spaces in the Portland metro are experiencing high vacancy rates and lower leasing activity. Work-from-home policies have decreased the demand for office space. Consequently, tenants have increased bargaining leverage; they are pressuring landlords to reduce rates, increase lease concessions, and raise tenant improvement budgets. Despite these adjustments, an increase in vacancies is expected, with interest rates and economic uncertainty adding volatility to the office market.[20] Other key findings include:

- **Record high vacancy rates:** High vacancy rates have continued to climb, reaching a record high of 13.3 percent vacant office space in 2024 Q2.[21]
- **Continued negative net absorption:** Net absorption in the Portland market was just over negative 500,000 square feet in 2024 Q2, the fourth quarter in a row of negative net absorption. Since the beginning of 2020, the Portland office market has only had positive net absorption for five quarters.[22]
- **Leasing activity:** Leasing and sales activity are on par with 2023, indicating that the vacancy and absorption trends are due to companies exiting the marketplace or downsizing at a higher rate, likely due to continued work-from-home policies.[23]

However, the Portland office market is not uniform, with the suburban office market performing better than the downtown and regional office markets. The Portland suburbs' office vacancy rates are 8.6 percent, compared to 23.9 percent downtown.[24]

Wilsonville Office Market

Wilsonville currently has approximately 1.4 million square feet of office space, representing roughly 18 percent of office space in the I-5 South submarket and 1 percent in the broader Portland metro region. According to CoStar, over the past decade, one office building was added to Wilsonville's market in 2020, located at 29250 Southwest Town Center Loop West. This office building was about 30,000 square feet, or roughly 2 percent of Wilsonville's total office space. Over the same period, the Portland metro added a greater share (9 percent) of

[20] Cushman & Wakefield, Office Marketbeat Q2 2024 Portland Office Report

[22] Kidder Matthews, Portland Office Market Report Q2 2024
[23] Kidder Matthews, Portland Office Market Report Q2 2024
[24] Cushman & Wakefield, Office Marketbeat Q2 2024 Portland Office Report

space to its office market. These projects, on average, have been significantly larger than usual office buildings, with a few very large projects surpassing 100,000 square feet.

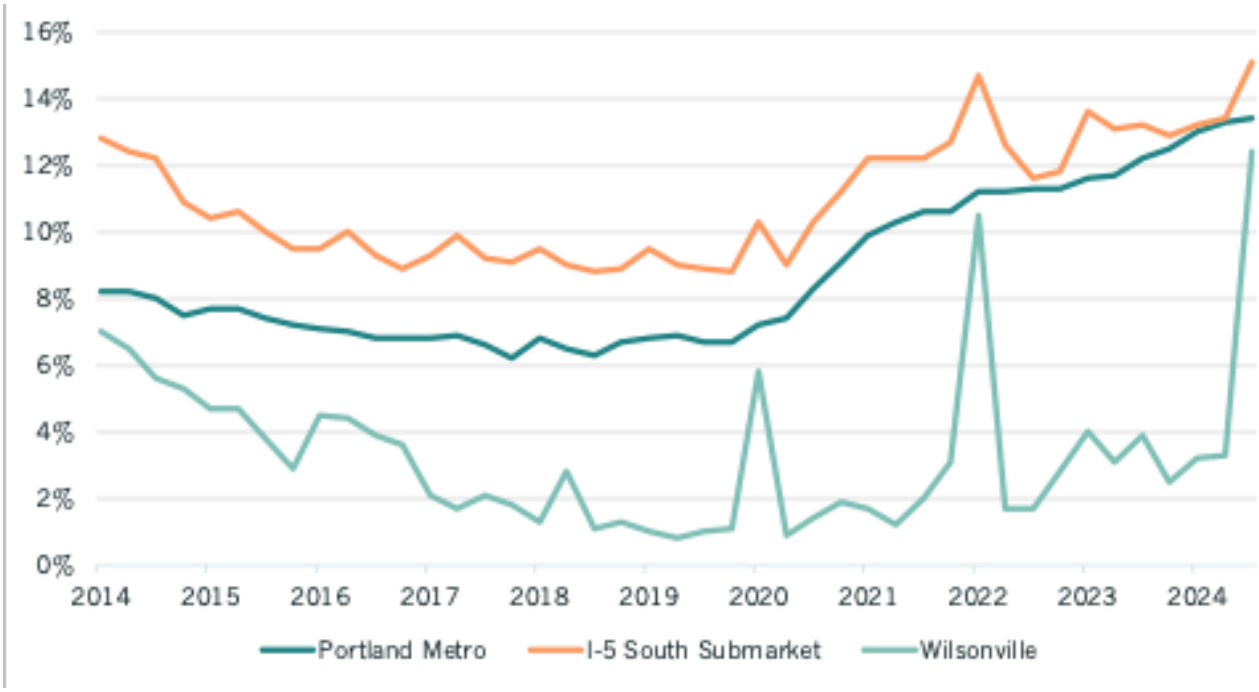

Table 12: Office Space Development Trends, 2014 to 2024

GEOGRAPHY	TOTAL BUILDINGS	TOTAL SQUARE FEET	AVERAGE BUILDING SIZE
ALL OFFICE DEVELOPMENT			
Portland Metro	6,217	118,809,170	19,110
I-5 South Submarket	431	7,533,437	17,479
Wilsonville	62	1,358,335	21,909
BUILT IN THE LAST 10 YEARS			
Portland Metro	66	10,354,342	156,884
I-5 South Submarket	4	80,976	20,244
Wilsonville	1	30,000	30,000

Source: CoStar, pulled August 2024

Per Costar, the I-5 South submarket office vacancy rates have been higher than the Portland metro's vacancy rates since 2014, although vacancy rates have been much more similar since 2022. Both have vacancy rates above 13 percent as of July 2024. While Wilsonville office vacancy rates have remained much lower, the end of a few leases are reflected in vacancy rate spikes in 2020, 2022, and 2024, when the vacancy rate spiked closer to the Portland metro average.

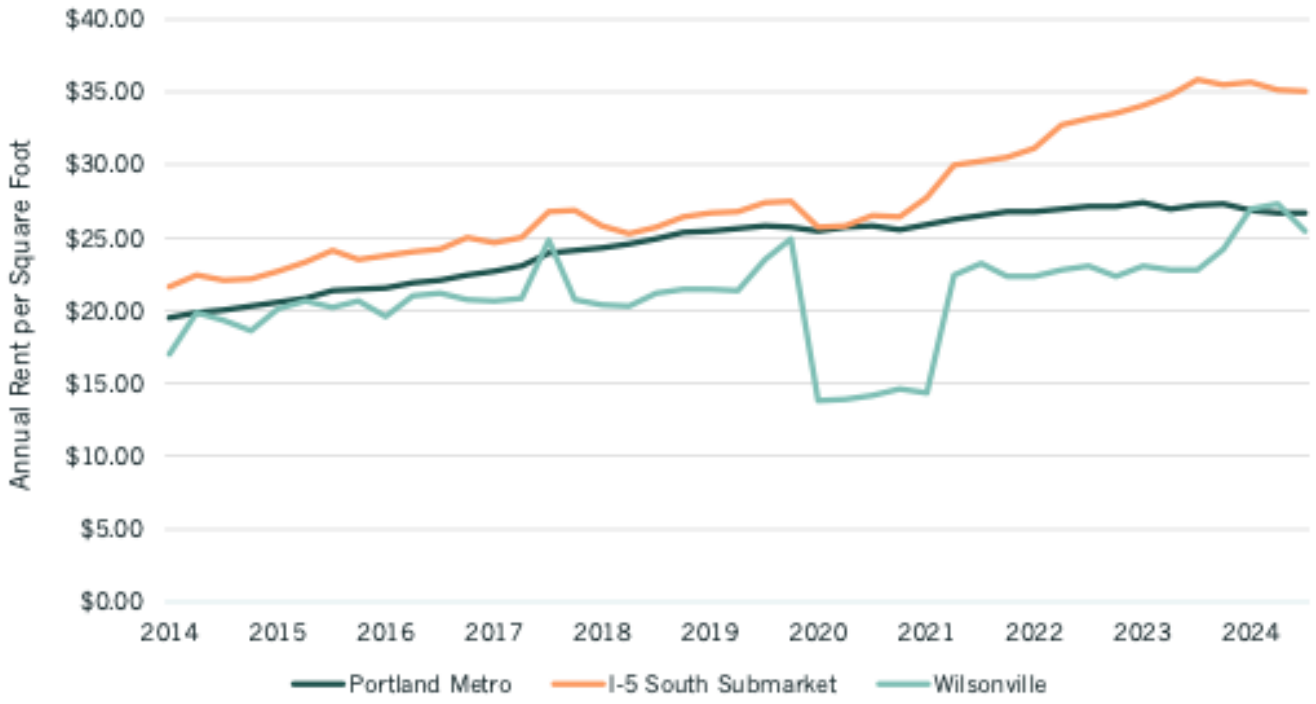

Figure 9: Office Vacancy Rate Trends, 2014-2024

Source: CoStar, pulled August 2024

Office rents have increased in the I-5 South submarket despite high vacancies, and they remain substantially above the Portland metro region's average, according to Costar. Historically, office rents in Wilsonville have been lower than in the Portland metro area. However, since an initial decline in 2020, rents in Wilsonville have risen steadily, reaching over $26 per square foot, now equal to the Portland metro average for the first time in a decade.

Figure 10: Office Lease Rate Trends, 2014-2024

Source: CoStar, pulled August 2024

Net absorption and delivery trends also indicate a relatively slow office market. From 2019 to 2024 Q3, net absorption was negative in all three areas. Over the same period, net absorption in the Portland metro area was negative 4.6 million square feet, negative 387,000 square feet in the I-5 South submarket, and negative 122,000 square feet in Wilsonville.

Industrial Market

Portland Metro Regional Trends

Like the national industrial market overall, the Portland metro area industrial market has been strong in recent years, particularly from 2021 to 2023. However, similar to national trends, a few metrics indicate that demand for industrial space is decelerating in the region:[25]

- **Increasing vacancy rates:** Vacancy for industrial space in the Portland metro region has risen steadily since early 2023, and net absorption was negative in both Q1 and Q2 of 2024. While overall leasing activity for industrial space in the area remained higher than the area's 10-year average, a few large companies downsizing or exiting the market contributed to negative net absorption and vacancy trends.
- **Slow lease-up for new construction:** The delivery of 1.2 million square feet to the market in early 2024 also contributed to the region's supply of vacant industrial space. However, newly constructed industrial space has been slow to lease up, with 93 percent of recent leasing activity in buildings built before 2010.
- **Rising unemployment rates:** In early 2024, Portland's unemployment rate (4.1 percent) surpassed the national average (3.8 percent) amid layoffs, including the shutdown of a large UPS location in North Portland, which impacted 300 sorting and distribution jobs.

However, investors and leasing professionals are confident in the regional market's long-term health, particularly due to significant investments in the region's semiconductor manufacturing sector.[26] Market strengths include:

- **CHIPS Act:** In 2022, the federal government allocated $50 billion as part of the CHIPS Act to bolster U.S. semiconductor manufacturing, which is expected to create thousands of regional manufacturing and construction jobs.[27] The expansion of the semiconductor industry could also have a ripple effect, creating demand for industrial space for equipment suppliers, supply chain materials manufacturers, and testing facilities.
- **Strong submarkets:** According to market reports from Cushman & Wakefield and CBRE, other strong industrial submarkets include food and beverage warehousing, tech warehousing, and auto part manufacturing.[28] These are some of the most common types of tenants seeking space in the market, although deals are taking longer on average to reach completion.[29]

---

[26] Cushman & Wakefield, Industrial Marketbeat Q2 2024 Portland Industrial Report
[27] Cushman & Wakefield, Industrial Marketbeat Q2 2024 Portland Industrial Report
[28] Cushman & Wakefield, Industrial Marketbeat Q2 2024 Portland Industrial Report
[29] CBRE, Q2 2024 Portland Industrial Market Update

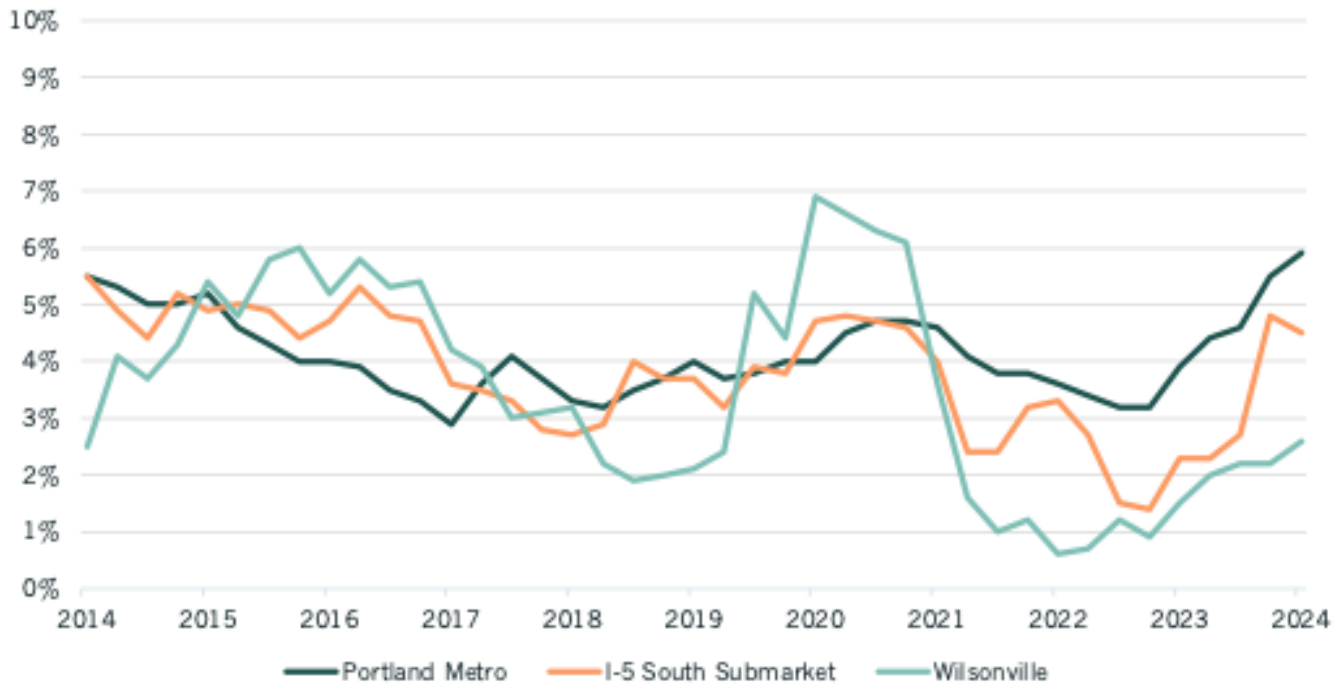
- **Market growth:** Current forecasts estimate that 2.4 million square feet will be delivered to the market in 2024, roughly 1 percent of the current Portland industrial space inventory. As reported by CBRE, investors and leasing professionals are confident that the Portland market has additional room for growth.

Wilsonville Industrial Market

Wilsonville has about 8.6 million square feet of industrial and flex space, representing roughly 24 percent of the I-5 South submarket and 3 percent of the Portland metro region's industrial space. The average size of Wilsonville's industrial building is roughly 63,000 square feet, almost twice as large as the average industrial building in the broader Portland metro (34,000 square feet).

Wilsonville has had limited industrial development in the past decade. Only 1.7 percent of Wilsonville's total industrial space was built in the last 10 years, compared to roughly 11 percent of the I-5 South submarket and Portland metro industrial space. This slow pace of development makes sense given the limited supply of developable industrial land in the City and, more precisely, the development constraints that exist on those lands.

Table 13: Industrial & Flex Space Development Trends, 2014 to 2024



GEOGRAPHY	TOTAL BUILDINGS	TOTAL SQUARE FEET	AVERAGE BUILDING SIZE
ALL INDUSTRIAL DEVELOPMENT			
Portland Metro	7,535	257,487,989	34,172
I-5 South Submarket	900	35,089,559	38,988
Wilsonville	137	8,605,081	62,811
BUILT IN THE LAST 10 YEARS			
Portland Metro	278	30,328,230	109,094
I-5 South Submarket	50	3,848,383	76,968
Wilsonville	2[30]	145,611	72,806

Source: CoStar, pulled August 2024

[30] The two buildings listed in CoStar are located at 96500 SW Parkway Ave (2025) and 10680 SW Clutter Road (2022). However, city staff noted three others: the Black Creek development in the Coffee Creek industrial area and two SSI Shredding facilities.

Wilsonville's industrial vacancy rate has remained below 6 percent for most of the past decade. In 2020 and 2021, Wilsonville saw a brief spike in vacancy, likely driven by the COVID-19 pandemic, which quickly dropped to just over 1 percent in 2022. As of July 2024, Wilsonville's combined industrial and flex space vacancy rate was 2.6 percent (Figure 12). Wilsonville's industrial vacancy rate has been below the Portland metro since 2021. As of July 2024, the Portland metro had a vacancy rate of 5.9 percent and I-5 South submarket had a vacancy rate of 4.5 percent.

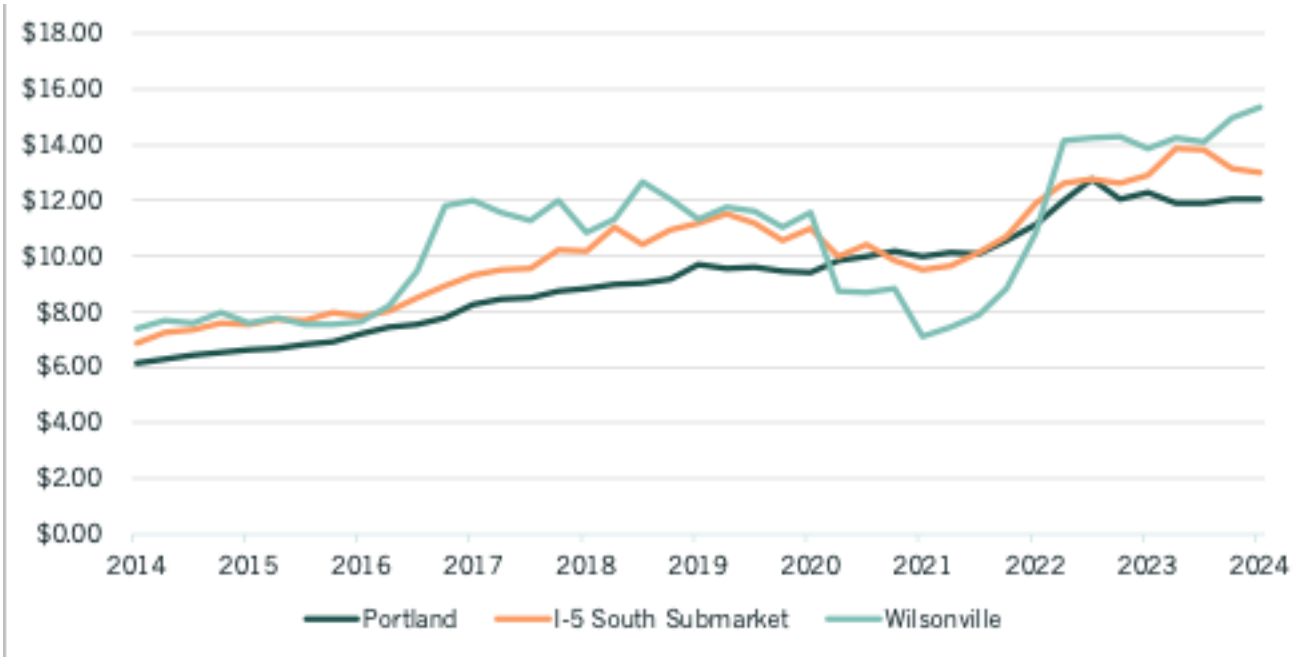


Figure 11: Industrial & Flex Vacancy Rate Trends, 2014-2024

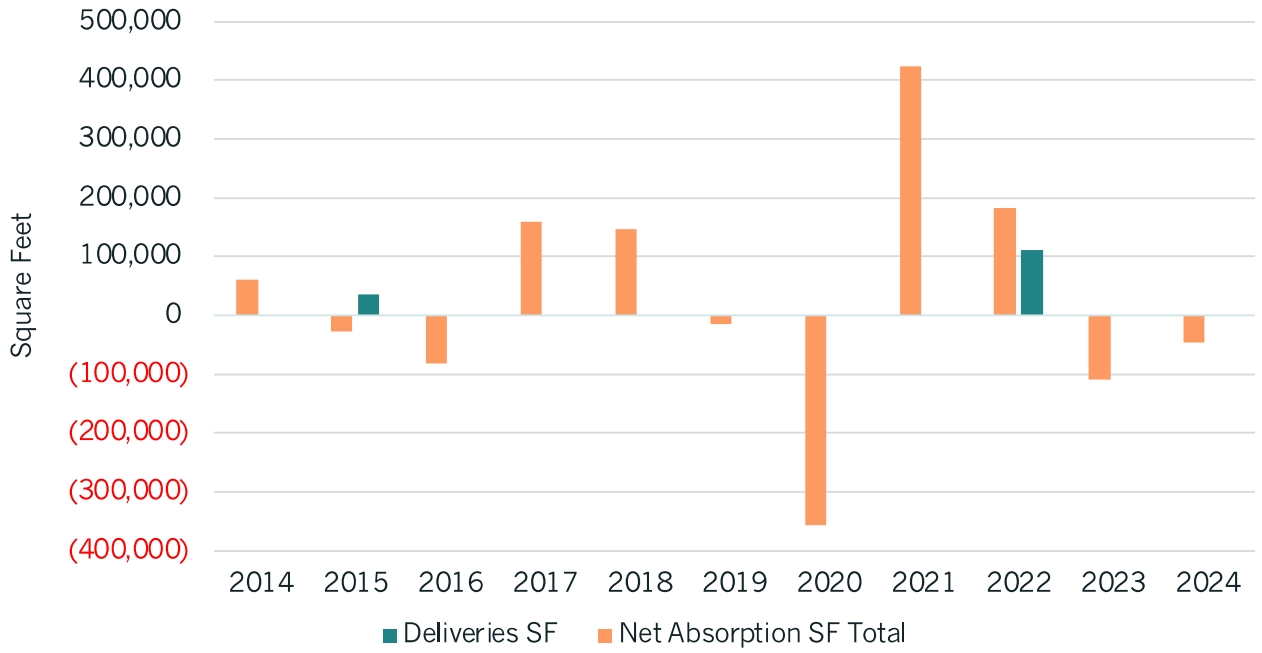
Source: CoStar, pulled August 2024

Triple net industrial rents in Wilsonville increased from 2014 to 2020 and were generally higher than the Portland metro region over the period.[31] Wilsonville shows a large drop in lease rates between 2020 and 2021, likely due to COVID-19 impacts. However, rates rebounded in 2022, reaching $15.35 per square foot in July 2024, higher than the Portland metro ($12.03) and I-5 South submarket ($12.99). The combination of rising rents and very low vacancy rates suggests a robust industrial market in Wilsonville, potentially attracting new development, especially speculative development.

Figure 12: Industrial & Flex Rents Trends, 2014-2024



Source: CoStar, pulled August 2024

[31] Triple-net (NNN) rents are annual rents on a per-square-foot basis not including any pass-through expenses such as taxes, insurance, and any utilities or maintenance costs, which are passed on to the tenant and paid separately.

Net absorption has been generally positive for industrial properties over the past decade, with a large vacancy in 2020; however, it was followed by high positive net absorption the following year. Net absorption was negative in 2023 and through August 2024 (when data was pulled) but at a smaller magnitude than in 2020.

Figure 13: Net Absorption for Industrial & Flex Space in Wilsonville, 2014 to 2024

Source: CoStar, pulled August 2024

TYPE OF INDUSTRIAL PRODUCT BUILT SINCE 2014

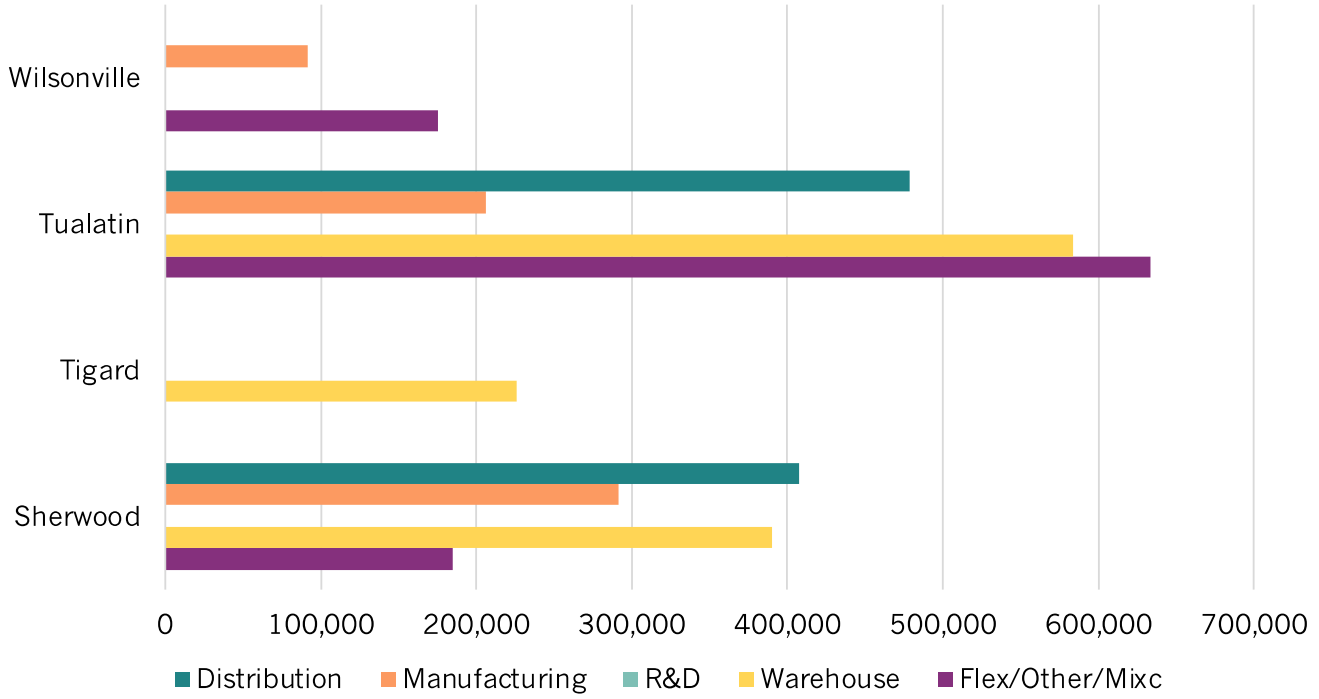
Within the industrial product type, CoStar delineates the properties into a secondary type based on their use, size, and amenities to industrial users. CoStar utilizes the following definitions for the secondary types of industrial space:

- **Distribution:** Spaces used for warehousing and distribution of inventory that are typically 200,000 square feet or more, have clear heights of 28 feet, are less than 5 percent office space, and have site coverage that can be up to 40 percent.
- **Warehouse:** Buildings that are 25,000 square feet or greater, are up to 20 percent office area, have clear heights of 22 feet or greater, and have site coverage up to 50 percent.
- **Manufacturing:** Buildings that are typically 300,000 square feet or greater with an office area up to 50 percent.
- **R&D:** Flex space specifically used for research and development.
- **Flex/Other/Misc.:** A versatile building that may be used with office (corporate headquarters), research and development, mixed-use industrial and retail sales, and includes but is not limited to industrial, warehouse, and distribution uses. At least half of the rentable area of the building must be used as office space. Flex buildings typically have ceiling heights under 18 feet, with light industrial zoning. Flex buildings have also been called Incubator, Tech and Showroom buildings in markets nationwide.

Table 14 shows industrial development by submarket, or secondary market, types. Over the past 10 years, the I-5 South submarket has captured a slightly smaller share of the total market at 8.7 percent compared to its total share of 10.2 percent. The secondary market type distribution has also changed. While the I-5 South submarket contains roughly 27 percent of the total market space for R&D and warehouse space, it has captured about 35 percent of the space built in the last 10 years. Meanwhile, it captured a smaller share of manufacturing and distribution development (19 percent in the past 10 years compared to 27 percent of the total market share).

Table 14: Industrial Development Trends by Secondary Market Type, Portland Metro and I-5 South Submarket, 2014 to 2024

	ALL DEVELOPMENT		PAST 10 YEARS		I-5 CAPTURE RATES	
	METRO	I-5	METRO	I-5	ALL DEV'T	2014-2024
Distribution	49,002,646	5,677,113	16,716,663	1,222,159	11.6%	7.3%
Manufacturing	43,382,806	6,661,789	5,802,456	700,301	15.4%	12.1%
R&D	4,036,770	409,055	514,319	87,476	10.1%	17.0%
Warehouse	116,255,396	19,920,386	11,999,179	2,178,085	17.1%	18.2%
Flex/Other/Misc	156,220,367	4,831,339	24,957,511	1,053,586	3.1%	4.2%
Total	**368,897,985**	**37,499,682**	**59,990,128**	**5,241,607**	**10.2%**	**8.7%**



Source: CoStar, pulled August 2024

Industrial development along the I-5 South submarket has recently concentrated in Tualatin and Sherwood, with Wilsonville falling behind. This trend is likely due to Wilsonville's shortage of development-ready industrial land and large parcels, a view supported by interviews with local developers, brokers, and economic development organizations.

Many speculative industrial developers are seeking large sites, as demonstrated by recent developments in Sherwood and Tualatin on parcels exceeding 10 acres. Notable examples include the recently completed Sherwood Commerce Center on a 30+ acre site and the proposed Rock Creek industrial site development on 25 acres in Sherwood. In Tualatin, the Tualatin Sherwood Corporate Park was completed in 2022 on over 40 acres, while the Hedges Creek Industrial Park is expected to be completed in 2025 on a 20-acre site.

Local developers report that most of the industrial demand is coming from existing regional businesses rather than out-of-state companies. These local industrial users are primarily looking to expand or upgrade their current facilities within the area. Many express a desire to be outside the City of Portland and Multnomah County, citing concerns about public safety and higher rates of taxation.

Figure 14. Secondary Industrial Space Recently Built or Proposed in I-5 South Submarket by City, 2019-2026

Source: CoStar, pulled August 2024

Target Industry Assessment

Wilsonville is well positioned within the region to capture industrial growth. It has access to a strong base of employment, proximity to I-5, and connections to other growing industrial areas in Sherwood and Tualatin. This section examines industries likely to be drawn to Wilsonville, considering its strengths and competitive edge. The analysis begins by identifying common barriers to industrial development, based on local stakeholder interviews. It then reassesses strengths and weaknesses outlined in the Basalt Creek Concept Plan (BCCP), updating these factors to reflect market and employment trends over the past decade. The section concludes by summarizing how these market trends will shape Basalt Creek's development.

Barriers to Industrial Development

Stakeholders identified a number of key barriers for industrial users that prevent development. While some of these challenges are more directly applicable to Basalt Creek than others, they all represent important considerations for the City as it prepares the area for development:

- **Site Readiness:** Many sites lack the necessary transportation and utility infrastructure and preparations to immediately accommodate industrial users.
- **Power Availability:** Immediate or quick access to heavy power is currently the most significant barrier for many industrial businesses. The increasing power demands of modern industrial operations make this a crucial factor.
- **Outdated Existing Buildings:** Many existing structures do not meet the needs of modern industrial users, requiring significant renovations or complete rebuilds.
- **Lack of Intermediate Industrial Spaces:** Medium-sized industrial users (users that require 20,000 to 40,000 square feet) have limited spaces to choose from.
- **Misaligned Visions and Overly Prescriptive Zoning:** Sometimes, the landowners' or city's vision for an area does not align with the diverse needs of potential users. Discussions with local developers and brokers highlight the importance of allowing a mix of uses for better financing opportunities. This is particularly relevant for speculative development, where end users are not known at the time of entitlement and construction. Overly prescriptive zoning that designates specific uses, such as manufacturing, can be more challenging to finance because banks see risk and concern if they perceive the list of potential tenants is too small or narrow. Additionally, various types of uses tend to cluster together due to supply chain benefits. For example, manufacturers often have suppliers located nearby. Overly prescriptive zoning can disrupt this natural ecosystem by preventing clustering.
- **Fragmented Land Ownership:** Areas with multiple small parcels under different ownership can make it difficult to assemble larger sites needed for significant industrial development.

- **Incompatible Neighboring Uses:** The presence of nonindustrial uses in close proximity can preclude development out of concern for possible or future conflicts that have the potential to limit or complicate the operations of industrial businesses.
- **Requirements for Connectivity:** In some cases, required access roads can deter large industrial developers because the roads may decrease the area of developable land while adding significant cost to a speculative project. Additionally, some industrial users who prioritize confidentiality and security may be less attracted to areas with public access requirements.

Comparative & Competitive Advantage

The BCCP outlined the Basalt Creek area's advantages and challenges, many of which are still relevant. The following includes Basalt Creeks' advantages and challenges drawing from the BCCP and updating based on new information gathered as a part of this report.

STRENGTHS AND COMPETITIVE ADVANTAGES

- Centrally located in the south metro, within the urban growth boundary, and designated in the City's comprehensive plan for industrial uses.
- Large contiguous cluster of existing and planned industrial employment areas, including Wilsonville's Coffee Creek Industrial Area, and adjacent employment lands in Tualatin and Sherwood.
- Large areas of contiguous land ownership with property owners who are interested in developing or selling for redevelopment.
- Long-term growth projections for employment and population in the southwest Portland metro area.
- Excellent access to I-5, I-205, and Highway 217. Additional transportation strengths include existing and planned arterial roads as well as local and regional transit service provided by TriMet, WES Commuter Rail, and SMART.[32]
- Access to an educated workforce as part of the Metro labor shed and Mid-Valley labor shed.
- Easily accessible to other growing industrial areas, particularly in Tualatin and Sherwood.
- Planned substation development.

CHALLENGES

- Zoning needs to be in place prior to development.
- Planning, financing, and construction of new infrastructure.

[32] Existing major arterials include SW Grahams Ferry Road, SW Boones Ferry Road, and SW Day Road; the City is also planning the extension of Basalt Creek Parkway.

- Existing low employment density uses (contractor establishments and storage uses) that generate income for property owners may reduce appetite to sell for redevelopment.
- Lot sizes and property aggregation. There is a mix of large and small lots throughout Basalt Creek. The time and cost required to secure properties from multiple parties to aggregate developable industrial properties of adequate size can be a significant deterrent to developers.
- Natural features, including wetlands and slopes. Basalt Creek and its surrounding slopes and wetland areas run north-south through the study area and divide the area into east and west sections.
- Growing power demands from industrial users and uncertainty on timing and capacity of additional service.[33]

Which industries may be attracted to Basalt Creek?

Basalt Creek's long-standing vision as an industrial area aligns well with current market trends, which show strong demand for industrial space both nationally and in the Portland metro region. Stakeholders point to Wilsonville's potential to attract a diverse range of industrial businesses, including those in the semiconductor supply chain, cleantech, advanced manufacturing, and data centers.

Wilsonville's appeal to these sectors stems from its strategic location in the south metro area, access to a skilled labor force, and proximity to related industries. The semiconductor sector in particular is poised for expansion due to recent CHIPS Act investments. Similarly, cleantech industries are anticipated to see growth within the Portland metro region. The availability of large areas of contiguous land ownership in the Basalt Creek Planning Area further enhances its attractiveness to major industrial users who seek large lots for development.

It is worth noting that while the Basalt Creek Concept Plan (BCCP) originally envisioned a mix of uses—including office space associated with industrial operations, primarily in the High-Tech Employment district—current market conditions suggest that office use will likely play a smaller role than initially planned. Instead, the focus is expected to shift more toward industrial and tech-oriented developments to capitalize on emerging economic opportunities. Below are details about the potential sectors and industries that may be particularly attracted to Wilsonville:

- **Semiconductor Sector Supply Chain:** This sector includes companies involved in the design, manufacturing, and testing of semiconductor chips, as well as those providing materials, equipment, and services to chip manufacturers. Wilsonville is attractive for this industry due to its proximity to existing semiconductor clusters in

[33] ECOnorthwest has reached out to PG&E to understand how much of a challenge access to adequate power may be and is waiting to hear back. This statement may be updated after that conversation.

the Portland metro area, access to a skilled workforce, and potential for large industrial sites. Basalt Creek would likely host businesses that support the supply chain rather than producing the chips themselves.

- **Cleantech, including Battery Technology:** Cleantech encompasses renewable energy technologies, energy efficiency solutions, and sustainable manufacturing processes. Businesses in this sector include energy storage and related sustainable material technologies and a variety of alternative energy technologies and production. Battery technology, crucial for electric vehicles and energy storage, is a growing subsector that is already present in Wilsonville. Wilsonville's strategic location and potential for large industrial sites make it suitable for cleantech manufacturing and R&D facilities.
- **Advanced Manufacturing:** This sector involves the use of innovative technologies to create products. It includes robotics, 3D printing, and smart manufacturing systems. Wilsonville's access to a skilled workforce and its location near tech hubs make it attractive for advanced manufacturing operations.
- **Distribution and Logistics:** This sector involves the storage, transportation, and delivery of goods. Wilsonville's location near major transportation routes (I-5 and I-205) and its proximity to Portland make it an ideal location for distribution centers and logistics hubs.
- **Data Centers:** Data centers are facilities used to house computer systems and associated components. Wilsonville's access to available land and the potential access to reliable power sources could make it attractive for data center development.[34] The proximity to tech companies in the Portland metro area is an additional advantage.

This diverse range of potential industries positions Wilsonville to capitalize on various economic opportunities, creating a resilient industrial base in Basalt Creek.

[34] Interviews with stakeholders have suggested that Wilsonville may be attractive to data centers. ECOnorthwest has reached out to PG&E to understand if Basalt Creek has/will have access to the power necessary for this type of use and is waiting to hear back.

4. Conclusion

The Basalt Creek area in Wilsonville is strategically positioned for industrial development with the potential to attract a variety of users, from manufacturing and logistics to data centers. The area's suitability for supporting the semiconductor supply chain is underscored by recent expansions of semiconductor suppliers in nearby Sherwood. Additionally, the area could be attractive to cleantech businesses, including those involved in battery storage and alternative energy technologies.

However, realizing this potential presents several challenges. Existing contractor establishments generate sufficient income for some property owners, reducing their incentive to sell or redevelop the land for higher-intensity industrial uses. Furthermore, relocation options for these businesses may be limited, complicating redevelopment efforts. (The feasibility of redevelopment will be further explored in a subsequent separate study.)

Conversely, some developers have already assembled land, and they are ready for immediate development, eager to capitalize on the strong industrial demand seen in nearby Coffee Creek, Tualatin, and Sherwood. Stakeholders emphasized the importance of large parcels in facilitating area redevelopment, with many developers willing to fund necessary infrastructure improvements if given access to such lots. For example, Schnitzer Properties owns property east of Grahams Ferry Road, south of Basalt Creek Parkway, and north of Day Road and eagerly awaits the adoption of zoning and policy to enable industrial development in this area. They intend to submit development and annexation applications as soon as zoning and policy is in place. Their recent development in Sherwood, known as the Sherwood Commerce Center, is an example of the type of development they are envisioning for their Basalt Creek property, offering flexible spaces for various industrial users.

It is crucial for Wilsonville to carefully balance its development goals for Basalt Creek with market realities. While the City may have preferences for certain types of businesses, being overly selective could deter development altogether. This is especially significant given the current economic climate. The BCCP originally envisioned office space within each district with the highest share in its High-Tech Employment District and anticipated that this office space would be in connection with industrial users. However, nationally and regionally demand for office space has been in decline with remote and hybrid work trends continuing to impact the need for office space. While office will likely still be a part of the BCPA, it may occupy a smaller share than originally envisioned.

Nationally, there's strong demand for industrial space. But Oregon's employment growth, which has been lagging national trends since 2020, may moderate this trend locally. Developers have stated that current industrial demand in the metro area is largely driven by regional businesses seeking to expand or upgrade their facilities. If Wilsonville imposes overly burdensome or restrictive requirements on the types of industrial users it allows (such as requiring a high share of manufacturing space), it risks limiting development feasibility and driving developers and industrial users to more accommodating locations.

The City must navigate these challenges while working toward its vision for Basalt Creek: a diverse mix of industrial uses, higher employment density, high-wage jobs, an enhanced tax base, and increased community prosperity.

Next Steps

These findings are preliminary and will be refined through further analysis, stakeholder engagement, and discussions with the Planning Commission and City Council. Upcoming tasks include completing the buildable lands inventory, conducting site suitability analyses for key locations, and assessing the feasibility of redeveloping contractor establishments. All these elements will ultimately be synthesized into a comprehensive final report outlining key findings and recommendations.

Appendix B: Buildable Lands Inventory and Site Suitability Analysis

ECOnorthwest

DATE:	December 20, 2024
TO:	City of Wilsonville
FROM:	ECOnorthwest: Nicole Underwood, Bob Parker, and Barrett Lewis
SUBJECT:	WILR Phase 1: BLI and Site Suitability Analysis

The Cities of Tualatin and Wilsonville adopted the Basalt Creek Concept Plan (BCCP) in 2018 after a lengthy joint planning process. Now, in 2024-25, the City of Wilsonville is working to advance the Basalt Creek Planning Area (BCPA) beyond the concept plan to a development-ready status by designating zoning and refining infrastructure plans. However, since adoption of the BCCP, economic conditions at national, state, regional, and local levels have shifted significantly and must now be considered.

To address these evolving conditions, the City hired ECOnorthwest to conduct a market assessment and industrial lands study focused on Wilsonville's portion of the BCPA. The study began with an Economic Inventory, which reviewed current market trends and industries suitable for the area.

This memorandum addresses Task 3 in the Scope of Work: updating the **Buildable Lands Inventory (BLI)** for the BCPA and conducting a **Site Suitability Analysis** for key opportunity sites. The updated BLI reflects recent land developments, adjusted constraints, and revised capacity estimates.

The Site Suitability Analysis examines three selected "opportunity sites" within the BCPA, assessing their potential to support the target industries identified in the Economic Inventory. This analysis considers site attributes, including size, location, access, topography, constraints, and surrounding land uses. It also considers infrastructure (transportation, water, sewer, stormwater) based on available data, with the understanding that infrastructure planning may evolve as work progresses.

Land Supply

This industrial Buildable Lands Inventory (BLI) updates the 2014 BLI from the original concept plan, providing a revised assessment of the buildable land *supply* available within Wilsonville's portion of the BCPA for employment-related growth and development. The amount of land needed to accommodate anticipated growth, often referred to as *demand* for land, depends on the type of employment-related development and other factors.

This BLI update serves two purposes: 1) to provide a revised assessment for developable acres in the BCPA and 2) to identify lands that have existing economic uses but low improvement values and/or low-density employment. These uses are inconsistent with the development vision expressed in the BCCP and are sites that may have redevelopment potential.

The BCPA encompasses a total of 453 acres across 85 tax lots. Of this:

- **173 acres** are currently in active use and are considered developed.
- **129 acres** are constrained by physical or environmental factors.
- **150 acres** are considered buildable and available for development.

The BLI also provides a basis for updating employment capacity. Given the 150 acres of buildable land and the expectation of employment densities between 10 and 18.5 employees per acre, the BCPA is expected to accommodate between 1,500 and 2,780 jobs and 2.3 million and 2.9 million square feet of development. The BCCP estimated total employment capacity at about 2,500 jobs.

This section outlines the methodology used to develop the BLI and employment and built space capacities, and it presents the results for Wilsonville's portion of the BCPA. ECOnorthwest analyzed GIS data from the City of Wilsonville, Metro, and Washington County, with City staff reviewing the findings for accuracy and completeness.

Methodology

The buildable lands inventory followed a structured process to assess land status:

1. **Generate UGB "land base":** ECOnorthwest established a baseline of tax lots within Wilsonville's portion of the BCPA designated for industrial and employment uses.
2. **Classify lands by development status:** The project team categorized parcels as vacant, partially vacant, or developed.
3. **Identify constraints:** ECOnorthwest applied physical and regulatory constraints, such as wetlands and natural resource protections, to identify unbuildable portions.

4. **Verify inventory results:** City staff reviewed classifications and aerial imagery to confirm accuracy.
5. **Tabulate and map results:** The team compiled findings into tables and maps to provide a clear overview of buildable lands.

The following section summarizes the results of the industrial BLI for the BCPA, presented in tabular and map formats.

Land Base

The land base for the Buildable Lands Inventory (BLI) includes all tax lots within Wilsonville's portion of the BCPA. Table 1 provides a breakdown of the land base by Wilsonville Comprehensive Plan designation within the BCPA.

Table 1. Employment Land Base by Wilsonville Comprehensive Plan Designation, BCPA, 2024

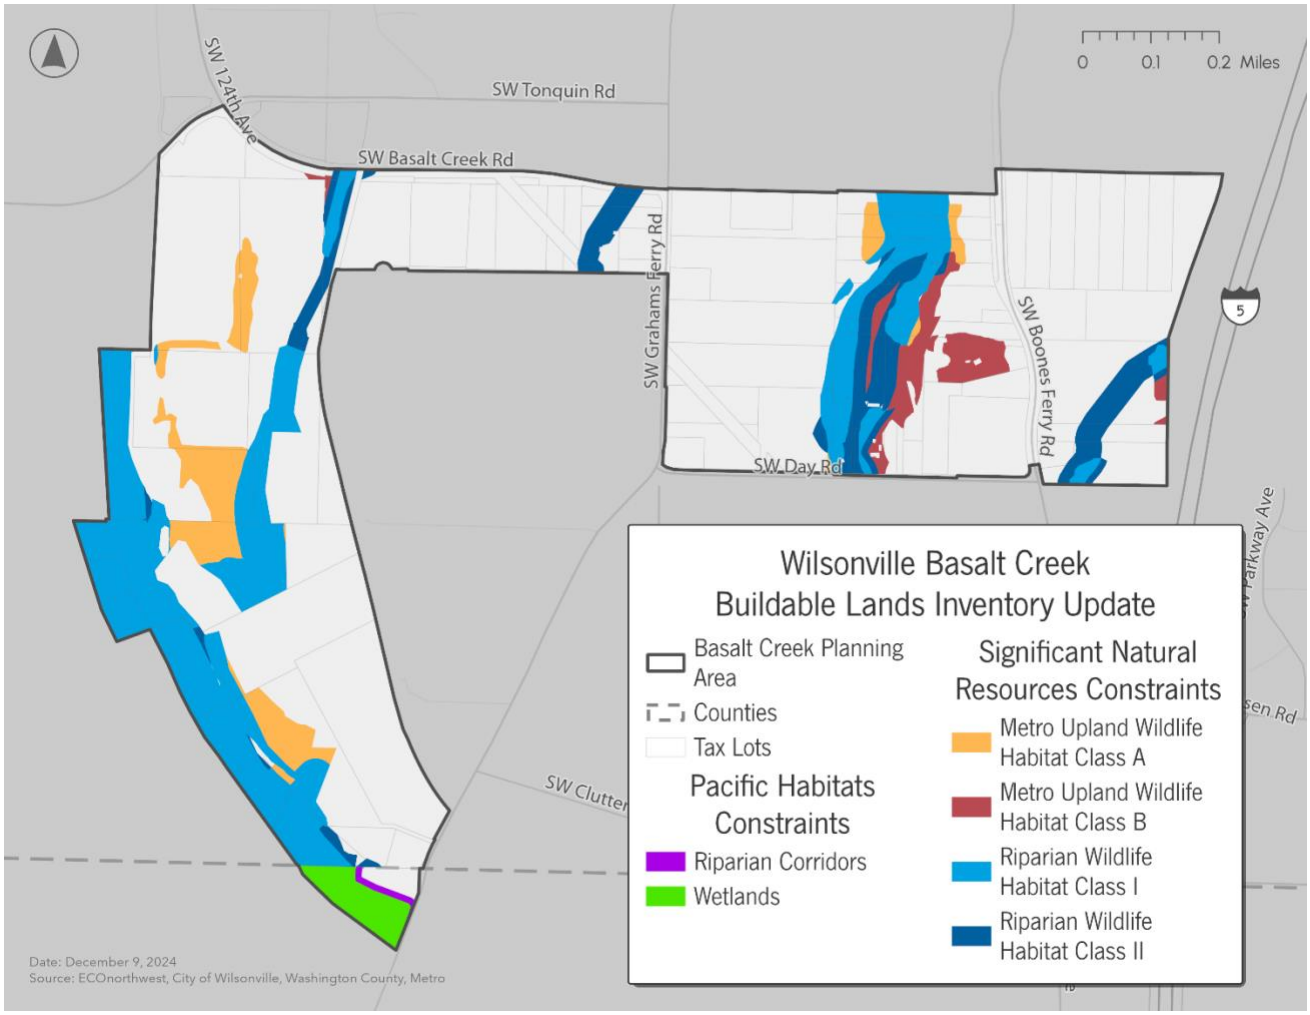
Plan Designation	Number of Tax Lots	Percent	Total Tax Lot Acreage	Percent (Total Acreage)
Industrial	63	74%	237	52%
Undesignated	22	26%	215	48%
Total	**85**	**100%**	**453**	**100%**

Source: ECOnorthwest analysis, City of Wilsonville, Clackamas County, Washington County, Metro

Development Status Classification

Table 2 displays the total acres of tax lots, categorized based on whether land is buildable. ECOnorthwest applied a rule-based classification of vacant, partially vacant, or developed land to determine the initial development status and verified the results through reviews by City staff. These reviews incorporated local knowledge and analyses of aerial maps.

Table 2. Employment Acres by Classification and Wilsonville Comprehensive Plan Designation, BCPA, 2024



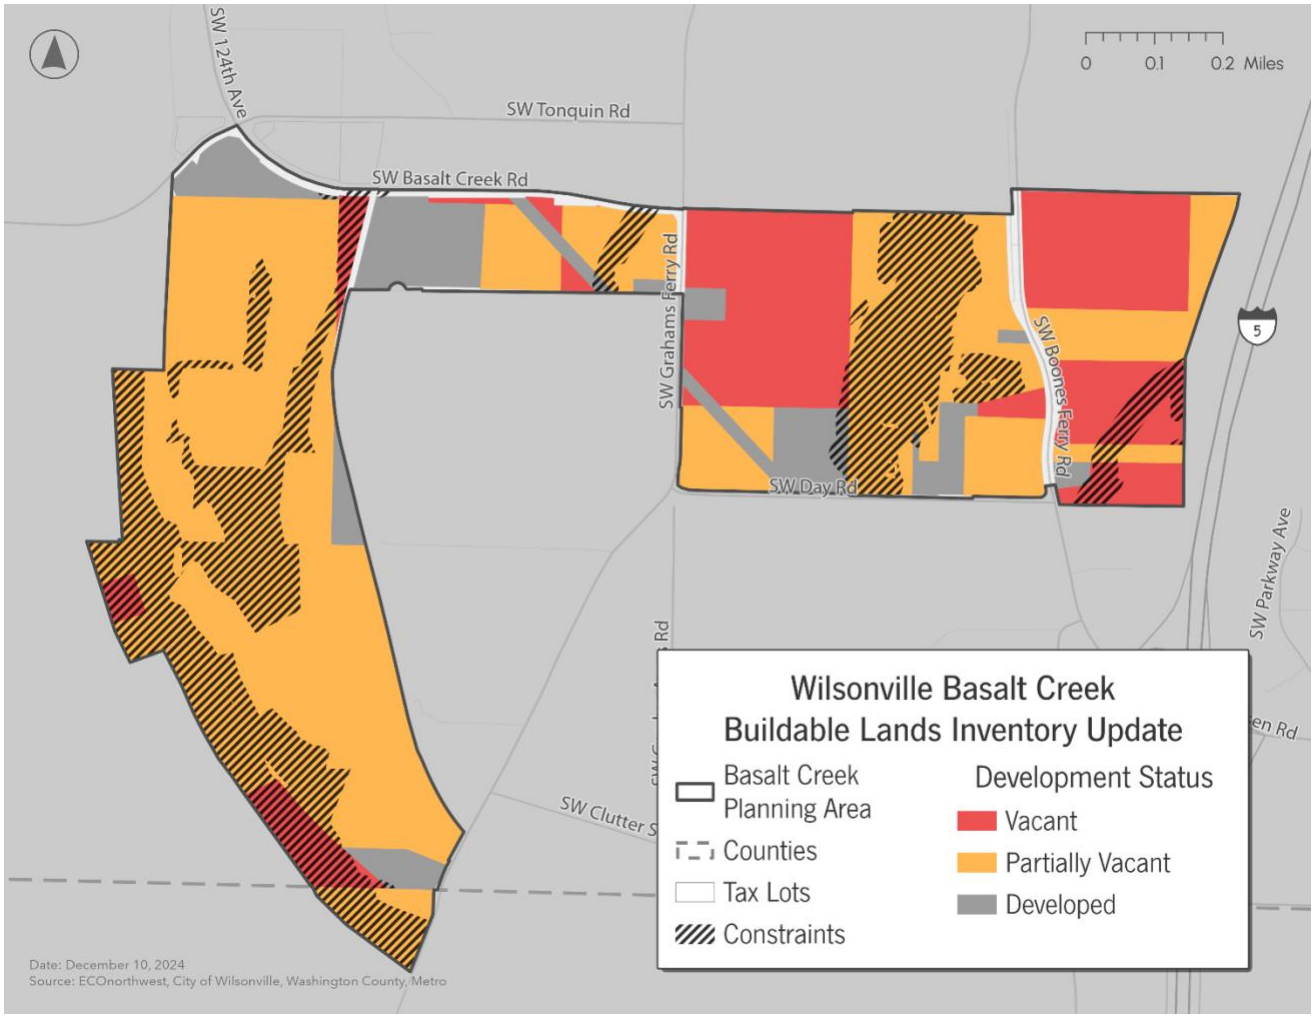
Plan Designation	Total Acres	Committed Acres	Constrained Acres	Buildable Acres
Industrial	237	63	48	127
Undesignated	215	110	81	24
Total	**453**	**173**	**129**	**150**

Source: ECOnorthwest Analysis, City of Wilsonville, Washington County, Metro, Pacific Habitat Services

Development Constraints

In coordination with City staff, ECOnorthwest identified physical constraints based on Washington County's Significant Natural Resources (SNR), as amended by Washington County Ordinances No. 901 and No. 902.[1] The SNR includes Metro Upland Wildlife Habitat Classes A and B, as well as Riparian Wildlife Habitat Classes I and II. For the single southern parcel located in the West Railroad area and within Clackamas County, GIS data provided by Pacific Habitat Services were used to identify physical constraints. These constraints are shown in Figure 1.

Figure 1. Development Constraints, BCPA, 2024



Source: ECOnorthwest Analysis, City of Wilsonville, Washington County, Metro, Pacific Habitat Services

[1] https://www.washingtoncountyor.gov/lut/planning/documents/ordinance-no-901a/download?inline

Figure 2 shows development status with constraints applied, resulting in buildable acres. Land classified as vacant or partially vacant and affected by these constraints is deemed unavailable for development and has been excluded from the inventory of buildable land.

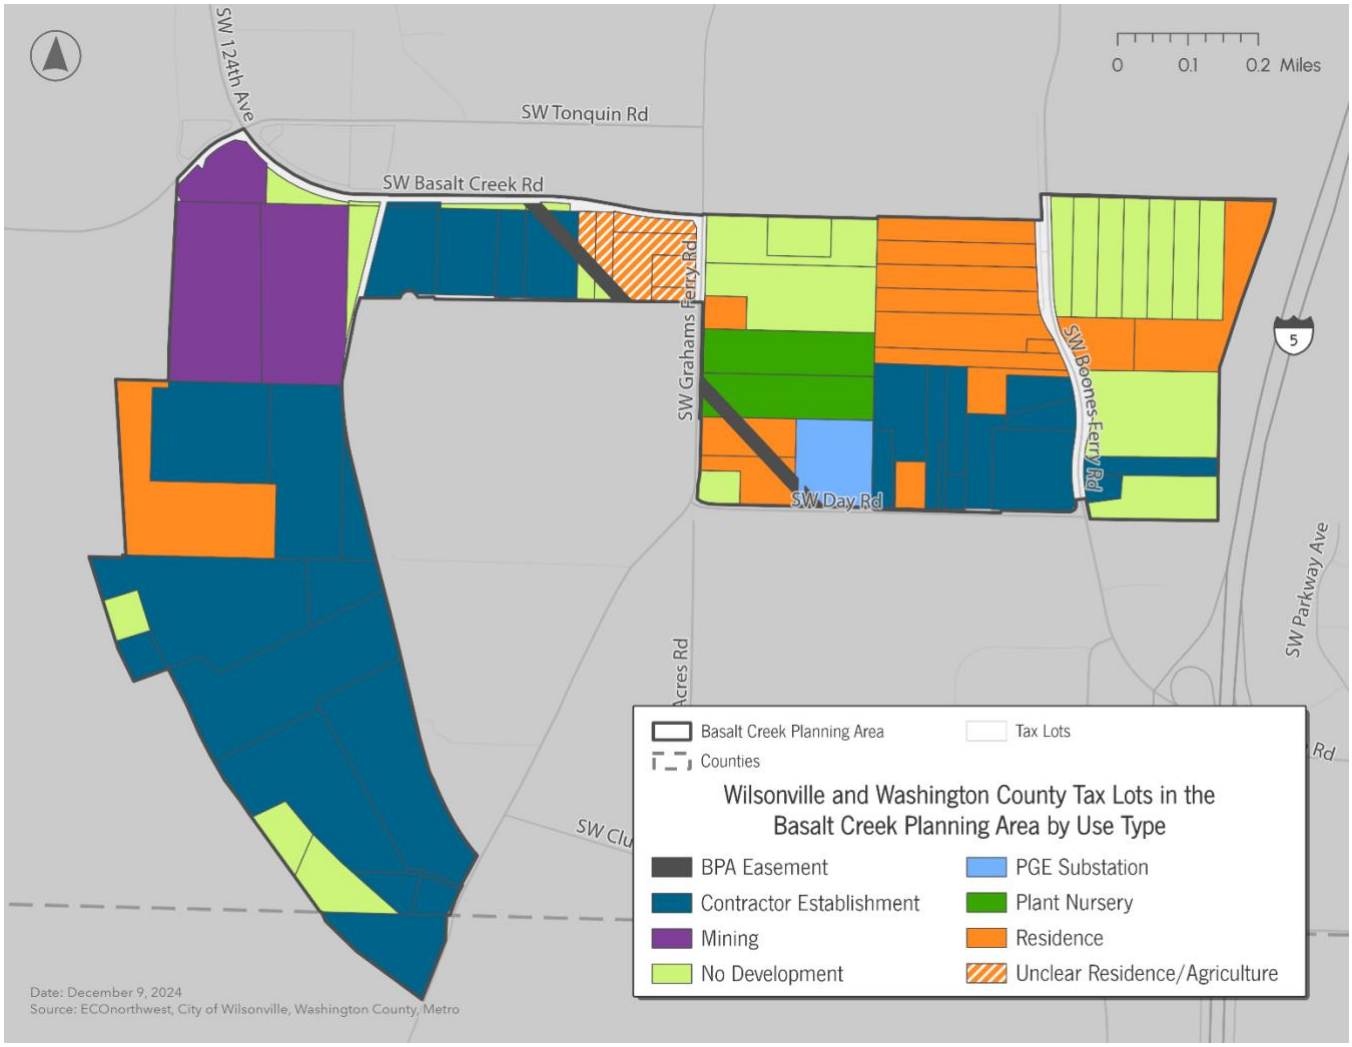


Figure 2. Development Status with Constraints, BCPA, 2024

Source: ECOnorthwest Analysis, City of Wilsonville, Washington County, Metro, Pacific Habitat Services

Figure 3 identifies land use categories for each site. ECOnorthwest collaborated with City staff to identify these categories through a detailed review process that combined local knowledge with aerial map analysis. Unlike basic classifications of vacant or partially vacant land, this map provides deeper insights into current land uses, offering valuable context for evaluating redevelopment potential and guiding the feasibility analysis (the results of which are shared in a separate memorandum).

Figure 3. Land Use Categories with Constraints, BCPA, 2024

Source: ECOnorthwest Analysis, City of Wilsonville, Metro

Vacant Buildable Land

The next step in the buildable lands inventory involved removing portions of vacant tax lots deemed unsuitable for development. Unsuitable areas fall into two categories:

1. Developed portions of partially vacant tax lots.
2. Areas affected by physical constraints (i.e., areas within Metro Upland Wildlife Habitat Classes A and B and Riparian Wildlife Habitat Classes I and II).

Table 3 presents the buildable acres—tax lot areas remaining after deducting these constraints—for both vacant and partially vacant land, categorized by Wilsonville's Comprehensive Plan designation. The BCPA has 150 total buildable acres available for development.

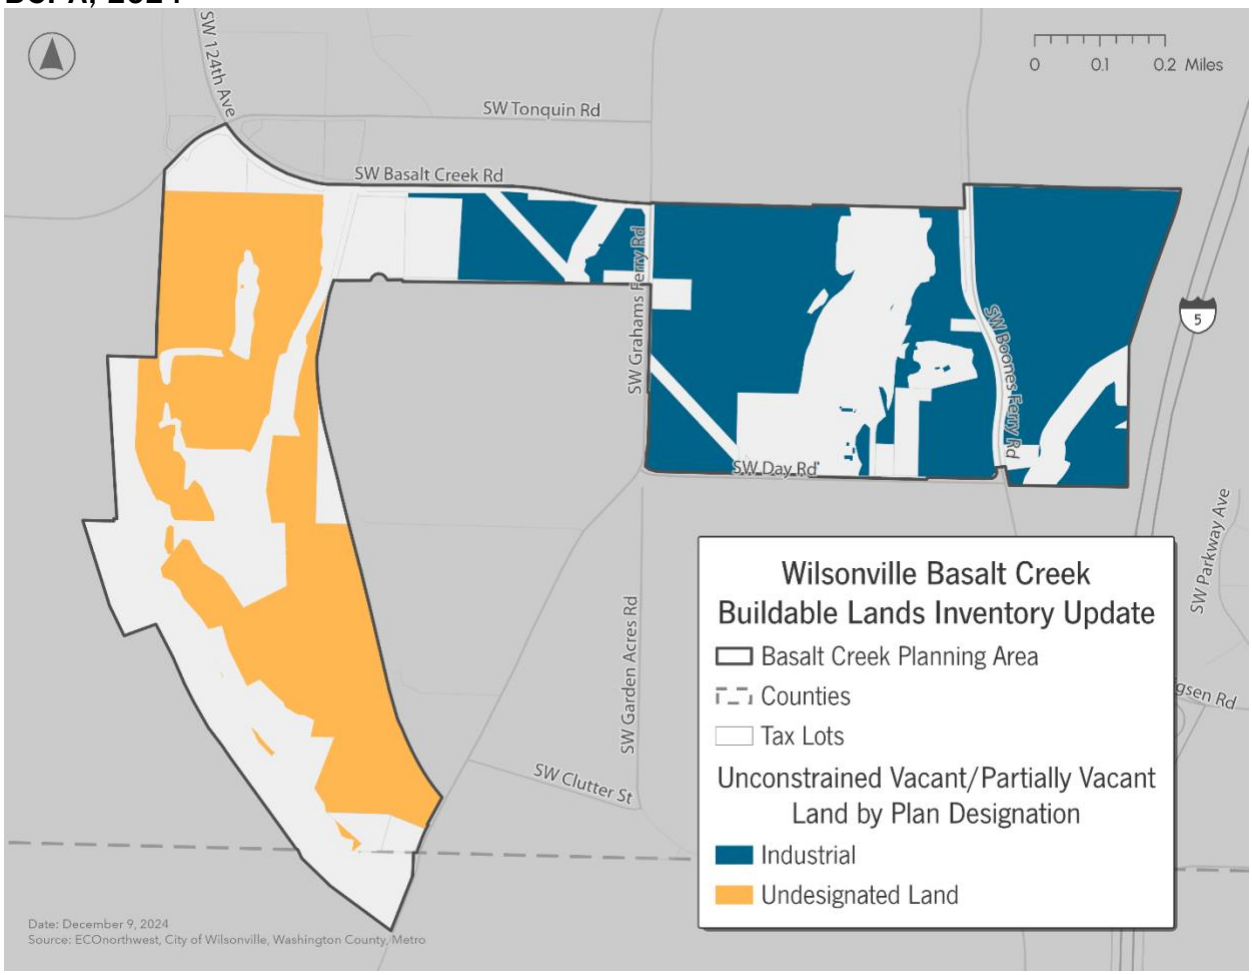

Table 3. Buildable Acres in Vacant and Partially Vacant Tax Lots by Wilsonville Comprehensive Plan Designations, BCPA, 2024

Plan Designation	Total Buildable Acres	Buildable Acres on Vacant Lots	Buildable Acres on Partially Vacant Lots
Industrial	127	87	40
Undesignated	24	0.4	23
Total	**150**	**87**	**63**

Source: ECOnorthwest Analysis, City of Wilsonville, Washington County, Metro

Figure 4 shows the buildable vacant and partially vacant land within the BCPA, categorized by Wilsonville Comprehensive Plan designation. It is important to note that tax lots shown as partially vacant in the map do not distinguish the part of the tax lot that is unavailable for development (or has redevelopment potential). However, the buildable lands inventory database accounts for these distinctions: the developed portions (unavailable for future development) are excluded, while the vacant portions are detailed in Table 4.

Figure 4. Buildable Employment Land by Wilsonville Comprehensive Plan Designation, BCPA, 2024

Source: ECOnorthwest Analysis, City of Wilsonville, Washington County, Metro, Pacific Habitat Services

Table 4 presents the size of buildable lots categorized by Wilsonville Comprehensive Plan designation across the BCPA. The planning area includes:

- Eight lots smaller than 0.5 acres, totaling 2 acres.
- Twenty-two lots between 0.5 and 2 acres, totaling 22 acres.
- Eighteen lots between 2 and 5 acres, totaling 57 acres.
- Six lots between 5 and 10 acres, totaling 46 acres.
- Two lots between 10 and 25 acres, totaling 23 acres.

Table 4. Buildable Acres and Tax Lots by Buildable Site Size by Wilsonville Comprehensive Plan Designation, BCPA, 2024

Plan Designation	Buildable Sites Size					
	0 - 0.5 Acres	0.5 - 1 Acres	1 - 2 Acres	2 - 5 Acres	5 - 10 Acres	10 - 25 Acres
Industrial	1	7	10	51	35	23
Undesignated	1	1	4	6	12	-
Acreage Total	**2**	**8**	**14**	**57**	**46**	**23**
Industrial	5	10	7	16	4	2
Undesignated	3	2	3	2	2	-
Tax Lot Total	**8**	**12**	**10**	**18**	**6**	**2**

Source: ECOnorthwest Analysis, City of Wilsonville, Washington County, Metro

Employment Capacity

ECOnorthwest analyzed the buildable land in Basalt Creek to update projections for potential job growth in the area. This assessment involved reviewing the capacity estimates from the BCCP and refining them using the updated land inventory of 150 buildable acres.

The analysis began with a review of research conducted by ECOnorthwest and other organizations on employment density. A common finding in such studies is the significant variability in employment density across industries, plan designations, and zoning districts. For example, an industrial zone may have employment densities ranging from 1-3 employees per acre for a warehousing facility and 10-15 employees per acre for flex spaces to densities over 25 employees per acre for office buildings.

The capacity estimates that follow are intended to provide a high-level estimate of job capacity based on the 2024 BLI update. Some factors, such as land needed for streets, would reduce capacity while others, such as higher lot coverages or multistory buildings, would increase capacity. The main utility of employment capacity estimates is in estimating

infrastructure needs. The figures that follow can be used to inform infrastructure demand estimates which can then be compared with infrastructure capacity to determine if existing and planned capacity are sufficient to accommodate expected employment densities.

Land Demand Methodology

When evaluating land and building capacity, two measures are commonly used to define the relationships between building size, floor area, and land area. These measures include:

- **Floor Area Ratio (FAR):** The ratio of a building's total square footage to the site's total square footage.
- **Employees Per Acre (EPA):** The total number of employees divided by the site size.

Basalt Creek Growth Capacity: Land Use Model Assumptions

This model builds on assumptions from the BCCP. Initially, the BCCP estimated an average of **18.5 jobs per gross acre** in Wilsonville's portion of Basalt Creek (excluding West Railroad). Key employment density estimates included:

- High-Tech Employment District: 20 jobs per gross acre.
- Craft Industrial: 22 jobs per gross acre.
- Light Industrial District: 16 jobs per gross acre.

ECOnorthwest applied the BCCP's assumption of 18.5 jobs per gross acre to model a high-density growth scenario. However, shifting market conditions—such as reduced demand for office space and increased demand for industrial and flex space (which typically have lower employment densities)—led ECOnorthwest to also model medium- and low-density growth scenarios to better reflect the potential range of employment densities in the study area. ECO also modeled different lot coverage ratios/FARs. The scenarios use lot coverages of 35 percent and 45 percent which is consistent with the assumptions used in the Task 4 redevelopment feasibility analysis of contractor establishments. The FARs of 0.35 and 0.45 reflect lot coverage ratios and the assumption that uses will be single story.

- **Low-Density Scenario:**
  - 10 employees per gross acre.
  - Lot coverage/FAR: 35 percent/0.35.
  - Reflects more traditional industrial densities and provides a more conservative estimate.
- **Medium-Density Scenario:**
  - 15 employees per gross acre.
  - Lot coverage/FAR: 45 percent/0.45.

- Assumes a greater share of office development compared to the low-density scenario, offering a more ambitious estimate.

- **High-Density Scenario (BCCP Adopted Assumption)**
  - 18.5 employees per gross acre.
  - Lot coverage/FAR: 45 percent/0.45.
  - Maintains the BCCP assumptions and envisions a greater share of office development than the other scenarios. It assumes the same lot coverage ratio which yields the same built space capacity as the medium-density scenario but with a higher number of employees occupying that space.

Results: Land Use Modeling for Basalt Creek

Table 5 outlines the results of this analysis, indicating that Wilsonville's portion of Basalt Creek has capacity for:

- **Employment:** Between 1,500 and 2,780 jobs.
- **Built Space:** Between 2.3 million and 2.9 million square feet.

These findings reflect the range of potential outcomes based on varying employment density assumptions.[2]

Table 5. Job Capacity and Built Space Capacity, Wilsonville BCPA

	Low	Medium	High
Job Capacity	1,500	2,250	2,780
Built Space Capacity (SF)	2,289,000	2,943,000	2,943,000

Source: Analysis by ECOnorthwest

[2] ECOnorthwest also analyzed the potential number of employees and built space under current density levels, estimated at approximately 5 employees per gross acre. If these existing conditions persist, the area is projected to accommodate around **750 employees** and **1.3 million square feet** of built space.

Site Suitability Analysis

The BCPA is well positioned to capture industrial growth in the South Metro region. It benefits from its strategic location with access to I-5, a robust employment base, and connections to other expanding industrial hubs in Sherwood and Tualatin. Over the summer, ECOnorthwest conducted an Economic Inventory to assess market conditions and identify industries most likely to establish a presence in Basalt Creek focusing on industrial and office uses in alignment with the BCCP vision.[3] The analysis highlighted strong national and regional demand for industrial space and identified key sectors with potential interest in the area, including the semiconductor supply chain, cleantech, advanced manufacturing, distribution and logistics, and data centers.

Although the BCCP originally envisioned a blend of industrial and office development, current market trends suggest a shift toward a greater emphasis on industrial uses. Office developments, while still anticipated, are expected to occupy a smaller footprint than initially planned.

WHICH SECTORS MAY BE ATTRACTED TO BASALT CREEK?

Below are the potential sectors that may be particularly attracted to Basalt Creek as identified in the Economic Inventory report.

- **Semiconductor Sector Supply Chain:** Companies providing materials, equipment, and services to chip manufacturers.
- **Cleantech, including Battery Technology:** Businesses involved in renewable energy technology, energy efficiency solutions, and sustainable manufacturing processes.
- **Advanced Manufacturing:** Companies using technology such as robotics, 3D printing, and computerized systems to manufacture specialized products or components.
- **Distribution and Logistics:** Storage, transportation, and delivery of goods.
- **Data Centers:** Facilities used to house computer systems and associated components.

To determine site specific competitiveness for these industries, ECOnorthwest evaluated three opportunity sites using the Mackenzie Infrastructure Finance Authority (IFA) Industrial Development Competitiveness Matrix as a foundation. Recognizing that industry requirements have evolved since the matrix's creation in 2015, the analysis incorporated updated reports and stakeholder feedback to align with current market demands. This Site Suitability Analysis assesses site characteristics such as size, location, and constraints to evaluate their ability to host target industries. While the analysis considered buildable land availability, its primary focus was on site potential, assuming redevelopment occurs. Feasibility and redevelopment likelihood of contractor establishments is addressed in a separate task.

[3] When evaluating the office market, medical office showed stronger growth than traditional office. However, ECOnorthwest did not further evaluate its potential, as it was not a use envisioned in the BCCP.

Opportunity Sites for Analysis

ECOnorthwest evaluated the following sites for their development potential (Figure 5):

- **SW Greenhill Site:** Selected for its consolidated land ownership and strong potential for near-term development, given the absence of active use.
- **Craft Industrial Area:** As a transitional area, the City seeks to assess this site's characteristics in detail to determine the most appropriate land uses. This will inform zoning designations.
- **West Railroad Site:** West Railroad lacked a defined concept in the original BCCP. To explore its potential, ECOnorthwest analyzed a portion of West Railroad, focusing on its development suitability. This will inform whether a zoning designation similar to the rest of the Basalt Creek area would be appropriate. The area also faces physical and service constraints, and the analysis evaluates whether these challenges might limit future development opportunities.

Figure 5. Opportunity Sites

Source: ECOnorthwest Analysis, City of Wilsonville, Washington County, Metro

Table 6 summarizes the size of unconstrained lots for the opportunity sites. Note that "unconstrained acres" here includes developed areas. In general, larger sites are more appealing to industrial users, who often seek parcels of 5 or more acres. Smaller sites, however, may require site aggregation to meet these needs. Notably, sites in SW Greenhill and West Railroad, which exceed 5 acres, could be especially attractive to developers. While all opportunity sites may require some degree of site aggregation, the Craft Industrial area faces the greatest challenge due to its relatively small lot sizes and fragmented land ownership.

Table 6. Unconstrained Acres and Tax Lots by Site Size for Opportunity Sites, BCPA, 2024

Site Suitability Area	Unconstrained Sites Size					
	0 - 0.5 Acres	0.5 - 1 Acres	1 - 2 Acres	2 - 5 Acres	5 - 10 Acres	10 - 25 Acres
Craft Industrial	-	1	5	8	-	-
SW Greenhill	-	-	-	31	-	21
West Railroad	0.3	-	3	10	19	60
Acreage Total	**0.3**	**1**	**9**	**49**	**19**	**81**
Craft Industrial	-	1	3	3	-	-
SW Greenhill	-	-	-	8	-	2
West Railroad	3	-	2	3	3	4
Tax Lot Total	**3**	**1**	**5**	**14**	**3**	**6**

Site Competitiveness Factors

The IFA Industrial Development Competitiveness Matrix includes the following factors for evaluating the competitiveness of different industries:

- Site Size
- Competitive Slope (physical slope of a parcel, which can impact its suitability for development)
- Access to Transportation and Trip Generation (Highway, Rail, and Airport Proximity)
- Access to Utility Infrastructure (Water, Sewer, Electricity, Telecommunications)
- Special Considerations

The industries evaluated in the IFA Industrial Development Competitiveness Matrix include the following, which align with the BCCP and the Economic Inventory findings, and are the focus of this analysis (the full matrix can be found in Appendix B.1):

- **Production Manufacturing:**
  - High-Tech/Cleantech Manufacturing
- **Value-Added Manufacturing and Assembly:**
  - Food Processing
  - Advanced Manufacturing and Assembly
- **Light/Flex Industrial:**
  - General Manufacturing
  - Industrial Business Parks and R&D Campuses
  - Business Services
- **Warehousing and Distribution**
  - Regional Warehouse/Distribution
  - Local Warehouse/Distribution
- **Specialized Uses:**
  - Data Centers

Industry-Specific Considerations

Recent growth in the semiconductor and cleantech sectors has prompted additional research to understand the evolving needs of these industries. To support this, the Oregon Legislature established the Oregon Semiconductor Task Force to identify industry needs and opportunities. Similarly, Business Oregon supported the creation of the Oregon Cleantech Competitiveness Assessment Report to evaluate the needs and prospects for cleantech industries. Key findings related to site-specific requirements from these initiatives are outlined below.

SEMICONDUCTOR SECTOR

The semiconductor industry offers Oregon a prime opportunity to expand advanced manufacturing, grow its traded sector, and create high-quality jobs. The $52 billion CHIPS Act, passed in July 2022, accelerates efforts to boost domestic semiconductor production by allocating $40 billion for manufacturing and $10 billion for research over five years.

The Metro region hosts a robust semiconductor cluster centered in Hillsboro. There has also been some semiconductor activity south of Hillsboro, including LAM Research in Sherwood and Tualatin, bolstering the supply chain presence in the South Metro. This established network positions the region to attract additional semiconductor-related investments.

The Semiconductor Task Force's Industrial Lands Subcommittee identified key site characteristics most important for the semiconductor industry:

- **Workforce Availability and Talent Proximity.** Access to skilled workers—engineers, technicians, and operators—is essential. Semiconductor clusters thrive where workers can easily transition between companies, creating a dynamic employment ecosystem. Workforce access is critical for both fabrication plants and supply chain operations.
- **Parcel Size and Usage.** Parcel size varies by operational needs. Fabrication plants require ***50–100 acres*** to accommodate clean rooms and infrastructure, with large-scale R&D and production facilities needing ***500+ acres***. Supply chain operations, such as equipment and material suppliers, generally need smaller parcels of ***15–35 acres***.
- **Infrastructure Readiness.** Reliable access to ***transportation, water, electricity, and wastewater systems*** is crucial. Semiconductor companies prioritize sites with infrastructure ready to support development within ***6 months to 3 years***.
- **Clustering with R&D Partners and Suppliers.** Collaboration with suppliers and R&D partners is vital. Fabrication plants benefit from proximity to suppliers for quick equipment maintenance and research. Supply chain operations also thrive in clusters, connecting with customers and transport hubs.
- **Environmental and Regulatory Considerations:** Predictable permitting processes are essential to avoid delays. While environmental regulations remain important, fast-tracked approvals are necessary to match the industry's pace.

SITE COMPETITIVENESS FOR THE CLEANTECH SECTOR

Oregon is well positioned to capitalize on the growth of cleantech industries, driven by federal initiatives like the Inflation Reduction Act and an increasing focus on sustainability. Cleantech encompasses a range of technologies, including renewable energy, energy-efficient materials, water technologies, and recycling systems. While the IFA Industrial Development Competitiveness Matrix provides general site characteristics for cleantech, the Oregon Cleantech Competitiveness Assessment Report—developed for Business Oregon—offers more detailed site selection criteria specific to established and emerging cleantech industries within the state. Key site characteristics for these subsectors are summarized below (a complete matrix is available in Appendix B.2). Scalability is essential for many users, as industries often begin on smaller sites but require the flexibility to expand as they grow.

- **Battery Storage:** These systems store renewable energy for later use, enhancing grid stability and reliability. Technologies range from lithium-ion to flow batteries, used in applications from small urban microgrids (0-5 acres) to large grid-scale facilities (25+ acres). Electrical system proximity and access for power generation facilities may vary, depending on the scale and intended use. Microgrid systems may only need connection to the local electrical grid, while large-scale grid storage may require connection to regional transmission lines or substations. Zoning flexibility for

energy uses is critical, while water needs and transportation access are generally less significant.

- **Mass Timber:** Engineered wood products like cross-laminated timber (CLT) and glued laminated timber (GLT) serve as sustainable alternatives to steel and concrete. Production facilities need medium to large sites (5-25+ acres), reliable transportation (particularly to arterial roads and railways) for raw materials, and substantial power supply.
- **Ag-Tech:** This sector integrates advanced technologies like AI, Internet of Things (IoT), agrivoltaics, and drones to optimize agriculture. Ag-tech operations, in this sense, are generally assumed to focus on software and small-scale equipment products, generally collaborating with large existing farms for R&D. These businesses typically require small sites (0-5 acres) with low transportation, water, and power demands.
- **Circular Economy:** This sector focuses on recycling and resource reuse, supporting waste-reduction and material-recovery technologies. Businesses range from R&D to recycling and upcycling facilities. Typically, these operations require small to medium-sized sites (0-25 acres), though the specific site needs depend on the types of raw materials and finished products, as well as the scalability of the industry. Good transportation access—especially to arterial roads and potentially railways—is important, along with moderate water and power requirements and flexible zoning options.
- **Solar and Wind Energy Production:** This sector encompasses both energy production and manufacturing. Manufacturing facilities share site requirements with advanced manufacturing industries, while energy production facilities vary significantly in scale. These range from small rooftop installations to large-scale farms, which require proximity to transmission lines and substations. The electrical system needs depend on the scale and purpose of the facility—microgrid systems may only require a connection to the local grid, while large-scale grid storage typically necessitates access to regional transmission lines or substations. Transportation access requirements also vary, but wind turbine manufacturing often requires rail access due to the size of components.
- **Water Technologies:** This sector focuses on addressing water scarcity and quality through innovations such as AI-driven leak detection, wastewater recycling, and desalination. It often involves both R&D and production facilities. These businesses typically require small to medium-sized sites (0-25 acres) with access to high-pressure water systems and significant power capacity, while having relatively low transportation needs.
- **Building Energy Technologies:** This sector focuses on innovations that improve energy efficiency, including smart HVAC systems and energy-efficient lighting to reduce building energy use. R&D and software development facilities in this space

typically require small sites (0-5 acres) with moderate to high electrical needs, while having low transportation and water requirements.

- **Electric Vehicle (EV) Infrastructure Technologies:** Supporting the adoption of EVs through charging networks and technology development, this sector generally requires medium to large sites (5-25+ acres) with high electrical power demands and good access to transportation networks.

Opportunity Site Characteristics

The market analysis revealed that Basalt Creek is well suited for various industrial uses, including light industrial, flex space, warehousing, distribution, advanced manufacturing, and support for cleantech and semiconductor sectors. These industries have specific site requirements. To assess how the three opportunity sites could accommodate different sectors, ECOnorthwest analyzed each site's characteristics and evaluated them against the competitiveness matrix and additional criteria specific to cleantech and semiconductor industries.

Table 7 outlines the physical characteristics of the three sites under analysis.

Table 7. Physical Characteristics of Opportunity Sites

SITE CHARACTERISTIC	SW GREENHILL	CRAFT INDUSTRIAL	WEST RAILROAD
Site Size and Ownership	♦ 57 acres ♦ 10 tax lots ♦ 2 owners (1 owns 42 acres, 1 owns 14 acres)	♦ 32 acres ♦ 7 tax lots ♦ 7 owners (fairly even site size distribution)	♦ 165 acres ♦ 15 tax lots ♦ 8 owners (1 owns 65 acres, 4 own ~20 acres each, 3 own smaller parcels)
Slope	Slopes of 10% or greater cover about 6 acres, or 11% of the total site area.	♦ Slopes of 10% or greater cover about 15 acres, or 46% of the total site area. These slopes are generally in the middle of the site, bordering Basalt Creek.	♦ Slopes of 10% or greater cover about 34 acres, or 20% of the total site area. However, some of these slopes are from activities on the sites and not physical attributes.
Surrounding Uses	♦ North: Planned for medium-low density residential and neighborhood commercial (Tualatin portion of BCPA) ♦ East: BCPA border and I-5 ♦ South: Undeveloped land, contractor establishment (planned High-Tech Employment District) ♦ West: Craft Industrial Opportunity Site	♦ North: Planned for (and under development) low-density residential (Tualatin portion of BCPA) ♦ East: SW Greenhill Opportunity Site (planned High-Tech Employment District) ♦ South: Contractor establishments, single residential property (planned High-Tech Employment District) ♦ West: Contractor establishments, plant nurseries, and undeveloped land (planned Light Industrial District)	♦ North: Adjacent to mining site ♦ East: Coffee Creek Correctional Facility and Coffee Creek Industrial area ♦ West: Coffee Creek provides a natural buffer ♦ South: Undeveloped land in Clackamas County
Constraints	♦ 52 unconstrained acres (91% of total area) ♦ Minimal constraints running along the eastern boundary	♦ 14 unconstrained acres (42% of total area); 9 of these acres are east of the constraints that dominate the central area; the remaining 5 acres occupy the northwest corner ♦ Constraints dominate the central north-south area	♦ 92 unconstrained acres (56% of total area) ♦ Constraints run along the entire western boundary and central northern half

Table 8 outlines the existing and planned utilities on the opportunity sites. Details on water, sewer, and roads were provided by City staff based on the most current local access maps from DKS. Final infrastructure alignment and capacity are still in the planning stages.

Table 8. Infrastructure and Utility Characteristics of Opportunity Sites

SITE CHARACTERISTIC	SW GREENHILL	CRAFT INDUSTRIAL	WEST RAILROAD
Water: Potable water delivery to BCPA requires Basalt Creek Parkway extension, Zone C booster station, and may require SW Grahams Ferry Rd extension. These systems will connect SW Tooze Rd to SW Day Rd – 10,200 LF 18" diameter pipe and 4,670 LF 12" diameter pipe. *Modeling needs to confirm these requirements.*	**Current:** No existing water lines in area. **Planned:** Requires water main along SW Boones Ferry Rd alignment (2,490 LF). Water lines assumed to generally follow local road layout (5,460 LF). Will connect proposed water lines to existing lines on SW Pioneer Ct and SW Day Rd. *Sizes to be confirmed during modeling.*	**Current:** No existing water lines in area. **Planned:** Assumed to utilize proposed water main along SW Boones Ferry Rd. *Sizes to be confirmed during modeling.*	**Current:** No existing water lines in area. **Planned:** Water lines assumed to follow road layout from SW Grahams Ferry to SW Tonquin Rd (6,900 LF). *Sizes to be confirmed during modeling.*
Roads	**Current:** Existing SW Boones Ferry Rd, SW Greenhill Rd **Planned:** New arterial to I-5 from SW Greenhill Rd (300 LF). New arterial from SW Day Rd to I-5 (1,060 LF). New local roads looping SW Greenhill Rd to SW Boones Ferry Rd (3,350 LF) and connecting to SW Pioneer Ct (2,110 LF).	**Current:** Existing SW Boones Ferry Rd. **Planned:** New local road looping SW Day Rd to SW Boones Ferry Rd (1,900 LF). Assumed to utilize SW Boones Ferry Rd.	**Current:** Existing SW Grahams Ferry Rd to south and SW Tonquin Rd to north. **Planned:** New local road connecting SW Grahams Ferry Rd to SW Tonquin Rd (6,900 LF) with a possible connection to SW Morgan Rd (2,570 LF).
Sewer: Wastewater collection for BCPA requires completion of Coffee Creek Interceptor Phase 2 – 2,000 LF of gravity system upsizing to 21" diameter pipe from SW Boeckman Rd along railroad to SW Ridder Rd. This also requires Coffee Creek Interceptor Railroad Crossing – 160 LF of 21" diameter pipe.	**Current:** No existing sewer lines in area. **Planned:** Gravity collection lines flow generally south and west along proposed road layout (5,460 LF). Requires new collection line along SW Day Rd (1,600 LF) and new line to travel south between SW Day Rd to connect to SW Garden Acres Rd just north of SW Ridder Rd (3,700 LF). *10-12" diameter collection lines are anticipated.*	**Current:** No existing sewer lines in area. **Planned:** Assumed to utilize proposed line along SW Boones Ferry Rd.	**Current**: No existing sewer lines in area. **Planned:** Gravity line flows from SW Clay St west, crosses railroad, and meets proposed local street alignment in West Railroad to SW Grahams Ferry Rd (6,900 LF). Lift station is required with pressure main along SW Grahams Ferry to SW Clutter St (380 LF) before returning to gravity along SW Clutter St to SW Garden Acres Rd (1,430 LF). *A 10" diameter pipe is anticipated for gravity lines.*
Natural Gas	The IFA matrix does not identify natural gas as a requirement for industries most likely to locate in the BCCP. Natural gas did not come up as a barrier for industrial development in interviews.		
Electricity	Discussions with PGE indicate that the area can accommodate industrial users with moderate power needs. However, large power users such as a data center may require infrastructure upgrades. These types of upgrades can take 3+ years.		
Telecommunication	Since the BCPA is located within the Metro, telecommunication service is expected to be adequate to meet the needs of likely users. Telecommunication capacity did not come up as a barrier for industrial development in interviews.		

Location in the overall region and access to highways, rail, other like businesses, and labor force also play a role in site selection for industries. Given the proximity of these sites within a very small area, we detail these overall characteristics for the BCPA rather than for each site (Table 9).

Table 9. Basalt Creek Transportation and Proximity Characteristics

SITE CHARACTERISTIC	BASALT CREEK EVALUATION
Available Trips	♦ The BCCP allocated 951 trips to Wilsonville's portion of Basalt Creek. The TRP identifies the necessary improvements to accommodate those trips. Additional development and trips would require an update to the TRP and additional capacity improvements to the planned system.
Transportation Access to Interstate or Principal Arterial	♦ The entirety of Basalt Creek is within 5 miles of access to I-5 and I-205 and is less than 10 miles from Highway 217.
Proximity to Regional Infrastructure Rail/Port/Airport	♦ Basalt Creek is ~27 miles from Portland International Airport and ~26 miles from the Port of Portland. ♦ A rail line runs through Basalt Creek. The type of rail line and potential for spurs are not known at this point.
Proximity to Labor Force	♦ Access to the broader Portland Metro and Mid-Valley labor forces.
Proximity to Goods	♦ Close proximity to wine region and agricultural land. ♦ Close proximity to distributors, other manufacturers, and tech hubs, including semiconductor businesses.

Evaluation of Compatible Uses

The suitability of potential users for each site is outlined below, based on site characteristics and industry-specific needs. This high-level evaluation focuses on physical site characteristics—such as size, location, and constraints—without factoring in the likelihood of redevelopment. It provides a broad understanding of site benefits, barriers, and potential industry suitability, serving as a foundation for planning and zoning rather than a definitive assessment of building configurations or sizes.

Infrastructure will be pivotal in shaping the types of industries and scale of development suitable for the area. This analysis incorporated available information on infrastructure elements such as water, wastewater, and roads; however, detailed system capacities, final road alignments, and the timing of improvements—particularly in areas like West Railroad—remain uncertain. These factors will play a significant role in determining site suitability.

Water and wastewater systems are expected to meet most demands, though high-water users may require additional capacity. Similarly, industries with significant electricity demands might necessitate infrastructure upgrades. Road alignments will impact parcel configurations, building sizes, and overall development potential. While these elements are critical to understanding site suitability, they are not yet classified as definitive constraints or advantages.

- **The SW Greenhill** site spans 57 acres, with 91 percent (52 acres) of the land unconstrained. Minimal slopes (affecting 11 percent of the site), a high proportion of undeveloped land, consolidated land ownership (two property owners), and proximity to existing infrastructure make it one of the most development-ready locations in Basalt Creek. The site could be physically suitable for a high-tech supply chain, cleantech industries, advanced manufacturing, food processing, small warehousing and distribution, and industrial business parks or R&D campuses. Its proximity to transportation networks and regional workforce access further enhances its competitiveness.
- **The Craft Industrial** area is split into eastern and western portions by site constraints and consists of seven tax lots with fragmented ownership, most under five acres. Only 14 acres are unconstrained, and its proximity to residential areas limits its suitability for high-intensity industrial uses. Instead, the area aligns with the Basalt Creek Concept Plan's vision for small-scale or micro-industrial uses, such as live-work spaces or makerspaces.

  With site aggregation, the southeastern portion could accommodate small-scale industrial or office users on up to five acres. These uses could resemble industrial condo developments like the Commerce Circle Business Park or Riverwood Business Center, which integrate office and small-scale production spaces. The northeastern portion, while it could also redevelop, is likely less appealing due to its irregular shape and nearby high-value residences. The presence of existing residences,

including some high-value homes, are likely to delay redevelopment timelines compared to other opportunity sites. However, the feasibility of redeveloping these residential properties was not assessed as a part of this study.

- **The West Railroad** site spans 165 acres, with 56 percent (92 acres) of the land unconstrained. Its large parcels and access to regional transportation networks could make it physically suitable for uses such as general manufacturing, food processing, and small to midsized warehousing or distribution. Proximity to Coffee Creek's industrial area further enhances its appeal to businesses providing support services to neighboring industries. However, significant infrastructure upgrades are required, and access is limited by the railroad undercrossing on SW Grahams Ferry Road. Additionally, the site's proximity to a rail line and a mining operation could make the site less attractive to advanced manufacturing or other industries sensitive to vibration. Ongoing infrastructure alignment and capacity studies will provide further clarity on the site's suitability for targeted industries.

In Table 10, the compatibility of each site with various industrial uses is color coded as follows:

- Red: Not competitive for the industry
- Yellow: Moderate potential
- Green: High compatibility and strong suitability

Table 10. Evaluation of Compatible Uses Based on Site Characteristics

INDUSTRIES		SW GREENHILL	CRAFT INDUSTRIAL	WEST RAILROAD
Production Manufacturing	High-Tech / Cleantech Manufacturing	Midsized, flat site; high power or utility demands could exclude some users depending on system capacity	May be able to accommodate a small user (under 5 acres) most likely on the southeastern portion; some users may prefer larger sites with expansion potential	Vibration *may* be a concern from nearby rail and/or mining; high power or utility demands could exclude some users depending on system capacity
Value-Added Manufacturing and Assembly	Food Processing	Water and sewer needs are high; high demands could exclude some users depending on system capacity	May be able to accommodate a small user (under 5 acres) most likely on the southeastern portion	Water and sewer needs are high; high demands could exclude some users depending on system capacity
	Advanced Manufacturing & Assembly	Midsized, flat site; lower water and sewer demand than high-tech industries	Site small and constrained; increased setbacks (if required) could be a problem; often requires on-site utility service areas	Vibration *may* be a concern from nearby rail and/or mining

INDUSTRIES		SW GREENHILL	CRAFT INDUSTRIAL	WEST RAILROAD
Light / Flex Industrial	General Manufacturing	Residential proximity may reduce appeal	Site small and constrained; residential proximity may reduce appeal	Desirable site size available; distance from sensitive uses (residential, park)
	Industrial Business Park and R&D Campus	Midsized, flat site; slightly small for some users	Site small and constrained	Constraints may limit large park potential
	Business / Admin Services	Midsized, flat site; high trip generation	May be able to accommodate a small user (under 5 acres) most likely on the southeastern portion; tolerates higher slopes; compatible near residential; high trip generation	Proximity to Coffee Creek Industrial area that hosts similar services is attractive; tolerates higher slopes; high trip generation
Warehouse & Distribution	Regional	Close to I-5; existing road infrastructure; site may be a little small for some users	Site too small and constrained; limited space for trucks	Constraints could limit large distribution centers; the City is evaluating needed improvement to better accommodate truck traffic
	Local	Close to I-5; existing road infrastructure; suitable for smaller users	Site too small and constrained; limited space for trucks	Close to I-5; suitable for smaller users; the City is evaluating needed improvement to better accommodate truck traffic
Specialized	Data Center	May be suitable, but power needs could exceed available capacity, requiring upgrades	Site too small and constrained	May be suitable, but power needs could exceed available capacity, requiring upgrades

Site Competitiveness for Semiconductor Industry

Basalt Creek lacks the large parcels required for fabrication plants but is positioned to accommodate supply chain businesses that support semiconductor manufacturing.

- **SW Greenhill:** High Potential – Could be competitive for the semiconductor supply chain businesses. This site is closest to development ready, which is highly competitive because semiconductor companies prioritize sites with infrastructure ready to support development within *6 months to 3 years.*
- **Craft Industrial:** Not Competitive – Given the small parcels on the Craft Industrial site, this site is not competitive for the semiconductor supply chain businesses.

- **West Railroad:** Moderate Potential – The longer timeline required to provide adequate infrastructure, combined with existing constraints, makes this site less attractive for the semiconductor industry.

Site Competitiveness for Cleantech

- **Craft Industrial:** Moderate Potential – Given the small parcels and extent of constraints, this site is not competitive for many cleantech businesses but may be attractive to small-scale users in ag-tech and building energy tech that require sites under 5 acres.

Table 11. Cleantech Evaluation of Compatible Uses for Craft Industrial

Battery Storage	Existing businesses add appeal, but energy demands may exceed supply; site size may be too small for many users
Mass Timber	Limited by small site size, lack of direct rail access, and high energy requirements
Ag-Tech	Site may be suitable for a small user
Circular Economy	Some users may prefer direct rail access; site may be too small for some users
Solar & Wind Energy	Small site; unsuitable for power generation and manufacturing
Water Tech	High demand user; water pressure adequacy and energy needs may pose challenges; site may be too small for some users
Building Energy Tech	Site may be suitable for a smaller user; energy demands could exceed supply
EV infrastructure Tech	Limited site size, lack of rail access, and high energy requirements

- **SW Greenhill and West Railroad:** High Potential – Site size and infrastructure could appeal to a variety of cleantech subsectors, including battery storage, ag-tech, circular economy, water tech, and building energy tech.

Table 12. Cleantech Evaluation of Compatible Uses

Battery Storage	Existing businesses add appeal, but energy demands may exceed supply
Mass Timber	Limited by lack of direct rail access and high energy requirements
Ag-Tech	Sites meet needs well
Circular Economy	High transportation needs: some facilities may prefer direct rail access
Solar & Wind Energy	Unsuitable for power generation; possible for manufacturing but limited by rail and power needs
Water Tech	High demand user; water pressure adequacy and energy needs may pose challenges; low transportation needs
Building Energy Tech	Sites meet needs well; energy demands could exceed supply
EV infrastructure Tech	Limited by lack of rail access and high power requirements

Conclusion

Land Supply

The BCPA offers a promising opportunity to support a diverse range of industrial and employment uses that align with Wilsonville's economic development goals. Since the previous Buildable Lands Inventory (BLI) update, the area has experienced growth in contractor establishments. The updated BLI identifies **150 acres of buildable land,** comprising **87 acres of vacant land** and **63 acres of partially vacant land,** after accounting for constraints and existing development. The supply is distributed across parcels of varying sizes, ranging from small lots under 5 acres to larger parcels exceeding 25 acres, providing a mix of options suitable for different industry needs. Given the 150 acres of buildable land and the expectation of employment densities between 10 and 18.5 employees per acre, the BCPA is expected to accommodate between **1,500 and 2,780 jobs**.

Site Suitability Analysis

The Site Suitability Analysis evaluates the competitiveness of three opportunity sites within the BCPA based on their ability to host key industries identified in the Economic Inventory. This evaluation focuses on physical site characteristics, such as size, location, and constraints, rather than the likelihood of redevelopment. Redevelopment feasibility is addressed in a separate deliverable.

- **SW Greenhill:** With its minimal constraints, lack of development, consolidated land ownership, and existing infrastructure, this site could be physically suited for cleantech, high-tech supply chains, advanced manufacturing industries, food processing, small warehousing and distribution, and industrial business parks or R&D campuses requiring medium-sized parcels. This validates the uses originally envisioned in the BCCP for the area.
- **Craft Industrial:** Due to significant constraints, the site is currently more suitable for micro-industrial uses, such as live-work spaces, as originally identified in the BCCP. However, with site aggregation, the southeastern portion could accommodate small-scale business or administrative services and production uses, similar to industrial condo developments like Commerce Circle Business Park or Riverwood Business Center. The presence of existing residences, including some high-value homes, are likely to delay redevelopment timelines compared to other opportunity sites.
- **West Railroad:** This site has potential for development in general manufacturing, food processing, warehousing and distribution, and business services. However, significant infrastructure upgrades are required, and existing constraints may limit the scale of some types of development.

Next Steps

The findings presented in this memorandum are preliminary and will be further refined through ongoing discussions with the Planning Commission and City Council. This analysis is being conducted in parallel with an evaluation of redevelopment feasibility for contractor establishments. Ultimately, these components, along with insights from the Economic Inventory, will be synthesized into a summary report that outlines key findings and recommendations.

Appendix B.1 IFA Industrial Development Competitiveness Matrix

ECOnorthwest

STATE OF OREGON - Infrastructure Finance Authority
Industrial Development Competitiveness Matrix

16	**SPECIAL CONSIDERATIONS:**		Adequate distance from sensitive land uses (residential, parks, large retail centers) necessary. High throughput of materials. Large yard spaces and/or buffering required. Often transportation related requiring marine/rail links.	Acreage allotment includes expansion space (often an exercisable option). Very high utility demands in one or more areas common. Sensitive to vibration from nearby uses.	May require high volume/supply of water and sanitary sewer treatment. Often needs substantial storage/yard space for input storage. Onsite water pre-treatment needed in many instances.	Surrounding environment of great concern (vibration, noise, air quality, etc.). Increased setbacks may be required. Onsite utility service areas. Avoid sites close to wastewater treatment plants, landfills, sewage lagoons, and similar land uses. Lower demands for water and sewer treatment than Production High-Tech Manufacturing.	Adequate distance from sensitive land uses (residential, parks) necessary. Moderate demand for water and sewer. Higher demand for electricity, gas, and telecom.	High diversity of facilities within business parks. R&D facilities benefit from close proximity to higher education facilities. Moderate demand on all infrastructure systems.	Relatively higher parking ratios may be necessary. Will be very sensitive to labor force and the location of other similar centers in the region. High reliance on telecom infrastructure.	Transportation routing and proximity to/from major highways is crucial. Expansion options required. Truck staging requirements mandatory. Minimal route obstructions between the site and interstate highway such as rail crossings, drawbridges, school zones, or similar obstacles.	Transportation infrastructure such as roads and bridges to/from major highways is most competitive factor.	Must be located witihn or near FAA-regulated UAV testing sites. Moderate utility demands. Low reliance on transportation infrastructure.	Larger sites may be needed. The 25 acre site requirement represents the more typical site. Power delivery, water supply, and security are critical. Surrounding environment (vibration, air quality, etc.) is crucial. May require high volume/supply of water and sanitary sewer treatment.	Located in more remote locations in the state. Usually without direct access (within 50 miles) of Interstate or City of more than 50,000 people.

Mackenzie; Business Oregon

Terms:

More Critical ↑ Less Critical	**'Required'** factors are seen as mandatory in a vast majority of cases and have become industry standards
	'Competitive' significantly increases marketability and is *highly recommended by Business Oregon* . May also be linked to financing in order to enhance the potential reuse of the asset in case of default.
	'Preferred' increases the feasibility of the subject property and its future reuse. Other factors may, however, prove more critical.
* Competitive Acreage: Acreage that would meet the site selection requirements of the majority of industries in this sector.	
**Total Site: Building footprint, including buffers, setbacks, parking, mitigation, and expansion space	
† Data Center Water Requirements: Water requirement is reported as gallons per MWh to more closely align with the Data Center industry standard reporting of Water Usage Effectiveness (WUE).	
‡ Data Center Sewer Requirements: Sewer requirement is reported as 200% of the domestic usage at the Data Center facility. Water and sewer requirements for Data Centers are highly variable based on new technologies and should be reviewed on a case-by-case basis for specific development requirements.	

Appendix B.2 Cleantech Industrial Sector Land Use Competitiveness Matrix

The Oregon Cleantech Competitiveness Assessment Report (Appendix D in the report) identified the following land use requirements for key cleantech subsectors in Oregon as described below.

Cleantech Land Use Criteria

Land use requirements for attracting and growing industrial users vary across sectors. We have reviewed typical land use and infrastructure needs based on existing facility development, anticipated growth needs, and similarities to existing established industrial users within the State. We have reviewed land use competitiveness for the following development criteria, which are commonly used when evaluating sites for attracting potential industrial users:

1. Total site size: Gross property area, including building footprint, setbacks, parking, laydown space, buffers and/or mitigation areas, and expansion areas.
   A. Small: 0-5 acres
   B. Medium: 5-25 acres
   C. Large: > 25 acres
2. Use allowance: Specific manufacturing use allowed under current zoning. Development standards also may limit feasibility of necessary elements such as utility yards.
   A. Low: Allowed outright
   B. Medium: Allowed conditionally or with limitations
   C. High: Not allowed
3. Site slope tolerance: Elevation differences across the site; generally, industries with large-footprint buildings or laydown yards require flatter sites.
   A. Low: 0-5%
   B. Moderate: 0-7%
   C. High: 0-12%
4. Access to interstate or principal arterial transportation routes: Access to shipping routes and available capacity for trips generated.
   A. Low: Relatively low need for access to transportation routes.
   B. Moderate: Access to principal transportation routes is preferred.
   C. High: Access to principal transportation routes is required.
5. Railroad access: Proximity and capacity for rail freight systems, for either raw materials or finished goods.
   A. Low: Relatively low need for rail access.
   B. Moderate: Access to rail access is preferred.
   C. High: Access to rail access is required.
6. Marine port access: Proximity and capacity for marine cargo shipping, for either raw materials or finished goods.
   A. Low: Relatively low need for marine access.
   B. Moderate: Access to marine access is preferred.

C. High: Access to marine access is required.

7. Airport access: Proximity and flight availability for employees, customers, or air cargo.
   A. Low: Relatively low need for airport access.
   B. Moderate: Access to airport access is preferred.
   C. High: Access to airport access is required.
8. High-pressure water supply: Proximity and capacity for high-pressure water supply, typically as municipal water.
   A. Low: Significant water usage is not expected to be a critical component of this industry.
   B. Moderate: Water usage may be high for this industry; high-pressure water supply is preferred.
   C. High: High-pressure water supply is required.
9. Electricity supply: Proximity and capacity for electrical power.
   A. Low: Significant electricity usage is not expected to be a critical component of this industry.
   B. Moderate: Electrical usage may be high for this industry; high-demand service and/or redundancy is preferred.
   C. High: High-demand service and/or redundant electrical supply is required.

The following table summarizes our recommendations of land use competitiveness for the selected Cleantech sectors across the criteria listed above.

Table 13. Competitiveness Matrix for Select Cleantech Industries

	Battery Storage	Mass Timber	Ag-Tech	Circular Economy	Solar & Wind Energy Prod	Water Tech	Building Energy Tech	EV Infrastructure Tech
Site Size	Small to Large[4]	Med to Large	Small[5]	Small to Med[6]	Med to Large[7]	Small to Med	Small	Med to Large
Use Allowance	Varies by jurisdiction

Electrical Supply Needs	High[9]	Mod. to High	Low	Mod.	High[6]	High	Mod. to High	High

Source: Oregon Cleantech Competitiveness Assessment Report, 2024

[4] Battery storage site sizes may vary widely, from urban microgrid installations to large-scale power grid storage.
[5] The Ag-Tech industries identified in this study are assumed to generally focus on software and small-scale equipment products. These companies may use large-scale farms for product development or research; however, since those are likely to be existing operating farm facilities, we do not identify them as a land use criterion here.
[6] Site facility size for circular economy is dependent on the raw materials and finished products involved and the industry scaling.
[7] Site size for solar/wind manufacturing facilities is similar to advanced manufacturing industries, while sites for solar/wind power generation vary greatly depending on scale, ranging from rooftop systems to grid-scale farms.
[8] Offshore wind power requires marine facilities to transport turbines and equipment to the generating site. Land-based wind power marine access varies.
[9] Electrical system proximity and access for power generation facilities may vary depending on the scale and intended use. Microgrid systems may only need connection to the local electrical grid, while large-scale grid storage may require connection to regional transmission lines or substations.

Appendix B.3 Buildable Lands Inventory Methodology

The BLI is intended to identify industrial lands that are available for development for employment uses within the City of Wilsonville's BCPA. The inventory is sometimes characterized as *supply* of land to accommodate anticipated employment growth. The amount of land needed to accommodate anticipated growth, often referred to as *demand* for land, depends on the type of employment-related development and other factors.

This appendix presents methods and definitions used to develop the industrial buildable lands inventory for the BCPA. The results (shown in the Land Supply section of the memorandum) are based on analyses by ECOnorthwest of data from the City of Wilsonville, Washington and Clackamas Counties, Metro, and Pacific Habitat Services. The analysis was reviewed by City staff. The remainder of this appendix summarizes key findings of the BLI.

Methods and Definitions

The BLI in Wilsonville's BCPA includes all land that allows industrial uses within the jurisdiction of Wilsonville's comprehensive plan use designations or unincorporated areas of Washington and Clackamas Counties. From a practical perspective, land was included in the BLI if it met all the following criteria:

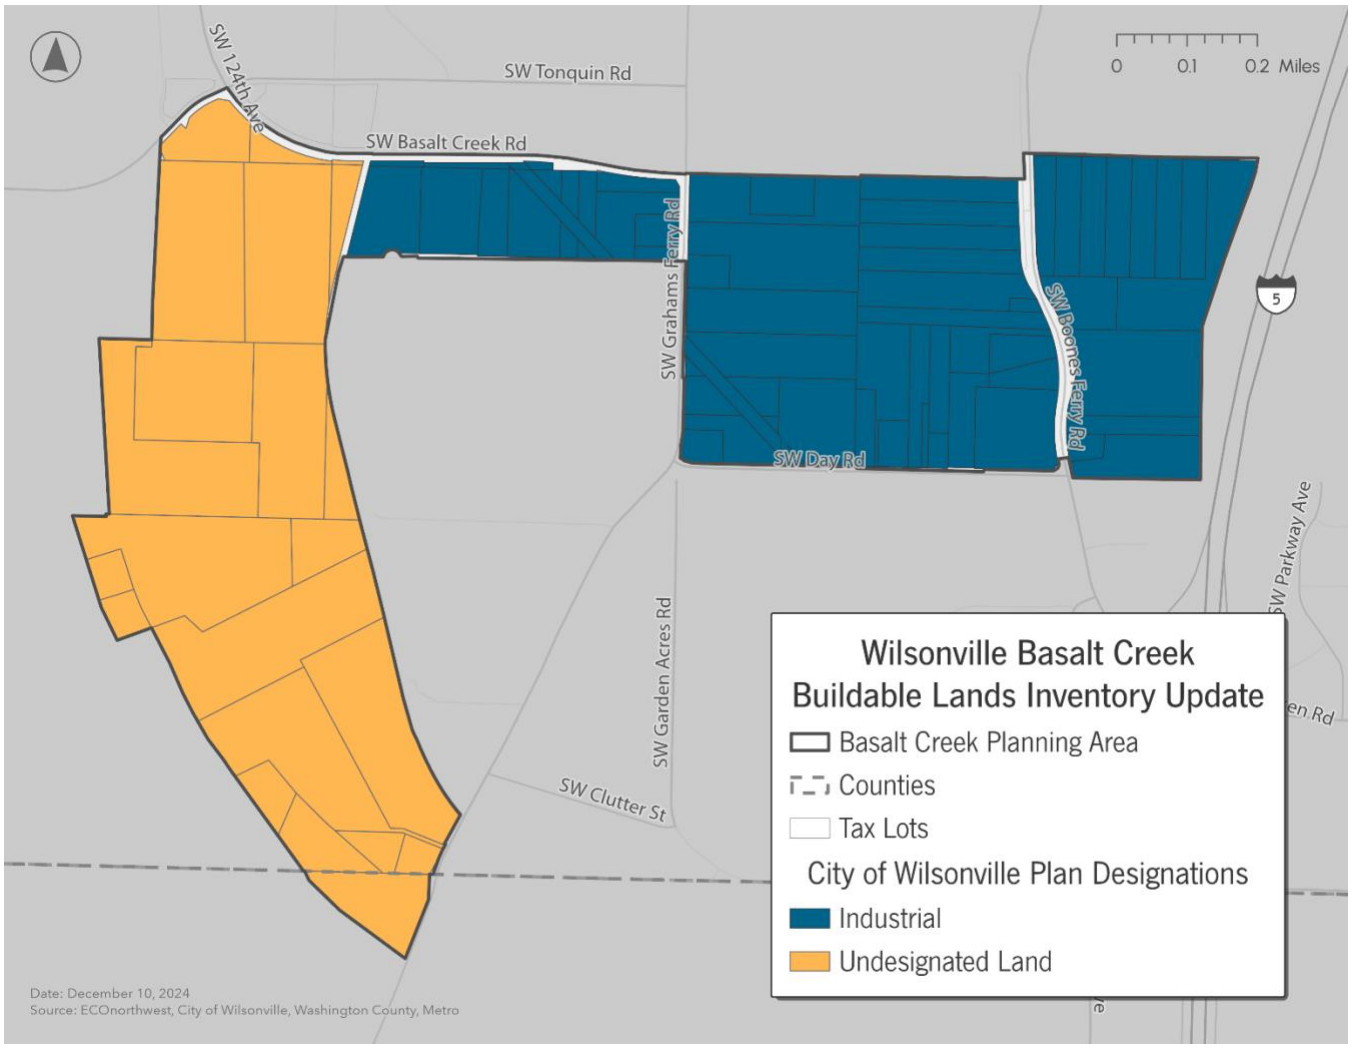
1. It is inside the BCPA
2. It is within a Wilsonville Comprehensive Plan designation or unincorporated areas of Washington and Clackamas Counties.
3. It is inside a tax lot (as defined by Metro), and
4. Its plan designation allows employment uses. *Note that tax lots do not generally include road or railroad rights-of-way or water.*

The inventory then builds from the tax lot–level database to estimate buildable land by Comprehensive Plan designation.

Inventory Steps

The five steps in the BLI are:

1. Generate UGB "land base"
2. Classify lands by initial development status
3. Identify constraints
4. Verify inventory results
5. Tabulate and map results



Step 1: Generate UGB "Land Base"

The industrial inventory used all tax lots within the BCPA with the appropriate types of comprehensive plan designations that fall under those land use categories:

- Industrial (I)
- Undesignated land (i.e., unincorporated land)

Figure 6 below shows a map of these designations used in the BLI.

Figure 6. Land Base by Wilsonville Comprehensive Plan Designation, BCPA, 2024

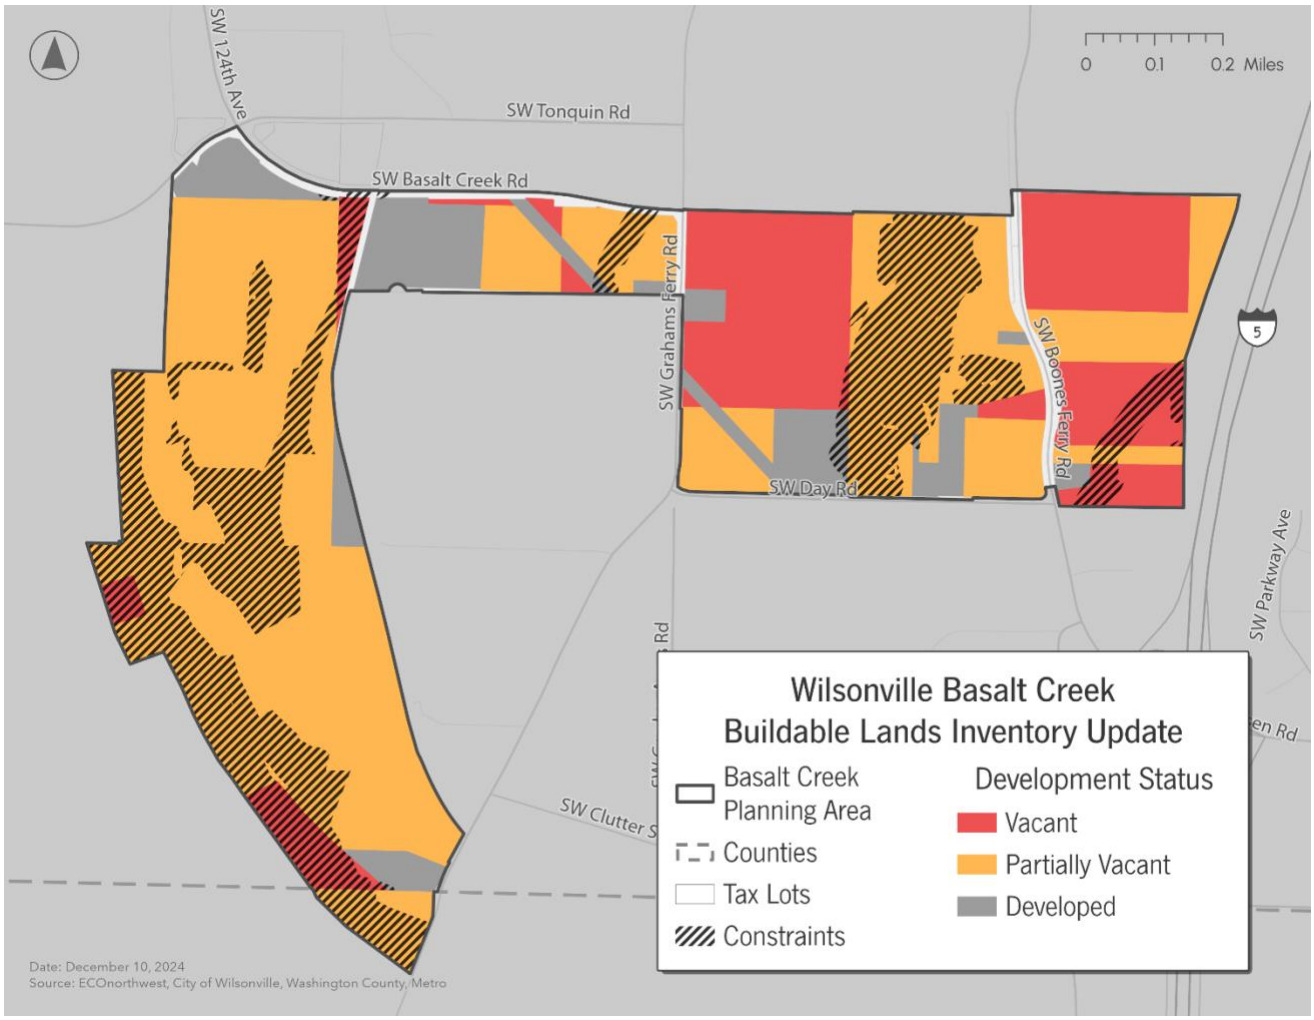
Source: ECOnorthwest Analysis, City of Wilsonville, Metro

Step 2: Classify Lands by Development Status

In this step, ECOnorthwest initially classified each tax lot with an employment plan designation (based on the definitions above) into one of three mutually exclusive categories based on development status:

- Vacant land
- Partially vacant land
- Developed land

ECOnorthwest identified buildable land and classified development status using a rule-based methodology adapted from Metro's Buildable Land Inventory documentation[10] and utilizing Metro's vacant and developed land GIS inventories. These classifications serve as a starting point for identifying development statuses and are further refined in step 4 through visual review by ECOnorthwest and the City of Wilsonville.



The rules are described in Table 14, and the development status classifications of the BLI land base are visualized in map format in Figure 7.

Table 14. Rules for Development Status Classification

DEVELOPMENT STATUS	DEFINITION	METHODOLOGICAL BASIS
Vacant Land	A tax lot where the area is: (a) Less than 2,000 sq ft and less than 10% developed, or (b) More than 95% vacant.	*Metro Appendix 2 - 2024 Buildable Land Inventory (BLI) and Capacity Estimates*[11]
Partially Vacant Land	A tax lot where the area does not meet the vacant land definition and is more than one-half acre vacant	No statutory definition
Developed Land	A tax lot that is not vacant or partially vacant.	*Metro Appendix 2*

[11] Ibid.

Figure 7. Development Status with Constraints, BCPA, 2024

Source: ECOnorthwest Analysis, City of Wilsonville, Washington County, Metro, Pacific Habitat Services

Step 3: Identify Constraints

As shown in

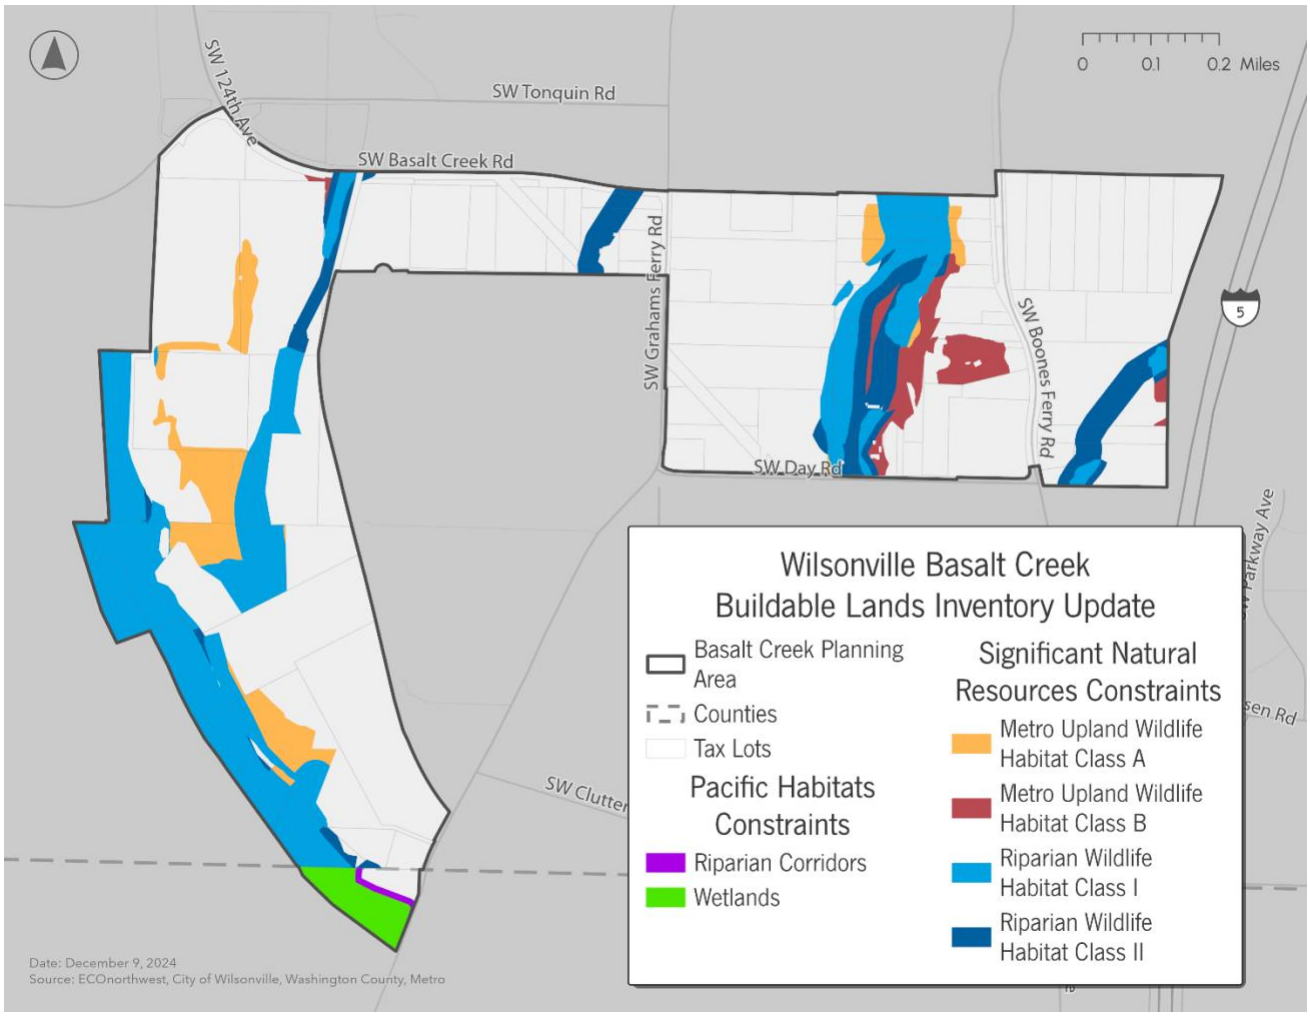

Table 15, the BLI included development constraints consistent with guidance in OAR 660-009-0005(2) and discussion with Wilsonville City staff.

Table 15. Constraints Included in BLI

DEVELOPMENT STATUS	STATUTORY AUTHORITY	THRESHOLD	SOURCE
Goal 5 Natural Resource Constraints			
Significant Natural Resources (SNR)	*OAR 660-009-0005(2)*	Lands within SNR classifications: ♦ Metro Upland Wildlife Habitat Classes A and B ♦ Riparian Wildlife Habitat Classes I and II	Washington County
Riparian Corridors	*OAR 660-009-0005(2)*	Lands within riparian corridors (Clackamas County only)	Pacific Habitat Services
Wetlands	*OAR 660-009-0005(2)*	Lands within wetlands (Clackamas County only)	Pacific Habitat Services

These areas were evaluated as prohibitive constraints (unbuildable). All constraints were merged into a single constraint file, which was then used to identify the area of each tax lot that is constrained. These areas were deducted from lands identified as vacant or partially vacant. Figure 8 shows a map of the individual constraints.

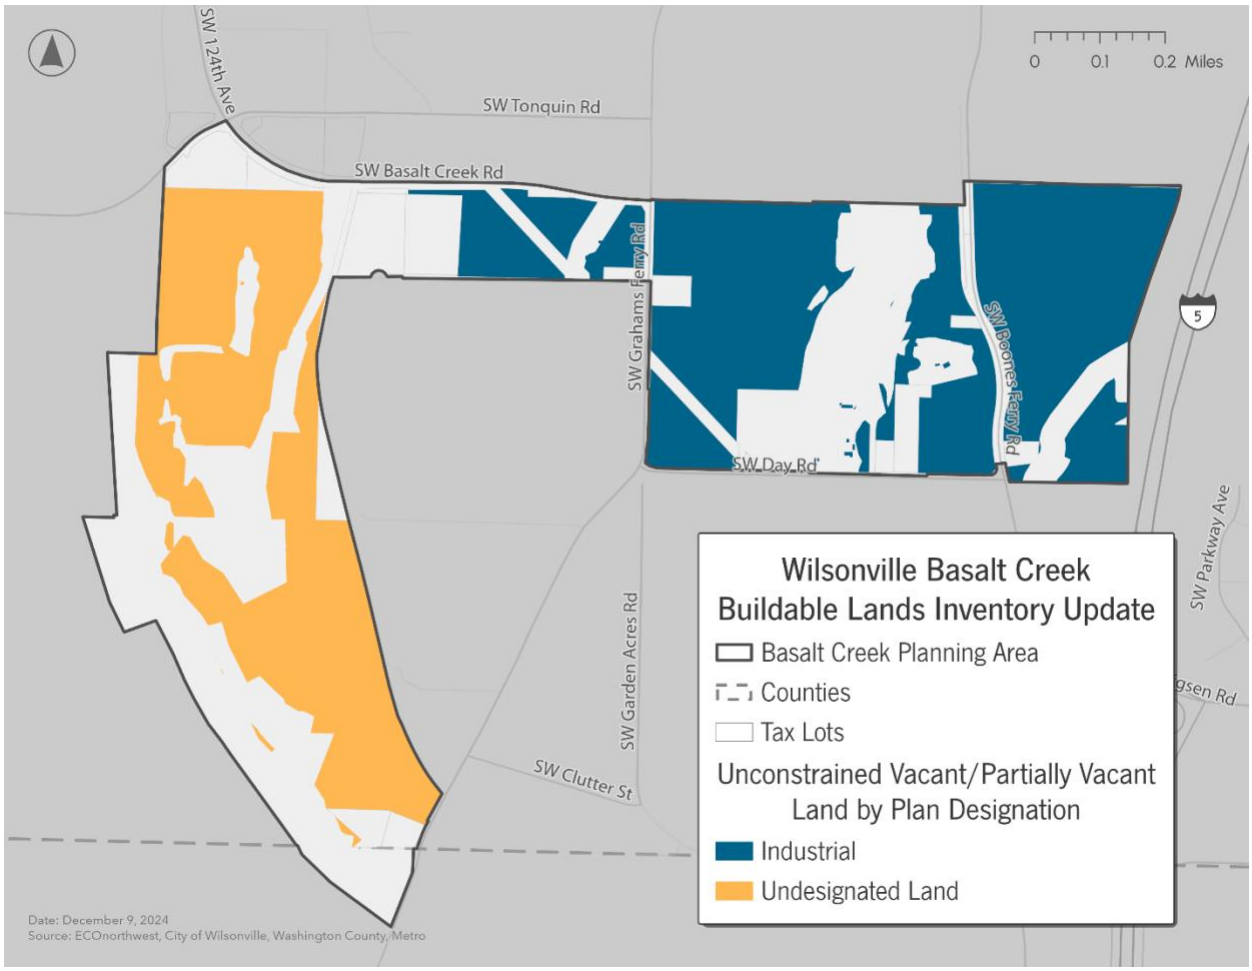
Figure 8. Development Constraints, BCPA, 2024

Source: ECOnorthwest Analysis, City of Wilsonville, Washington County, Metro, Pacific Habitat Services

Step 4: Verify Inventory Results

ECOnorthwest used a multistep verification process. The first verification step involved a "visual assessment" of land classifications using GIS and recent aerial photos. The visual assessment involved reviewing classifications overlaid on recent aerial photographs to verify uses on the ground. ECOnorthwest reviewed all tax lots included in the inventory using the visual assessment methodology. The second round of verification involved City staff verifying the visual assessment output. ECOnorthwest amended the BLI based on City staff review and a discussion of staff's comments.

Step 5: Tabulate and Map Results



The results of the industrial BLI are presented in tabular form in Table 16 and in a map in Figure 9.

Table 16. Buildable Acres in Vacant and Partially Vacant Tax Lots by Wilsonville Plan Designations, BCPA, 2024

Plan Designation	Total Buildable Acres	Buildable Acres on Vacant Lots	Buildable Acres on Partially Vacant Lots
Industrial	127	87	40
Undesignated	24	0.4	23
Total	**150**	**87**	**63**

Appendix C: Redevelopment Feasibility of Contractor Establishments

ECOnorthwest

DATE:	December 12, 2024
TO:	City of Wilsonville
FROM:	ECOnorthwest: Nicole Underwood, Michelle Anderson, and Bob Parker
SUBJECT:	WILR Phase 1: Redevelopment Feasibility of Contractor Establishments

The Cities of Tualatin and Wilsonville adopted the Basalt Creek Concept Plan (BCCP) in 2018 after a lengthy joint planning process. Now, in 2024-25, the City of Wilsonville is working to advance the Basalt Creek Planning Area (BCPA) beyond the concept plan to a development-ready status by designating zoning and refining infrastructure plans. However, since adoption of the BCCP, economic conditions at national, state, regional, and local levels have shifted significantly and must now be considered.

To address these evolving conditions, the City hired ECOnorthwest to conduct a market assessment and industrial lands study focused on Wilsonville's portion of the BCPA. This study comprises several interconnected tasks:

- An **Economic Inventory** that evaluated current market trends and identified industries suitable for the area (completed).
- An updated **Buildable Lands Inventory (BLI)** that reflects recent land developments, adjusted constraints, and revised capacity estimates (ongoing).
- A **Site Suitability Analysis** that evaluates three key opportunity sites for their potential to support target industries based on attributes like size, location, and access (ongoing).
- An **Analysis of Future Development of Contractor Establishments in the BCPA** given prevailing lease rates and market conditions (this memorandum).

This memorandum addresses the fourth task by evaluating the redevelopment potential of contractor establishments within the BCPA. Currently, the Wilsonville portion of the BCPA falls under Washington County's Future Development 20-Acre District (FD-20) zoning, which allows a variety of low-intensity uses. The area has limited development, with much of the developed land used for contractor establishments, which typically include small offices (often converted residences), storage buildings, and laydown yards. While these uses contribute to jobs and economic activity, they yield limited employment opportunities and lower property values compared to those envisioned in the BCCP or those typically expected for land within the metro urban growth boundary (UGB) and city limits.

The primary question we address in this task is: What is the redevelopment potential of existing contractor establishments in the BCPA, given prevailing lease rates and market conditions? This analysis will help the City understand what types of development the market will support, which desired development types identified in the BCCP are viable under current economic conditions, and what conditions might be necessary in the future to support desired development.

The findings from this analysis will guide recommendations on policy interventions and strategic actions the City can take to support desired development and promote redevelopment feasibility. These efforts are part of a broader initiative to position Basalt Creek as a key area for regional job growth and long-term economic success.

Redevelopment Feasibility of Existing Contractor Establishments

The Economic Inventory identified a range of industrial users who may find Basalt Creek particularly attractive due to its prime location in the Southwest Metro area, access to a skilled workforce, availability of industrial land, strong transportation networks, and proximity to existing industrial clusters. Discussions with stakeholders also highlighted strong regional demand for industrial space.

However, several challenges complicate redevelopment efforts. Many existing contractor establishments generate significant income for property owners, reducing their motivation to sell or redevelop the land for higher-intensity industrial uses. Additionally, relocation options for businesses currently occupying these sites may be limited, creating further barriers to redevelopment.

These challenges raise critical questions about whether current market rents and sales prices are sufficient to make redevelopment feasible in the BCPA. This analysis evaluates the conditions needed to support redevelopment in Basalt Creek.

WHICH SECTORS MAY BE ATTRACTED TO BASALT CREEK?

Below are the potential sectors that may be particularly attracted to Basalt Creek, as identified in the Economic Inventory report.

Semiconductor Sector Supply Chain: Companies providing materials, equipment, and services to chip manufacturers.

Cleantech, including Battery Technology: Businesses involved in renewable energy technology, energy efficiency solutions, and sustainable manufacturing processes.

Advanced Manufacturing: Companies using technology such as robotics, 3D printing, and computerized systems to manufacture specialized products or components.

Distribution and Logistics: Storage, transportation, and delivery of goods.

Data Centers: Facilities used to house computer systems and associated components.

Methods and Approach

What are the key questions?

While there is clear demand for industrial space in the BCPA, the question remains: **What conditions (e.g., market, ownership, site, zoning) are needed to promote and incentivize urban industrial development as envisioned in the BCCP?** To answer this core question, ECOnorthwest identified several subquestions to guide the analysis.

- What types of property owners are in the study area, and who is respectively occupying the site (e.g., the owner or tenant)?
  - Understanding ownership and occupancy dynamics helps assess the financial motivations of property owners and helps determine whether redevelopment offers an incentive.
- What are the potential future uses for these sites?
  - Identifying potential future uses informs construction costs, market rents, and site utilization. Evaluating the likely range of site utilization (based on constraints and zoning) helps determine whether redevelopment would offer higher returns compared to current uses.

By addressing these supporting questions, ECOnorthwest evaluated scenarios where ownership, occupancy, and future uses align to incentivize redevelopment. This structured approach provides insights into the conditions necessary to drive redevelopment in the BCPA.

How did we answer the key questions?

ECOnorthwest used a detailed pro forma model to evaluate multiple potential development scenarios. These scenarios incorporated variations in current ownership and occupancy, potential future uses, and site utilization (for additional details, see Appendix). For this quantitative analysis, we focused on conditions that could support new development, either on recently acquired properties (e.g., speculative purchases) or on land likely to transact for redevelopment in the future.

WHAT IS A PRO FORMA?

The pro forma method, a standard tool in real estate feasibility studies, replicates the decision-making process of investors and lenders. It assesses the balance between development costs, expected revenue, and financing structures to identify potential viability gaps.

The pro forma considers the site utilization and potential building program of each scenario, development hard costs (construction labor and materials), other development costs (soft

costs, contingency, developer fee, etc.), costs of capital, relevant operating costs, and land acquisition costs. For each scenario, the pro forma calculated the rent levels required to cover these costs and achieve financial feasibility.

DATA LIMITATIONS AND METHODOLOGY

While the quantitative analysis provided valuable insights, data limitations in the study area and the I-5 South Submarket (such as limited observations of contractor establishment rents) posed some challenges. These limitations are typical for studies in smaller submarkets. To address this, we supplemented the analysis with qualitative methods, including interviews with developers and brokers, to validate assumptions and refine recommendations. We also conducted a range of sensitivity testing to account for potential variance (e.g., higher and lower potential contractor establishment rents) instead of basing the results of our analysis on one assumption. As a result, we believe the findings accurately reflect current market conditions in Wilsonville and provide a reliable basis for evaluating redevelopment feasibility in the BCPA.

WHY IS DEVELOPMENT FEASIBILITY AND PRO FORMA ANALYSIS IMPORTANT?

Development can be costly and risky. Getting funding to construct new development requires lenders and investors to be reasonably confident they will earn enough financial return to justify the risks.

Economic or market feasibility is generally assessed by comparing the expected revenues (rents, sales prices) against the costs of development. If a development project is not profitable, it is not feasible; it will not be built. While some of the factors that determine market feasibility are outside a jurisdiction's direct control (e.g., labor and materials costs, interest rates, market rents), local jurisdictions can provide incentives (such as tax exemptions or land donations) or adjust building, utility, and zoning fees; zoning; programs; and other regulations that can have a substantial impact on whether development could be feasible or not.

ASSUMPTIONS AND INDUSTRY STANDARDS

We based several assumptions on industry standards to ensure consistency and accuracy:

- **Construction Costs:** Used national averages adjusted with a Portland metro–specific multiplier to account for regional building conditions.
- **Other Development Costs and Operating Costs:** Applied standard rates for soft costs (architectural design, site engineering, permitting and entitlement fees, capital carrying costs, etc.), contingency, and developer fees.

For a more detailed overview of the data, assumptions, and methodology, please refer to the Appendix.

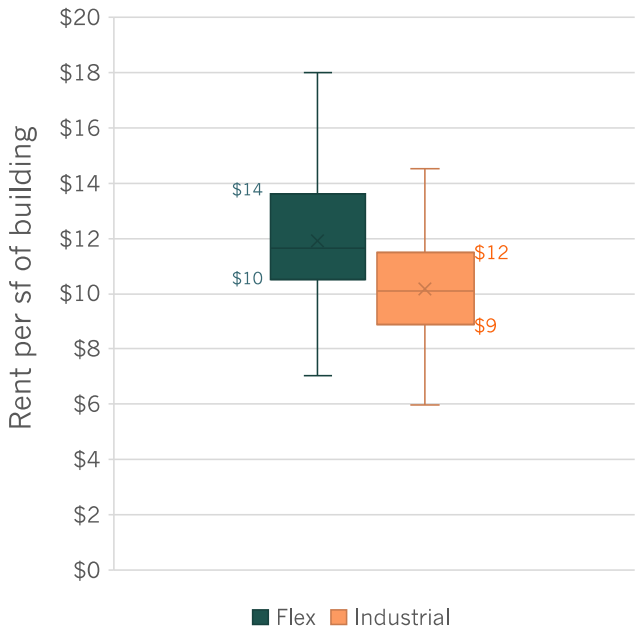
UNDERSTANDING THE PRICE OF LAND IN THE BCPA: HOW THIS IS FACTORED INTO FEASIBILITY RESULTS

Predicting the price that a landowner would require when selling property for development is an imperfect science—each landowner has reasons to sell or hold their land. Some property owners are willing to develop their land without selling, but based on interviews, we determined this would be rare in the study area. For the purposes of this analysis, we assumed the value of the property (i.e., the price of the land at which an owner would be willing to sell) could be derived from current comparable property sales prices in the area using a **"comps approach"** as well as using an **"income-based approach"** that considers the revenue stream from current tenants on the property. Therefore, this memo analyzes the rent needed based on the range of land values given these two approaches.

We identified vacant land sales (including contractor establishment sales) in the I-5 South Submarket using CoStar data. Most of the vacant land properties recently transacted (over the last 4 years) for approximately $7 to $17 per square foot of land. One improved land transaction (with a contractor establishment) had a sale price that indicated it transacted for $26 per square foot of land. These observations served as our range of land prices using a comps approach. Many of these comps, both vacant land and contractor establishments, might have been leased to tenants and generated income; however, the prices they sold for could have been decided via an unknown variety of methods (including an income-based approach and then a subsequent negotiation). Therefore, for the purposes of this analysis, we refer to all these observed transactions as being within the "comps approach" method.

The income-based approach relied on data collected during interviews, which indicated the rent for contractor yards in the area could range from $0.18 to $0.23 per square foot of land per month. We considered this gross annual revenue, net of approximately 5 percent for various operating costs, and divided by a range of capitalization (cap) rates (5 percent to 7 percent) to estimate the value. Using a cap rate is a common valuation approach in the commercial real estate industry. This analysis resulted in a range of $19 to $52 per square foot of land—considerably higher than most of the results from the comps approach. This approach more accurately reflects the value current owners place on the potential future revenue from their existing tenants, as well as the level of incentive required to encourage them to sell and repurpose the property. Although this income-based value could eventually be negotiated during a potential sale, we still use this range in our analysis to reflect values that a landowner might require to sell their land.

Key Findings



Current uses are generating substantial revenue with minimal management effort or risk.

Our market research and interviews highlighted that the rent for current uses varied based on whether the site was mostly open land or a building was present. Sites without buildings typically structured their rent per square foot of land, and this typically ranged from $0.18 to $0.23 per month. For example, a 1-acre site could generate annual gross rent of approximately $95,000 to $120,000 with minimal management effort or operating costs. (This is intended for illustrative purposes only and can scale to larger site sizes.)

Over the past four years, vacant land in the area has sold for around $7 to $17 per square foot. For the same illustrative 1-acre site, this translates to sale prices ranging from $305,000 to $750,000. The resulting ratio of annual gross lease revenue to property value ranges from 13 percent (a monthly rent of $0.18 per square foot relative to a land value of $17 per square foot) to 39 percent (a monthly rent of $0.23 per square foot relative to a land value of $7 per square foot). This means that property owners who recently purchased land and rent it to contractor establishments could recover their investment within 2.5 to 8 years. For long-term landowners who have already paid off their investment, rents represent additional income with minimal effort. Either way, given the substantial revenue from these uses, a landowner has very little incentive to redevelop.

For sites with buildings and yards, rents are typically based on the building area and range from $0.85 to $1.30 per square foot of building per month, or $10.20 to $15.60 per square foot per year. In comparison, flex and industrial spaces in the I-5 South Submarket rent for $9 to $14 per square foot per year, meaning that rent for an existing contractor establishment building with a yard is already achieving similar market rents to potential future uses. Not only are some of these contractor establishments already achieving comparable rents to flex and industrial uses, but they are also doing so without the risks of redevelopment (which include new capital investment, entitlements, the time to convert the land to the new use and generate revenue, and opportunity cost, among others).

Figure 1. Market Rent of Potential Future Uses

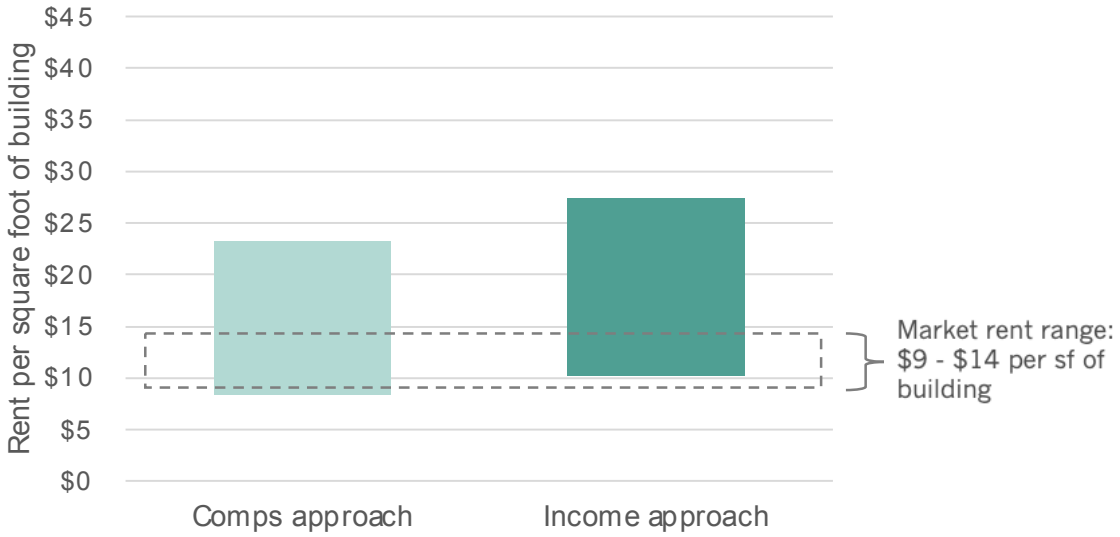
Source: ECOnorthwest analysis, CoStar

Rents would likely need to increase by at least three-fifths (60 percent), if not double (100 percent), to fund construction and create incentive to flip existing contractor establishments.

For our pro forma analysis, we evaluated a range of scenarios based on the variation in ownership and occupancy, future uses, future site utilization, and land acquisition costs (see Appendix for more detail). As previously discussed, ECOnorthwest solved for the rent needed to cover these various costs and then compared to the potential market rent of the flex and industrial uses observed in the I-5 South Submarket. We show these results for a range of potential land acquisition prices and construction costs.

We analyzed results for three different physical scenarios based on observed comparable developments (using the relationship between building square footage and site square footage):

- **Very high site utilization** based on 45 percent site coverage, similar to Graham's Ferry Industrial Center. Note: future development in some portions of BCPA may face constraints due to natural site features or zoning standards that may make achieving this site utilization challenging.
- **High site utilization** based on 35 percent site utilization, similar to the Sherwood Commerce Center
- **Low site utilization** based on 20 percent site utilization, similar to observed flex and industrial uses built over the last 20 years in the I-5 South Submarket



INTERPRETING THE RESULTS CHARTS

Development feasibility hinges on a range of different assumptions. Rather than picking one specific set of assumptions, the results charts shown in this memo encompass a range of potential assumptions, namely land acquisition costs and development costs.

ECOnorthwest compared the feasibility results to both the comps approach and income approach—**one column** in the following charts shows the resulting range of rents needed if assuming a comps approach, and **one column** shows the range needed based on an income approach. **Both columns** also include sensitivity testing given a range of construction costs and land prices, which is reflected in the size of the bars (the same range is assumed for each of the land price method scenarios). **A dashed box** is also shown to represent the range of observed rents for potential future uses. The rent results would ideally be within, if not lower than, this range for the development to be feasible.

In the **very high site utilization** scenario, future flex and industrial uses are only feasible when land acquisition costs remain low—below $20 per square foot—and other development costs are average or low. This combination of assumptions results in rents similar to the existing market rents of $9 to $14 per square foot of building (see comparison to gray bar shown in results chart in Figure 2). To make redevelopment feasible for properties with land costs higher than $20 per square foot (common for land with existing uses), the market rent for flex and industrial uses would likely need to increase by at least three-fifths, if not double, while construction costs remain constant.

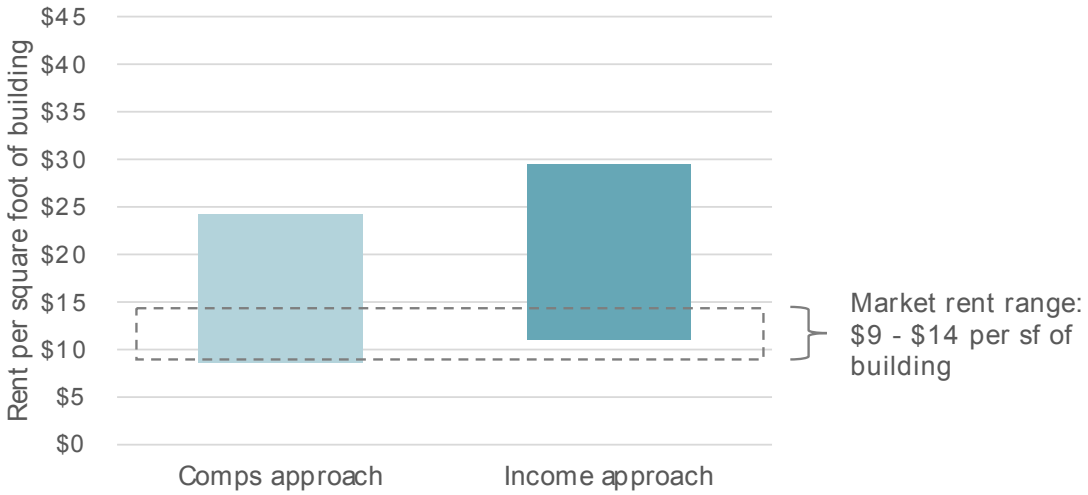


Figure 2. Rent Needed for Very High Site Utilization (45%)

Source: ECOnorthwest analysis

The results in the **high site utilization scenario** are similar to the very high site utilization scenario. However, relative to the latter, rents would need to increase to cover the same range of land and development costs. Future flex and industrial uses are only feasible when land acquisition costs remain low—below $20 per square foot—and other development costs are average or low. This combination of assumptions results in rents similar to the existing market rents of $9 to $14 per square foot of building (see comparison to gray bar shown in results chart in Figure 3). To make redevelopment feasible for properties with land costs higher than $20 per square foot (common for land with existing uses), the market rent for flex and industrial uses must increase by at least three-quarters, if not double, while construction costs remain constant.

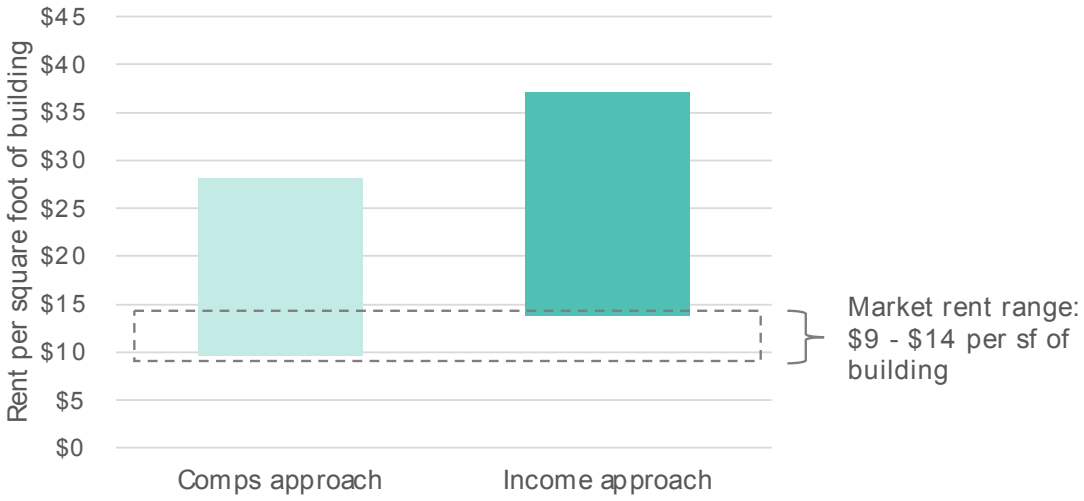

Figure 3. Rent Needed for High Site Utilization (35%)

Source: ECOnorthwest analysis

In the **low site utilization scenario**, future flex and industrial uses are only feasible when land acquisition costs are assumed to be low—less than $10 per square foot, based on the low end of recent comparable sales of vacant land—and other development costs are low. This combination of assumptions results in rents similar to the existing market rents of $9 to $14 per square foot of building (see comparison to gray bar shown in results chart in Figure 4). For properties with existing uses (where land is likely to transact between $19 and $52 per square foot), the market rent for flex and industrial uses must double while construction costs remain constant to make redevelopment feasible.

Figure 4. Rent Needed for Low Site Utilization (20%)

Source: ECOnorthwest analysis

Owner-occupied sites face greater feasibility challenges when landowners want to maintain their business operations.

Owner-occupied sites present more complex financial considerations compared to vacant or tenant-occupied properties. Landowners using their property for their own business must account for additional costs if they relocate, including relocation expenses, higher rents (or purchase prices) for new properties, and potentially higher ongoing business costs. For example, moving farther from suppliers or services could result in increased fuel or labor expenses.

To justify relocating their business, landowners would likely need to sell their property at an even higher price than what the quantitative analysis assumes. This requirement would, in turn, translate to higher rents than those shown in the results charts (Figure 3 and Figure 4). However, if the landowner does not intend to maintain their business, financial considerations would be less complex. Without the need to account for future business costs or the loss of tenant income, necessary rents could align more closely with those projected in the comps approach.

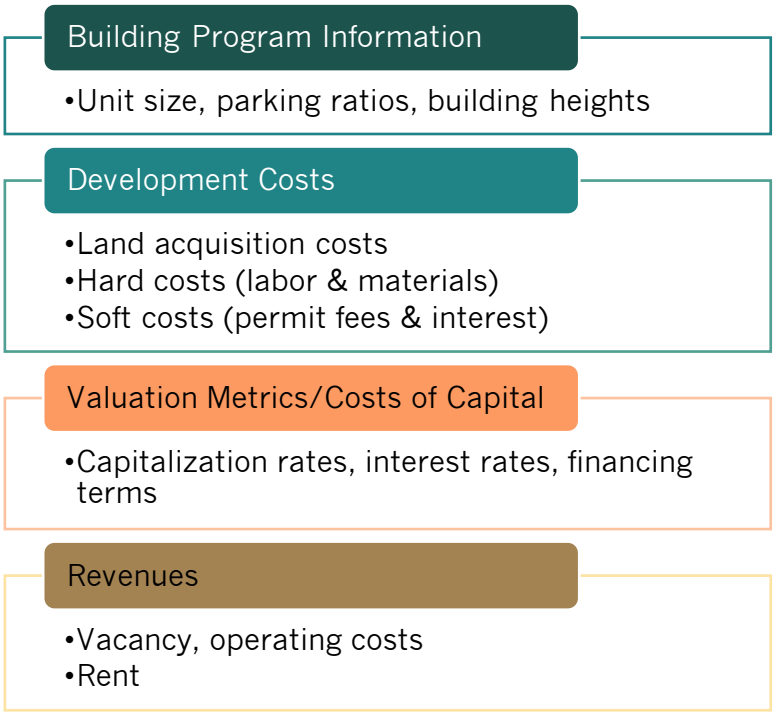
Conclusion and Next Steps

Current contractor establishments generate significant revenue with minimal effort or risk, reducing financial incentives for redevelopment. Rents for existing contractor establishments, particularly those with buildings, are already comparable to market rates for industrial and flex uses in the I-5 South Submarket. Therefore, for redevelopment to become financially feasible, market rents would likely need to rise by at least three-fifths, if not double, depending on site utilization, land acquisition costs, and construction costs. Higher site utilization scenarios present some redevelopment feasibility when land acquisition costs are low (below $20 per square foot). Conversely, properties with higher land costs or existing uses would either have substantially higher rents or reduced development costs (e.g., construction, financing) to achieve feasibility.

Owner-occupied properties are less likely to redevelop if the owner wants to maintain their business operations. Redevelopment is difficult for owner-occupants, as they must consider relocation costs and potential increases in operational expenses. Limited regional industrial land supply could push these businesses to relocate further from their markets, increasing costs for labor, transportation, and operations. Without substantial increases in land values or rents, redevelopment for these properties remains unlikely.

Achieving the City's development vision for Basalt Creek will require strategic interventions. Potential approaches could include purchasing and aggregating properties to create development-ready parcels, subsidizing infrastructure costs, adjusting system development charges (SDCs), offering other development incentives, or implementing other strategies yet to be identified.

The findings in this memorandum are preliminary and will be refined through further analysis and discussions. This study is being conducted alongside updates to the buildable lands inventory and site suitability analysis. Ultimately, these components will be synthesized with insights from the Economic Inventory into a comprehensive final report that outlines key findings and actionable recommendations.



Appendix C.1

Financial Feasibility Methods

To model development feasibility, ECOnorthwest employed a pro forma model, which is a common method used in real estate feasibility studies because it simulates the decision-making process of investors and lenders. The pro forma assesses the balance between development costs, expected revenue, and financing structure, which helps to identify viability gaps.

Figure 5. Factors Used in the Pro Forma Analysis

Source: ECOnorthwest

This method provides a general analysis of prototypical development scenarios, or prototypes, without accounting for unique conditions that might influence development feasibility (e.g., higher predevelopment costs). Therefore, this analysis serves as a strong indicator of the relative likelihood of development rather than an absolute measure of feasibility.

The pro forma considers the site utilization and potential building program of each scenario, development hard costs (construction labor and materials), other development costs (soft costs, contingency, developer fee, etc.), costs of capital, relevant operating costs, and land acquisition costs. It then calculates the rent required to cover these costs for each scenario.

Scenarios Evaluated

To establish relevant assumptions for the pro forma model, we first identified the scenarios needed to address the research questions. These scenarios were based on variations in current ownership and occupancy, potential future uses, and site utilization.

CURRENT SITE OWNERSHIP AND OCCUPANCY

We started with an understanding of the current site ownership and occupancy. Based on our understanding, there were three main categories:

- **Owners of vacant or unused land.** This category includes people who recently purchased land with the intent to develop and existing owners potentially interested in selling their land for new development.
- **Owners renting to contractor establishment tenants.** These owners might sell their property but would need compensation for the foregone future revenue from their tenants.
- **Owners using the land for their own contractor establishments.** Financial considerations for this group vary substantially. Landowners would need to account for up-front and ongoing costs associated with relocating their businesses, making this scenario more complex to quantify compared to vacant or tenant-occupied sites.

APPROACH TO ESTIMATING LAND PRICE

- **Vacant and underutilized land:** We used a comparable sales ("comps") approach to estimate land price, which accounts for the sales price of recently purchased land, especially by those intending to develop (see the callout box on page 5 for details on the comps approach).
- **Tenant-occupied land:** For owners renting to contractor establishment tenants, we used an income-based approach to estimate the financial hurdle of land price. This better reflects the potential foregone revenue from tenants (see the callout box on page 5 for details on the income-based approach).
- **Owner-occupied land:** Due to varied business conditions of landowners who are using the land for their own contractor establishment, we evaluated this scenario qualitatively, considering insights from the other scenarios.

FUTURE BUILDING PROGRAMS

We then considered the potential future building programs that could occur on these former contractor establishment sites. We based the building square footage of our two prototypes on observed comparable flex and industrial spaces, based on CoStar data from the I-5 South Submarket. Key considerations included:

- **Site Utilization:** Over the past 20 years, average site utilization (building area relative to site area) in the I-5 South Submarket was about 20 percent. Recent developments such as the Sherwood Commerce Center and Graham's Ferry Industrial Center achieved 35 percent and 45 percent site utilization, respectively. But this was enabled by maximizing impervious coverage for parking and truck logistics. Future development in some portions of the study area may face constraints due to natural site features or zoning

standards. We therefore modeled three prototypes to capture a range of potential future development conditions:

- **Low utilization:** 20 percent
- **High utilization:** 35 percent
- **Very high utilization:** 45 percent

CONSTRUCTION COSTS

Lastly, for the scenarios we modeled, we evaluated a range of potential construction costs for flex and industrial uses. We referenced the **2024 National Building Cost Manual** by Craftsman to arrive at a range of potential construction costs for various building types that could house future flex and industrial uses. We conducted sensitivity testing of the potential rents needed to cover low to high construction costs, and the results that informed our key findings are inclusive of the range used.

The land cost, site utilization, and building costs were all assumptions that varied in our analyses as we conducted sensitivity testing of different scenarios (e.g., high site coverage, high land costs, high construction costs). All other pro forma assumptions we held constant. We describe the specifics of these assumptions in the section below.

Detailed Methods and Assumptions

To evaluate future flex or industrial rental uses, we began by calculating development costs. This involved applying the cost-per-square-foot values (see Table 1. Scenarios and Assumptions Used) to the building square footage derived from the site utilization. From that construction cost, we calculated the soft cost, contingency, and developer fees to arrive at the total development cost.

Given the potential range of sources to fund these projects, we used a high-level approach and assumed all sources of money that funded the project would require a 6 percent annual return based on a 30-year term. We calculated a payment inclusive of this return, based on the total development cost, to arrive at the rent needed to cover these annual costs. We also assumed these rents would be triple net and that, therefore, the operating costs would be passed on to the tenant, which is common for flex and industrial lease terms. We highlight the specific assumptions of this analysis, and any relevant ranges, in Table 1.

Table 1. Scenarios and Assumptions Used

Source: ECOnorthwest, CoStar, Redfin, Craftsman, Stakeholder Interviews

Assumption	Values
Land price	Ranged from $7 to $26 based on observed sales comps of vacant land as well as one sale observation of a contractor establishment. Ranged from $19 to $52 per square foot based on income-based approach.
Building program	(3) square footage estimates based on a calculation of 20% site utilization, 35% site utilization, 45% site utilization
Construction costs	$75 to $200 per square foot of building; $20 per square foot of paving
Soft costs	20% of hard costs
Contingency	5% of hard and soft costs
Developer fee	5% of hard and soft costs plus contingency
Costs of capital	6% annual interest range, 30-year term for all funding sources
Operating costs	Assumed triple net rents

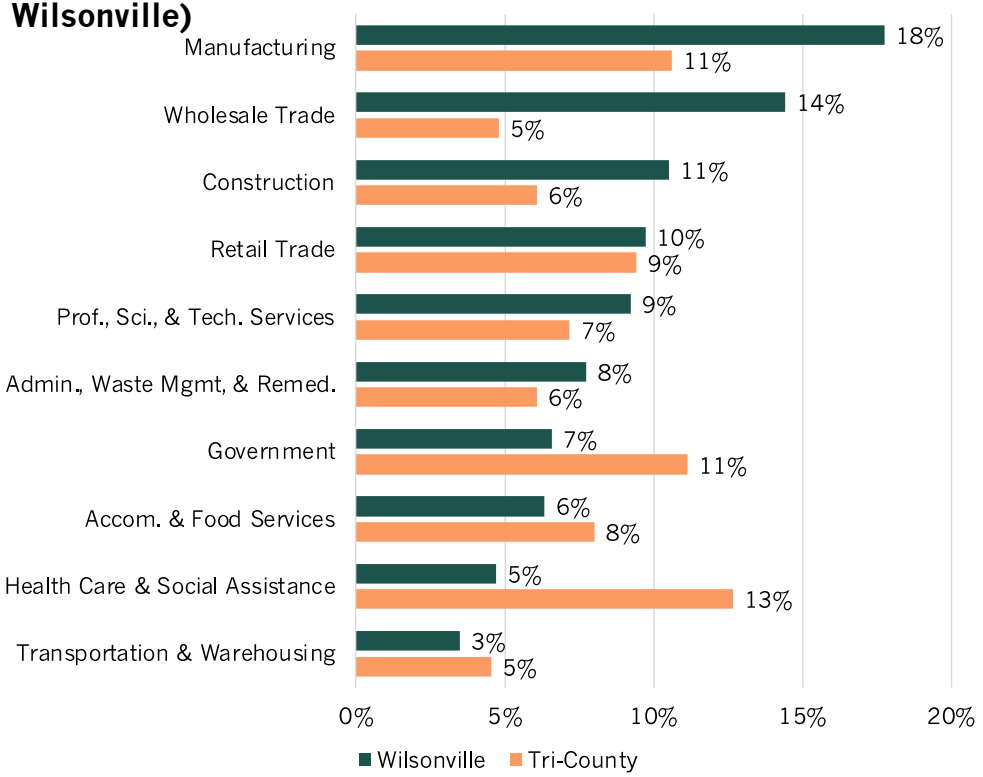
Discussion

- What input does Planning Commission have in response to this information pertaining to the regulatory context?



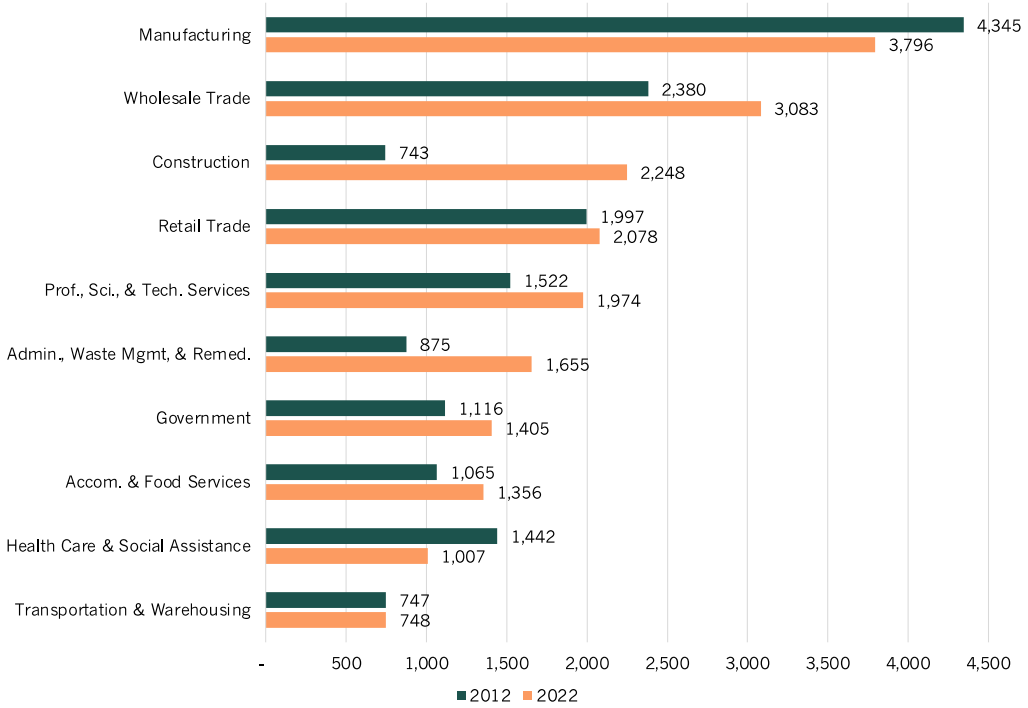
Industrial Market Refocus

Industrial Employment Base: Portland Region & Wilsonville

In 2022

- Wilsonville had 21,383 covered employees
- Wilsonville's three largest industries were manufacturing, wholesale trade, and construction
  - These sectors make up 43% of jobs in Wilsonville and 22% of jobs in the Tri-County region

2022 Industry Distribution for Wilsonville and Tri-County Region (10 Industries with greatest employment in Wilsonville)



Source: QCEW

Employment Growth: Portland Region & Wilsonville

Between 2012 and 2022…

- Wilsonville's employment grew 18%
- Wilsonville's job growth was largely driven by construction, admin & waste management, wholesale trade, & professional services

2022 Industry Distribution for Wilsonville and Tri-County Region, (10 Industries with greatest employment in Wilsonville)

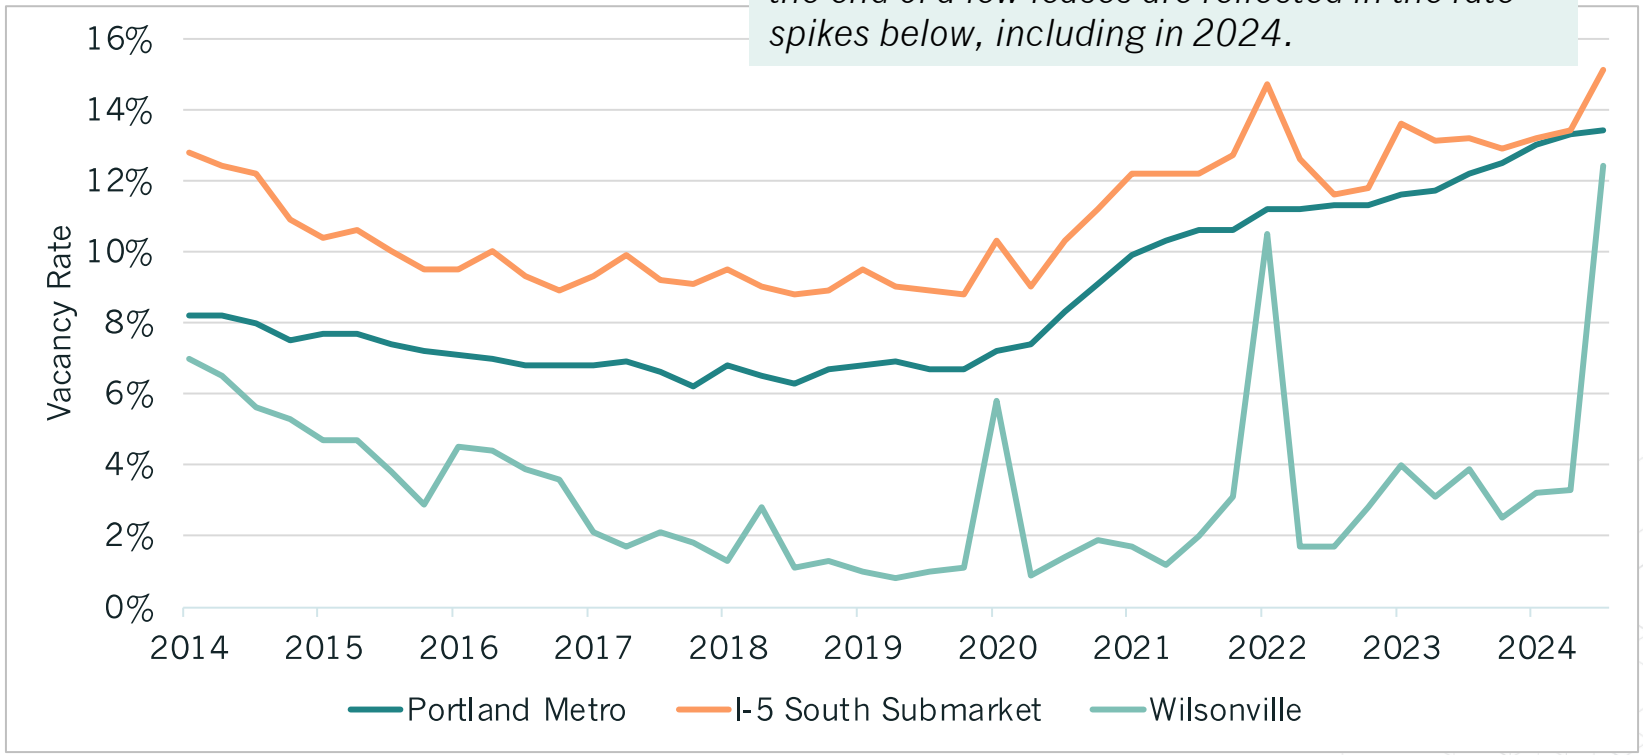
Office Market

Office Market Trends: Portland Region & Wilsonville

Summary

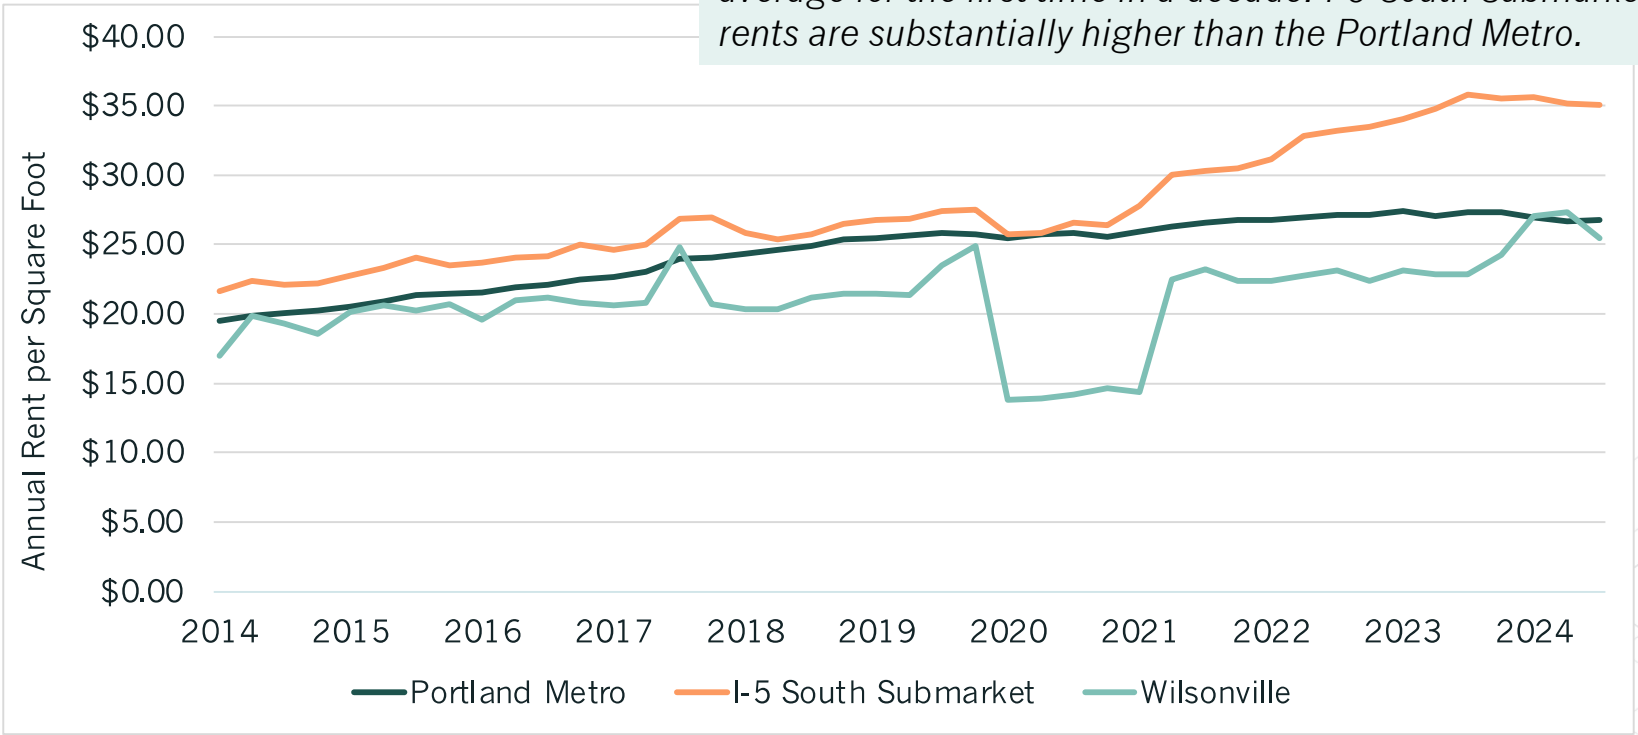
Portland Metro



- Record high vacancy rates
- Continued negative net absorption as companies reevaluate their need for space
- Low leasing activity
- Suburban office markets performing better than downtown

Wilsonville

- Lower vacancy rates than the broader region with recent spikes as leases end
- Rents on par with Portland Metro for first time in a decade but below I-5 South Submarket
- Negative net absorption 2020-2024



Office Market: Wilsonville

While Wilsonville's office vacancy rate has generally been lower than the broader region's, the end of a few leases are reflected in the rate spikes below, including in 2024.

Office Market: Wilsonville

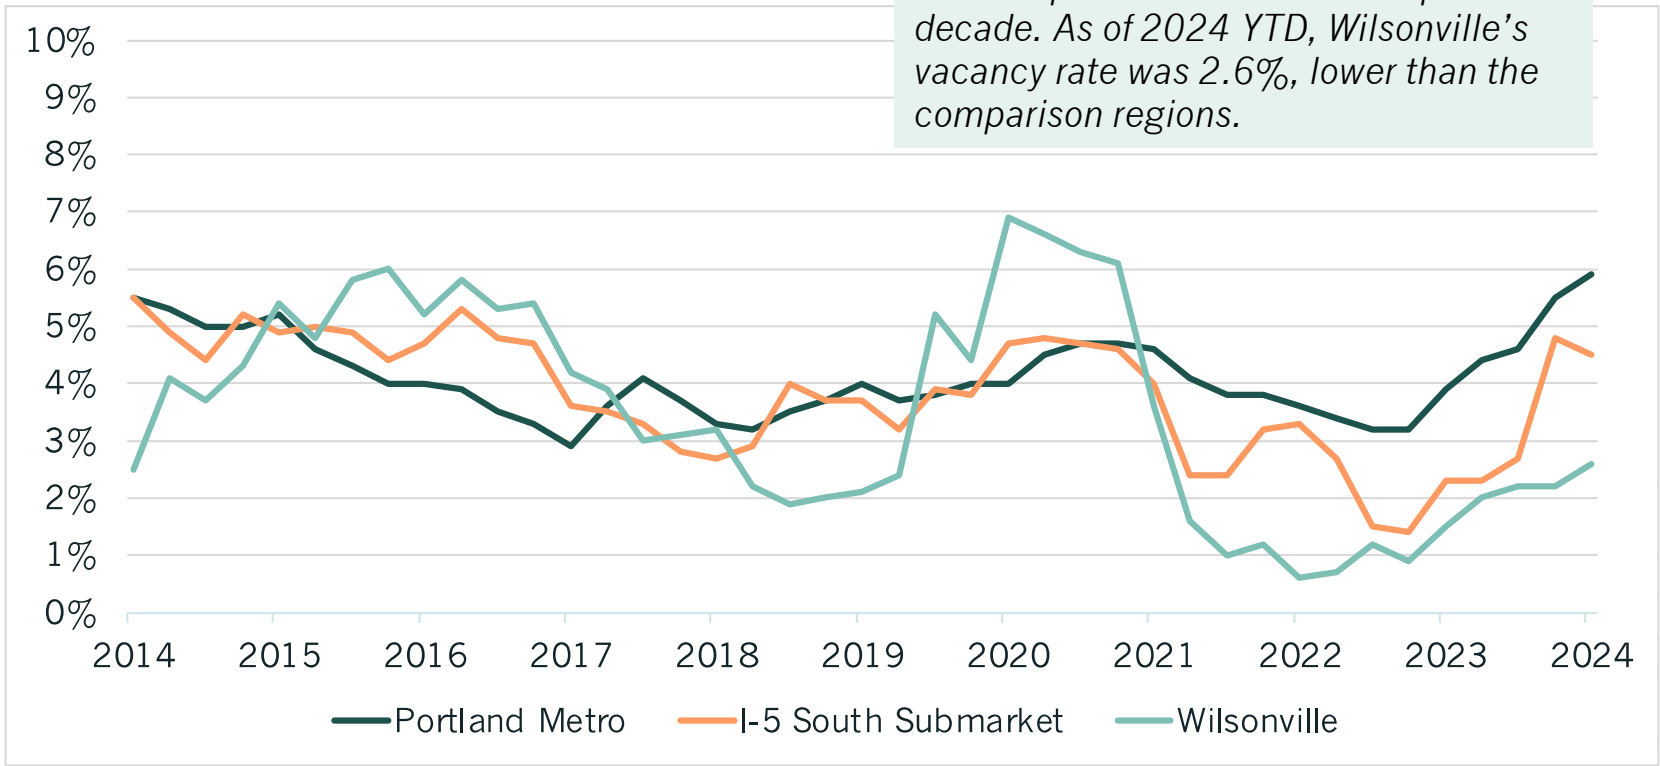
Since the decline in 2020, office rents have risen in Wilsonville and are now equal to the Portland Metro average for the first time in a decade. I-5 South Submarket rents are substantially higher than the Portland Metro.

Industrial Market

Industrial & Flex Trends: Portland Region & Wilsonville

Summary

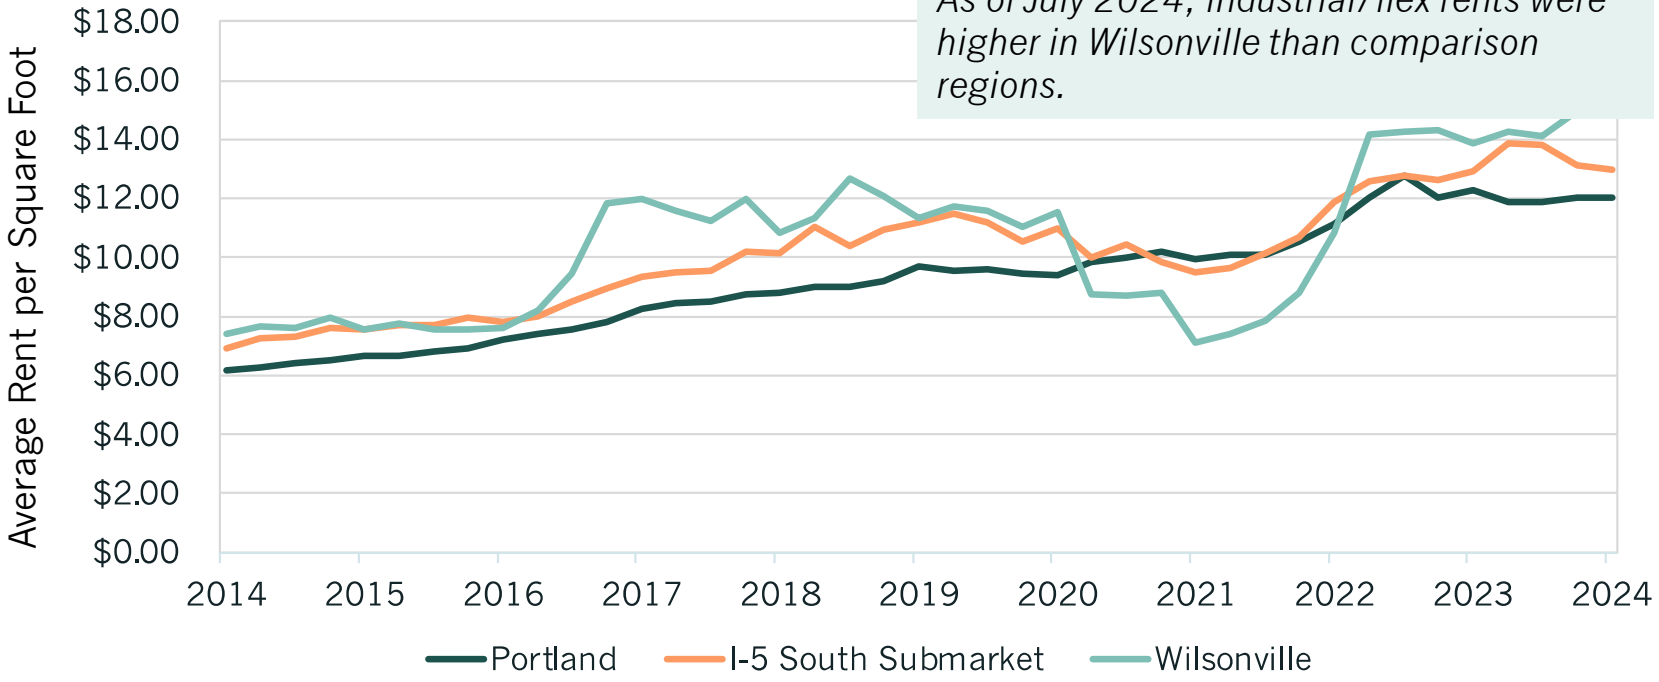
Portland Metro



- Strong growth between 2021-2023 but growth is decelerating
- Investor confidence in the market
  - CHIPS Act
  - Strong submarkets
  - Continued growth in industrial space

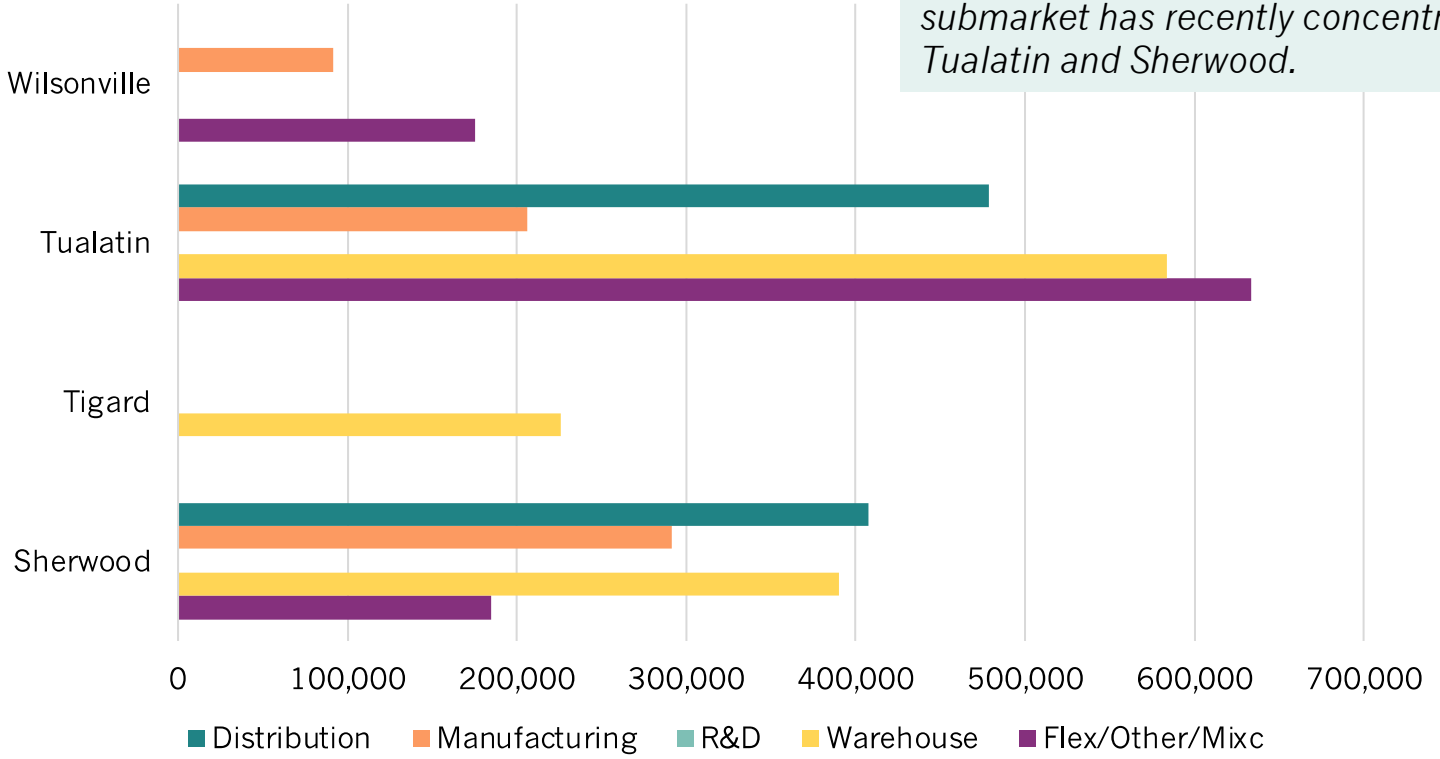
Wilsonville

- Very low vacancy, below broader market
- Increasing rents, above broader market
- Limited industrial development over the past decade



Industrial & Flex: Wilsonville

Wilsonville's vacancy rate has remained below 6 percent for most of the past decade. As of 2024 YTD, Wilsonville's vacancy rate was 2.6%, lower than the comparison regions.



Industrial & Flex: Wilsonville

Industrial rents in Wilsonville have generally increased over the past decade. As of July 2024, industrial/flex rents were higher in Wilsonville than comparison regions.

Industrial & Flex Trends I-5 South Submarket, 2019-2026

Industrial development in the I-5 South submarket has recently concentrated in Tualatin and Sherwood.

Market-driven? Aspirational?

- Determined by market forces, profit potential
- Influenced by supply and demand
- Based on market dynamics
- Positive and negative issues
- Shorter-sighted approach

Market-driven? Aspirational?

- Determined by market forces
- Influenced by supply and demand
- Based on market dynamics
- Shorter-sighted approach

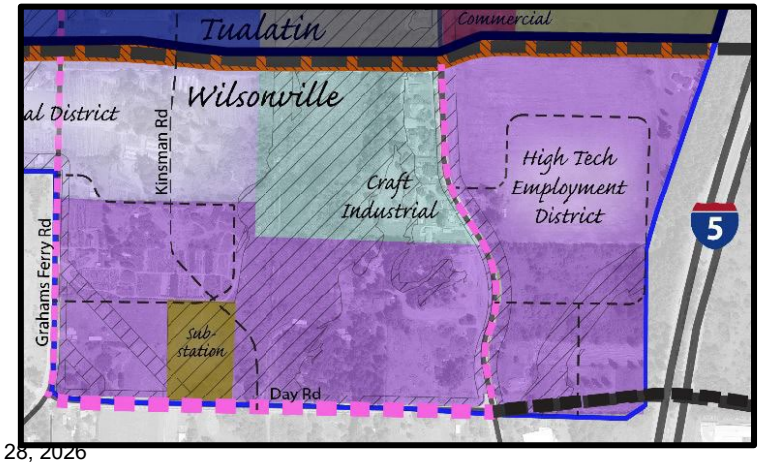
- Determined by community vision
- Considers social, environmental, economic benefits
- Might require significant changes to achieve
- Future-oriented and longer-sighted approach

Concept Plan Guiding Principles

- Maintain and complement Wilsonville's unique identity
- Capitalize on the area's unique assets and natural location
- Explore creative approaches to integrate jobs and housing in the Craft Industrial District
- Create a uniquely attractive business community unmatched in the metropolitan region
- Ensure appropriate transitions between land uses
- Meet regional responsibility for jobs
- Design cohesive and efficient transportation and utility systems
- Maximize assessed property value
- Incorporate natural resource areas and provide recreational opportunities as community amenities and assets

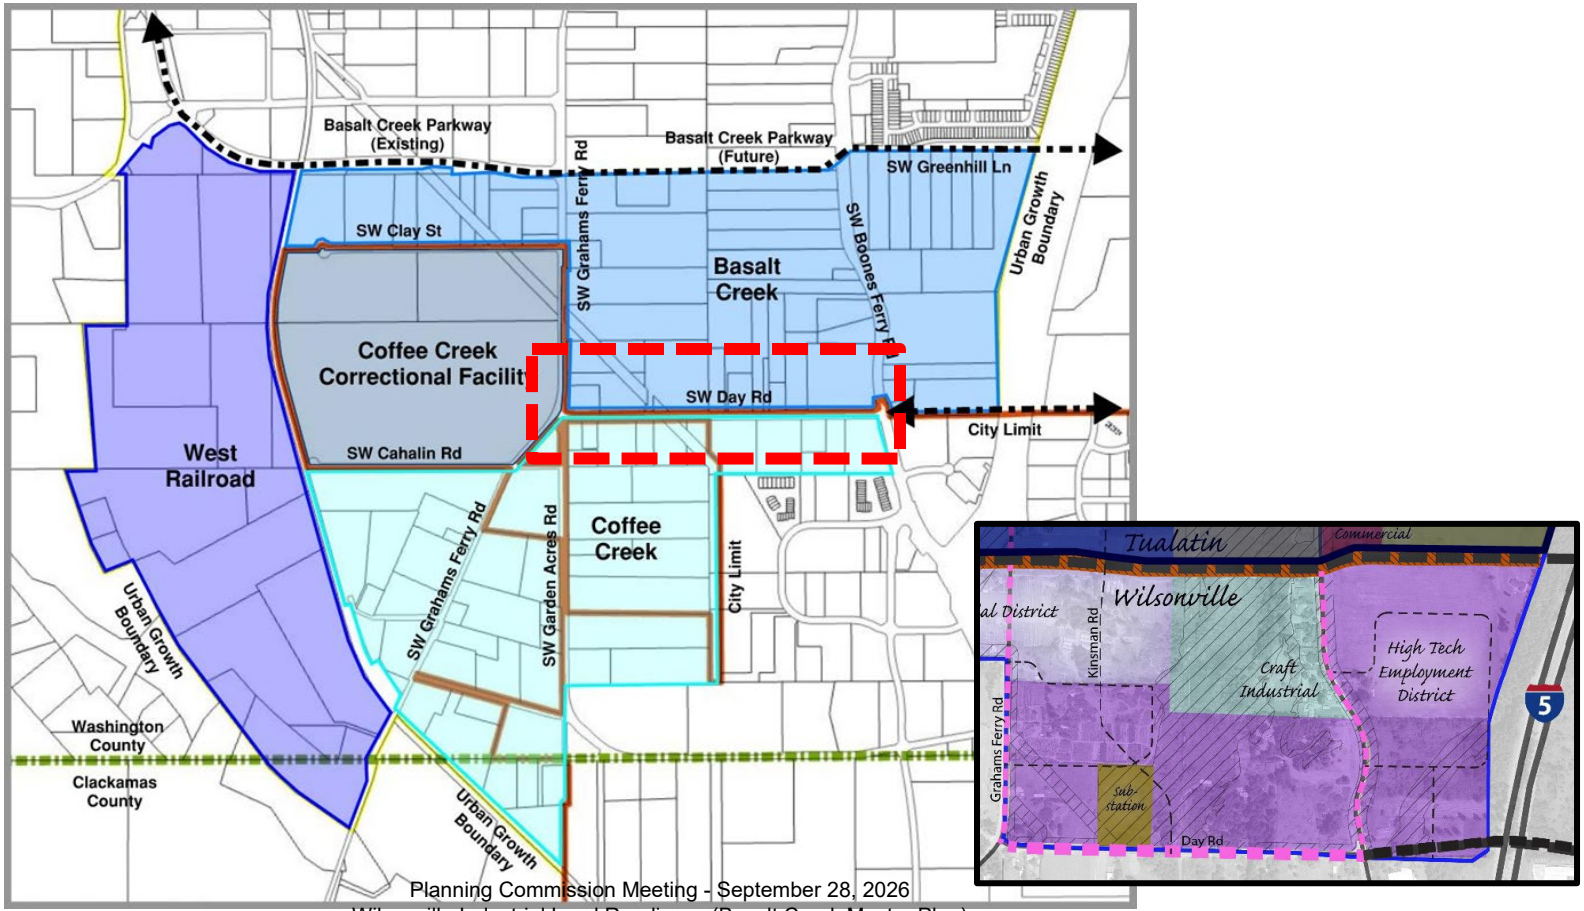
Discussion

- What input does Planning Commission have in response to the information presented pertaining to industrial demand, and current market conditions?
  - In particular, considering the scale between market driven and aspirational land use choices, does Planning Commission lean to one end or the other and how far, or land in the middle?



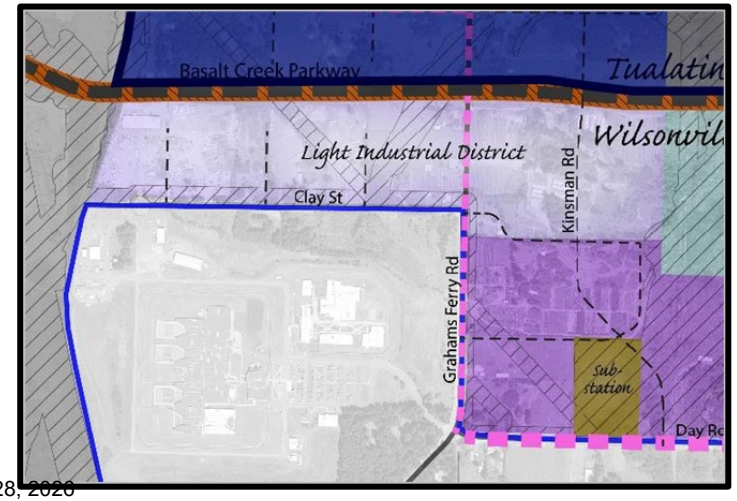
BCCP Land Use Types

High-Tech Employment

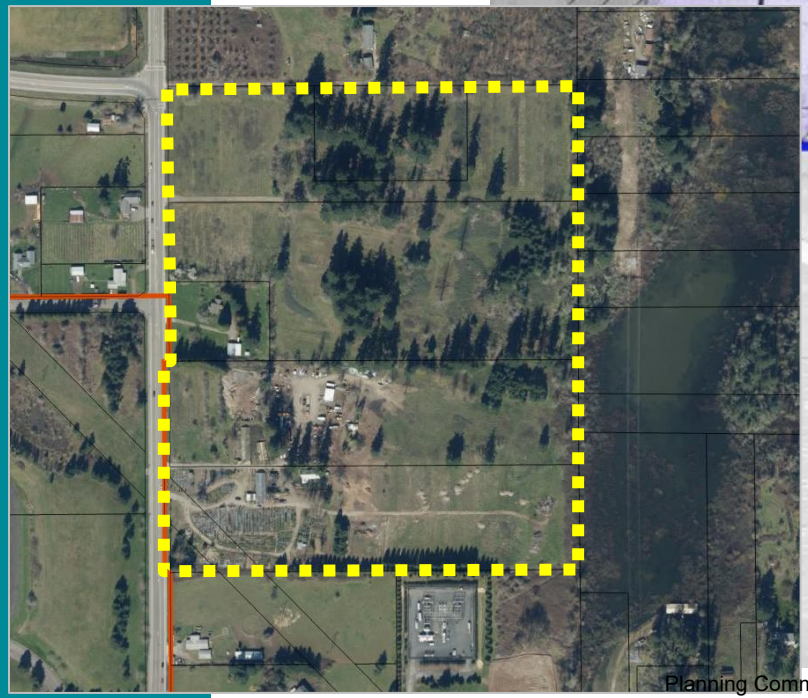


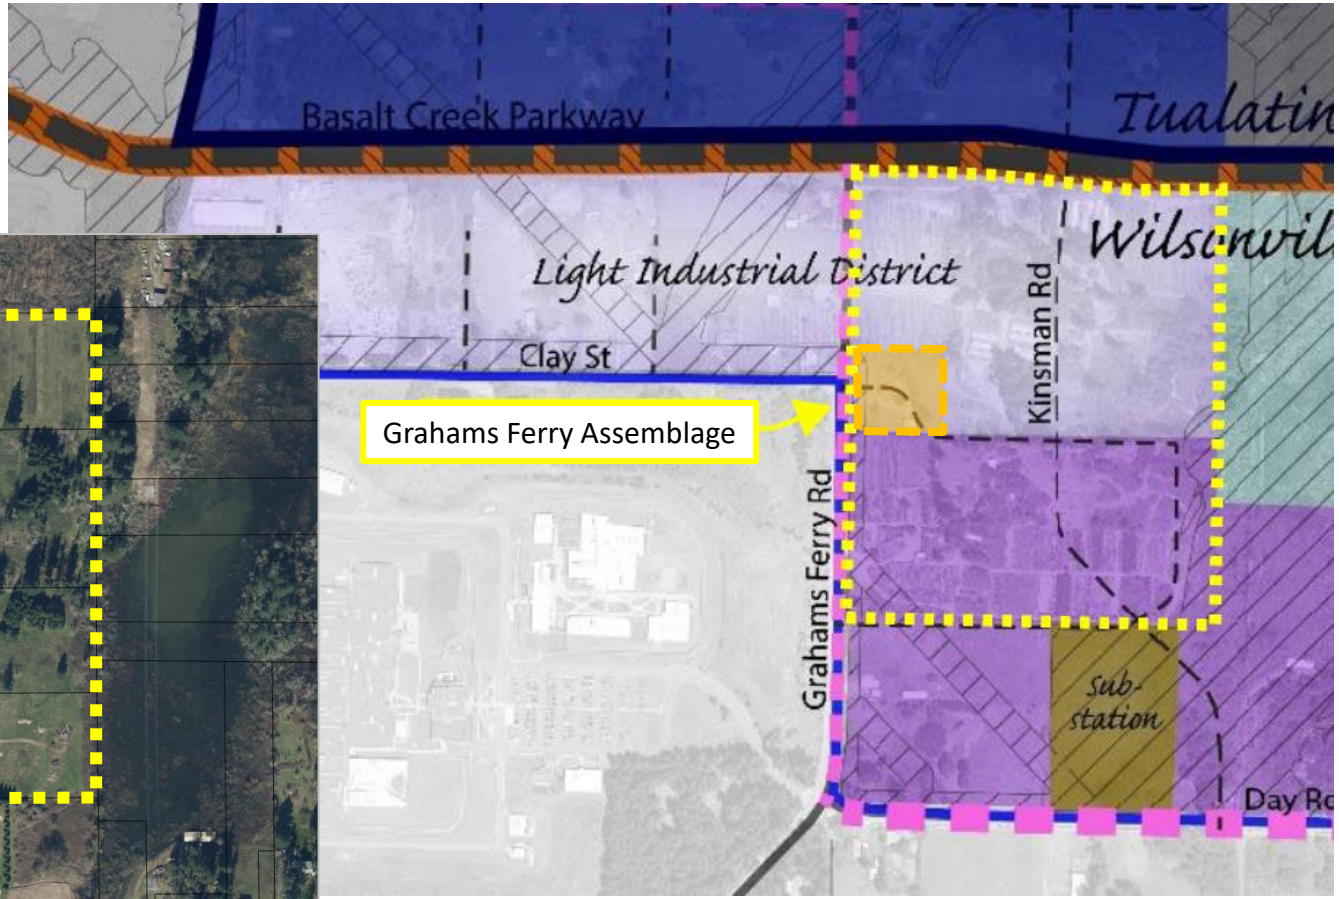
High-Tech Employment

High-Tech Employment



Light Industrial





Grahams Ferry Assemblage Site

Discussion

- Regarding the High-Tech Employment and Light Industrial land use types:
  - Are there uses that should be avoided or discouraged in the areas designated for these land use types because they are counter to the intended industrial use?
  - Do the boundaries of these land use types continue to be appropriate, or should they potentially be adjusted?
  - Related to the Grahams Ferry Assemblage, which is all under one ownership, should it continue to be split between these two land use types or wholly designated as one and, if so, which one?

Draft PC Minutes were reviewed and approved at the April 9, 2025 PC Meeting.

CITIZEN INPUT
There was none.

ADMINISTRATIVE MATTERS
1. Consideration of the February 12, 2025 Planning Commission Minutes

The February 12, 2025 Planning Commission minutes were accepted as presented.

WORK SESSION
2. Wilsonville Industrial Land Readiness (Basalt Creek) (Luxhoj)

Cindy Luxhoj, Associate Planner, explained the Planning Commission's input was again being sought on industrial land use types in Basalt Creek. The three discussion topics tonight regarded the regulatory context that brought the Basalt Creek Planning Area into the urban growth boundary (UGB), a refocus on the Industrial market, and further discussion of the High-Tech Employment and Light Industrial land use types. She began by presenting the Regulatory context via PowerPoint.

Commissioner comments regarding the regulatory context and responses to Commissioner questions were as follows:

- The definition of Industrial does limit anything retail or consumer based. The type of medical offices allowed would depend on foot traffic; for example, inpatient or research facilities with less foot traffic and a high employment count could meet the intent.

- Understanding the context and limitations of UGB and why Tualatin was different was very helpful.
- The verbiage noting only 1.7% of total industrial space being built on Page 2 of the Staff report regarded Wilsonville only accounting for a very small percentage of total industrial development in the greater Metro market.
  - Most of Wilsonville's industrial stocks were built in the 1980s and 1990s.
- The State mandated the need for planning horizons for jobs and housing within cities' urban growth boundaries due to the growing demand for employment and housing over the next 20 years, which was only possible if enough land is available to accommodate those needs, so cities are required to look for additional land or capacity within their current UGBs.
  - Due to a shortage of Industrial acreage in the Metro region, Basalt Creek Concept Plan (BCCP) Area was intentionally brought in and designated as Title 4 land to ensure it was protected for Industrial use and not Commercial. Title 4 was developed to maintain large lots and reduce the impact of commercial development in those areas.
  - The City is required to use the BCCP area as Industrial because Metro's Urban Growth Reports promise this land will be developed with Industrial or employment and at a certain job density so decisions to bring in additional Industrial land are based on prior land uses already assigned.
- Metro prefers not to do enforcement but does assess if the City is in compliance with its Urban Growth Management Functional Plan and can also withhold tax revenues.
- While contractor establishments could be seen as an industrial-type activity, they would not fall within what Metro expected in terms of future urbanized employment growth. Since the existing contractor establishments were not within the City of Wilsonville, the City was not out of compliance. The land was still within Washington County, so no enforcement mechanism existed, and Metro knew about the existing FD-20 zoning when the area was brought into the UGB.

Economic Development Manager Lorenzen noted his responsibility is to strengthen and grow the City's tax base, and industrial employment uses have big revenue implications for Wilsonville. He continued the PowerPoint presentation, describing Wilsonville's strong industrial employment base and its benefits, as well as Office and Industrial market trends, vacancy rates, and Industrial rent rates compared to the Portland Metro area. Wilsonville's combination of rising rents and a very low vacancy rate suggest a robust industrial market.

Commissioner comments and responses by Staff to Commissioner questions regarding the Industrial Market Refocus were discussed as follows:

- Citizens have a perception that office and industrial vacancies are much higher, perhaps due to seeing vacant retail space and because these uses do not create many traffic issues, which would make them more aware.
  - Some vacancies that occurred most recently were large and visible, such as the Rite Aid distribution center, leading people to conclude it was happening everywhere. That site is now leased and occupied again. For a submarket so geographically well-positioned like

Wilsonville, and from a transportation access point industrial vacancies do not last very long unless there are extenuating circumstances,

- For speculative developers, the 10-acre minimum threshold is pretty solid, but owner/occupied users, like Precision Countertops, might only need a few acres. Some Basalt Creek land parcels have been aggregated by people waiting for the City to begin accepting development applications, so some sites well above the 10-acre threshold are ready. The Greenhill site, which is privately owned, is also well above 10-acres.
  - The balance of the planning area is similar to Coffee Creek with land divided up in wonky ways and mostly under the 10-acre threshold, which is an obstacle and something to think about when considering policy decisions and recommendations to the City Council for how parcelized property could be overcome to facilitate development.
- While the specific development land inventories in Tualatin and Sherwood were unknown, infrastructure continues to be an obstacle in all communities, even where opportunities exist. However, where aggregation is possible, the infrastructure hurdle can sometimes be overcome because the economics make sense. The economics do not work with the cost of extending infrastructure to smaller development sites.
- One of the biggest impediments in Wilsonville is that the land has not been zoned yet. Once zoned, the land can be annexed.
- Like Coffee Creek, development in Basalt Creek will occur along the path of least resistance and where opportunity is ripe. Other more challenging areas will be slower to develop.

Associate Planner Luxhoj continued the presentation, describing market-driven versus aspirational choices around land use and land use planning and reviewing the BCCP's guiding principles. She requested feedback on the scale between market driven and aspirational land use choices in Basalt Creek for guidance as planning continues for Basalt Creek. (Slides 24-26)

Overall, Commissioners were inclined toward aspirational choices to guide planning in Basalt Creek, adding the following additional comments:

- Being mindful of the initial financial impact to residents of developing the needed infrastructure was important and must be balanced with aspirational choices.
- Aspirational goals could not be achieved outside what the market demands.
- Knowing Tualatin's area would have more residential land, Wilsonville's area would blend from that residential to varying industrial types.
- Concerns were expressed about what businesses would fit and the types of businesses the City wanted to attract. Industrial users, especially on the western side, had to be aware of the natural resources and the impacts to that area, which would exclude some business types.
- Allowing land owners choices was important, as discussed previously regarding the Craft Industrial area.
- Given the West Railroad's severe constraints, a less aspirational approach should be taken because the market would dictate those land uses.

- Though numbers regarding demand were sobering, not having planning be completely market driven was good.
- The Planning Commission's fundamental role is focused on designing Wilsonville and what the city should look like, rather than letting developers and businesses decide. The Commission has one chance with this undeveloped land, so the aspirational aspects are key. Figuring out what the Commission wants for the city is exciting.
- Having the additional context of what has already been done with regard to Metro and what the region needs addressed the market-driven aspects enabling the Commission to push more aspirational choices providing the balance needed.
- Additional Commissioner comments noted even the BCCP recognized the larger constraints on the West Railroad area, especially given the railroad overpass.
  - Staff assured further analysis on the West Railroad area would be coming soon.
- In light of being flexible, the City would need to monitor the manufacturing park on Tualatin's side because that development would likely draw other businesses to be adjacent. Understanding the pace of that development and the health of those planning processes would help the City take advantage of it.

Economic Development Manager Lorenzen agreed the Commission could be more aspirational in certain places in Basalt Creek, while needing to concede to the market in other places to strike a balance. Given all the different nuances and considerations in Basalt Creek, where could the Commission be strategic and targeted in where to be aspirational and where would that approach lead to properties that languish in perpetuity?

Planning Manager Pauly added that in his experience at the City, he has learned its development culture and the Commission's discussion reflected the City's development approach over the decades. Comments about the balance needed were appreciated as the sometimes the City focused on aspirational aspects, which was appreciated by residents and the business community, while sometimes, the market influenced development. Thinking long-term, it was important to remember that the built environment in Basalt Creek will remain a long time.

Economic Development Manager Lorenzen noted that as discussed regarding the market dynamics data, a lot of the existing demand was for speculative development or projects where facilities are built to accommodate multiple tenants. No owner users like Intel doing self-development were knocking at the City's door.

- Flexibility would be important when considering land use categories in the coming months to ensure properties that are built would also be occupied. If the number of users and uses was too small, a speculative project would be inhibited from coming to fruition and penciling out in the short or long term.

Associate Planner Luxhoj continued the PowerPoint presentation, reviewing the High-Tech Employment and Light Industrial land use types, as well as the Grahams Ferry Assemblage Site. (Slides 27-32)

- The questions for discussion sought input on appropriate land use types, the boundaries of the land use types, and keeping separate or combining the land use types of the Grahams Ferry Assemblage Site. (Slide 33)
  - She noted the City only has two industrial zones, Planned Development Industrial (PDI) and PDI-RSIA (Regionally Significant Industrial Area). The bulk of the Basalt Creek Planning Area would be PDI, but perhaps some specific subdistricts might be desired within the zone. For example, the City might want to avoid or discourage some uses in the High-Tech Employment area, such as call centers or warehousing that provide fewer jobs and take up more land.
- She understood the way the different land areas were assigned to High-Tech Employment and Light Industrial land use types had to do with trips and trip generation. The High-Tech Employment district would have the highest density of employment and in an attempt to balance the number of trips in Wilsonville and Tualatin, which would have a lot with its residential development, resulted in the High-Tech being extended and covering more area in Basalt Creek. Additionally, there was a desire to have consistent design on both sides of Day Rd.

Planning Director Bateschell added at the time, the City also desired having higher density employment opportunities in the Basalt Creek area. Outside of this urban reserve, the City had only one other future urban reserve for Wilsonville that would likely involve employment as most areas would likely be primarily residential with some commercial element. Areas near Elligsen Rd, especially north of Argyle Square, might have some employment.

- Wilsonville's strong industrial base has always been important to the City's financial well-being, as well as a lot of great job opportunities for employees.
- Staff had pulled together land use prototypes for Basalt Creek based on existing employment within the city and Council feedback, which ultimately evolved to having added employment density in the area.
  - When planning Basalt Creek, the feeling was that Wilsonville already had High-Tech, so the dialog regarded attracting other industries, especially supporting businesses to the larger tech industries. The City wanted to attract those types of companies, that type of design and development, and to make sure space was provided for it within Basalt Creek.
- Bringing the Basalt Creek area in for two cities to concept plan was unique. Knowing the land area would be primarily industrial with some residential in the north, the transportation system was planned first based on the trip generation for employment/industrial, and knowing the entire Washington County and South County Industrial area had multiple industrial areas that would connect to the road network coming through Basalt Creek.
- The Basalt Creek Transportation Refinement Plan was adopted before the BCCP given the assumptions around regional and local planning area trip rates, as well as what the planned transportation system could accommodate. If the regional or local planning area growth resulted in higher trips, then the current system as planned would be insufficient and additional transportation projects would be needed.

- The entire transportation system was built on a freight network for industrial growth, rather than local residential or town center type of development.

Commissioner comments and Staff's responses to questions regarding High-Tech Employment and Light Industrial land use types as follows (Slide 33):

- The Basalt Creek Parkway would only have two intersections, one at Grahams Ferry and one at Boones Ferry, as much of the Parkway would be elevated. People would access the different businesses in the High-Tech and employment areas from Day Rd. Grahams Ferry Rd, Day Rd, and Boones Ferry Parkway would be the main arterials and all had limited intersections. While businesses would front the arterials, no driveway access would be available from those streets.
  - Intersections would be at Clay/Grahams Ferry Rd, roundabout at Day /Grahams Ferry/Garden Acres Rd, and on intersection on Day Rd midway between Grahams Ferry and Boones Ferry Rds. The supporting streets in Coffee Creek would provide the internal connectivity and feed up to the Day Rd intersection.
  - No supporting street existed on the south side of Coffee Creek for the properties to front, so driveway access would be needed, such as the Delta Logistics driveway onto Day Rd.
  - Ideally, the internal connectivity would be provided by internal local street connections.
- The only one way to get into West Railroad is from Grahams Ferry at the south end of West Railroad. The revised local street concept map by DKS showed some access from the north but only by currently undeveloped local streets.
- Any buildings on the northern border of the Grahams Ferry Assemblage Site would not front onto the Basalt Creek Parkway.
- Given the large parcel of land, the Grahams Ferry Assemblage Site should have flexibility to develop Light Industrial and/or High-Tech, which would not interfere with whatever is developed across the street in Tualatin.
  - Owners of the Grahams Ferry Assemblage Site have also been assembling land north of the Parkway.
- The amount of truck traffic would depend how restrictive the City decides to be on High-Tech and Light Industrial since the majority of the City's industrial development was done through PDI zoning. The PDI-RSIA provided the additional requirements for Metro's Title 4 and had a few more commercial restrictions and land division requirements.
  - Because of assumptions regarding the mix of building types and types of jobs, some jobs would interface less with freight trucks with more truck traffic for Light Industrial.
  - The BCCP did not indicate whether the amount of traffic trips would be regulated or incentivized, which lead to questions of the Commission about aspirational choices. No decisions had been made through the concept planning process about the levels or differences in zoning and what the transportation system could support.
- To maintain the land use types established in the BCCP, some level of consistency was needed; however, how specific the Commission chose to be was open ended. The Commission could use land use standards or be more prescriptive or limited in one of the

land areas or choose to be more incentive based through the Code, economic development programs, or even through a design overlay.

- Light Industrial is a blend of manufacturing and High-Tech, which was why it was partitioned in the north section, and being farther from the freeway, it would be less truck intensive.
  - Clay Rd would be redesigned with development to accommodate heavy truck traffic. One reason Light Industrial was adjacent to Clay Rd was the interface with the Coffee Creek Correctional Facility. Being a lower visibility, dead end street, Clay Rd may have different design standards, and the Commission might be less specific about the businesses, building types, employee numbers, etc. allowed there.
  - The canyon and wetland are important attributes to the Light Industrial area which is marked as High-Tech and Craft Industrial, which was also discussed during the concept planning process.
- The Transportation Refinement Plan would be sent to the Commissioners to help address questions about traffic, trips, etc. As development occurs, all the roads would be upgraded to handle more capacity; for instance, Day Rd and the Basalt Creek Parkway would be developed into 5-lane roadways.
- How are land use designations applied to preexisting parcels with preexisting uses or that are already developed?
  - The actual zoning is not applicable until the land is annexed. No City zoning is applied to an existing use in the County that remains in the County. Zoning can be applied through an inclusive list of identified uses or by excluding uses the City might be concerned about taking land from the intended use.
- Making the Grahams Ferry Assemblage Site one land use type made sense, and while either land use type was acceptable.
- Being aspirational, High-Tech was the appropriate land use for the large Assemblage Site area as it checked all the boxes on economic development.
- Distribution/warehouse land use types should be avoided as the I-5 situation may not be able to handle a distribution center. Unless the City had line of sight for concurrency for resolving the I-5 issues, the City should be very limiting on uses that would drive a significant amount of trips.

Chair Hendrix called for public comment.

Ryan Schera, Schnitzer Properties, noted the Schnitzer had owned the split-zoned Grahams Ferry Assemblage for two years and provides manufacturing, wholesale trade, and distribution that supports a lot of high-tech and industrial business on Portland's west side. His key comments were as follows:

- Most industrial land developers in the Portland Metro area want 25+ acres, rather than 10+ acres. Aggregation of a larger property is rare, and the Assemblage Site was about 50 acres. Schnitzer held its properties long term, building Class A mixed and industrial development for a mix of uses that serve the community.
- The Coffee Creek Industrial examples provided in Staff's presentation were High-Tech uses in Light Industrial buildings. Light Industrial and High-Tech could coexist on one piece of

property in one zone. The City's PDI zone already accommodates a mix of the uses and attracts developers. Mentor Graphics and many distributors in the city were in PDI zones.

- Schnitzer could not get a $150 million construction loan on a split-zoned property, which would result in the property sitting vacant and fallow and no infrastructure being built. Without that infrastructure, no other Basalt Creek district areas would be built, unless the City paid for it.
- He would advocate for one zone across the entire district, unless the City wanted higher standards along Day Rd. Otherwise, all the stars had to align as far as having land owners ready to sell and developers ready to spend time buying small properties to aggregate a site large enough to develop and fit within the color/zone on the map, so these properties would sit vacant for a long time.
- Aspirational uses should be worked in to be allowed in addition to the PDI, which would allow Schnitzer to locate a tech company in its Light Industrial buildings. High-Tech and Light Industrial could service one another as well as the entire industrial supply chain and ecosystem throughout the entire west side: Wilsonville, Sherwood, Beaverton, even Salem.
- Tens of millions of dollars in infrastructure is required for Basalt Creek development. With an aspirational-only approach, the land will sit vacant with no tax revenue for schools, parks, roads, etc. Nothing was wrong with adding in aspirational uses but mandating one or another would make it hard to develop the entire district.
- Only five or six developers in Portland could build in Basalt Creek, and they should be at the table as well, though they would be saying the same thing.
- Schnitzer's concern was that financing for development would never occur, especially with restrictive uses or a split-zoned site.

3. Wilsonville Industrial Land Readiness (Basalt Creek) (Luxhoj)(60 Minutes)

PLANNING COMMISSION MEETING
STAFF REPORT

Meeting Date: February 12, 2025	**Subject: Wilsonville Industrial Land Readiness – Basalt Creek** **Staff Member:** Cindy Luxhoj AICP, Associate Planner, and Dan Pauly AICP, Planning Manager **Department:** Community Development
Action Required	**Advisory Board/Commission Recommendation**
☐ Motion ☐ Public Hearing Date: ☐ Ordinance 1st Reading Date: ☐ Ordinance 2nd Reading Date: ☐ Resolution ☒ Information or Direction ☐ Information Only ☐ Council Direction ☐ Consent Agenda	☐ Approval ☐ Denial ☐ None Forwarded ☒ Not Applicable **Comments:** N/A
Staff Recommendation: Staff recommends Planning Commission provide feedback about technical analyses and land use types related to refinement of the Basalt Creek Concept Plan for Phase 1 of the Wilsonville Industrial Land Readiness project.	
Recommended Language for Motion: N/A	
Project / Issue Relates To: Basalt Creek Concept Plan area	

☒Council Goals/Priorities: Attract high-quality industry and support economic opportunity for all in Wilsonville	☒Adopted Master Plan(s): Basalt Creek Concept Plan	☐Not Applicable

ISSUE BEFORE COMMISSION

Staff is seeking input from the Planning Commission on technical analyses of natural resources, transportation, and utilities, and conceptual land use types related to refinement of the Basalt Creek Concept Plan for Phase 1 of the Wilsonville Industrial Land Readiness (WILR) project.

EXECUTIVE SUMMARY:

A number of the key reports and studies for Phase 1 of the WILR project, which focused on the Basalt Creek Planning Area (BCPA) have been completed. At past work sessions, Planning Commission has provided input on the Economic Inventory and Land Use Analysis, Buildable Lands Inventory, Site Suitability Analysis, and Analysis of Future Development of Contractor Establishments. In addition to this work, several other technical analyses for Phase 1 have been completed, including the Transportation System Plan Evaluation and Local Street Concept Map by DKS (Attachment 1), Natural Resource Inventory by Pacific Habitat Services (Attachment 2), and Infrastructure Summary by City Engineering staff (Attachment 3). All these documents will inform the final components of Phase 1, which will include drafting of a Basalt Creek Master Plan and subsequent implementing Development Code.

The Basalt Creek Concept Plan (BCCP) established a vision for urbanization of the BCPA consistent with the guiding principles adopted by the Wilsonville and Tualatin during the planning process. Components of the vision included meeting regional responsibility for jobs and housing, capitalizing on the BCPA's assets, protecting existing neighborhoods, maintaining the cities' unique identities, exploring creative approaches to land use, including integration of employment and housing, ensuring appropriate transitions between land uses, and integrating high-quality design and amenities for employment. Further, the BCCP identified preferred land uses across the area, recommended high-level designs for transportation and infrastructure systems to support future development consistent with local, regional and state goals, and set specific action items and implementation measures.

The BCCP map identified land use designations for properties within the BCPA including High-Tech Employment, Craft Industrial, and Light Industrial (Attachment 4). These uses represent a mix of employment development types and include a modest opportunity for live/work housing. The land use types are compatible with adjacent and nearby industrial areas, such as the Coffee Creek Industrial Area, and provide flexibility to meet a range of market demands. The BCCP considered the land use types and uses to be good candidates for the City's Industrial Design Overlay District (form-based Code), adopted in 2018 for the Coffee Creek Industrial Area, should the City decide to extend it north into all or a portion of the BCPA.

One objective of the analyses in Phase 1 of the WILR project was to determine, based on updated information in the key reports and studies, whether the land use types envisioned in the BCCP continue to be the best option, or whether refinements are needed to realize the vision. Staff has prepared a synopsis of the land use types as a basis for discussion (Attachment 4).

Discussion Questions

During the work session input is requested from the Planning Commission in response to the questions below:

- What input does Planning Commission have in response to the transportation, utility, and natural resources studies?

- What direction does Planning Commission have about the land use types? Do they continue to be the best option, or what refinements are needed to realize the vision of the BCCP?

EXPECTED RESULTS:
Feedback from Planning Commission will guide next steps in planning for the BCPA, including drafting of a Master Plan and package of proposed Code amendments, developing economic development strategies, and preparing an infrastructure funding plan.

TIMELINE:
Additional work sessions with the Planning Commission and City Council are anticipated throughout 2025. Public hearings on related Development Code amendments are expected in late 2025, with concurrent work on the infrastructure funding plan and Phase 2 analyses occurring throughout the year.

CURRENT YEAR BUDGET IMPACTS:
Funding for the first phase of the WILR project is allocated in the FY2024-25 Planning Division budget and, for the second phase, will be allocated in the FY2025-26 budget. The first phase was primarily funded by a $100,000 grant from Business Oregon, which concluded at the end of 2024, with additional funding available, if needed, from a $290,000 Metro grant, which also is funding the second project phase.

COMMUNITY INVOLVEMENT PROCESS:
The Basalt Creek Concept Plan review process included comprehensive community involvement to gather input. For the first phase of the WILR project, ECOnorthwest focused on gathering input from Business Oregon, Greater Portland Inc., property owners, and developers, to understand demand for industrial land in Wilsonville as well as property owners' current and future plans for their property. This informed the market, site suitability, and contractor establishment analyses and will be considered in determining appropriate zoning standards to apply and preparing needed Code amendments.

POTENTIAL IMPACTS OR BENEFIT TO THE COMMUNITY:
Preparing a Basalt Creek Master Plan, adopting appropriate zoning standards, creating an infrastructure funding plan, and identifying and pursuing economic development strategies will remove barriers to development and enable implementation of the Basalt Creek Concept Plan and Master Plan. When developed, Basalt Creek will create jobs, thus contributing to the income and property tax base, support economic mobility for residents through family-wage employment in a highly livable, full-service City, and enable this industrial area to reach its full economic potential, resulting in positive impacts on the greater Wilsonville community.

ALTERNATIVES:
As the Master Plan, zoning Code amendments, economic development strategies, and an infrastructure funding plan are developed, a number of alternatives will be explored and developed with the Planning Commission and City Council.

WILSONVILLE BASALT CREEK PLAN – WILSONVILLE TSP UPDATE EVALUATION

DATE: December 27, 2024

TO: Dan Pauly | City of Wilsonville

FROM: Jenna Bogert, PE | DKS Associates

SUBJECT: Wilsonville Basalt Creek Plan TSP Evaluation P#21123-034

BACKGROUND AND PURPOSE

The Basalt Creek Planning Area (BCPA) is generally located between the southern edge of Tualatin and the northern boundary of Wilsonville (Figure 1). The Basalt Creek Concept Plan was formally adopted by the cities of Tualatin and Wilsonville in August 2018 and provides guidance for future land use and transportation decisions in the BCPA. In April 2019, the City of Wilsonville amended their Transportation System Plan (TSP) to include the key transportation projects from the Concept Plan (Table 1). Many of these projects were already identified in the METRO Regional Transportation Plan (2014) at the time of the development of the Basalt Creek Concept Plan.

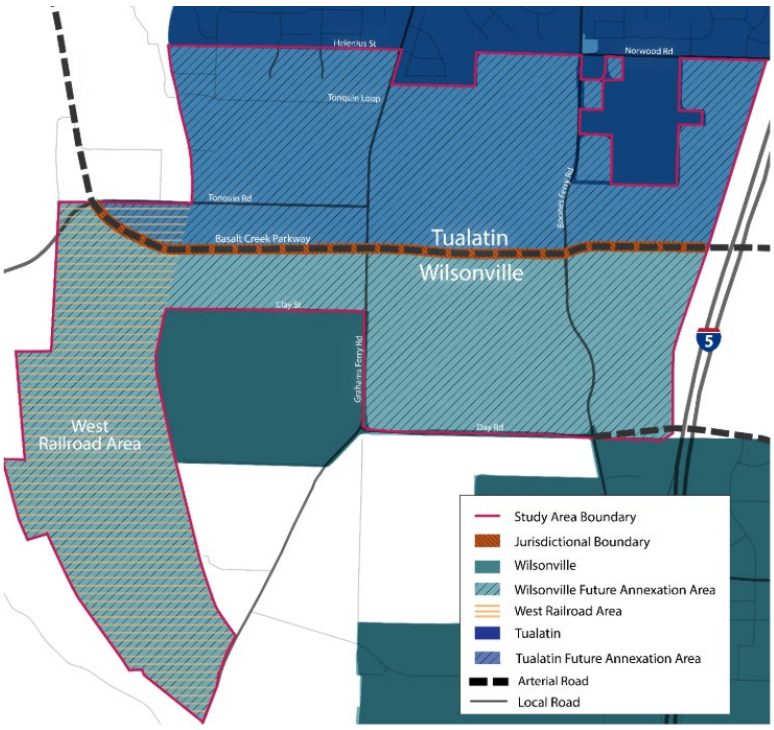

FIGURE 1: BASALT CREEK PLANNING AREA
Source: Basalt Creek Concept Plan (2018)

The purpose of this memorandum is to review the City's current list of TSP projects related to the BCPA and ensure that the land use assumptions and identified transportation projects are still applicable. Through this review, DKS will identify any new transportation improvement projects that might be needed to further support the current development plan for the BCPA.

LIST OF WILSONVILLE TSP PROJECTS RELATED TO BASALT CREEK

Table 1 shows the list of Basalt Creek projects that were added or updated in the City's Transportation System Plan (TSP) as part of the 2019 amendment. Refer to Figure 5-3 and Figure 5-8 of the City's TSP for the maps showing these projects.

It should be noted that two more amendments to the TSP have been approved by Council since 2019, an amendment in November 2020 and in May 2023. The amendment in November 2020 was related to the adoption of the City's Town Center Plan and the amendment in May 2023 was related to the adoption of the Frog Pond East & South Master Plan. Neither of these amendments involved any changes to projects in the Basalt Creek Area.

Also noted in Table 1 is whether the project is included in the Metro Regional Transportation Plan (2023). As of December 2024, there were two projects that were included in the Metro RTP that are not included in the current Wilsonville TSP.[1]

- METRO RTP Project #11924, Grahams Ferry Road from Tonquin Road to Day Road, Improve roadway to 5 lanes including sidewalks and bike lanes. Long-Term 2045 Strategic Project List.
  This project is a more aspirational investment that may need further study. The City should discuss this project internally and with Washington County to determine whether a three-lane or five-lane cross section is preferred on Grahams Ferry Road.
- METRO RTP Project #12095, Boones Ferry Road-Elligsen Road from 95th Avenue to I-5 Interchange Ramps. Improve safety and/or operations with pedestrian crossings, speed feedback signs, transit priority technology, etc. Near-Term 2030 Constrained Project List.

Another project of note in the Metro RTP is the I-5 Boone Bridge and Seismic Improvement Project (#12305). This project would replace Boone Bridge with a seismically resilient structure and add an auxiliary lane on SB I-5 from Wilsonville Road to the Wilsonville-Hubbard Highway (OR 551) interchange and is on the 2045 Long-Term Constrained Project List. Although this project is not directly located in the BCPA, it is anticipated to relieve some level of the current congestion on the I-5 mainline through Wilsonville, which today, often has secondary impacts on traffic congestion at the two Wilsonville I-5 Interchanges, including Boones Ferry Road, Day Road, and Grahams Ferry Road.

[1] Link to map of METRO RTP Projects.

TABLE 1: BASALT CREEK TSP PROJECTS (2019 TSP AMENDMENT)

PROJECT #	PROJECT	NOTES
RE-P6	Basalt Creek Parkway Overcrossing of I-5	New to 2019 Wilsonville TSP, added to Additional Planned Project List; On the 2045 Long-Term Strategic Project List in the Metro RTP
RE-P5	Day Road Overcrossing of I-5 (Boones Ferry Road to Elligsen Road)	New to 2019 Wilsonville TSP, added to Additional Planned Project List; On the 2045 Long-Term Strategic Project List in the Metro RTP
RE-P15	Pioneer Court Extension (north and west to Boones Ferry Road)	New to 2019 Wilsonville TSP, added to Additional Planned Project List
RE-14	Basalt Creek Parkway Extension (Grahams Ferry Road and Boones Ferry Road)	Moved from Additional Planned Project List to Higher-Priority Project List; On the 2030 Near-Term Constrained Project List in the Metro RTP
RW-04	Boones Ferry Road Widening to Five Lanes (Day Road to Basalt Creek Parkway)	New to 2019 Wilsonville TSP, added to High Priority Project List; On the 2030 Near-Term Constrained Project List in the Metro RTP #11487
RW-05	Grahams Ferry Road Widening to Three Lanes (Day Road to Basalt Creek Parkway)	Moved from Additional Planned Project List to Higher-Priority Project List; On the 2045 Long-Term Constrained Project List in the Metro RTP #10588
SI-07	Boones Ferry Road at I-5 Southbound Ramps (add dual southbound left turn lanes)	New to 2019 Wilsonville TSP, added to High Priority Project List; On the 2045 Long-Term Constrained Project List in the Metro RTP
SI-08	Boones Ferry Road at 95th Avenue (access management strategies)	New to 2019 Wilsonville TSP, added to High Priority Project List
LT-02	Basalt Creek Canyon Ridge Trail	New to 2019 Wilsonville TSP, added to High Priority Project List
LT-03	I-5 Easement Trail	New to 2019 Wilsonville TSP, added to High Priority Project List

BASALT CREEK PLANNING AREA GROWTH SINCE 2019 TSP AMENDMENT

Since the Basalt Creek Concept Plan was adopted in 2018, there has been little development within the Basalt Creek Planning Area (BCPA). Approved developments are listed below. These developments will account for approximately 20% of the total anticipated vehicle trips generated by development in the BCPA through 2035 as documented in the Basalt Creek Concept Plan.

- **Autumn Sunrise Subdivision in Tualatin**; consists of 400 single-family homes to be constructed in four phases; phases 1 through 3 are complete or nearly complete which would include 80 townhomes.
- **Plambeck Gardens Apartments in Tualatin**; includes 116 apartment units within two, four-story buildings; buildings are currently under construction
- **Brown Contracting Expansion in Washington County**; Brown Contracting is located at 9675 SW Day Road, just outside of city of Wilsonville city limits. However, the site is accessed via Day Road, which is a city-owned roadway. In May 2024, the property owner submitted a request for a site expansion that included the addition of covered, open-air storage building and a gravel storage expansion. A traffic study indicated that around 100 additional daily vehicle trips were generated by these site expansion changes, which were constructed prior to the traffic study.

Transportation infrastructure projects in the BCPA that have been constructed since 2018 include:

- **Basalt Creek Parkway/124th Avenue** Extension between Grahams Ferry Road and Tualatin-Sherwood Road (complete in 2019)

Although 10 years (48%) of the 21-year Basalt Creek Concept planning period (2014 – 2035) has elapsed, only 20% of the anticipated development and transportation infrastructure has been approved/constructed.

Because of this, a re-evaluation of the future 2035 traffic volumes and vehicle operations was not a compelling effort at this time. The best recommendation for the City of Wilsonville at this stage in the development of the BCPA is to continue to track vehicle trips generated by BCPA developments during the land use approval process.

At this point in time, no additional transportation projects beyond what is in the current TSP are needed to support the planned growth within the BCPA.

Additionally, the traffic analysis in the Basalt Creek Concept Plan was developed prior to the impacts of COVID-19. Which means that regional and baseline traffic volumes now have a lower 2035 projection as compared to when the Basalt Creek Concept Plan and Wilsonville Transportation System Plan Amendment were adopted. During 2020 and 2021, there was a notable dip in traffic citywide. The traffic volumes on the adjacent roadways had not quite reached pre-COVID-19 levels as of 2023 but appear to be increasing through 2024. See Table 2 below for a summary of traffic counts collected near the Basalt Creek area over the last few years. The dip in traffic that occurred in 2020 and 2021 indicates that there is the potential for more vehicle capacity within the BCPA beyond the analysis and identified transportation projects documented in the Basalt Creek Concept Plan and City of Wilsonville Transportation System Plan.

TABLE 2: HISTORY OF TRAFFIC VOLUMES NEAR BASALT CREEK PLANNING AREA

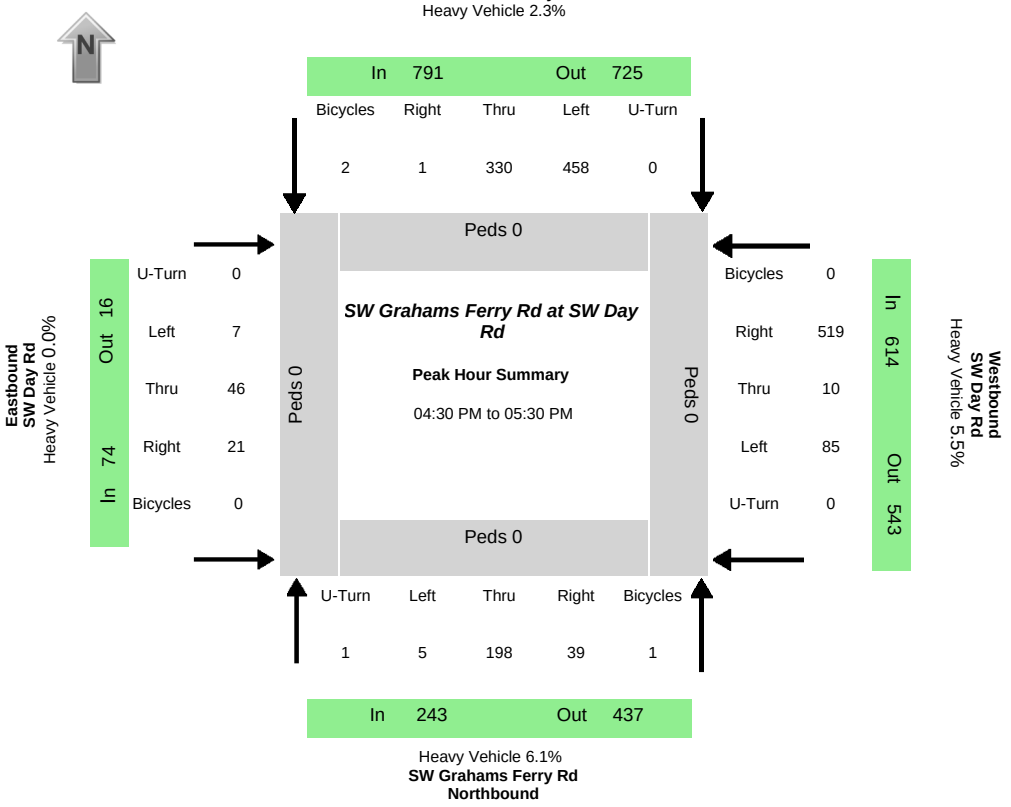
LOCATION	PM PEAK HOUR TRAFFIC VOLUMES			PERCENT CHANGE (2019 TO 2023)
	April/May 2019	March 2023	May 2024	
GRAHAMS FERRY ROAD (NORTH OF DAY RD)	1,520	1,485	1,600	-2%
DAY ROAD (BETWEEN GRAHAMS FERRY RD AND BOONES FERRY RD)	1,150	1,050	-	-8%
BOONES FERRY ROAD (NORTH OF DAY RD)	1,060	960	-	-9%
BOONES FERRY ROAD (SOUTH OF DAY RD)	2,120	2,000	-	-6%

NON-VEHICLE TSP RECOMMENDATIONS

The Basalt Creek Concept Plan only identified personal motor vehicle-related projects. Only a high-level evaluation of **transit, freight, pedestrians, and bicycles needs** were documented in the Plan. Therefore, a re-evaluation of these non-personal motor vehicle modes of travel was conducted and the following list of projects have been identified as needed to support the Basalt Creek Planning Area (BCPA) beyond what is already in the Wilsonville Transportation System Plan (TSP).

- Coordinate with SMART to expand transit service (e.g., new routes, bus stops, etc.) to the Basalt Creek Planning Area as it develops.
- Consider an enhanced pedestrian/bicycle crossing of Day Road where the south end of LT-02 (Basalt Creek Canyon Trail) would connect with the north end of the pedestrian/bicycle facilities along the Coffee Creek Supporting Street.
- Consider a trail connection (pedestrian and bicycle only) from Ridder Road north to the future Coffee Creek Supporting Street. Approximately 800 feet in length. Trail alignment would run along the west side of the BPA Substation.

BASALT CREEK AREA (WILSONVILLE) LOCAL STREET CONCEPT MAP



DKS identified likely connection points and alignments for the future local streets in the Wilsonville portion of the BCPA. This area is generally bound by Day Road to the south, Tonquin Road to the north, Grahams Ferry Road to the west, and I-5 to the east. A local access plan for the West Railroad planning area was also included on the map. This area is generally bound by Basalt Creek Parkway to the north, Grahams Ferry Road to the south, Coffee Creek to the west, and the UPRR Railroad to the east. Refer to Attachment B for the local street concept map of these areas.

RE: **Natural Resources Inventory for the Basalt Creek Neighborhood in Wilsonville**

Pacific Habitat Services (PHS) conducted an inventory of wetlands, tree groves and riparian areas within the Basalt Creek planning area during the summer of 2024. The City of Wilsonville is conducting an industrial land readiness study that will inform zoning Code amendments and an infrastructure funding plan to enable future development as envisioned in the Basalt Creek Concept Plan area (BCPA). A component of this analysis is updating the Buildable Lands Inventory, including identifying natural resources in compliance with Statewide Planning Goal 5. This memorandum describes the inventory methodology for identifying these resources within the BCPA.

Public Involvement: Prior to beginning the inventory field work, all landowners were contacted in person, or received a phone call or email from the City of Wilsonville describing the project and asking permission to enter their property. Right of access was granted to PHS by landowner permission only. The properties of those not responding were not accessed. Access information was collected in a database by the City of Wilsonville and provided to PHS to coordinate directly with landowners for site access.

Inventory Methodology: Within the study area PHS determined the location of all wetlands regardless of size or quality. All mapped wetlands accompanied with an on-site visit were determined by application of the Routine On-site Determination method, as described in the *Corps of Engineers Wetland Delineation Manual, Wetlands Research Program Technical Report Y 87 1* ("The 1987 Manual") and the *Regional Supplement to the Corps of Engineers Wetland Delineation Manual: Western Mountains, Valleys, and Coast Region*. The quality/condition of any wetland greater than 0.5 acre was assessed for significance criteria by applying a characterization tool called the Oregon Freshwater Wetland Assessment Methodology (OFWAM).

Natural Resources Inventory for the Basalt Creek Planning Area in Wilsonville
Pacific Habitat Services, Inc.
November 26, 2024

The inventory also required the identification and mapping of upland tree groves and riparian areas. General vegetation composition within the riparian corridors was recorded, along with an evaluation of slopes within the corridor reach, which when greater than 25% requires a 50-foot offset from the break in slope. This information was used to evaluate the Riparian Corridor Type, as described in Wilsonville Municipal Code Section 4.139- Significant Resource Overlay Zone (SROZ) Ordinance.

The boundaries of tree groves were identified and mapped based upon the limits of the drip line of trees within the BCPA, as based on recent aerial photographs. Best effort was made to exclude areas that exist as part of a landscaped residence, which likely does not contribute to forested habitat connectivity, but may be adjacent to these habitats.

Routine Off-site Determination: Prior to beginning field work, off-site mapping was reviewed to determine the approximate location of wetland boundaries based on available information. This information included the USGS topographic quadrangles, Natural Resource Conservation Service (NRCS) agronomic soil survey maps, the National Wetlands Inventory maps, City of Wilsonville 1999 Local Wetland Inventory (outside of the BCPA), aerial photographs, the existing City of Wilsonville Significant Resource Overlay Zone (SROZ) maps, and a Department of State Lands (DSL) review of any past wetland delineations or permits taking place within the BCPA.

Routine On-site Determination: Where property access permission was granted, on-site observation and inspection of soils, vegetation, and hydrology were made. Soil profiles were examined for hydric soils and wetland hydrology field indicators. A visual percent-cover estimate of the dominant species of the plant community for a maximum 30-foot radius was also made at each observation point. Though numerous observations and excavations were made to determine wetland boundaries in the field, no flagging of boundaries was completed.

Wetland Quality Assessment: To evaluate significance criteria of each wetland greater than 0.5 acres, the OFWAM assessment was utilized. OFWAM evaluates the following ecological functions, where if one of the four is intact- a “Locally Significant Wetland” criteria (OAR 141-0860350) is met: diverse wildlife habitat, intact fish habitat, intact water quality, or intact hydrologic control.

Results

Wetlands: The inventory identified approximately 59.02 acres of potentially jurisdictional wetlands within the BCPA. These wetlands and their codes are listed below.

Table 1. Wetland Overview

Wetland Code	Area (acres)	Potentially Significant
BC-1	19.58	Yes
	0.03	
BC-2	5.46	Yes
	31.54	
BC-3	1.61	No
BC-4a	0.01	n/a
BC-4b	0.04	n/a

BC-7	0.02	n/a
BC-8	0.03	n/a
Total	**59.02**	**56.61**

BC = Basalt Creek

As shown, Wetlands BC-1 and BC-2 meet significance criteria as shown in the OFWAM results included with this memorandum. Wetland BC-1, which is a wetland complex surrounding Tapman Creek in the eastern study area, provides diverse wildlife habitat with a hydrologic control function intact. Wetland BC-2 is a wetland complex surrounding Coffee Lake Creek in the western study area. This complex also maintains an intact hydrologic control function and has a surface water connection to downstream waters that provide habitat for indigenous anadromous salmonids at the confluence with the Willamette River.

Wetland BC-3 is an excavated shallow pond and was evaluated under ORWAP due the size of the wetland- which is greater than 0.5 acres. The wetland did not meet significance criteria.

Wetlands BC-4a-h are remnants of what was likely a historic drainage, but residual portions of this feature now function as a wetland and have been hydrologically segregated in some areas and piped in others. This feature has a small remnant stream portion with corresponding riparian area that connects to Coffee Lake Creek.

All other wetland features are not locally significant, and either shallow wetland swales identified through topography, mapped hydric soils, mapped historic wetlands, and historical aerial imagery, and/or they are wetland features visible from nearby roadways and properties with public access.

Streams: Two major stream systems exist within the Basalt Creek (BC) study area, Tapman Creek (BC-TC), and Coffee Lake Creek (BC-CLC). A small tributary extends into Coffee Lake Creek as well (BC-CLCa). An overview of their adjoining riparian areas is described below.

Riparian Areas: Two main riparian areas were identified and assessed during this inventory process. One resides adjacent to Coffee Lake Creek and a small tributary to Coffee Lake Creek (BC-CLC and BC-CLCa); the second resides adjacent to Tapman Creek (BC-TC). The riparian areas both exhibit a width that is less than one APTH wide (Appropriate Potential Tree Height) before slopes are reached. For steep slopes greater than 25%, riparian areas were extended 50-feet beyond the break in slope as described in Table NR-1: Metro Water Quality Resource Area Slope

Natural Resources Inventory for the Basalt Creek Planning Area in Wilsonville
Pacific Habitat Services, Inc.
November 26, 2024

Calculation (WMC 4.139). Areas with habitat connectivity through adjoining riparian forested areas were also included in the riparian corridor.

Table 2: Riparian Area Overview

Riparian Code	Riparian Corridor Type	Adjacent Waters
BC-RIP1	NR-1 (Stream Riparian Ecosystem)	Tapman Creek
BC-RIP2	NR-1 (Stream Riparian Ecosystem)	Coffee Lake Creek; Coffee Lake Creek Tributary

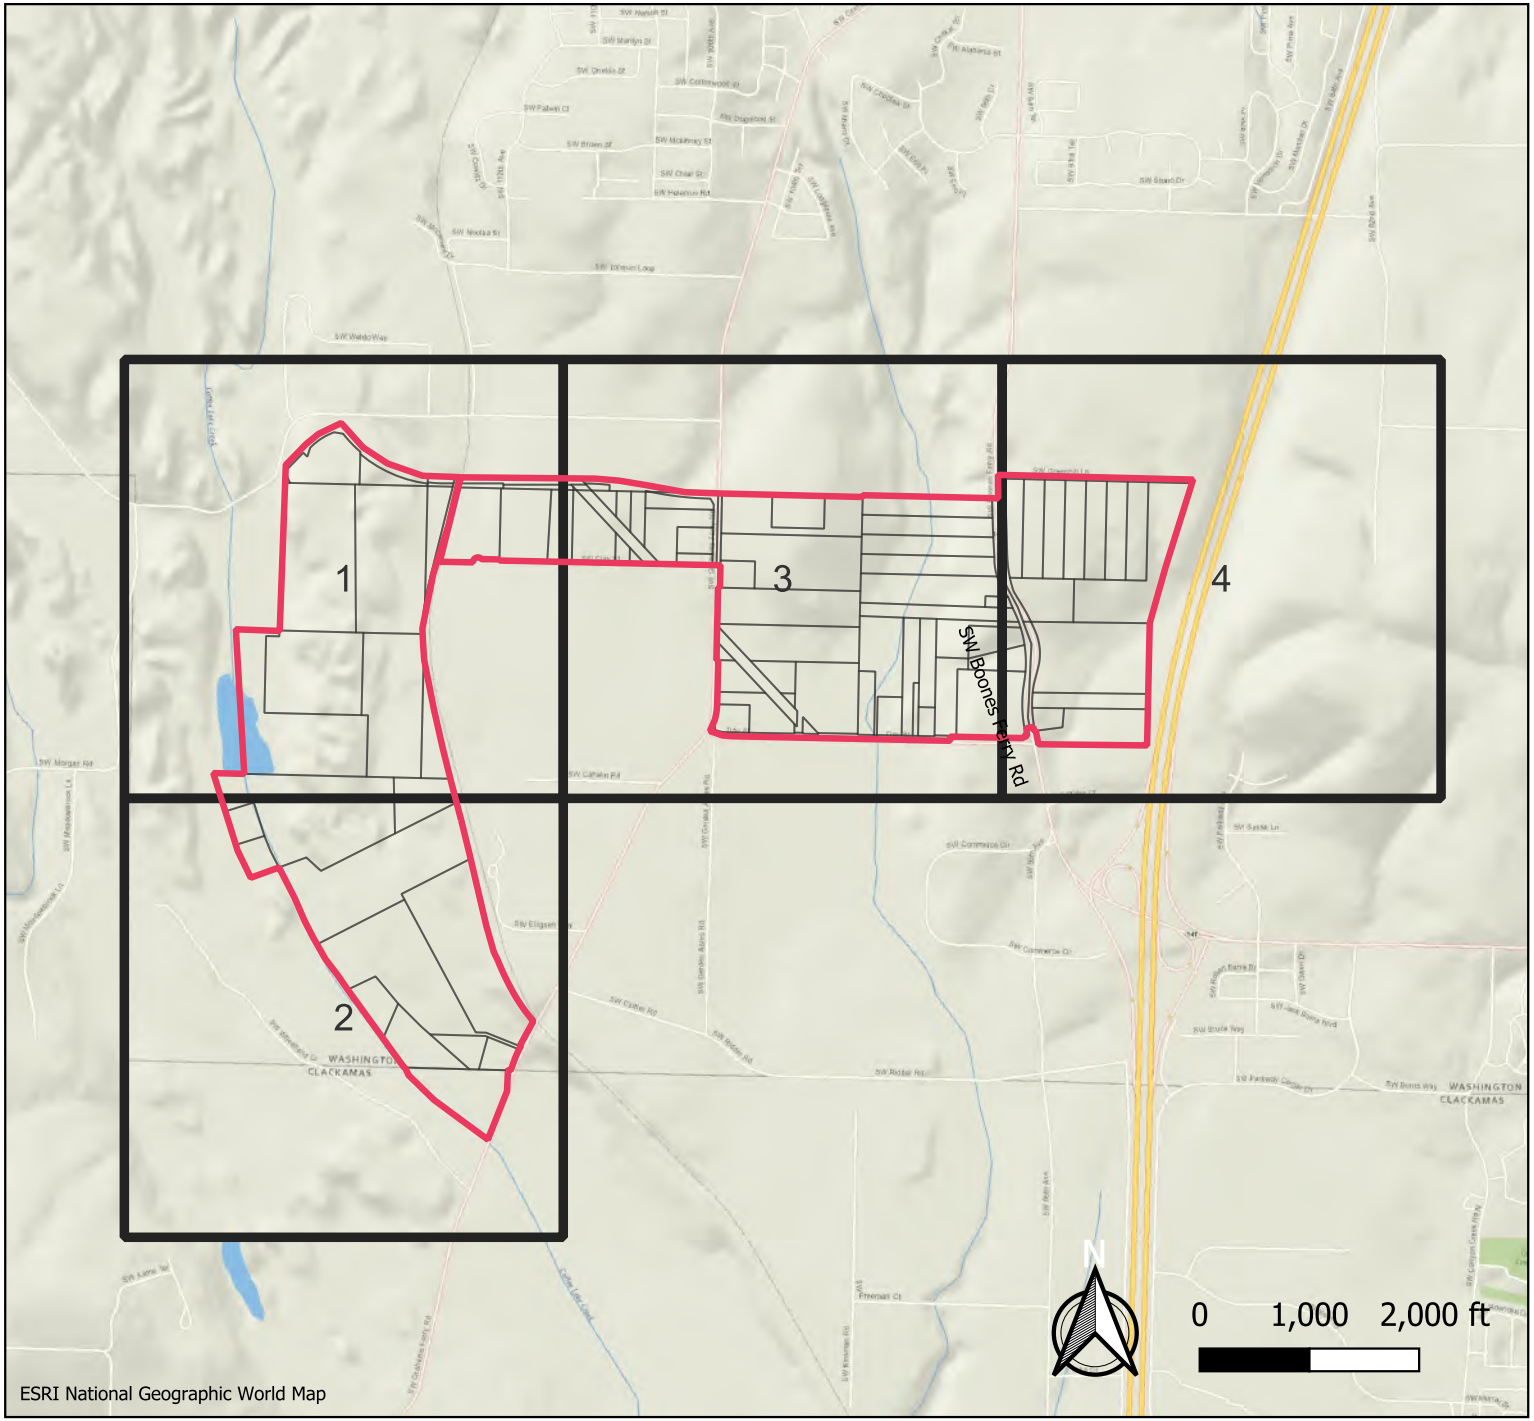
BC= Basalt Creek
RIP= Riparian Area

Upland Tree Groves: Several upland tree groves were mapped within the BCPA, some of which are adjacent to wetlands or very close to riparian corridors, but are isolated by a break in tree canopy. PHS mapped the boundaries as described in the methods section. The grove mapping was not based on surveyed locations of trees with known diameters at breast height. Grove mapping was isolated to areas with significant groups of trees and excluded predominantly scrub-shrub or herbaceous vegetation.

Wildlife Habitat: The City includes riparian areas and upland forested areas as Wildlife Habitat, however, Wildlife Habitat within these categories is evaluated for significance through the upland areas' potential for wildlife habitat diversity, water quality protection, ecological integrity, connectivity, and uniqueness. Evaluating this criteria, Upland Tree Grove BC-G7 was designated as significant due to its unique habitat and connectivity to Significant wetland areas.

Conclusions

PHS identified two significant wetland areas (BC-1 and BC-2), surrounded by two Significant riparian areas (BC-RIP1, BC-RIP2). Two major stream systems exist within the two significant wetland areas (Tapman Creek, Coffee Lake Creek, Tributary to Coffee Lake Creek). Several upland tree groves exist, with one meeting criteria for wildlife habitat[1] (BC-G7). A Significant Resource Overlay Zone will encompass all significant resources to meet Goal 5 objectives and include an appropriate off-set. The Significant Resources mapped by PHS within the Basalt Creek Planning Area include the following:



Significant Resources to include in SROZ	
Streams	BC-TC (Tapman Creek), BC-CLC (Coffee Lake Creek), BC-CLCa (Tributary to Coffee Lake Creek)
Wetlands	BC-1, BC-2
Riparian Areas	BC-RIP1, BC-RIP2
Wildlife Habitat	BC-G7 (Upland Tree Grove)

[1] (b) "Wildlife habitat" is an area upon which wildlife depend in order to meet their requirements for food, water, shelter, and reproduction. Examples include wildlife migration corridors, big game winter range, and nesting and roosting sites. {OAR 660-23-110}

Basalt Creek Infrastructure Summary

Roads

DRAFT

New arterial to i5 from Greenhill (300 LF). New arterial from Day Rd to i5 (1,060 LF). New arterial connecting Kinsman Rd with Ridder Rd (2,040 LF). New local roads looping Greenhill to Boones

Ferry (3,350 LF) and connecting to Pioneer Ave (2,110 LF). New local looping Day Rd to Boones Ferry (1,900 LF). New local roads on the north side of Day Rd connecting to Clay St (4,900 LF). New local roads on the south side of Day Rd connecting to Garden Acres Rd and Grahams Ferry Rd (7,700 LF). New local road connecting Grahams Ferry to Tonquin Rd (6,900 LF) with a possible connection to Morgan Rd (2,570 LF).

Water

Potable water delivery to the Basalt Creek Area requires the Basalt Creek Parkway Extension (in design), a Zone C booster station (Water Distribution Master Plan, 2012), and *may* require the Grahams Ferry Road Extension (Water Distribution System Master Plan, 2012) which connects Tooze Rd with Day Rd – 10,200 LF 18" diameter pipe and 4,670 LF 12" diameter pipe.

Project Name, Document Sited	Project Description	Cost, Date of Cost	Adjusted Cost, 2024 (CPI)	Adjusted Cost, 2024 (NHCCI)
Placeholder for Booster Station				
Placeholder for Upsizing Requirements				
Conceptual Water System, Basalt Creek Utility Infrastructure Concept Plan (2016)	Assumes that most of the system will be served by Tualatin pressure zone B, with a small portion utilizing Wilsonville Zone C (using booster station). Assumes some rock excavation and generally 8" pipe with some upsizing of existing 8" mains to 12". Systems must remain looped.	$6,350,000 2016	$8,445,500 33% inflation	$9,594,850 1.519 index increase

Requires new water main along Boones Ferry alignment (2,490 LF). Water lines assumed to generally follow the local road layout (5,460 LF). Will connect proposed water lines to existing lines on Pioneer and Day Rd. Sizes to be confirmed during modeling.

Modeling needs to confirm these requirements. Modeling is being conducted by Keller and will confirm layout, costs, and extension requirements, including booster station.

Wastewater

Wastewater collection for the Basalt Creek Area requires the completion of the Coffee Creek Interceptor Phase 2 (Collection System Master Plan, 2014) – 2,000 LF of gravity system upsizing to 21" diameter pipe from Boeckman Rd along the railroad to Ridder. This also requires the Coffee Creek Interceptor Railroad Crossing (Collection System Master Plan, 2014) – 160 LF of 21" diameter pipe.

DRAFT

Project Name, Document Sited	Project Description	Cost, Date of Cost	Adjusted Cost, 2024 (CPI)	Adjusted Cost, 2024 (NHCCI)
Coffee Creek Interceptor Phase 2 (Collection System Master Plan, 2014)	Gravity Upsizing, considered required for Basalt Creek and Coffee Creek developments. Install 2,000 LF of 21" pipe. Extents from P&W Railroad to Boeckman Road.	$1,700,000 2014	$2,295,000 (35% Inflation)	$2,475,200 (1.456 index increase)
Coffee Creek Interceptor RR Crossing (Collection System Master Plan, 2014)	Existing crossing can serve Coffee Creek and only approx. 13% of Basalt Creek developments. 160 linear feet of 21" pipe, railroad crossing. Extents under the P&W Railroad. This project may require bore and jack construction.	$480,000 2014	$648,000 (35% Inflation)	$698,880 (1.456 index increase)
Conceptual Sewer System, Basalt Creek Utility Infrastructure Concept Plan (2016)	Assumes some deep trenching and rock excavation, generally a mix of 8” and 10” mainlines. Some force mains may be required, assumed 8” pipe.	$11,511,000 2016	$15,309,630 33% inflation	$17,393,121 1.519 index increase

To serve the Basalt Creek local area, gravity collection lines flow generally south and west along proposed road layout (20,000 LF). 8” to 12” diameter mains are anticipated, with some deep trenching and rock excavation requirements expected.

For the West Railroad area, gravity line flows from Clay St west, cross the railroad, and meet the proposed local street alignment in West Railroad to Grahams Ferry (6,900 LF). A lift station is required with a pressure main along Grahams Ferry to Cutter St (380 LF) before returning to gravity along Cutter to Garden Acres (1,430 LF). A 10” diameter pipe is anticipated for gravity lines.

Stormwater

Day Road Improvements Phase 1 and 2 are required to serve the Basalt Creek Development (Stormwater Master Plan, 2024).

DRAFT

Project Name, Document Sited	Project Description	Cost, Date of Cost	Adjusted Cost, 2024 (CPI)	Adjusted Cost, 2024 (NHCCI)
Day Road Improvements, Phase 1 (Stormwater Master Plan, 2024)	Regrade and reconstruct 4,500 feet of open channel to eliminate negative slope, widening to floodplain at 223.0. Install 200 LF of open-bottom or box culverts (4 culverts total). Remove the unmapped, 50-foot existing culvert and install 180 LF of two barrel, 36-inch diameter PVC culverts at Day Road.	$8,020,000 2024		
Day Road Improvements, Phase 2 (Stormwater Master Plan, 2024)	Remove 1,200 LF of existing pipe. Upsize 1,800 LF of existing 36-inch parallel storm pipes to 48-inch. Replace seven 72-inch manholes and install 3 trash racks.	$3,930,000 2024		

Additionally, stormwater mains are expected to follow the road layout (20,000LF), 12” diameter.

DRAFT

Synopsis of Basalt Creek Concept Plan Land Use Districts

Introduction

This synopsis provides background information about scenario planning that shaped the Basalt Creek Concept Plan (BCCP) map and land use districts, and details about each land use type. It also incorporates new information from analyses completed as part of the Phase 1 of the Wilsonville Industrial Land Readiness (WILR) project that could influence decision making about refinement of the land use types in response to changes in the Basalt Creek Planning Area (BCPA) since adoption of the Concept Plan.

Analysis of Contractor Establishments

The Analysis of Future Development of Contractor Establishments, one of the key reports prepared for Phase 1 of the WILR project, evaluated the redevelopment potential of contractor establishments in the BCPA under current market conditions. As much of the BCPA including West Railroad, north of SW Clay Street, and the eastern half of the north side of SW Day Road, is occupied by contractor establishments, this creates additional challenges to urban industrial development. The analysis notes that contractor establishments are unlikely to transition to higher intensity uses without City intervention and, if the City seeks to promote urban industrial development in these areas, a more proactive approach will be necessary, including targeted incentives and policies to encourage redevelopment.

Concept Plan Scenario Planning

Scenario planning is a tool used to estimate the likely future effects of growth and development patterns in a specific area. This information helps local governments make decisions about what type of land use, transportation and infrastructure plans and policies will best meet community needs in the future. Scenario planning helps identify challenges and opportunities for desired growth and allows exploration of different approaches to achieve the community vision for an area. Unlike a plan, scenarios are very specific, intending to model likely future land uses. Learning from these, a plan can be developed to allow for several beneficial scenarios.

Final Concept Plan Development

Scenarios were used in the BCCP to understand how different land use decisions, infrastructure investments, other regulations and policies might impact the future outcomes in Basalt Creek – and how well they achieved the guiding principles for the planning process. The scenarios that were designed and tested for the BCPA integrated many different variables (such as different land uses and service areas) and the relationships between those variables. By modifying the scenarios, the impact of different sets of decisions were able to be better understood.

A series of five scenarios were developed in an ongoing iterative process. These scenarios were fully analyzed for transportation, infrastructure, and land use implications, including how land use types and densities were balanced to meet obligations for providing regional employment capacity while limiting negative impacts on congestion and traffic levels. A preferred scenario was developed, which became the basis for the Basalt Creek Concept Plan Map.

Basalt Creek Concept Plan Map and Land Use Types

The BCCP Map, shown below after the summary table, includes three land use types in the area designated as future City of Wilsonville: High-Tech Employment District, Light Industrial District, and Craft Industrial District. Each land use district includes an assumed mix of office, industrial, warehousing and retail as shown in the table below:

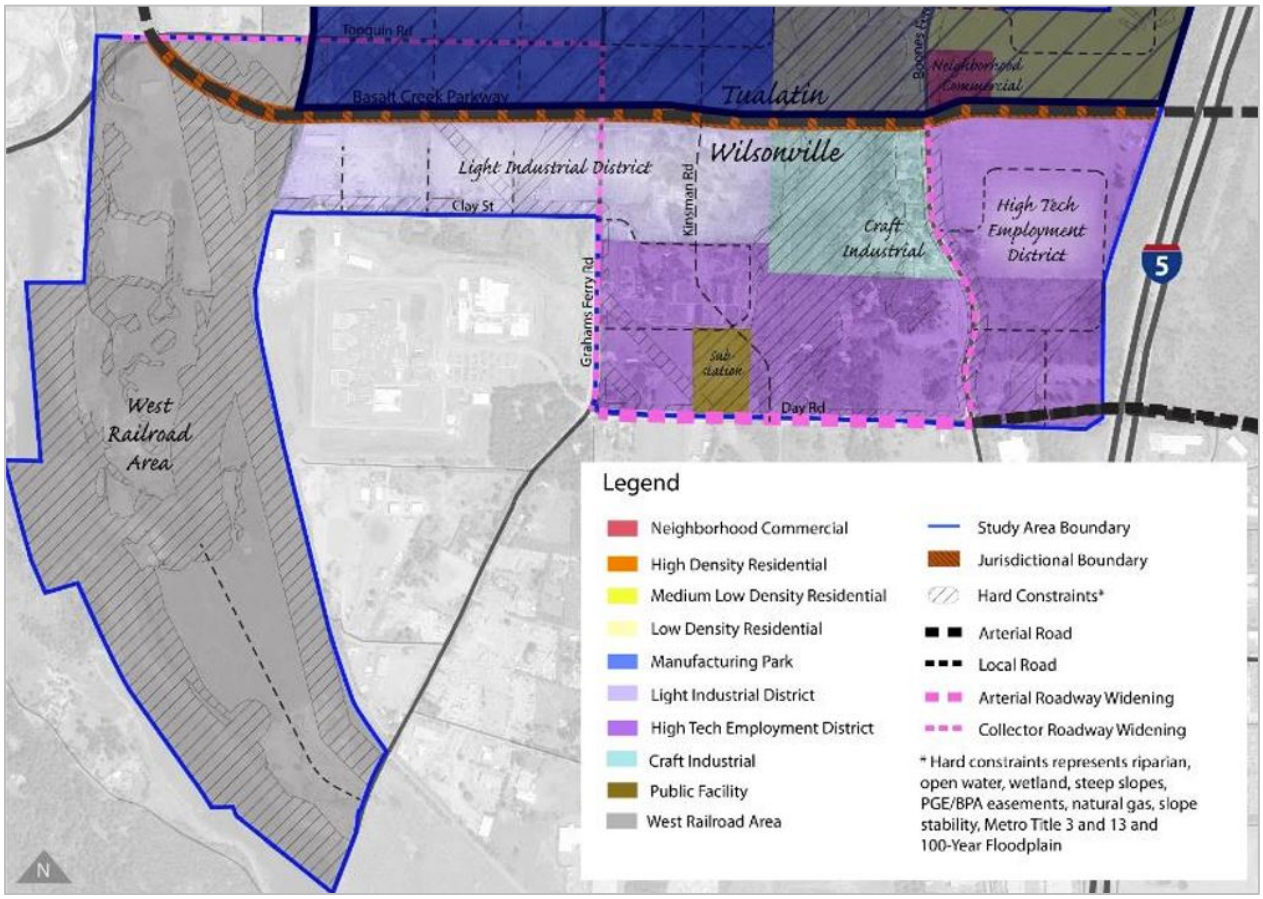

Table 1. Assumed Use Mix for Basalt Creek Concept Plan Land Use Districts.

Land Use District	Use/Share %				Jobs	
	Office	Industrial	Warehousing	Retail	Total	Per Gross Acre
High-Tech Employment	45%	38%	15%	1%	1916	20.28
Light Industrial	19%	69%	11%	1%	581	16.46
Craft Industrial	31%	44%	1%	24%	27	21.70

Because the West Railroad area was considered heavily constrained by natural resources and lack of access to transportation and utility infrastructure, assigning a land use type to this area was deferred until further planning could occur.

The land use types represent a mix of employment development types, include a modest opportunity for live/work housing in the Craft Industrial District, support adjacent and nearby industrial areas such as the Coffee Creek Industrial Area, and provide flexibility to meet a range of market demands. The BCCP considered the land use types and uses to be good candidates for the City's Industrial Form-based Code, adopted in 2018 for the Coffee Creek Industrial Area, should the City decide to extend it north into all or a portion of the BCPA.

Figure 1. Basalt Creek Concept Plan Map with Land Use Designations.

Land Use Districts

As discussed in the previous section, the BCCP Map includes three land use types: High-Tech Employment District, Light Industrial District, and Craft Industrial District. Each is discussed in detail in this section, including new information from analyses completed as part of the Phase 1 of the Wilsonville Industrial Land Readiness (WILR) project that could influence decision making about refinement of the land use types in response to changes in the Basalt Creek Planning Area (BCPA) since adoption of the Concept Plan. In addition, although the West Railroad area was not assigned a land use type in the BCCP, because it was heavily constrained with limited development potential, changes have occurred in the intervening years that warrant planning consideration for designating land use type(s). Hence, West Railroad also is discussed in this section.

High-Tech Employment District

The High-Tech Employment District, shown in purple on the BCCP Map excerpt below, is planned for all land in the BCPA east of SW Boones Ferry Road and most of the land south of SW Clay Street, if extended to the east side of SW Grahams Ferry Road, and extending south to SW Day Road, and bordered to the west by Coffee Creek Correctional Facility.

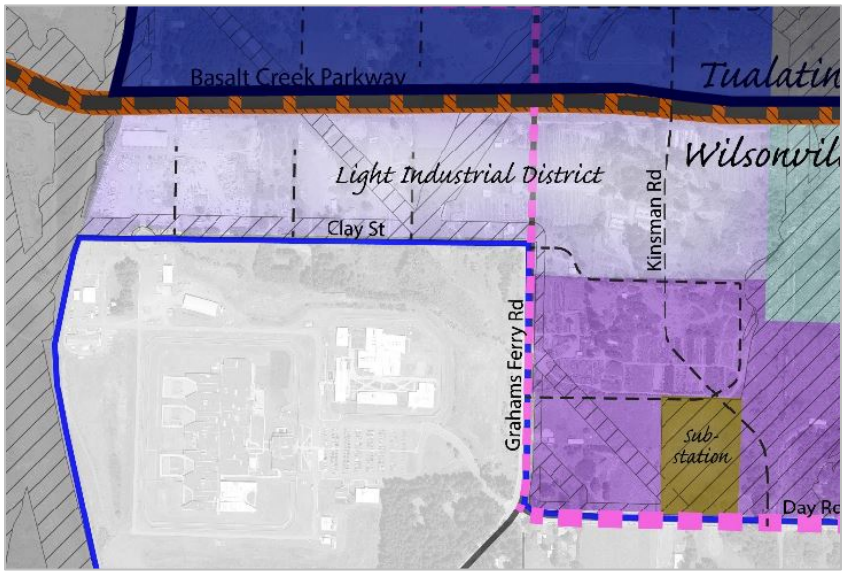
This land use type as modeled in the BCCP is expected to accommodate the largest number of jobs, estimated to be 1,916. Envisioned to include high-tech single-users accompanied by manufacturing and some warehouse space, employment was assumed to be roughly half office and half industrial. Initially modeled as one- and two-story buildings, the City desired to provide opportunities for four- to five-story office buildings as well, particularly near I-5 and along SW Boones Ferry Road.

Another consideration in determining the geographic extent of this High-Tech Employment District is that properties on the south side of SW Day Road are in the Coffee Creek Master Plan area, which is zoned PDI-RSIA with the Coffee Creek Industrial Design Overlay District (form-based code). Thus, assigning this land use type to properties on the north side of SW Day Road would result in consistency

of use and development form along both sides of the roadway, particularly if the Design Overlay District were extended to include all or part of the BCPA.

Some examples that were modeled for the High-Tech Employment District in the BCCP include Eaton on SW Kinsman Road, DW Fritz on SW Boeckman Road, and Rockwell on SW Parkway Avenue. These developments or similar examples are illustrated below:

In many ways, development envisioned for the High-Tech Industrial District is similar to what is anticipated in the Coffee Creek Industrial area – an industrial district appropriate for light manufacturing, flex uses, corporate headquarters and technology campuses, and industrial office, with some ancillary warehousing and distribution, as well as limited retail and service uses. The BCCP originally envisioned office space within each land use type with the highest share in the High-Tech Employment District and anticipated that the office space would be in connection with industrial users. However, the recently prepared Economic Inventory and Land Use Analysis for Phase 1 of the Wilsonville Industrial Land Readiness project, concluded that nationally and regionally demand for office space has been in decline with remote and hybrid work trends continuing to impact the need for office space. Therefore, while office will likely still be a part of the BCPA, it may occupy a smaller share than originally envisioned.



The Site Suitability Analysis prepared as part of Phase 1 of the WILR project includes the SW Greenhill site, which spans 57 acres in the High-Tech Employment land use type east of SW Boones Ferry Road.

This site's high proportion of undeveloped land, consolidated land ownership (two owners), and proximity to existing infrastructure, make it one of the most attractive locations in Basalt Creek for industrial development. Consistent with the vision of the BCCP, the site could be physically suitable for high-tech supply chain, cleantech industries, advanced manufacturing, food processing, warehousing and distribution, and industrial business parks or R&D campuses. Its proximity to transportation networks and regional workforce access further enhances its competitiveness.

There are some challenges posed by the presence of contractor establishments north of SW Day Road, along its eastern half within this land use type, that create additional challenges to urban industrial development. As noted earlier, contractor establishments are unlikely to transition to higher intensity uses without City intervention and, if the City seeks to promote urban industrial development in these areas, a more proactive approach will be necessary, including targeted incentives and policies to encourage redevelopment.

Light Industrial District

The Light Industrial District, shown in light purple on the BCCP Map excerpt below, is planned for land on the southern side of the future Basalt Creek Parkway between it and SW Clay Street, north of Coffee Creek Correctional Facility, and east of SW Grahams Ferry Road to the Basalt Creek Canyon.

This land use type is expected to include primarily manufacturing and warehouse uses in single- or multi-tenant buildings with some office and commercial activities. The Light Industrial is anticipated to accommodate a moderate number of jobs, estimated at 581 in the BCCP.

Some examples that were modeled for the Light Industrial District in the BCCP include Synergy Medical Systems (formerly American Medical Concepts) at 28050 SW Boberg Road, Houston's at 9799 SW Freeman Drive, McKesson at 970 SW Commerce Circle, Rite Aid at 29555 SW Boones Ferry Road, Canyon Creek Business Center and Wilsonville Corporate Center. These developments or similar examples are illustrated below:

The uses and form of development in the Light Industrial District as envisioned in the BCCP is similar to development in existing industrial areas of the City, such as along SW 95th Avenue, SW Commerce Circle, and SW Boberg Road. Although the Site Suitability Analysis prepared as part of Phase 1 of the WILR project does not include a site with this land use type designation, it notes that an approach supporting a wide range of industrial and office uses consistent with the BCCP and the Economic Inventory is desirable. This approach allows the market to determine the most appropriate locations for various business types while still prioritizing industries aligned with the City's employment and wage goals.

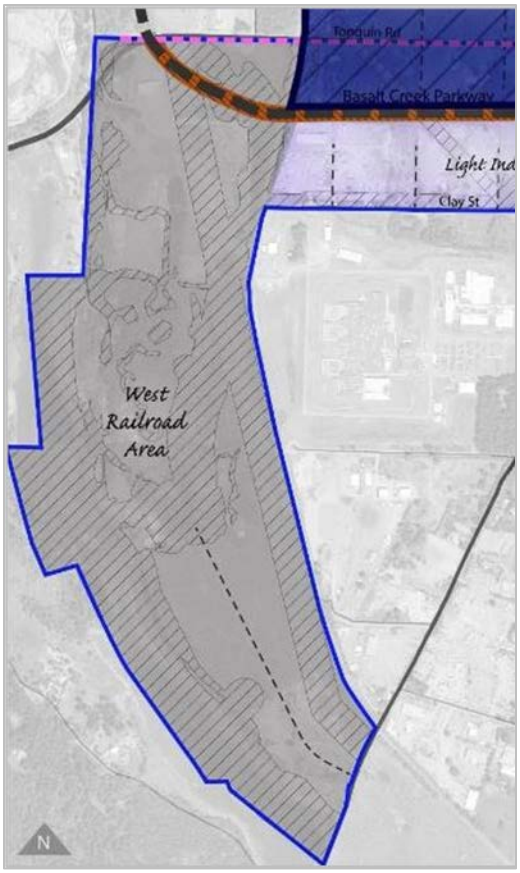
It should be noted that there are some challenges posed by the presence of contractor establishments on the north side of SW Clay Street, west of SW Grahams Ferry Road, that create additional challenges to urban industrial development.

Craft Industrial District

The Craft Industrial District, shown in turquoise on the BCCP Map excerpt below, is planned at the southwest corner of the intersection of SW Boones Ferry Road and the future extension of the Basalt Creek Parkway. This land use type anticipates a mix of small tenant spaces for creative industries and smaller-scale commercial uses and may include some limited residential use.

The Craft Industrial District responds to existing single-family residential development in the area, topography and natural constraints of the Basalt Creek Canyon, and the area's location directly south across the Basalt Creek Parkway from residential land and a neighborhood commercial node in Tualatin. Business development is expected to occur gradually over time, providing a transition to the higher intensity employment uses to the east and south in the High-Tech Employment District. In the long term, the area is anticipated to have two- to three-story buildings with small tenant spaces for light industrial manufacturing and office uses on the ground floor, as well as some retail, and living space above. Industries could include incubator, craft and artisan, innovation, and maker spaces. This land use type as modeled in the BCCP includes less than 20% residential use and is expected to accommodate 27 new jobs and 6 new housing units in the form of live-work or work-live units.

Some examples that were modeled for the Craft Industrial District in the BCCP include the Hood River waterfront and southeast Portland. Hood River, in particular, was considered a good example of development that could occur in the Craft Industrial District with two- and three-story buildings being used by craft industries with live-work spaces adjacent to a park, natural areas, and other industrial uses. Developments in these areas or similar examples are illustrated below:



The BCCP envisioned a mix of uses in the Craft Industrial District that blend well with adjacent neighborhoods. These could include small tenant spaces for creative industries, such as incubator spaces, craft beer, wine, and food spaces, a tasting room, brewery, seamstress, photographer or photography studio, or the newest tech innovations, with some office, retail, and services. This could enable young entrepreneurs to live and work close to industries with which they would want to partner, and could provide supporting services and retail for employees.

The Site Suitability Analysis prepared as part of Phase 1 of the WILR project reviews the potential of this Craft Industrial District. With only 14 acres of unconstrained land available for development and its proximity to residential areas to the north in Tualatin, as well as existing residential development on parcels in this land use type, its suitability for high-intensity industrial uses is limited. The analysis concludes that the area aligns with the BCCP's vision for small-scale or micro-industrial uses, such as live-work spaces or makerspaces.

With site aggregation, as noted in the Site Suitability Analysis, the southeastern portion of the Craft Industrial District could accommodate small-scale industrial or office users on up to five acres. These uses could resemble industrial condo developments like the Commerce Circle Business Park or Riverwood Business Center, which integrate office and small-scale production spaces. The northeastern portion, while it could also redevelop, is likely less appealing due to its irregular shape and nearby high-value residences. The presence of existing residences, including some high-value homes, is likely to delay redevelopment timelines compared to other areas in the BCPA, although it is possible that transitional uses such as home-based businesses or cottage industries in accessory structures, could occur in the interim.

West Railroad

West Railroad, shown grey on the BCCP Map excerpt below, is divided from the rest of the BCPA by the Portland and Western Railroad (PNWR) and the Coffee Creek Correctional Facility. When the BCCP was adopted, this area was heavily constrained by natural resources, fragmented property ownership, and lack of access to adequate water, sewer, and transportation infrastructure. Although the area was considered to have potential for resource conservation and future public access to nature, due to the constraints, a future land use scenario was not created.

The Site Suitability Analysis prepared as part of Phase 1 of the WILR project includes West Railroad as an opportunity site, which spans 165 acres. The large parcels and access to regional transportation networks could make West Railroad physically suitable for uses such as general manufacturing, food processing, and warehousing or distribution. Proximity to Coffee Creek's industrial area further enhances its appeal to businesses providing support services to neighboring industries.

However, significant infrastructure upgrades are required in West Railroad, and access is limited by only one established point of vehicular ingress and egress at SW Grahams Ferry Road. The low railroad undercrossing on SW Grahams Ferry Road further constrains access as it does not currently allow passage by standard-height semi-trucks. The area's proximity to a rail line and a mining operation could make it less attractive to advanced manufacturing or other industries sensitive to vibration. Finally, the proliferation of contractor establishments in West Railroad in recent years creates additional challenges to urban industrial development as discussed in the introductory section of this synopsis.

Wilsonville Industrial Land Readiness – Basalt Creek

Planning Commission Work Session
February 12, 2025

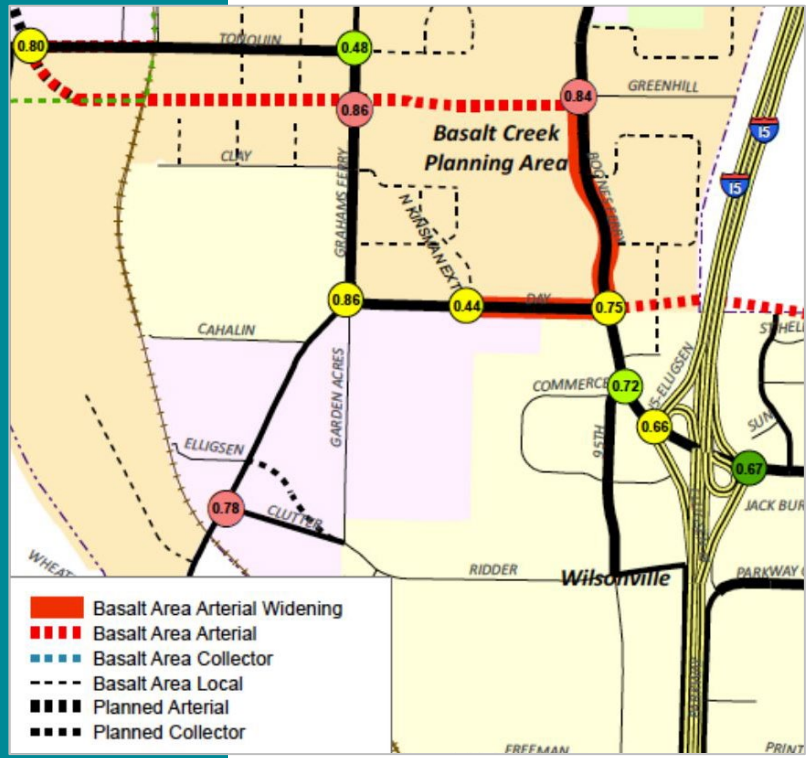
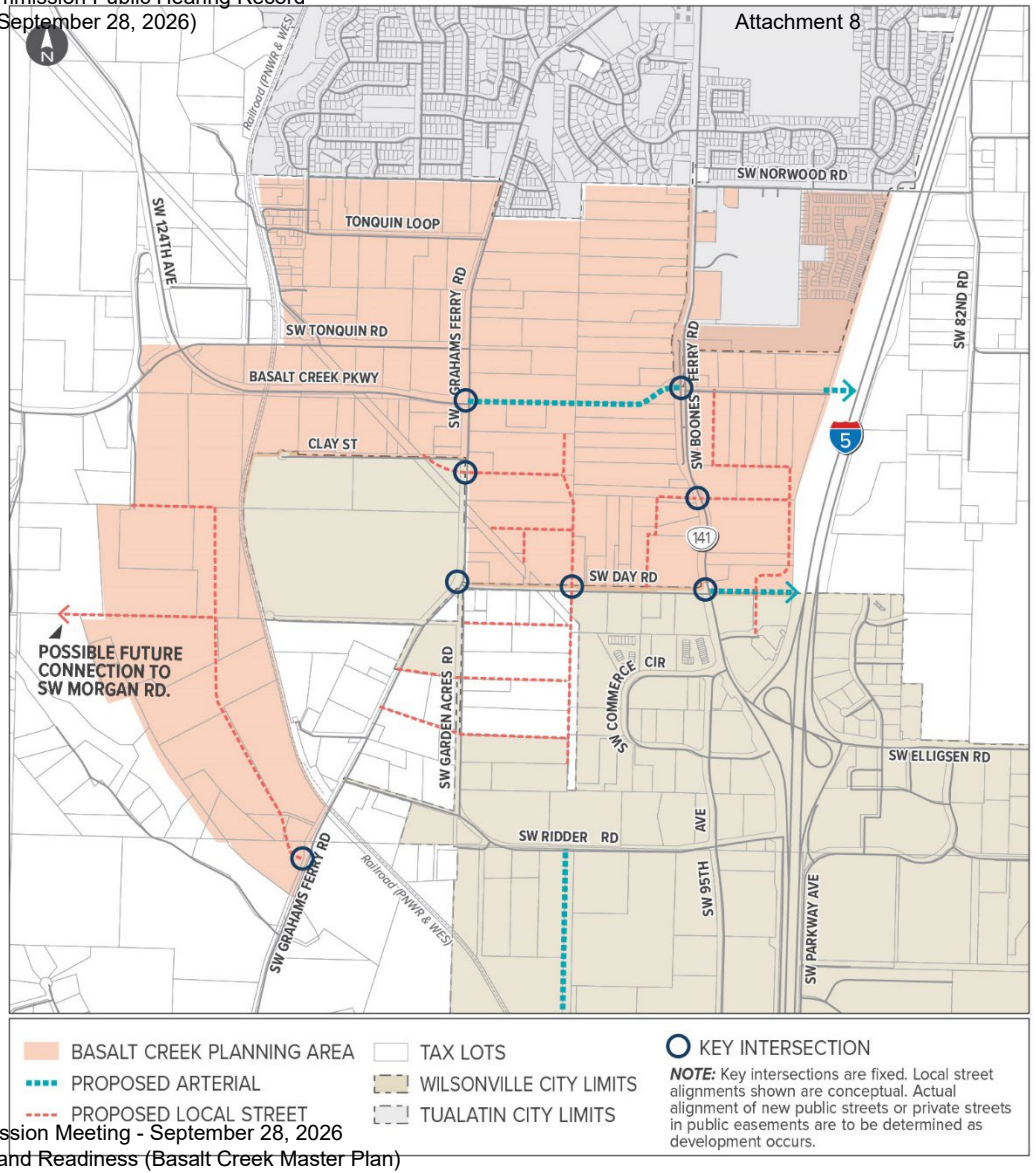
  - Zoning Analysis
  - Code Amendments

Basalt Creek Concept Plan Vision



- Meet regional responsibility for jobs
- Capitalize on assets of Planning Area
- Maintain Wilsonville's unique identities
- Explore creative approaches to land use



Basalt Creek Concept Plan Vision

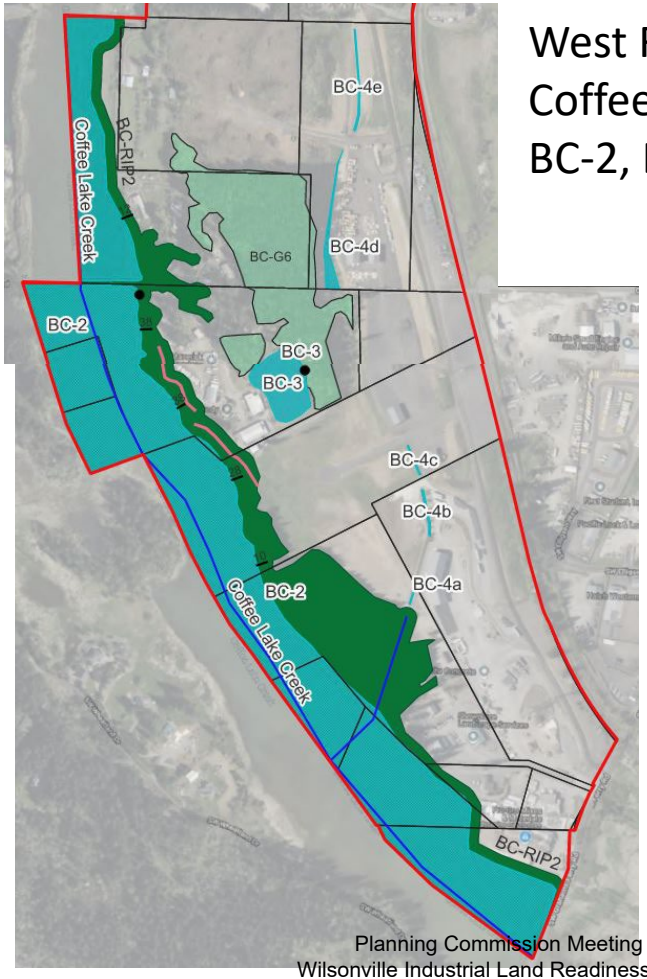
- Integrate employment in Wilsonville with adjacent housing
- Ensure appropriate transitions between land uses
- Incorporate high-quality design and amenities for employment

Transportation

Local Street Concept Map

TSP Re-evaluation

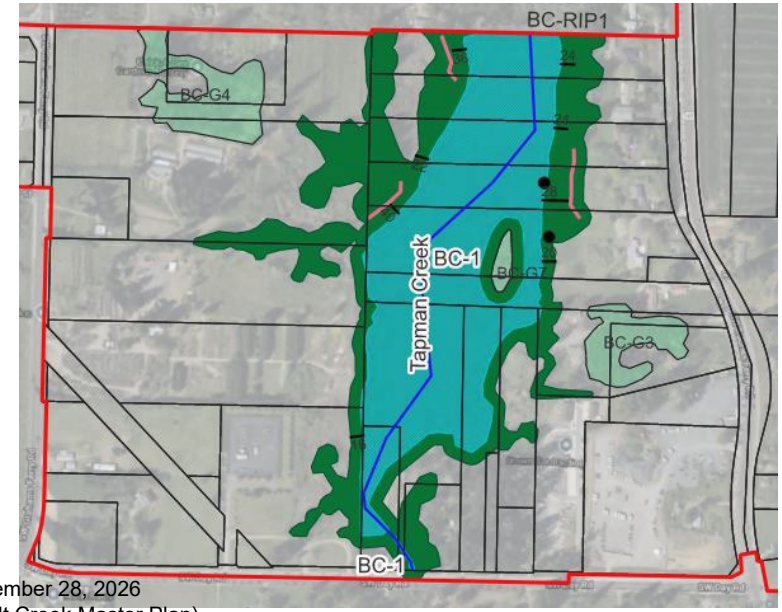
- List of projects still applicable
- No new projects added with 2020 or 2023 TSP amendments
- 48% (10 years) of 21-year planning period elapsed
- 20% of anticipated development and transportation infrastructure approved and/or constructed
- Re-evaluation of future 2035 traffic volumes not warranted
- COVID-related dip in traffic indicates potential for more vehicle capacity in Planning Area



Infrastructure

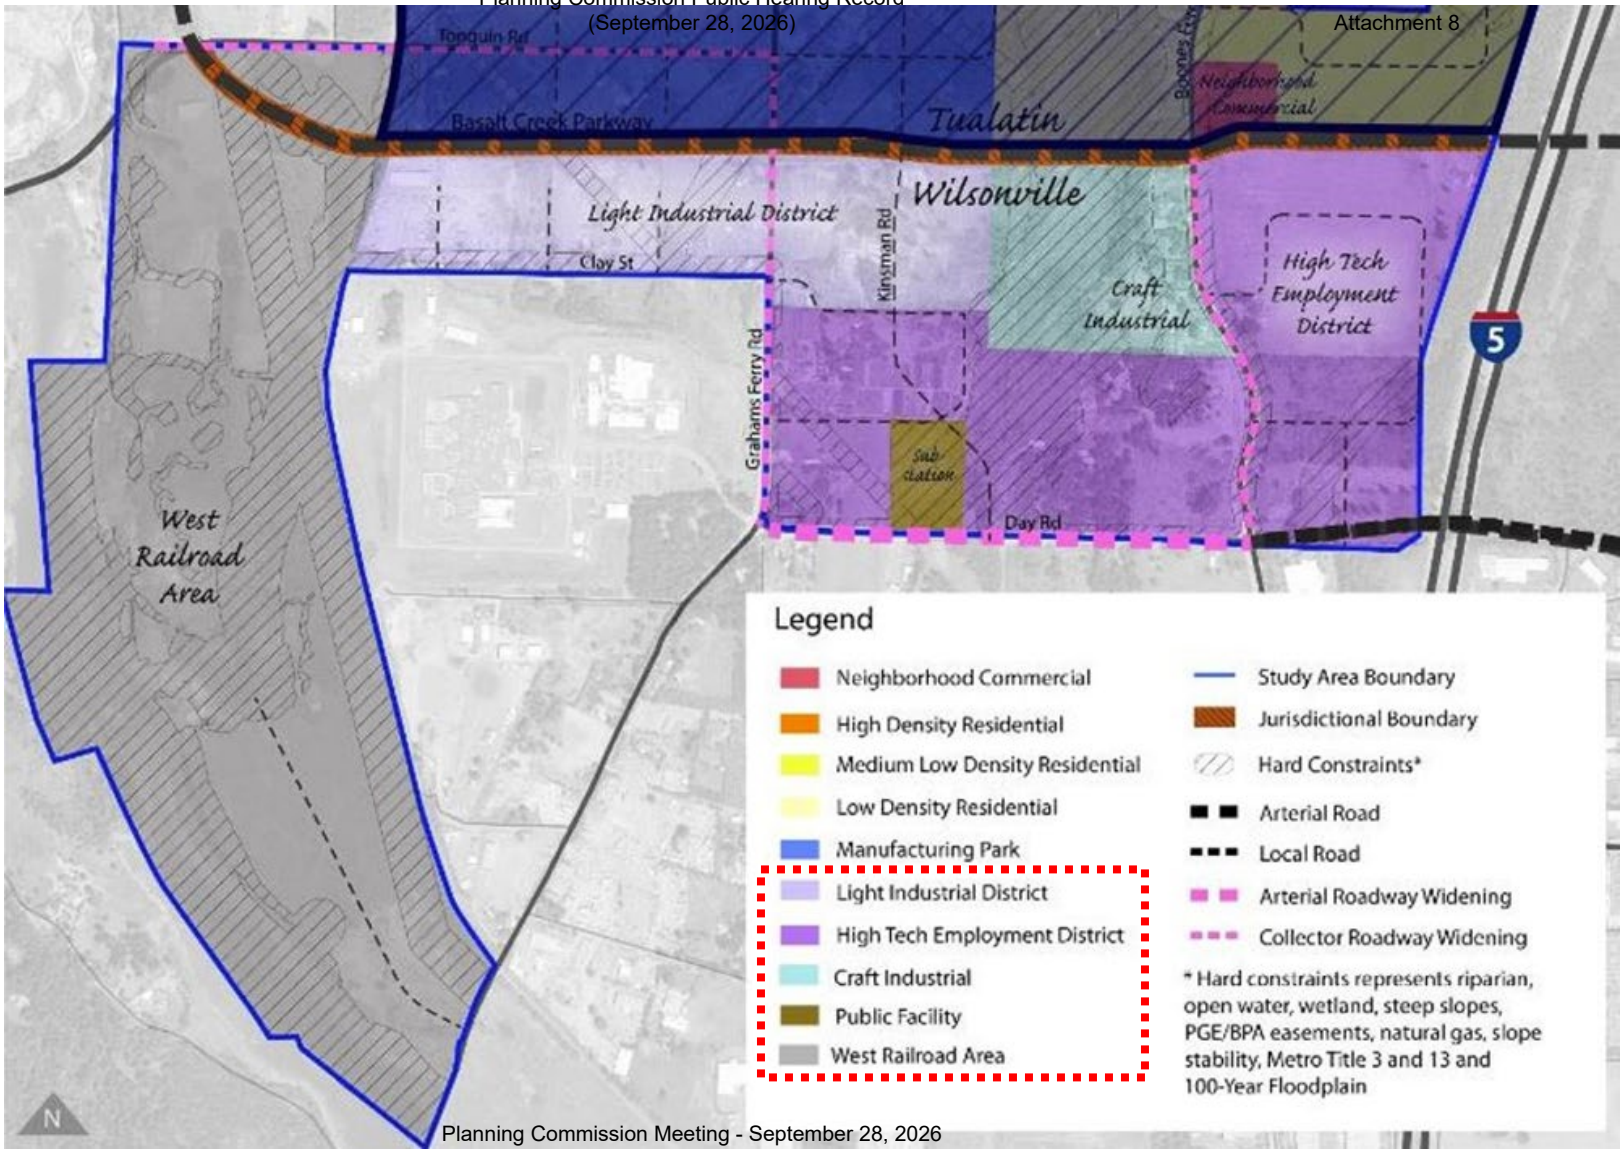
Draft Infrastructure Summary

- Utility master plan updates include Basalt Creek
- Utilities updated based on revised Local Street Concept Map
- Main lines anticipated to follow arterial street layout
- Cost estimating will be refined in infrastructure funding plan



Natural Resources

Natural Resources Inventory



West Railroad
Coffee Lake Creek and Tributary

Discussion

Discussion

- What input does Planning Commission have in response to the transportation, utility, and natural resources studies?

- What direction does Planning Commission have about the land use types? Do they continue to be the best option, or what refinements are needed to realize the vision of the Basalt Creek Concept Plan?

WORK SESSION

3. Wilsonville Industrial Land Readiness (Basalt Creek) (Luxhoj)

Cindy Luxhoj, Associate Planner, explained the Planning Commission's input was again being sought on technical analyses and land use types related to refinement of the Basalt Creek Concept Plan (BCCP) for the Wilsonville Industrial Land Readiness (WILR) Project. She presented via PowerPoint an overview of the BCCP Vision as well as the documents for the Commission's consideration, which included analyses from DKS Associates, Pacific Habitat Services, and City Staff, noting the documents would inform the Basalt Creek Tasks, which included drafting a Basalt Creek Master Plan and subsequent implementing Development Code. (Slide 3) Planning Manager Pauly also provided additional comments.

Questions were addressed by Staff as follows:

- The area north of SW Greenhill Ln is the City of Tualatin is zoned residential. (Slide 25)
- Concern was expressed about traffic considering the 500 to 600 new houses being built in Tualatin as well as all the traffic flowing south from industrial areas in Sherwood, Tualatin, and Tigard with the only access to the freeway being at the south boundary of the planning area. Was there enough capacity to handle that amount of traffic and what was the timing for the road improvements throughout the process? (Slide 7)
  - Planning Staff did not have details regarding the timing of the improvements, but the City's Engineering Staff had been involved with the County in planning the Basalt Creek Parkway Extension and the details could be provided outside the meeting.
  - In terms of the impact of Tualatin's traffic, a traffic analysis was done with the BCCP and Staff is actively tracking development in Tualatin to ensure the balance of traffic between the two cities is maintained. The concurrency requirements in the Development Code would still apply, in that if development exceeded traffic capacity, occupancy would not be allowed until street improvements are funded and would be completed within 24 months.
- At this time, Staff was not aware of any consideration for an additional light rail station in the area. The area was in TriMet's territory, but the City hoped to correct that so SMART could serve the area. SMART's focus would be to coordinate with the businesses to get employees to and from the WES station as efficiently as possible.
- The dotted lines extending east at Basalt Creek Pkwy and Day Rd and stopping at I-5 indicated long-term plans for flyovers, not new interchanges; however, those plans were farther out than the planning horizon than the BCCP.
- The Natural Resources Inventory revealed no huge surprises regarding Tapman Creek in the Basalt Creek Canyon, but West Railroad has more developable land than originally believed.
- Information on the current mix of land use types in the city compared to what is being proposed in Basalt Creek, as well as on the vacancy rates for those product types in the city had been provided but was not organized in that manner. Staff would work with the ECOnorthwest to do so.

- Conversations with PGE had been ongoing about whether the existing infrastructure would support the energy demands of any potential development, and PGE is confident in its ability to build out to serve heavy power users in the area.
  - Staff did not have any cost details as PGE manages that, but PGE had no red flags. PGE was building out the new substation, so a lot of power infrastructure was nearby to build upon.
  - Typically, the utility, ratepayers, and developer work out the cost burden for any required upgrades or additional infrastructure. Some cost analysis was done with ECOnorthwest's work given the different types of uses that might occur, and availability of power was not noted as a limiting factor, but Staff would get more information for the Commission.
- An off-street trail was proposed along the west side of the canyon that would cross under the landing off the southside of the extended Basalt Creek Pkwy and connect to the trail in Tualatin as well as extend farther south to another city trail that would connect to Day Rd and other bicycle and pedestrian infrastructure.
  - The Tonquin Trail was also proposed to go along the west side of West Railroad and east side of the Coffee Creek Wetland.
- The gray area north of the Basalt Creek Parkway extension and south of Norwood Rd would likely be a combination of residential and recreation uses as Tualatin had recently acquired a couple of parcels for a park in that area. (Slide 7) The dark blue area north of the Basalt Creek Parkway is for manufacturing in Tualatin's new Basalt Creek Employment Zone. (Slide 14)
- The Infrastructure Summary did not include costs, such as for the Day Road improvements because costs had escalated but Staff would be doing a cash flow analysis in the coming months. Future infrastructure costs were hard to pin down.
- Staff has market study information for the West Railroad Area from ECOnorthwest and would have a better understanding of the costs to provide industrial traffic access and other infrastructure, which would play into the feasibility. Through this project, a Comprehensive Plan designation would be identified for potential future development.
- Understanding the current land use inventory citywide would help prevent overburdening an area with one land use that has no demand. For example, if the West Railroad Area is found to be best for Craft Industrial due to the nature of the current infrastructure, was there enough demand for Craft Industrial to cover the 162 acres?
  - Determining demand involved a combination of flexibility for certain corridors, like Day Rd and I-5, and design considerations, which have been discussed, as well as ensuring there is employment and inventorying the emerging uses and the market demand for current uses, such as data centers. Assumptions were made about potential water and sewer demands, as well as employee counts.

Commissioner Willard:

- Noted that with all the riparian areas and BC-2 Overlay, the West Railroad Area was not industrial-ready for any industry, adding that using it for industrial would be a waste of a beautiful area that could have a park along the wetlands. It seemed the concept plan was

flawed in flagging West Railroad as industrial. The market shows its value is light contractor laydowns that are somewhat disorganized and don't require heavy equipment access. Perhaps the industrial concept should be abandoned and other uses considered that could enrich the community.

- **Associate Planner Luxhoj** responded the area was added to the urban growth boundary (UGB) for industrial. Metro owned a lot of property immediately adjacent to West Railroad, and for conservation purposes, has protection as natural areas. The biggest change was that a lot more natural resources existed when the BCCP was done, and now much of the area has been developed for storage and lay down yards, which has influenced the City's perspective. West Railroad is severely constrained by infrastructure, and the analysis of the Grahams Ferry access could have a huge impact on what is viable for the area.
  - Without semi-truck access, warehousing and distribution uses were not possible, and with no access for cement trucks, data centers could not be built. Staff did not believe another at-grade railroad crossing was possible. If changing Grahams Ferry Rd to get trucks through was not possible, the City would have to rethink the land uses for the West Railroad Area.
- **Planning Manager Pauly** noted West Railroad is shown as employment land in Metro's 2040 Growth Concept and depending on the Commission's direction on preferred uses, Staff could follow up on the uses allowed under the regional designation to ensure all options are on the table. There is demand for industrial. West Railroad is surrounded by industrial areas and has access to rail, but road and utility access were the biggest challenges.

- Expressed similar sentiment about the BC-1 resource area in the Craft Industrial area which is also heavily constrained. Disrupting zoning where housing currently exists while in a housing crisis seemed counterintuitive and zoning it for something like Craft Industrial was concerning given the uncertain future about the demand for live-work models, which did not often materialize as desired.
  - **Planning Manager Pauly** noted the live-work models presented were one potential long-term vision, and that Craft Industrial provided opportunities for someone to build a sign shop, for example, at the back of the lot and live in the existing home.
- Replied that those types of employers could not afford the property, so it would never happen.
  - **Planning Manager Pauly** explained Craft Industrial was about providing flexibility in an area with unique qualities. The idea was to give options to residential property owners in a buffer area transitioning long-term from residential to industrial where industrial developers may outbid a residential buyer.
    - He confirmed that Staff was in contact with Tualatin about its planning journey, including their transportation and environmental impacts to ensure a concurrency between the two communities. Discussions had been ongoing around park coordination, for example.
- Suggested adding to the report that both City Staffs were in communication and confident in the plans moving forward.

Planning Manager Pauly stated Staff sought direction about what to explore for West Railroad, knowing some constraints may exist, noting that Staff would return to the Commission for a more detailed discussion on how the information from the Infrastructure Study would impact West Railroad. He asked about the Commission's general thoughts on the land designations in the BCCP and whether any changes should be contemplated.

Commissioner Hendrix responded the road access analysis for West Railroad and understanding the requirements around bringing the area into the UGB would be helpful.

- She appreciated Commissioner Willard's comment on Craft Industrial, noting she was also curious about turning the area into something useful for nearby residents. Having the context of the adjacent uses in Tualatin was helpful. She was open to more discussion.
- Her first reaction was that Wilsonville already had a lot of Light Industrial. She was curious about the demand but understood Staff's perspective of planning for what might be coming. She believed more information was needed to make a more formal recommendation.

Commissioner Heberlein:

- Regarding West Railroad, knowing whether the benefit is worth the cost of overcoming the challenges would help identify a potential land use type, whether industrial, residential, or a public benefit. While Metro had things in mind, a lot has changed since from a housing perspective, so perhaps another land use option could be considered.
    - Craft Industrial had similar challenges as far as knowing what made sense there. With such a small area, is there a benefit of trying to do something different?
    - Having more information on the current mix and what the demand might be would provide a better perspective on whether the right mix was in the right places.
    - **Planning Manager Pauly** stated talking about the market was always interesting, because Wilsonville would be very different if historically, the City did what the market said. It was always a tough balance. Frog Pond was about pushing a realistic change towards a policy goal, while still being realistic with the market. Some push may be needed to get the market to do some of the key design elements along Day Rd, for example.
        - Historically, Wilsonville has been very sensitive about how the city looks from I-5, and what policies and uses should be considered to ensure the kind of gateway the community envisioned.
- Understanding the current state and the market demands is just a piece of the puzzle, not to match the market to have the right demand. However, if a significant imbalance is found, perhaps considering a change should be discussed in order to have some flexibility, rather a hard requirement for one area versus another.
    - The industrial side of things did not seem to be as strong a focus as some of the residential expectations.

WORK SESSION

3. Wilsonville Industrial Land Readiness (Basalt Creek) (Luxhoj)(45 Minutes)

PLANNING COMMISSION MEETING
STAFF REPORT

Meeting Date: December 11, 2024	**Subject: Wilsonville Industrial Land Readiness – Basalt Creek** **Staff Member:** Cindy Luxhoj AICP, Associate Planner, and Dan Pauly AICP, Planning Manager **Department:** Community Development
Action Required	**Advisory Board/Commission Recommendation**
☐ Motion ☐ Public Hearing Date: ☐ Ordinance 1st Reading Date: ☐ Ordinance 2nd Reading Date: ☐ Resolution ☒ Information or Direction ☐ Information Only ☐ Council Direction ☐ Consent Agenda	☐ Approval ☐ Denial ☐ None Forwarded ☒ Not Applicable **Comments:** N/A
Staff Recommendation: Staff recommends Planning Commission provide requested input about the Wilsonville Industrial Land Readiness project.	
Recommended Language for Motion: N/A	
Project / Issue Relates To: Basalt Creek Concept Plan area	

☒Council Goals/Priorities: Attract high-quality industry and support economic opportunity for all in Wilsonville	☒Adopted Master Plan(s): Basalt Creek Concept Plan	☐Not Applicable

ISSUE BEFORE COMMISSION

Staff is seeking input from the Planning Commission on two draft work products for the Basalt Creek industrial area – the Buildable Lands Inventory and Site Suitability Analysis Memo and the Redevelopment Feasibility of Contractor Establishments Memo – as the City works on making the area development ready.

EXECUTIVE SUMMARY:

At the Planning Commission's October 9, 2024, work session, staff presented the draft Economic Inventory and Land Use Analysis for the first phase of the Wilsonville Industrial Land Readiness (WILR) project. The first phase is focused on the Basalt Creek and West Railroad planning areas (henceforth referred to collectively as "Basalt Creek") that are the subject of the Basalt Creek Concept Plan, jointly prepared with the City of Tualatin, and adopted by the City of Wilsonville in 2018. This first phase of the WILR project lays the foundation for moving the Concept Plan area to a development ready status, thus enabling the City to accept development applications for industrial projects and realizing the area's economic development potential.

The project team has completed two additional draft work products: the Buildable Lands Inventory and Site Suitability Analysis Memo (Attachment 1), and the Redevelopment Feasibility of Contractor Establishments Memo (Attachment 2). At the work session, the project team will briefly discuss the preliminary findings of these two documents and seek feedback and guidance from Planning Commission.

Buildable Lands Inventory and Site Suitability Analysis

With regard to the draft Buildable Lands Inventory, Basalt Creek encompasses 453 aces in 85 tax lots of which 175 acres are currently in active use and considered developed, 127 acres are constrained by physical and environmental factors, and 150 acres are considered buildable and available for development. The supply is distributed across parcels of varying sizes, ranging from five to larger than 25 acres, providing a mix of options suitable for different industry needs. Thus, there is a promising opportunity to support a diverse range of industrial and employment uses that align with Wilsonville's economic development goals. However, much of the overall land supply is being used as contractor establishments, as illustrated in Figure 3 of the Buildable Lands Inventory and Site Suitability Analysis Memo (page 6 of Attachment 1), which poses challenges for redevelopment to other industrial uses (as further described below).

The draft Site Suitability Analysis looks at the market competitiveness of three specific sites in Basalt Creek. The analysis focuses on the physical site characteristics, such as size, location, and constraints, rather than on the likelihood of redevelopment. It specifically examines the characteristics of the opportunity sites to assess their ability to support target industries should landowners choose to develop or redevelop their property. Preliminary findings of the draft Site Suitability Analysis include the following:

- **SW Greenhill:** This opportunity site includes 57 acres in 10 tax lots with two landowners, one owning 42 acres and the other 14 acres. With its minimal constraints, lack of development, and availability of existing infrastructure, this site is suited for cleantech, high-tech supply chains, advanced manufacturing industries, food processing, small warehousing and distribution, and industrial business parks or R&D campuses requiring medium-sized parcels.
- **Craft Industrial:** This opportunity site includes 32 acres in 7 tax lots, each individually owned and of generally even size. Due to significant constraints, the site is currently more

suitable for micro-industrial uses, such as live-work spaces, as originally identified in the Concept Plan. However, with site aggregation, the eastern portion could accommodate small-scale business or administrative services and production uses, similar to industrial condo developments like Commerce Circle Business Park or Riverwood Business Center. The presence of existing residences, including some high-value homes, is likely to delay redevelopment timelines compared to other opportunity sites.

- **West Railroad:** This opportunity site includes 165 acres in 15 tax lots with 8 landowners, one owning 65 acres, four with about 20 acres each, and three owning smaller parcels. The site offers development potential for general manufacturing, food processing, warehousing and distribution, and business services. However, significant infrastructure upgrades are required, and existing constraints may limit the scale of some types of development.

Redevelopment Feasibility of Contractor Establishments

Contactor establishments are properties characterized by small offices (often former residences), storage buildings, and laydown yards, that provide limited employment and lower property values compared with typical urbanized industrial land. Figure 3 in Attachment 1 (page 6) shows the current extent of contractor establishments in Basalt Creek. The draft analysis of contractor establishments highlights several ways this type of development impacts redevelopment efforts in the planning area. It raises critical questions about what conditions (e.g., market, ownership, site, zoning) are needed to promote and incentivize urban industrial development as envisioned in the Concept Plan. Preliminary findings include:

- **Current contractor establishments generate significant revenue with minimal effort or risk, reducing financial incentives for redevelopment.** Rents for existing contractor establishments, particularly those with buildings, are comparable to market rates for industrial and flex uses in the I-5 South Submarket. Therefore, for redevelopment to become financially feasible, market rents would need to rise by 60% to 100%, depending on site utilization and construction costs.
- **Owner-occupied properties are less likely to redevelop if the owner wants to maintain their business operations.** Redevelopment is difficult for owner-occupants, as they must consider relocation costs and potential increases in operational expenses. Limited regional industrial land supply could push these businesses to relocate further from their markets. Without substantial increases in land values or rents, redevelopment of these properties remains unlikely.
- **Achieving the City's development vision for Basalt Creek will require strategic interventions.** Potential approaches could include purchasing and aggregating properties to create development-ready parcels, subsidizing infrastructure costs, adjusting system development charges (SDCs), offering other development incentives, or other strategies yet to be identified.

Conclusion

The analyses and related findings are preliminary and will be refined through further analysis and additional discussion with the Planning Commission and City Council. Once the analyses are complete, they will all be synthesized into a comprehensive final report outlining key findings and recommendations.

The City Council was briefed and provided input at their December 2, 2024, meeting on similar materials to those presented to Planning Commission at this work session.

Following staff's presentation, input is requested from the Planning Commission in response to the questions below:

- What comments or direction does Planning Commission have in response to the Buildable Lands Inventory and Site Suitability Analysis Memo? Does this align with the vision for Basalt Creek? If surprising, what questions would help guide future decisions?
- What input does Planning Commission have on the Redevelopment Feasibility of Contractor Establishments Memo? Does the Commission want planning efforts to focus on accommodating and managing contractor establishments as industrial businesses or encouraging their relocation and redevelopment of the land?

EXPECTED RESULTS:
Feedback from Planning Commission on these draft documents will guide their completion, as well as guide other implementation items for the Basalt Creek and West Railroad planning areas, including drafting a package of proposed Code amendments, developing economic development strategies, and preparing an infrastructure funding plan.

TIMELINE:
Additional work sessions with the Planning Commission and City Council are anticipated in January through April 2025. Public hearings on related Development Code amendments are expected in mid-2025 with work on the infrastructure funding plan occurring throughout next year.

CURRENT YEAR BUDGET IMPACTS:
Funding for the first phase of the WILR project is allocated in the FY2024-25 Planning Division budget and, for the second phase, will be allocated in the FY2025-26 budget. The first phase is primarily funded by a $100,000 grant from Business Oregon, with additional funding available, if needed, from a $290,000 Metro grant, which also will fund the second project phase.

COMMUNITY INVOLVEMENT PROCESS:
The Basalt Creek Concept Plan review process included comprehensive community involvement to gather input. For the first phase of the WILR project, ECONorthwest focused on gathering input from Business Oregon, Greater Portland Inc., property owners, and developers, to understand demand for industrial land in Wilsonville as well as property owners' current and future plans for

their property. This informed the market, site suitability, and contractor establishment analyses and will be considered in determining appropriate zoning standards to apply and preparing needed Code amendments.

POTENTIAL IMPACTS OR BENEFIT TO THE COMMUNITY:
Adoption of appropriate zoning standards, creating an infrastructure funding plan, and identifying and pursuing economic development strategies will remove barriers to development and enable implementation of the Basalt Creek Concept Plan. When developed, Basalt Creek will create jobs, thus contributing to the income and property tax base, support economic mobility for residents through family-wage employment in a highly livable, full-service City, and enable this industrial area to reach its full economic potential, resulting in positive impacts on the greater Wilsonville community.

ALTERNATIVES:
As zoning standards, economic strategies, and an infrastructure funding plan are developed, a number of alternatives will be explored and developed with the Planning Commission and City Council.

ATTACHMENTS:
1. Draft Buildable Lands Inventory and Site Suitability Analysis Memo (November 20, 2024)
2. Draft Redevelopment Feasibility of Contractor Establishments Memo (November 20, 2024)

DATE:	November 20, 2024
TO:	City of Wilsonville
FROM:	ECOnorthwest: Nicole Underwood, Bob Parker, and Barrett Lewis
SUBJECT:	WILR Phase 1: BLI and Site Suitability Analysis - DRAFT

The cities of Tualatin and Wilsonville adopted the Basalt Creek Concept Plan (BCCP) in 2018 after a lengthy joint planning process. Now, in 2024-25, the City of Wilsonville is working to advance the Basalt Creek Planning Area (BCPA) beyond the concept plan to a development-ready status by designating zoning and refining infrastructure plans. However, since adoption of the BCCP, economic conditions at national, state, regional, and local levels have shifted significantly, and must now be considered.

To address these evolving conditions, the City hired ECOnorthwest to conduct a market assessment and industrial lands study focused on Wilsonville's portion of the BCPA. The study began with an Economic Inventory, which reviewed current market trends and industries suitable for the area.

This memorandum addresses Task 3 in the Scope of Work: updating the **Buildable Lands Inventory (BLI)** for the BCPA and conducting a **Site Suitability Analysis** for key opportunity sites. The updated BLI reflects recent land developments, adjusted constraints, and revised capacity estimates.

The Site Suitability Analysis examines three selected "opportunity sites" within the BCPA, assessing their potential to support the target industries identified in the Economic Inventory. This analysis considers site attributes including size, location, access, topography, constraints, and surrounding land uses. It also considers infrastructure (transportation, water, sewer, stormwater) based on available data, with the understanding that infrastructure planning may evolve as work progresses.

DRAFT

Land Supply

This industrial Buildable Lands Inventory (BLI) updates the 2014 BLI from the original concept plan, providing a revised assessment of the buildable land *supply* available within Wilsonville's portion of the BCPA for employment-related growth and development. The amount of land needed to accommodate anticipated growth, often referred to as *demand* for land, depends on the type of employment-related development and other factors.

This BLI update serves two purposes: 1) to provide a revised assessment for developable acres in the BCPA, and 2) to identify lands that have existing economic uses but low improvement values and/or low-density employment. These uses are inconsistent with the development vision expressed in the BCCP and are sites that may have redevelopment potential.

The BCPA encompasses a total of 453 acres across 85 tax lots. Of this:

- **175 acres** are currently in active use and are considered developed.
- **127 acres** are constrained by physical or environmental factors.
- **150 acres** are considered buildable and available for development.

This section outlines the methodology used to develop the BLI and presents the results for Wilsonville's portion of the BCPA. ECOnorthwest analyzed GIS data from the City of Wilsonville, Metro, and Washington County, with City staff reviewing the findings for accuracy and completeness.

Methodology

The buildable lands inventory followed a structured process to assess land status:

1. **Generate UGB "land base":** ECOnorthwest established a baseline of tax lots within Wilsonville's portion of the BCPA designated for industrial and employment uses.
2. **Classify lands by development status:** The project team categorized parcels as vacant, partially vacant, or developed.
3. **Identify constraints:** ECOnorthwest applied physical and regulatory constraints, such as wetlands and natural resource protections, to identify unbuildable portions.
4. **Verify inventory results:** City staff reviewed classifications and aerial imagery to confirm accuracy.
5. **Tabulate and map results:** The team compiled findings into tables and maps to provide a clear overview of buildable lands.

The following section summarizes the results of the industrial BLI for the BCPA, presented in tabular and map formats.

DRAFT

Land Base

The land base for the Buildable Lands Inventory (BLI) includes all tax lots within Wilsonville's portion of the BCPA. Table 1 provides a breakdown of the land base by Wilsonville Comprehensive Plan designation within the BCPA.

Table 1. Employment Land Base by Wilsonville Comprehensive Plan Designation, BCPA, 2024

Plan Designation	Number of Tax Lots	Percent	Total Tax Lot Acreage	Percent (Total Acreage)
Industrial	63	74%	237	52%
Undesignated	22	26%	215	48%
Total	**85**	**100%**	**453**	**100%**

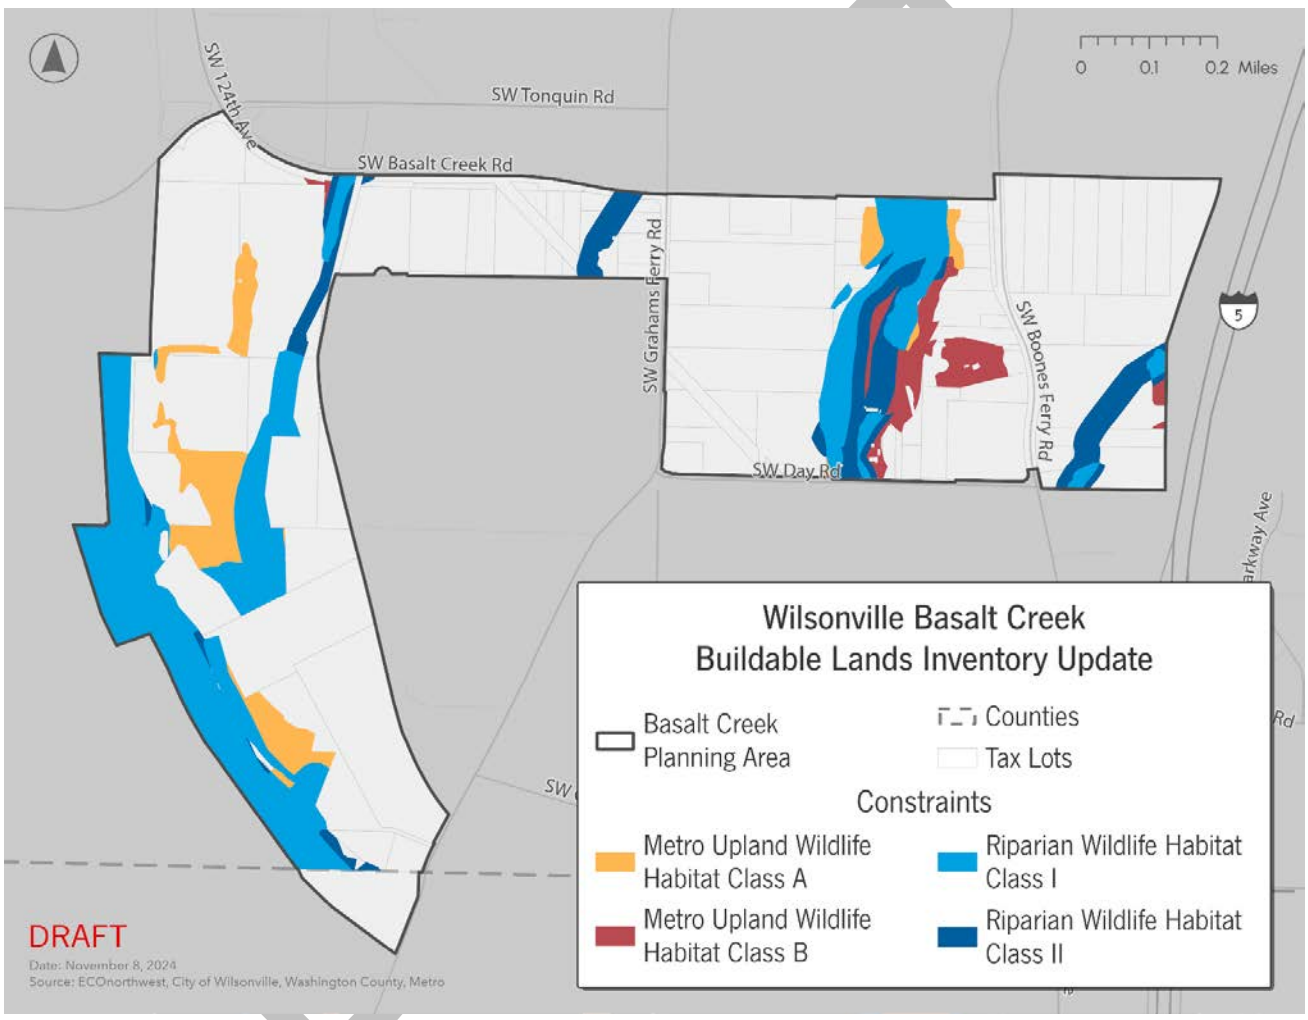
Source: ECOnorthwest analysis, City of Wilsonville, Clackamas County, Washington County, Metro

Development Status Classification

Table 2 displays the total acres of tax lots, categorized based on whether land is buildable. ECOnorthwest applied a rule-based classification of vacant, partially vacant, or developed to determine the initial development status and verified the results through reviews by City staff. These reviews incorporated local knowledge and analyses of aerial maps.

Table 2. Employment Acres by Classification and Wilsonville Comprehensive Plan Designation, BCPA, 2024

Plan Designation	Total Acres	Developed Acres	Constrained Acres	Buildable Acres
Industrial	237	63	48	127
Undesignated	215	113	79	24
Total	**453**	**175**	**127**	**150**



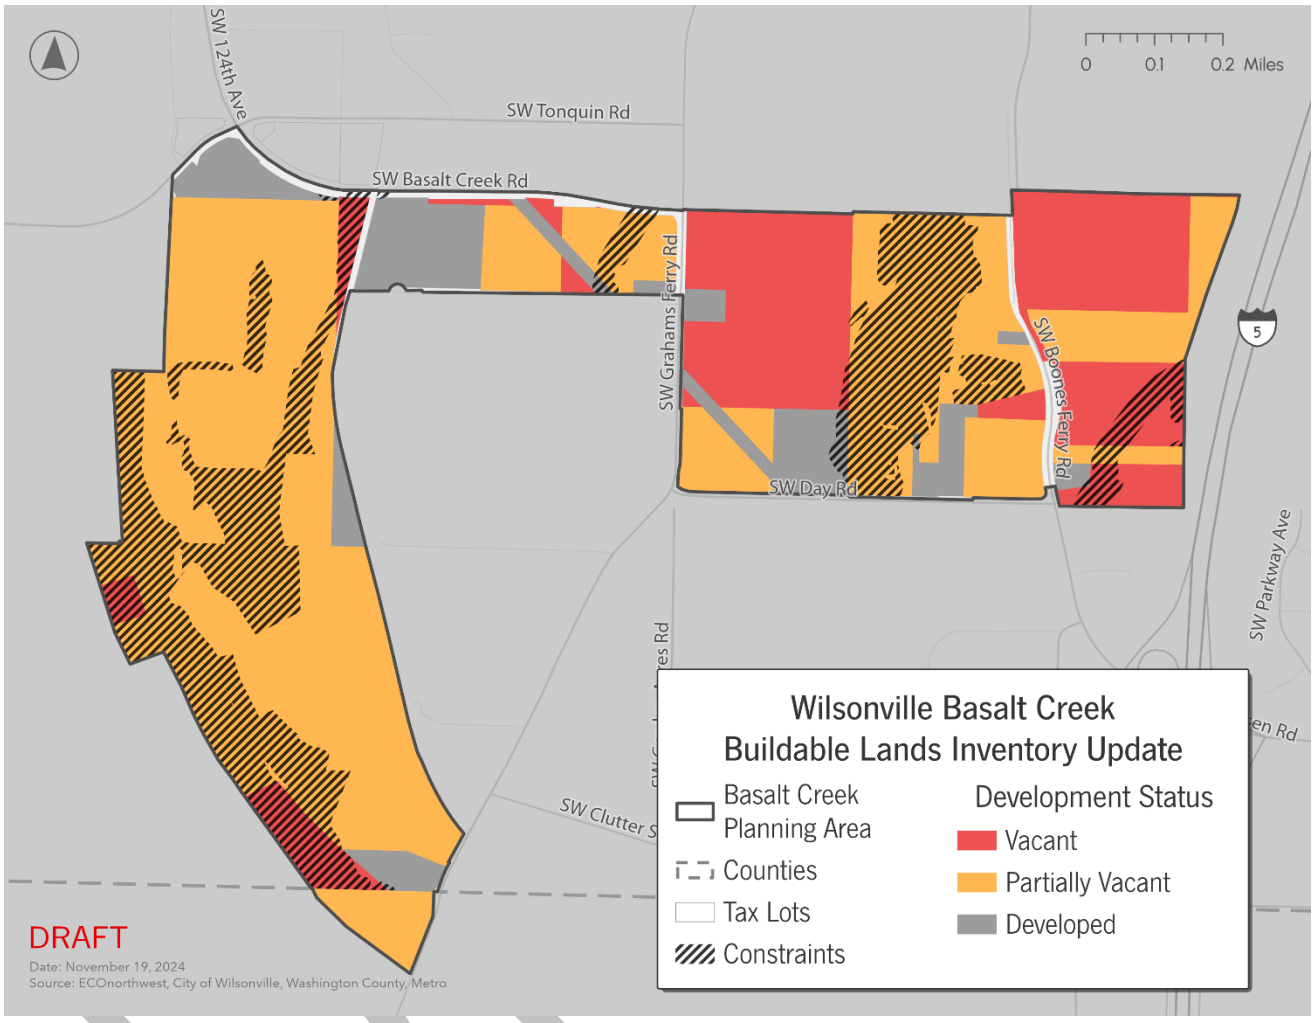
Source: ECOnorthwest analysis, City of Wilsonville, Washington County, Metro

DRAFT

Development Constraints

In coordination with City staff, ECOnorthwest identified physical constraints based on Washington County's Significant Natural Resources (SNR), as amended by Washington County Ordinances No. 901 and No. 902.[1] The SNR includes Metro Upland Wildlife Habitat Classes A and B, as well as Riparian Wildlife Habitat Classes I and II. These constraints are shown in Figure 1.

Figure 1. Development Constraints, BCPA, 2024



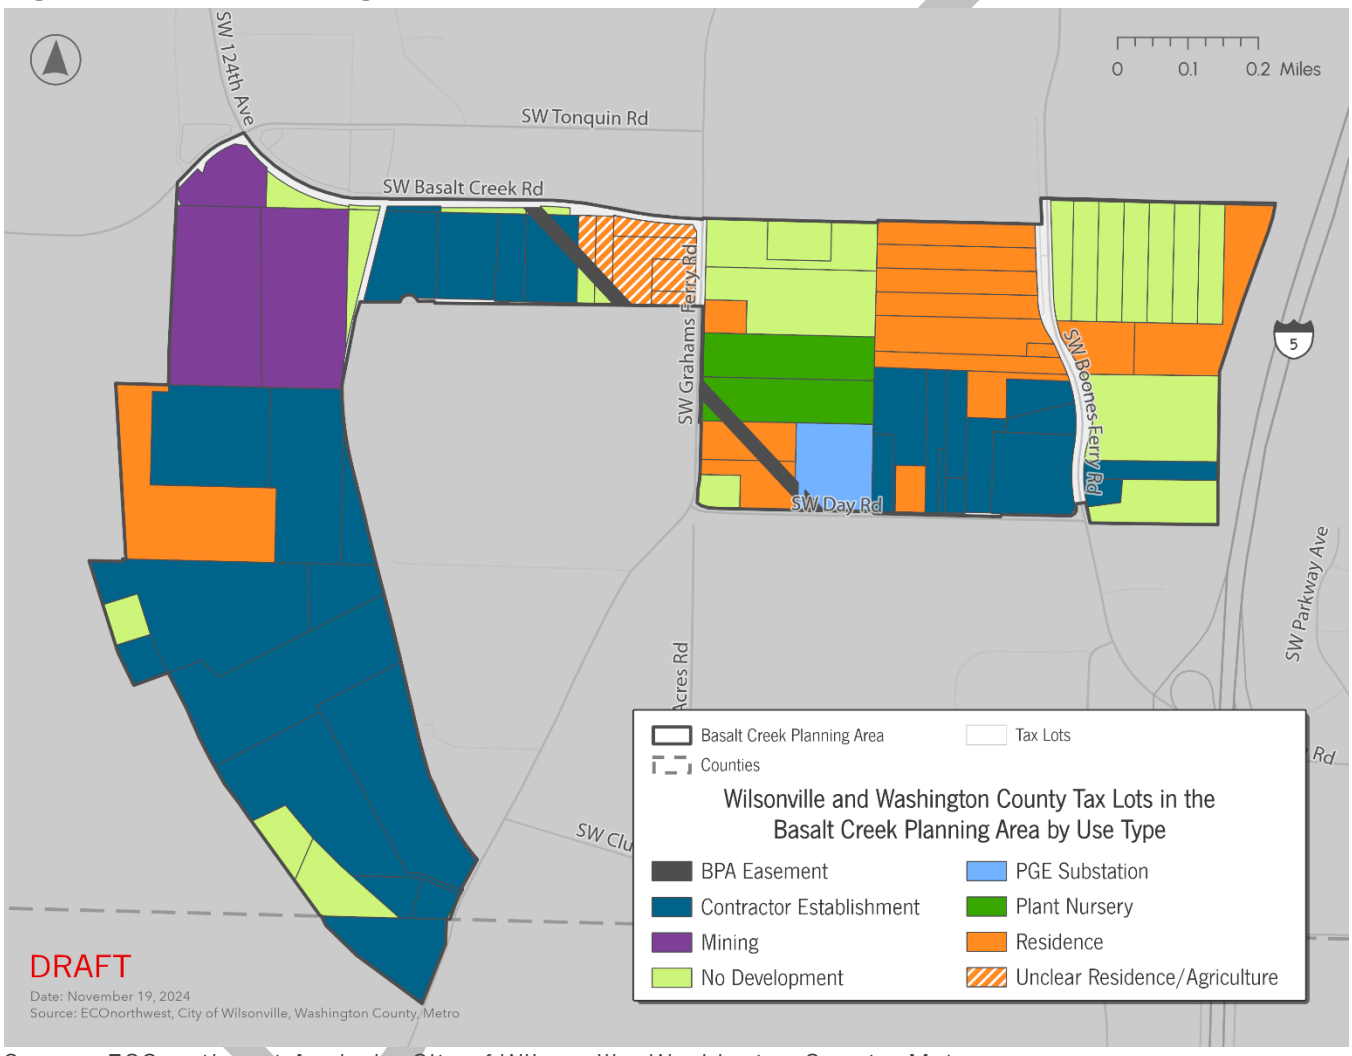
Source: ECOnorthwest Analysis, City of Wilsonville, Washington County, Metro

Note: ECOnorthwest is awaiting the required data to update the constraints of the Clackamas County parcel. This update will be included in a future draft.

[1] https://www.washingtoncountyor.gov/lut/planning/documents/ordinance-no-901a/download?inline

Figure 2 shows development status with constraints applied, resulting in buildable acres. Land classified as vacant or partially vacant but affected by these constraints is deemed unavailable for development and has been excluded from the inventory of buildable land.

Figure 2. Development Status with Constraints, BCPA, 2024



Source: ECOnorthwest Analysis, City of Wilsonville, Washington County, Metro

Note: ECOnorthwest is awaiting the required data to update the constraints of the Clackamas County parcel. This update will be included in a future draft.

Figure 3 identifies land use categories for each site. ECOnorthwest collaborated with City staff to identify these categories through a detailed review process that combined local knowledge with aerial map analysis. Unlike basic classifications of vacant or partially vacant land, this map provides deeper insights into current land uses, offering valuable context for evaluating redevelopment potential and guiding the feasibility analysis (the results of which will be shared in a separate memorandum).

Figure 3. Land Use Categories with Constraints, BCPA, 2024

Source: ECOnorthwest Analysis, City of Wilsonville, Washington County, Metro

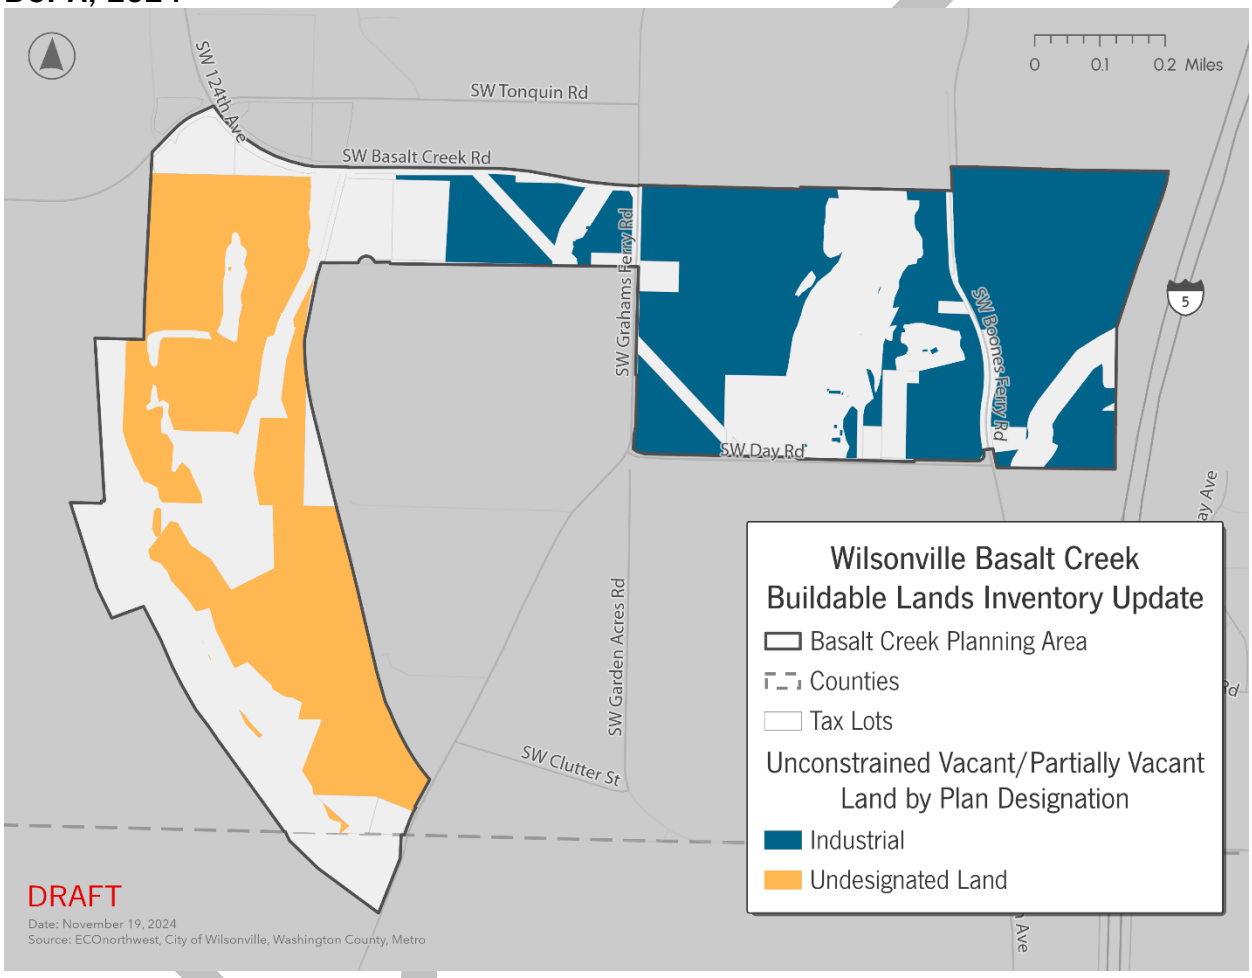
Vacant Buildable Land

The next step in the buildable lands inventory involved removing portions of vacant tax lots deemed unsuitable for development. Unsuitable areas fall into two categories:

1. Developed portions of partially vacant tax lots.
2. Areas affected by physical constraints (i.e. areas within Metro Upland Wildlife Habitat Classes A and B and Riparian Wildlife Habitat Classes I and II)

Table 7 presents the buildable acres—tax lot areas remaining after deducting these constraints—for both vacant and partially vacant land, categorized by Wilsonville's Comprehensive Plan designation. The BCPA has 150 total buildable acres available for development.

Table 3. Buildable Acres in Vacant and Partially Vacant Tax Lots by Wilsonville Plan Designations, BCPA, 2024



Plan Designation	Total Buildable Acres	Buildable Acres on Vacant Lots	Buildable Acres on Partially Vacant Lots
Industrial	127	87	40
Undesignated	24	0.4	23
Total	**150**	**87**	**63**

Source: ECOnorthwest Analysis, City of Wilsonville, Washington County, Metro

DRAFT

Figure 4 shows the buildable vacant and partially vacant land within the BCPA, categorized by Wilsonville Comprehensive Plan designation. It is important to note that tax lots shown as partially vacant in the map do not distinguish the part of the tax lot that is unavailable for development (or has redevelopment potential). However, the buildable lands inventory database accounts for these distinctions: the developed portions (unavailable for future development) are excluded, while the vacant portions are detailed in Table 4.

Figure 4. Buildable Employment Land by Wilsonville Comprehensive Plan Designation, BCPA, 2024

Source: ECOnorthwest Analysis, City of Wilsonville, Washington County, Metro

Table 4 presents the size of buildable lots categorized by Wilsonville Comprehensive Plan designation across the BCPA. The planning area includes:

- Eight lots smaller than 0.5 acres, totaling 2 acres.
- Twenty-two lots between 0.5 and 2 acres, totaling 22 acres.
- Eighteen lots between 2 and 5 acres, totaling 57 acres.
- Six lots between 5 and 10 acres, totaling 46 acres.
- Two lots between 10 and 25 acres, totaling 23 acres.

Table 4. Buildable Acres and Tax Lots by Buildable Site Size by Wilsonville Comprehensive Plan Designation, BCPA, 2024

Plan Designation	Buildable Sites Size					
	0 - 0.5 Acres	0.5 - 1 Acres	1 - 2 Acres	2 - 5 Acres	5 - 10 Acres	10 - 25 Acres
Industrial	1	7	10	51	35	23
Undesignated	1	1	4	6	12	-
Acreage Total	**2**	**8**	**14**	**57**	**46**	**23**

DRAFT

Site Suitability Analysis

The BCPA is well positioned to capture industrial growth in the South Metro region. It benefits from its strategic location with access to I-5, a robust employment base, and connections to other expanding industrial hubs in Sherwood and Tualatin. Over the summer, ECOnorthwest conducted an Economic Inventory to assess market conditions and identify industries most likely to establish a presence in Basalt Creek focusing on industrial and office uses in alignment with the BCCP vision.[2] The analysis highlighted strong national and regional demand for industrial space and identified key sectors with potential interest in the area, including the semiconductor supply chain, cleantech, advanced manufacturing, distribution and logistics, and data centers.

Although the BCCP originally envisioned a blend of industrial and office development, current market trends suggest a shift towards a greater emphasis on industrial and tech-oriented uses. Office developments, while still anticipated, are expected to occupy a smaller footprint than initially planned.

WHICH SECTORS MAY BE ATTRACTED TO BASALT CREEK?

Below are the potential sectors that may be particularly attracted to Basalt Creek as identified in the Economic Inventory report.

- **Semiconductor Sector Supply Chain:** Companies providing materials, equipment, and services to chip manufacturers.
- **Cleantech, including Battery Technology:** Businesses involved in renewable energy technology, energy efficiency solutions and sustainable manufacturing processes.
- **Advanced Manufacturing:** Companies using technology such as robotics, 3D printing, and computerized systems to manufacture specialized products or components.
- **Distribution and Logistics:** Storage, transportation and delivery of goods.
- **Data Centers:** Facilities used to house computer systems and associated components.

To determine site specific competitiveness for these industries, ECOnorthwest evaluated three opportunity sites using the Mackenzie Infrastructure Finance Authority (IFA) Industrial Development Competitiveness Matrix as a foundation. Recognizing that industry requirements have evolved since the matrix's creation in 2015, the analysis incorporated updated reports and stakeholder feedback to align with current market demands. This Site Suitability Analysis assesses site characteristics such as size, location, and constraints to evaluate their ability to host target industries. While the analysis considered buildable land availability, its primary focus was on site potential, assuming redevelopment occurs.

[2] When evaluating the office market, medical office showed stronger growth than traditional office. However, ECOnorthwest did not further evaluate its potential as it was not a use envisioned in the BCCP.

DRAFT

Feasibility and redevelopment likelihood of contractor establishments is addressed in a separate task.

Opportunity Sites for Analysis

ECOnorthwest evaluated the following sites for their development potential (Figure 5):

- **SW Greenhill Site:** Selected for its consolidated land ownership and strong potential for near-term development, given the absence of active use.
- **Craft Industrial Area:** As a transitional area, the City seeks to assess this site's characteristics in detail to determine the most appropriate land uses. This will inform zoning designations.
- **West Railroad Site:** West Railroad lacked a defined concept in the original BCCP. To explore its potential, ECOnorthwest analyzed a portion of West Railroad, focusing on its development suitability. This will inform whether a zoning designation similar to the rest of the Basalt Creek area would be appropriate. The area also faces physical and service constraints, and the analysis evaluates whether these challenges might limit future development opportunities.

DRAFT

Figure 5. Opportunity Sites

Source: ECOnorthwest Analysis, City of Wilsonville, Washington County, Metro

Note: ECOnorthwest is awaiting the required data to update the constraints of the Clackamas County parcel. This update will be included in a future draft.

Table 5 summarizes the size of unconstrained lots for the opportunity sites. Note that "unconstrained acres" here includes developed areas. In general, larger sites are more appealing to industrial users, who often seek parcels of 5 or more acres. Smaller sites, however, may require site aggregation to meet these needs. Notably, sites in SW Greenhill and West Railroad, which exceed 5 acres, could be especially attractive to developers. While all opportunity sites may require some degree of site aggregation, the Craft Industrial area faces the greatest challenge due to its relatively small lot sizes and fragmented land ownership.

Table 5. Unconstrained Acres and Tax Lots by Site Size for Opportunity Sites, BCPA, 2024

Site Suitability Area	Unconstrained Sites Size					
	0 - 0.5 Acres	0.5 - 1 Acres	1 - 2 Acres	2 - 5 Acres	5 - 10 Acres	10 - 25 Acres
Craft Industrial	-	1	5	8	-	-
SW Greenhill	-	-	-	31	-	21
West Railroad	0.3	-	2	10	19	60
Acreage Total	**0.3**	**1**	**7**	**49**	**19**	**81**
Craft Industrial	-	1	3	3	-	-
SW Greenhill	-	-	-	8	-	2
West Railroad	3	-	1	4	3	4
Tax Lot Total	**3**	**1**	**4**	**15**	**3**	**6**

Site Competitiveness Factors

The IFA Industrial Development Competitiveness Matrix includes the following factors for evaluating the competitiveness of different industries:

- Site Size
- Competitive Slope (physical slope of a parcel, which can impact its suitability for development)
- Access to Transportation and Trip Generation (Highway, Rail, and Airport Proximity)
- Access to Utility Infrastructure (Water, Sewer, Electricity, Telecommunications)
- Special Considerations

The industries evaluated in the IFA Industrial Development Competitiveness Matrix include the following, which align with the BCCP and the Economic Inventory findings, and are the focus of this analysis (the full matrix can be found in Appendix A):

- **Production Manufacturing:**
  - High-Tech/Cleantech Manufacturing
- **Value-Added Manufacturing and Assembly:**
  - Food Processing
  - Advanced Manufacturing and Assembly
- **Light/Flex Industrial:**

- General Manufacturing
- Industrial Business Parks and R&D Campuses
- Business Services

- **Warehousing and Distribution**
  - Regional Warehouse/Distribution
  - Local Warehouse/Distribution
- **Specialized Uses:**
  - Data Centers

Industry-Specific Considerations

Recent growth in the semiconductor and cleantech sectors has prompted additional research to understand the evolving needs of these industries. To support this, the Oregon Legislature established the Oregon Semiconductor Task Force to identify industry needs and opportunities. Similarly, Business Oregon supported the creation of the Oregon Cleantech Competitiveness Assessment Report to evaluate the needs and prospects for cleantech industries. Key findings related to site-specific requirements from these initiatives are outlined below.

SEMICONDUCTOR SECTOR

The semiconductor industry offers Oregon a prime opportunity to expand advanced manufacturing, grow its traded sector, and create high-quality jobs. The $52 billion CHIPS Act, passed in July 2022, accelerates efforts to boost domestic semiconductor production by allocating $40 billion for manufacturing and $10 billion for research over five years.

The Metro Region hosts a robust semiconductor cluster centered in Hillsboro. There has also been some semiconductor activity south of Hillsboro, including LAM Research in Sherwood and Tualatin, bolstering the supply chain presence in the South Metro. This established network positions the region to attract additional semiconductor-related investments.

The Semiconductor Task Force's Industrial Lands Subcommittee identified key site characteristics most important for the semiconductor industry:

- **Workforce Availability and Talent Proximity.** Access to skilled workers—engineers, technicians, and operators—is essential. Semiconductor clusters thrive where workers can easily transition between companies, creating a dynamic employment ecosystem. Workforce access is critical for both fabrication plants and supply chain operations.
- **Parcel Size and Usage.** Parcel size varies by operational needs. Fabrication plants require *50–100 acres* to accommodate cleanrooms and infrastructure, with large-

DRAFT

scale R&D and production facilities needing ***500+ acres***. Supply chain operations, such as equipment and material suppliers, generally need smaller parcels of ***15–35 acres***.

- **Infrastructure Readiness.** Reliable access to ***transportation, water, electricity, and wastewater systems*** is crucial. Semiconductor companies prioritize sites with infrastructure ready to support development within ***6 months to 3 years***.
- **Clustering with R&D Partners and Suppliers.** Collaboration with suppliers and R&D partners is vital. Fabrication plants benefit from proximity to suppliers for quick equipment maintenance and research. Supply chain operations also thrive in clusters, connecting with customers and transport hubs.
- **Environmental and Regulatory Considerations:** Predictable permitting processes are essential to avoid delays. While environmental regulations remain important, fast-tracked approvals are necessary to match the industry's pace.

SITE COMPETITIVENESS FOR THE CLEANTECH SECTOR

Oregon is well-positioned to capitalize on the growth of cleantech industries, driven by federal initiatives like the Inflation Reduction Act and an increasing focus on sustainability. Cleantech encompasses a range of technologies, including renewable energy, energy-efficient materials, water technologies, and recycling systems. While the IFA Industrial Development Competitiveness Matrix provides general site characteristics for cleantech, the Oregon Cleantech Competitiveness Assessment Report—developed for Business Oregon—offers more detailed site selection criteria specific to established and emerging cleantech industries within the state. Key site characteristics for these subsectors are summarized below (a complete matrix is available in Appendix B). Scalability is essential for many users, as industries often begin on smaller sites but require the flexibility to expand as they grow.

- **Battery Storage:** These systems store renewable energy for later use, enhancing grid stability and reliability. Technologies range from lithium-ion to flow batteries, used in applications from small urban micro-grids (0-5 acres) to large grid-scale facilities (25+ acres). Electrical system proximity and access for power generation facilities may vary, depending on the scale and intended use. Micro-grid systems may only need connection to the local electrical grid, while large-scale grid storage may require connection to regional transmission lines or substations. Zoning flexibility for energy uses is critical, while water needs and transportation access are generally less significant.
- **Mass Timber:** Engineered wood products like cross-laminated timber (CLT) and glued laminated timber (GLT) serve as sustainable alternatives to steel and concrete. Production facilities need medium to large sites (5-25+ acres), reliable transportation (particularly to arterial roads and railways) for raw materials, and substantial power supply.

DRAFT

- **Ag-Tech:** This sector integrates advanced technologies like AI, Internet of Things (IoT), agrivoltaics, and drones to optimize agriculture. Ag-tech operations, in this sense are generally assumed to focus on software and small-scale equipment products, generally collaborating with large existing farms for R&D. These businesses typically require small sites (0-5 acres) with low transportation, water, and power demands.
- **Circular Economy:** This sector focuses on recycling and resource reuse, supporting waste-reduction and material recovery technologies. Businesses range from R&D to recycling and upcycling facilities. Typically, these operations require small to medium-sized sites (0-25 acres), though the specific site needs depend on the types of raw materials and finished products, as well as the scalability of the industry. Good transportation access—especially to arterial roads and potentially railways—is important, along with moderate water and power requirements and flexible zoning options.
- **Solar and Wind Energy Production:** This sector encompasses both energy production and manufacturing. Manufacturing facilities share site requirements with advanced manufacturing industries, while energy production facilities vary significantly in scale. These range from small rooftop installations to large-scale farms, which require proximity to transmission lines and substations. The electrical system needs depend on the scale and purpose of the facility—micro-grid systems may only require a connection to the local grid, while large-scale grid storage typically necessitates access to regional transmission lines or substations. Transportation access requirements also vary, but wind turbine manufacturing often requires rail access due to the size of components.
- **Water Technologies:** This sector focuses on addressing water scarcity and quality through innovations such as AI-driven leak detection, wastewater recycling, and desalination. It often involves both R&D and production facilities. These businesses typically require small to medium-sized sites (0-25 acres) with access to high-pressure water systems and significant power capacity, while having relatively low transportation needs.
- **Building Energy Technologies:** This sector focuses on innovations that improve energy efficiency, including smart HVAC systems and energy-efficient lighting to reduce building energy use. R&D and software development facilities in this space typically require small sites (0-5 acres) with moderate to high electrical needs, while having low transportation and water requirements.
- **Electric Vehicle (EV) Infrastructure Technologies:** Supporting the adoption of EVs through charging networks and technology development, this sector generally requires medium to large sites (5-25+ acres) with high electrical power demands and good access to transportation networks.

DRAFT

Opportunity Site Characteristics

The market analysis revealed that Basalt Creek is well-suited for various industrial uses, including light industrial, flex space, warehousing, distribution, advanced manufacturing, and support for cleantech and semiconductor sectors. These industries have specific site requirements. To assess how the three opportunity sites could accommodate different sectors, ECOnorthwest analyzed each site's characteristics and evaluated them against the competitiveness matrix and additional criteria specific to cleantech and semiconductor industries. Table 7 outlines the physical characteristics of the three sites under analysis.

DRAFT

Table 6. Physical Characteristics of Opportunity Sites

SITE CHARACTERISTIC	SW GREENHILL	CRAFT INDUSTRIAL	WEST RAILROAD
Site Size and Ownership	♦ 57 acres ♦ 10 tax lots ♦ 2 owners (1 owns 42 acres, 1 owns 14 acres)	♦ 32 acres ♦ 7 tax lots ♦ 7 owners (fairly even site size distribution)	♦ 165 acres ♦ 15 tax lots ♦ 8 owners (1 owns 65 acres, 4 own ~20 acres each, 3 own smaller parcels)
Slope	Slopes of 10% or greater cover about 6 acres, or 11% of the total site area.	♦ Slopes of 10% or greater cover about 15 acres, or 46% of the total site area. These slopes are generally in the middle of the site, bordering Basalt Creek.	♦ Slopes of 10% or greater cover about 34 acres, or 20% of the total site area. However, some of these slopes are from activities on the sites and not physical attributes
Surrounding Uses	♦ North: Planned for medium-low density residential and neighborhood commercial (Tualatin portion of BCPA) ♦ East: BCPA border and I-5 ♦ South: Undeveloped land, contractor establishment (planned High-Tech Employment District) ♦ West: Craft Industrial Opportunity Site	♦ North: Planned for (and under development) low-density residential (Tualatin portion of BCPA) ♦ East: SW Greenhill Opportunity Site (planned High-Tech Employment District) ♦ South: Contractor establishments, single residential property (planned High-Tech Employment District) ♦ West: Contractor establishments, plant nurseries, and undeveloped land (planned Light Industrial District)	♦ North: Adjacent to mining site ♦ East: Coffee Creek Correctional Facility and Coffee Creek Industrial area ♦ West: Coffee Creek provides a natural buffer ♦ South: Undeveloped land in Clackamas County
Constraints	♦ 52 unconstrained acres (91% of total area) ♦ Minimal constraints running along the eastern boundary	♦ 14 unconstrained acres (42% of total area); 9 of these acres are east of the constraints that dominate the central area; the remaining 5 acres occupy the northwest corner ♦ Constraints dominate the central north-south area	♦ 90 unconstrained acres (55% of total area) ♦ Constraints run along the entire western boundary and central northern half

DRAFT

Table 8 outlines the existing and planned utilities on the opportunity sites. Details on water, sewer, and roads were provided by City staff based on the most current local access maps from DKS. Final infrastructure alignment and capacity are still in the planning stages. d

Table 7. Infrastructure and Utility Characteristics of Opportunity Sites

SITE CHARACTERISTIC	SW GREENHILL	CRAFT INDUSTRIAL	WEST RAILROAD
Water: Potable water delivery to BCPA requires Basalt Creek Parkway Extension, Zone C booster station, and may require SW Grahams Ferry Rd Extension. These systems will connect SW Tooze Rd to SW Day Rd – 10,200 LF 18" diameter pipe and 4,670 LF 12" diameter pipe. *Modeling needs to confirm these requirements.*	**Current:** No existing water lines in area. **Planned:** Requires water main along SW Boones Ferry Rd alignment (2,490 LF). Water lines assumed to generally follow local road layout (5,460 LF). Will connect proposed water lines to existing lines on SW Pioneer Ct and SW Day Rd. *Sizes to be confirmed during modeling.*	**Current:** No existing water lines in area. **Planned:** Assumed to utilize proposed water main along SW Boones Ferry Rd. *Sizes to be confirmed during modeling.*	**Current:** No existing water lines in area. **Planned:** Water lines assumed to follow road layout from SW Grahams Ferry to SW Tonquin Rd (6,900 LF). *Sizes to be confirmed during modeling.*
Roads	**Current:** Existing SW Boones Ferry Rd, SW Greenhill Rd **Planned:** New arterial to I-5 from SW Greenhill Rd (300 LF). New arterial from SW Day Rd to I-5 (1,060 LF). New local roads looping SW Greenhill Rd to SW Boones Ferry Rd (3,350 LF) and connecting to SW Pioneer Ct (2,110 LF).	**Current:** Existing SW Boones Ferry Rd. **Planned:** New local road looping SW Day Rd to SW Boones Ferry Rd (1,900 LF). Assumed to utilize SW Boones Ferry Rd.	**Current:** Existing SW Grahams Ferry Rd to south and SW Tonquin Rd to north. **Planned:** New local road connecting SW Grahams Ferry Rd to SW Tonquin Rd (6,900 LF) with a possible connection to SW Morgan Rd (2,570 LF).
Sewer: Wastewater collection for BCPA requires completion of Coffee Creek Interceptor Phase 2 – 2,000 LF of gravity system upsizing to 21" diameter pipe from SW Boeckman Rd along railroad to SW Ridder Rd. This also requires Coffee Creek Interceptor Railroad Crossing – 160 LF of 21" diameter pipe.	**Current:** No existing sewer lines in area. **Planned:** Gravity collection lines flow generally south and west along proposed road layout (5,460 LF). Requires new collection line along SW Day Rd (1,600 LF), and new line to travel south between SW Day Rd to connect to SW Garden Acres Rd just north of SW Ridder Rd (3,700 LF). *10-12" diameter collection lines are anticipated.*	**Current:** No existing sewer lines in area. **Planned:** Assumed to utilize proposed line along SW Boones Ferry Rd.	**Current**: No existing sewer lines in area. **Planned:** Gravity line flows from SW Clay St west, crosses railroad, and meets proposed local street alignment in West Railroad to SW Grahams Ferry Rd (6,900 LF). Lift station is required with pressure main along SW Grahams Ferry to SW Clutter St (380 LF) before returning to gravity along SW Clutter St to SW Garden Acres Rd (1,430 LF) *A 10" diameter pipe is anticipated for gravity lines.*
Natural Gas	The IFA matrix does not identify natural gas as a requirement for industries most likely to locate in the BCCP. Natural gas did not come up as a barrier for industrial development in interviews.		
Electricity	Discussions with PGE indicate that the area can accommodate industrial users with moderate power needs. However large power users such as a data center may require infrastructure upgrades. These types of upgrades can take 3+ years.		
Telecommunication	Since the BCPA is located within the Metro, telecommunication service is expected to be adequate to meet the needs of likely users. Telecommunication capacity did not come up as a barrier for industrial development in interviews.		

DRAFT

Location in the overall region and access to highways, rail, other like businesses, and labor force also play a role in site selection for industries. Given the proximity of these sites within a very small area we detail these overall characteristics for the BCPA rather than for each site (Table 9).

Table 8. Basalt Creek Transportation and Proximity Characteristics

SITE CHARACTERISTIC	BASALT CREEK EVALUATION
Available Trips	♦ The BCCP allocated 951 trips to Wilsonville's portion of Basalt Creek. The TRP identifies the necessary improvements to accommodate those trips. Additional development and trips would require an update to the TRP and additional capacity improvements to the planned system.
Transportation Access to Interstate or Principal Arterial	♦ The entirety of Basalt Creek is within 5 miles of access to I-5 as well as I-205 and is less than 10 miles from Highway 217.
Proximity to Regional Infrastructure Rail/Port/Airport	♦ Basalt Creek is ~27 miles from Portland International Airport and ~26 miles from the Port of Portland. ♦ A rail line runs through Basalt Creek, but without any spurs, the area lacks direct rail access for industries. Note: The project team is still confirming the type of rail line and potential for spurs.
Proximity to Labor Force	♦ Access to the broader Portland Metro and Mid-Valley labor forces.
Proximity to Goods	♦ Close proximity to wine region and agricultural land ♦ Close proximity to distributors, other manufacturers, and tech hubs, including semiconductor businesses

DRAFT

Evaluation of Compatible Uses

The suitability of potential users for each site is outlined below, based on site characteristics and industry-specific needs. *Note: While water and wastewater capacity, as well as final road alignments, are still in the planning stages, they could influence the types of industries and scale of development that locate on these sites. Generally, water and wastewater capacity is expected to be sufficient, though high-water-use industries are highlighted as needing additional consideration in the matrix. Final road alignments could also affect parcel configurations as well as building size and scale depending on their placement. These factors are acknowledged but are not currently identified as definitive constraints or benefits.*

- **The SW Greenhill** site spans 57 acres, with 91 percent (52 acres) of the land unconstrained. Minimal slopes (affecting 11 percent of the site), a high proportion of undeveloped land, and proximity to existing infrastructure make it one of the most development-ready locations in Basalt Creek. The site could be suitable for high-tech supply chain, cleantech industries, advanced manufacturing, food processing, small warehousing and distribution, and industrial business parks or R&D campuses. Its proximity to transportation networks and regional workforce access further enhances its competitiveness.
- **The Craft Industrial** site comprises seven tax lots under separate ownership, most of which are smaller than 5 acres. Substantial constraints limit the developable area to 14 acres. Its proximity to residential areas and existing housing developments makes it less attractive for high-intensity industrial activities. In its current configuration, the site is better suited for micro-industrial uses, such as live-work spaces as originally identified in the BCCP.

  With site aggregation, the southeastern portion could support a small-scale industrial and/or office user requiring up to 5 acres. These uses could resemble industrial condo developments like the Commerce Circle Business Park or Riverwood Business Center, which integrate office and small-scale production spaces. While the northeastern portion may also appeal to small industrial users, its irregular shape and the presence of high-value residences make redevelopment less likely there compared to the southeastern portion.

  The site's existing residences, some of which are high-value homes, are likely to extend redevelopment timelines relative to other opportunity sites. However, the feasibility of redeveloping these residential properties was not assessed as a part of this study.
- **The West Railroad** site spans 165 acres, with 55 percent (90 acres) of the land unconstrained. Its large parcel sizes and proximity to regional transportation networks make it a strong candidate for general manufacturing, food processing, and small to mid-sized warehousing or distribution uses. Moderate constraints are concentrated along the western and northern boundaries. Additionally, the lack of

DRAFT

confirmed direct rail access and the need for infrastructure upgrades may present challenges for industries reliant on heavy logistics or rail connections. Additionally, the site's proximity to a rail line and a mining operation could make the site less attractive to advanced manufacturing or other industries sensitive to vibration. On the other hand, the site's proximity to Coffee Creek's existing industrial development may make it attractive to business services supporting nearby industries. Note: The project team is continuing to assess rail access and the potential impact of the railroad and nearby mining operations on the site's attractiveness for certain industries. At this stage, these factors are identified as potential considerations. Additionally, the City is still evaluating necessary road improvements to West Railroad to better accommodate truck traffic. Further analysis of how infrastructure constraints or enhancements might influence industry suitability will be included in the next draft if additional information becomes available.

In Table 10, the compatibility of each site with various industrial uses is color-coded as follows:

- Red: Not competitive for the industry
- Yellow: Moderate potential
- Green: High compatibility and strong suitability

Table 9. Evaluation of Compatible Uses Based on Site Characteristics

INDUSTRIES		SW GREENHILL	CRAFT INDUSTRIAL	WEST RAILROAD
Production Manufacturing	High Tech / Cleantech Manufacturing	Mid-sized, flat site; high power or utility demands could exclude some users depending on system capacity	May be able to accommodate a small user (under 5 acres) most likely on the southeastern portion; some users may prefer larger sites with expansion potential	Vibration may be a concern from nearby rail and mining (This may or may not be a barrier – project team is still confirming); high power or utility demands could exclude some users depending on system capacity
Value-Added Manufacturing and Assembly	Food Processing	Water and sewer needs are high; high demands could exclude some users depending on system capacity	May be able to accommodate a small user (under 5 acres) most likely on the southeastern portion	Water and sewer needs are high; high demands could exclude some users depending on system capacity
	Advanced Manufacturing & Assembly	Mid-sized, flat site; lower water and sewer demand than high-tech industries	Site small and constrained; increased setbacks (if required) could be a problem; often requires onsite utility service areas	Vibration may be a concern from nearby rail and mining (This may or may not be a barrier – project team is still confirming)

DRAFT

INDUSTRIES		SW GREENHILL	CRAFT INDUSTRIAL	WEST RAILROAD
Light / Flex Industrial	General Manufacturing	Residential proximity may reduce appeal	Site small and constrained; residential proximity may reduce appeal	Desirable site size available; distance from sensitive uses (residential, park)
	Industrial Business Park and R&D Campus	Mid-sized, flat site; slightly small for some users	Site small and constrained	Constraints may limit large park potential
	Business / Admin Services	Mid-sized, flat site; high trip generation	May be able to accommodate a small user (under 5 acres) most likely on the southeastern portion; tolerates higher slopes; compatible near residential; high trip generation	Proximity to Coffee Creek Industrial area which hosts similar services is attractive; tolerates higher slopes; high trip generation
Warehouse & Distribution	Regional	Close to I-5; existing road infrastructure; site may be a little small for some users	Site too small and constrained; limited space for trucks	Constraints could limit large distribution centers; The City is evaluating needed improvement to better accommodate truck traffic
	Local	Close to I-5; existing road infrastructure; suitable for smaller users	Site too small and constrained; limited space for trucks	Close to I-5; suitable for smaller users; The City is evaluating needed improvement to better accommodate truck traffic
Specialized	Data Center	May be suitable but power needs could exceed available capacity requiring upgrades	Site too small and constrained	May be suitable but power needs could exceed available capacity requiring upgrades

Site Competitiveness for Semiconductor Industry

Basalt Creek lacks the large parcels required for fabrication plants but is positioned to accommodate supply chain businesses that support semiconductor manufacturing.

- **SW Greenhill:** High Potential – Could be competitive for the semiconductor supply chain businesses. This site is closest to development ready, which is highly competitive as semiconductor companies prioritize sites with infrastructure ready to support development within *6 months to 3 years.*
- **Craft Industrial:** Not Competitive – Given the small parcels on the Craft Industrial site, this site is not competitive for the semiconductor supply chain businesses.

- **West Railroad:** Moderate Potential – The longer timeline required to provide adequate infrastructure, combined with existing constraints, makes this site less attractive for the semiconductor industry.

Site Competitiveness for Cleantech

- **Craft Industrial:** Moderate Potential – Given the small parcels and extent of constraints, this site is not competitive for many cleantech businesses but may be attractive to small scale users in ag-tech and building energy tech that require sites under 5 acres.

Table 10. Cleantech Evaluation of Compatible Uses for Craft Industrial

Battery Storage	Existing businesses add appeal, but energy demands may exceed supply; site size may be too small for many users
Mass Timber	Limited by small site size, lack of direct rail access and high energy requirements
Ag-Tech	Site may be suitable for a small user
Circular Economy	Some users may prefer direct rail access; site may be too small for some users
Solar & Wind Energy	Small site; unsuitable for power generation and manufacturing
Water Tech	High demand user; water pressure adequacy and energy needs may pose challenges; site may be too small for some users
Building Energy Tech	Site may be suitable for a smaller user; energy demands could exceed supply.
EV infrastructure Tech	Limited site size, lack of rail access and high energy requirements

- **SW Greenhill and West Railroad:** High Potential – Site size and infrastructure could appeal to a variety of cleantech subsectors including battery storage, ag-tech, circular economy, water tech, and building energy tech.

Table 11. Cleantech Evaluation of Compatible Uses

Battery Storage	Existing businesses add appeal, but energy demands may exceed supply
Mass Timber	Limited by lack of direct rail access and high energy requirements
Ag-Tech	Sites meet needs well
Circular Economy	High transportation needs: some facilities may prefer direct rail access
Solar & Wind Energy	Unsuitable for power generation; possible for manufacturing but limited by rail and power needs
Water Tech	High demand user; water pressure adequacy and energy needs may pose challenges; low transportation needs
Building Energy Tech	Sites meet needs well; energy demands could exceed supply.
EV infrastructure Tech	Limited by lack of rail access and high power requirements

Conclusion

Land Supply

The BCPA offers a promising opportunity to support a diverse range of industrial and employment uses that align with Wilsonville's economic development goals. Since the previous Buildable Lands Inventory (BLI) update, the area has experienced growth in contractor establishments. The updated BLI identifies **150 acres of buildable land,** comprising **87 acres of vacant land** and **63 acres of partially vacant land,** after accounting for constraints and existing development. The supply is distributed across parcels of varying sizes, ranging from small lots under 5 acres to larger parcels exceeding 25 acres, providing a mix of options suitable for different industry needs.

Note: ECOnorthwest will include employment capacity estimates in the next version of this draft.

Site Suitability Analysis

The Site Suitability Analysis evaluates the competitiveness of three opportunity sites within the BCPA based on their ability to host key industries identified in the Economic Inventory. This evaluation focuses on physical site characteristics, such as size, location, and constraints, rather than the likelihood of redevelopment. Redevelopment feasibility is addressed in a separate deliverable.

- **SW Greenhill:** With its minimal constraints, lack of development and existing infrastructure, this site could be suited for cleantech, high-tech supply chains, advanced manufacturing industries, food processing, small warehousing and distribution, and industrial business parks or R&D campuses requiring medium-sized parcels. This validates the uses originally envisioned in the BCCP for the area.
- **Craft Industrial:** Due to significant constraints, the site is currently more suitable for micro-industrial uses, such as live-work spaces, as originally identified in the BCCP. However, with site aggregation, the eastern portion could accommodate small-scale business or administrative services and production uses, similar to industrial condo developments like Commerce Circle Business Park or Riverwood Business Center. The presence of existing residences, including some high-value homes, are likely to delay redevelopment timelines compared to other opportunity sites.
- **West Railroad:** This site has potential for development in general manufacturing, food processing, warehousing and distribution, and business services. However, significant infrastructure upgrades are required, and existing constraints may limit the scale of some types of development.

DRAFT

Next Steps

The findings presented in this memorandum are preliminary and will be further refined through ongoing discussions with the Planning Commission and City Council. This analysis is being conducted in parallel with an evaluation of redevelopment feasibility for contractor establishments. Ultimately, these components, along with insights from the Economic Inventory, will be synthesized into a comprehensive final report that outlines key findings and recommendations.

16	SPECIAL CONSIDERATIONS:		Adequate distance from sensitive land uses (residential, parks, large retail centers) necessary. High throughput of materials. Large yard spaces and/or buffering required. Often transportation related requiring marine/rail links.	Acreage allotment includes expansion space (often an exercisable option). Very high utility demands in one or more areas common. Sensitive to vibration from nearby uses.	May require high volume/supply of water and sanitary sewer treatment. Often needs substantial storage/yard space for input storage. Onsite water pre-treatment needed in many instances.	Surrounding environment of great concern (vibration, noise, air quality, etc.). Increased setbacks may be required. Onsite utility service areas. Avoid sites close to wastewater treatment plants, landfills, sewage lagoons, and similar land uses. Lower demands for water and sewer treatment than Production High-Tech Manufacturing.	Adequate distance from sensitive land uses (residential, parks) necessary. Moderate demand for water and sewer. Higher demand for electricity, gas, and telecom.	High diversity of facilities within business parks. R&D facilities benefit from close proximity to higher education facilities. Moderate demand on all infrastructure systems.	Relatively higher parking ratios may be necessary. Will be very sensitive to labor force and the location of other similar centers in the region. High reliance on telecom infrastructure.	Transportation routing and proximity to/from major highways is crucial. Expansion options required. Truck staging requirements mandatory. Minimal route obstructions between the site and interstate highway such as rail crossings, drawbridges, school zones, or similar obstacles.	Transportation infrastructure such as roads and bridges to/from major highways is most competitive factor.	Must be located within or near FAA-regulated UAV testing sites. Moderate utility demands. Low reliance on transportation infrastructure.	Larger sites may be needed. The 25 acre site requirement represents the more typical site. Power delivery, water supply, and security are critical. Surrounding environment (vibration, air quality, etc.) is crucial. May require high volume/supply of water and sanitary sewer treatment.	Located in more remote locations in the state. Usually without direct access (within 50 miles) of Interstate or City of more than 50,000 people.

Mackenzie; Business Oregon

Terms:

More Critical ↑ Less Critical	**'Required'** factors are seen as mandatory in a vast majority of cases and have become industry standards
	'Competitive' significantly increases marketability and is *highly recommended by Business Oregon* . May also be linked to financing in order to enhance the potential reuse of the asset in case of default.
	'Preferred' increases the feasibility of the subject property and its future reuse. Other factors may, however, prove more critical.
* Competitive Acreage: Acreage that would meet the site selection requirements of the majority of industries in this sector.	
**Total Site: Building footprint, including buffers, setbacks, parking, mitigation, and expansion space	
† Data Center Water Requirements: Water requirement is reported as gallons per MWh to more closely align with the Data Center industry standard reporting of Water Usage Effectiveness (WUE).	
‡ Data Center Sewer Requirements: Sewer requirement is reported as 200% of the domestic usage at the Data Center facility. Water and sewer requirements for Data Centers are highly variable based on new technologies and should be reviewed on a case-by-case basis for specific development requirements.	

DRAFT

Appendix B. Cleantech Industrial Sector Land Use Competitiveness Matrix

The Oregon Cleantech Competitiveness Assessment Report (Appendix D in the report) identified the following land use requirements for key cleantech subsectors in Oregon as described below.

Cleantech Land Use Criteria

Land use requirements for attracting and growing industrial users vary across sectors. We have reviewed typical land use and infrastructure needs based on existing facility development, anticipated growth needs, and similarities to existing established industrial users within the State. We have reviewed land use competitiveness for the following development criteria, which are commonly used when evaluating sites for attracting potential industrial users:

1. Total site size: Gross property area, including building footprint, setbacks, parking, laydown space, buffers and/or mitigation areas, and expansion areas.
   A. Small: 0-5 acres
   B. Medium: 5-25 acres
   C. Large: > 25 acres
2. Use allowance: Specific manufacturing use allowed under current zoning. Development standards also may limit feasibility of necessary elements such as utility yards.
   A. Low: Allowed outright
   B. Medium: Allowed conditionally or with limitations
   C. High: Not allowed
3. Site slope tolerance: Elevation differences across the site; generally, industries with large-footprint buildings or laydown yards require flatter sites.
   A. Low: 0-5%
   B. Moderate: 0-7%
   C. High: 0-12%
4. Access to Interstate or Principal Arterial transportation routes: Access to shipping routes and available capacity for trips generated.
   A. Low: Relatively low need for access to transportation routes.
   B. Moderate: Access to principal transportation routes is preferred.
   C. High: Access to principal transportation routes is required.
5. Railroad access: Proximity and capacity for rail freight systems, for either raw materials or finished goods.
   A. Low: Relatively low need for rail access.
   B. Moderate: Access to rail access is preferred.
   C. High: Access to rail access is required.
6. Marine port access: Proximity and capacity for marine cargo shipping, for either raw materials or finished goods.
   A. Low: Relatively low need for marine access.
   B. Moderate: Access to marine access is preferred.

DRAFT

C. High: Access to marine access is required.

7. Airport access: Proximity and flight availability for employees, customers, or air cargo.
   A. Low: Relatively low need for airport access.
   B. Moderate: Access to airport access is preferred.
   C. High: Access to airport access is required.
8. High pressure water supply: Proximity and capacity for high pressure water supply, typically as municipal water.
   A. Low: Significant water usage is not expected to be a critical component of this industry.
   B. Moderate: Water usage may be high for this industry; high-pressure water supply is preferred.
   C. High: High-pressure water supply is required.
9. Electricity supply: Proximity and capacity for electrical power.
   A. Low: Significant electricity usage is not expected to be a critical component of this industry.
   B. Moderate: Electrical usage may be high for this industry; high-demand service and/or redundancy is preferred.
   C. High: High-demand service and/or redundant electrical supply is required.

The following table summarizes our recommendations of land use competitiveness for the selected Cleantech sectors across the criteria listed above.

DRAFT

DRAFT

[3] Battery storage site sizes may vary widely, from urban micro-grid installations to large-scale power grid storage.
[4] The Ag-Tech industries identified in this study are assumed to generally focus on software and small-scale equipment products. These companies may use large-scale farms for product development or research; however, since those are likely to be existing operating farm facilities we do not identify them as a land use criteria here.
[5] Site facility size for circular economy is dependent on the raw materials and finished products involved, and the industry scaling.
[6] Site size for solar/wind manufacturing facilities is similar to advanced manufacturing industries, while sites for solar/wind power generation vary greatly depending on scale ranging from rooftop systems to grid-scale farms.
[7] Off-shore wind power requires marine facilities to transport turbines and equipment to the generating site. Land-based wind power marine access varies.
[8] Electrical system proximity and access for power generation facilities may vary, depending on the scale and intended use. Micro-grid systems may only need connection to the local electrical grid, while large-scale grid storage may require connection to regional transmission lines or substations.

DATE:	November 20, 2024
TO:	City of Wilsonville
FROM:	ECOnorthwest: Nicole Underwood, Michelle Anderson, and Bob Parker
SUBJECT:	WILR Phase 1: Redevelopment Feasibility of Contractor Establishments - DRAFT

The cities of Tualatin and Wilsonville adopted the Basalt Creek Concept Plan (BCCP) in 2018 after a lengthy joint planning process. Now, in 2024-25, the City of Wilsonville is working to advance the Basalt Creek Planning Area (BCPA) beyond the concept plan to a development-ready status by designating zoning and refining infrastructure plans. However, since adoption of the BCCP, economic conditions at national, state, regional, and local levels have shifted significantly, and must now be considered.

To address these evolving conditions, the City hired ECOnorthwest to conduct a market assessment and industrial lands study focused on Wilsonville's portion of the BCPA. This study comprises several interconnected tasks:

- An **Economic Inventory** that evaluated current market trends and identified industries suitable for the area (completed).
- An updated **Buildable Lands Inventory (BLI)** that reflects recent land developments, adjusted constraints, and revised capacity estimates (ongoing).
- A **Site Suitability Analysis** that evaluates three key opportunity sites for their potential to support target industries based on attributes like size, location, and access (ongoing).
- An **Analysis of Future Development of Contractor Establishments in the BCPA** given prevailing lease rates and market conditions (this memorandum).

This memorandum addresses the fourth task by evaluating the redevelopment potential of contractor establishments within the BCPA. Currently, the Wilsonville portion of the BCPA falls under Washington County's Future Development, 20-acre District (FD-20) zoning, which allows a variety of low-intensity uses. The area has limited development, with much of the developed land used for contractor establishments, which typically include small offices (often converted residences), storage buildings, and laydown yards. While these uses contribute to jobs and economic activity, they yield limited employment opportunities and lower property values compared to those envisioned in the BCCP or typically expected for land within the Metro Urban Growth Boundary (UGB) and city limits.

The primary question we address in this task is: What is the redevelopment potential of existing contractor establishments in the BCPA, given prevailing lease rates and market conditions? This analysis will help the City understand what types of development the market will support, which desired development types identified in the BCCP are viable

under current economic conditions, and what conditions might be necessary in the future to support desired development.

The findings from this analysis will guide recommendations on policy interventions and strategic actions the City can take to support desired development and promote redevelopment feasibility. These efforts are part of a broader initiative to position Basalt Creek as a key area for regional job growth and long-term economic success.

Redevelopment Feasibility of Existing Contractor Establishments

The Economic Inventory identified a range of industrial users who may find Basalt Creek particularly attractive due to its prime location in the Southwest Metro area, access to a skilled workforce, availability of industrial land, strong transportation networks, and proximity to existing industrial clusters. Discussions with stakeholders also highlighted strong regional demand for industrial space.

However, several challenges complicate redevelopment efforts. Many existing contractor establishments generate significant income for property owners, reducing their motivation to sell or redevelop the land for higher-intensity industrial uses. Additionally, relocation options for businesses currently occupying these sites may be limited, creating further barriers to redevelopment.

These challenges raise critical questions about whether current market rents and sales prices are sufficient to make redevelopment feasible in the BCPA. This analysis evaluates the conditions needed to support redevelopment in Basalt Creek.

WHICH SECTORS MAY BE ATTRACTED TO BASALT CREEK?

Below are the potential sectors that may be particularly attracted to Basalt Creek as identified in the Economic Inventory report.

Semiconductor Sector Supply Chain: Companies providing materials, equipment, and services to chip manufacturers.

Clean Tech, including Battery Technology: Businesses involved in renewable energy technology, energy efficiency solutions and sustainable manufacturing processes.

Advanced Manufacturing: Companies using technology such as robotics, 3D printing, and computerized systems to manufacture specialized products or components.

Distribution and Logistics: Storage, transportation and delivery of goods.

Data Centers: Facilities used to house computer systems and associated components.

DRAFT

Methods and Approach

What are the key questions?

While there is clear demand for industrial space in the BCPA, the question remains: **What conditions (e.g., market, ownership, site, zoning) are needed to promote and incentivize urban industrial development as envisioned in the BCCP?** To answer this core question, ECOnorthwest identified several sub-questions to guide the analysis.

- What types of property owners are in the study area and who is respectively occupying the site (e.g., does the owner occupy or a tenant)?
  - Understanding ownership and occupancy dynamics helps assess the financial motivations of property owners and determine whether redevelopment offers an incentive.
- What are the potential future uses for these sites?
  - Identifying potential future uses informs construction costs, market rents, and site utilization. Evaluating the likely range of site utilization (based on constraints and zoning) helps determine whether redevelopment would offer higher returns compared to current uses.

By addressing these supporting questions, ECOnorthwest evaluated scenarios where ownership, occupancy, and future uses align to incentivize redevelopment. This structured approach provides insights into the conditions necessary to drive redevelopment in the BCPA.

How did we answer the key questions?

ECOnorthwest used a detailed pro forma model to evaluate multiple potential development scenarios. These scenarios incorporated variations in current ownership and occupancy, potential future uses, and site utilization (for additional details, see Appendix). For this quantitative analysis, we focused on conditions that could support new development, either on recently acquired properties (e.g., speculative purchases) or on land likely to transact for redevelopment in the future.

WHAT IS A PRO FORMA?

The pro forma method, a standard tool in real estate feasibility studies, replicates the decision-making process of investors and lenders. It assesses the balance between development costs, expected revenue, and financing structures to identify potential viability gaps.

The pro forma considers the site utilization and potential building program of each scenario, development hard costs (construction labor and materials), other development costs (soft

DRAFT

costs, contingency, developer fee, etc.), costs of capital, relevant operating costs, and land acquisition costs. For each scenario, the pro forma calculated the rent levels required to cover these costs and achieve financial feasibility.

DATA LIMITATIONS AND METHODOLOGY

While the quantitative analysis provided valuable insights, data limitations in the study area and the I-5 South Submarket, such as limited observations of contractor establishment rents, posed some challenges. These limitations are typical for studies in smaller submarkets. To address this, we supplemented the analysis with qualitative methods, including interviews with developers and brokers, to validate assumptions and refine recommendations. We also conducted a range of sensitivity testing to account for potential variance (e.g., higher and lower potential contractor establishment rents) instead of basing the results of our analysis on one assumption. As a result, we believe the findings accurately reflect current market conditions in Wilsonville and provide a reliable basis for evaluating redevelopment feasibility in the BCPA.

WHY IS DEVELOPMENT FEASIBILITY AND PRO FORMA ANALYSIS IMPORTANT?

Development can be costly and risky. Getting funding to construct new development requires lenders and investors to be reasonably confident they will earn enough financial return to justify the risks.

Economic or market feasibility is generally assessed by comparing the expected revenues (rents, sales prices) against the costs of development. If a development project is not profitable, it is not feasible; it will not be built. While some of the factors that determine market feasibility are outside a jurisdiction's direct control (e.g., labor and materials costs, interest rates, market rents), local jurisdictions can provide incentives (such as tax exemptions or land donations); or adjust building, utility, and zoning fees, zoning, programs, and other regulations that can have a substantial impact on whether development could be feasible or not.

ASSUMPTIONS AND INDUSTRY STANDARDS

We based several assumptions on industry standards to ensure consistency and accuracy:

- **Construction Costs:** Used national averages adjusted with a Portland-metro-specific multiplier to account for regional building conditions.
- **Other Development Costs and Operating Costs:** Applied standard rates for soft costs (architectural design, site engineering, permitting and entitlement fees, capital carrying costs, etc.), contingency, and developer fees.

For a more detailed overview of the data, assumptions, and methodology, please refer to the Appendix.

DRAFT

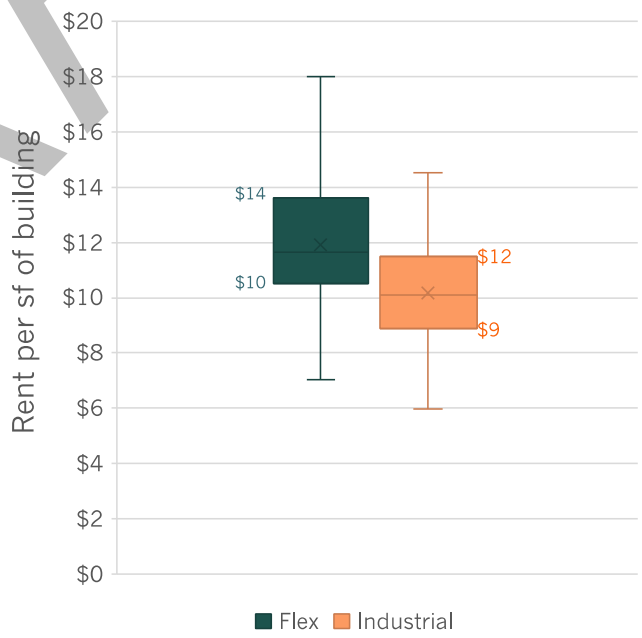
UNDERSTANDING THE PRICE OF LAND IN THE BCPA: HOW THIS IS FACTORED INTO FEASIBILITY RESULTS

Predicting the price that a landowner would require when selling property for development is an imperfect science – each landowner has reasons to sell or hold their land. Some property owners are willing to develop their land without selling, but based on interviews, we determined this would be rare in the study area. For the purposes of this analysis, we assumed the value of the property (i.e., the price of the land at which an owner would be willing to sell) could be derived from current comparable property sales prices in the area, a **"comps approach"** as well as using an **"income-based approach"** that considers the revenue stream from current tenants on the property. Therefore, this memo analyzes the rent needed based on the range of land values given these two approaches.

We identified vacant land sales (including contractor establishment sales) in the I-5 South Submarket using CoStar data. Most of the vacant land properties recently transacted (over the last 4 years) for approximately $7 to $17 per square foot of land. One improved land transaction (with a contractor establishment) had a sale price that indicated it transacted for $26 per square foot of land. These observations served as our range of land prices using a comps approach. Many of these comps, both vacant land and contractor establishments, might have been leased to tenants and generated income, however, the prices they sold for could have been decided via an unknown variety of methods (including an income-based approach and then a subsequent negotiation). Therefore, for the purposes of this analysis, we refer to all these observed transactions as being within the "comps approach" method.

The income-based approach relied on data collected during interviews that indicated the rent for contractor yards in the area could range from $0.18 to $0.23 per square foot of land per month. We considered this gross annual revenue, net of approximately 5 percent for various operating costs, and divided by a range of capitalization (cap) rates (5 percent to 7 percent) to estimate the value. Using a cap rate is a common valuation approach in the commercial real estate industry. This analysis resulted in a range of $19 to $52 per square foot of land – considerably higher than most of the results from the comps approach. This approach more appropriately accounts for the value that current owners might apply to their future revenue stream from existing tenants and therefore the hurdle needed to incentivize owners to sell and change the use on the property. Although this income-based value could eventually be negotiated during a potential sale, we still use this range in our analysis to reflect values that a landowner might

DRAFT



Key Findings

Current uses are generating substantial revenue with minimal management effort or risk.

Our market research and interviews highlighted that the rent for current uses ranged based on whether the site was mostly open land or if a building was present as well. Sites without buildings typically structured their rent per square foot of land, and this typically ranged from $0.18 to $0.23 per month. For example, a 1-acre site could generate annual gross rent of approximately $95,000 to $120,000 with minimal management effort or operating costs. (This is intended for illustrative purposes only and can scale to larger site sizes.)

Over the past four years, vacant land in the area has sold for around $7 to $17 per square foot. For the same, illustrative 1-acre site, this translates to sale prices ranging from $305,000 to $750,000. The resulting ratio of annual gross lease revenue to property value ranges from 13 percent (at $0.18 per square foot rent per month relative to $17 per square foot land value) to 39 percent (at $0.23 per square foot rent per month relative to $7 per square foot land value). This means that property owners who recently purchased land and rent it to contractor establishments could recover their investment within 2.5 to 8 years. For long-term landowners who have already paid off their investment, rents represent additional income with minimal effort. Either way, given the substantial revenue from these uses, a landowner has very little incentive to redevelop.

Figure 1. Market Rent of Potential Future Uses

Source: ECOnorthwest analysis, CoStar

For sites with buildings and yards, rents are typically based on the building area and range from $0.85 to $1.30 per square foot of building per month, or $10.20 to $15.60 per square foot per year. In comparison, flex and industrial spaces in the I-5 South Submarket rent for $9 to $14 per square foot per year, meaning that rent for an existing contractor establishment building, with yard, is already achieving similar market rents to potential future uses. Not only are some of these contractor establishments already achieving comparable rents to flex and industrial uses, but they are also doing so without the risks of redevelopment (which include new capital investment, entitlements, the time to convert the land to the new use and generate revenue, and opportunity cost, among others).

DRAFT

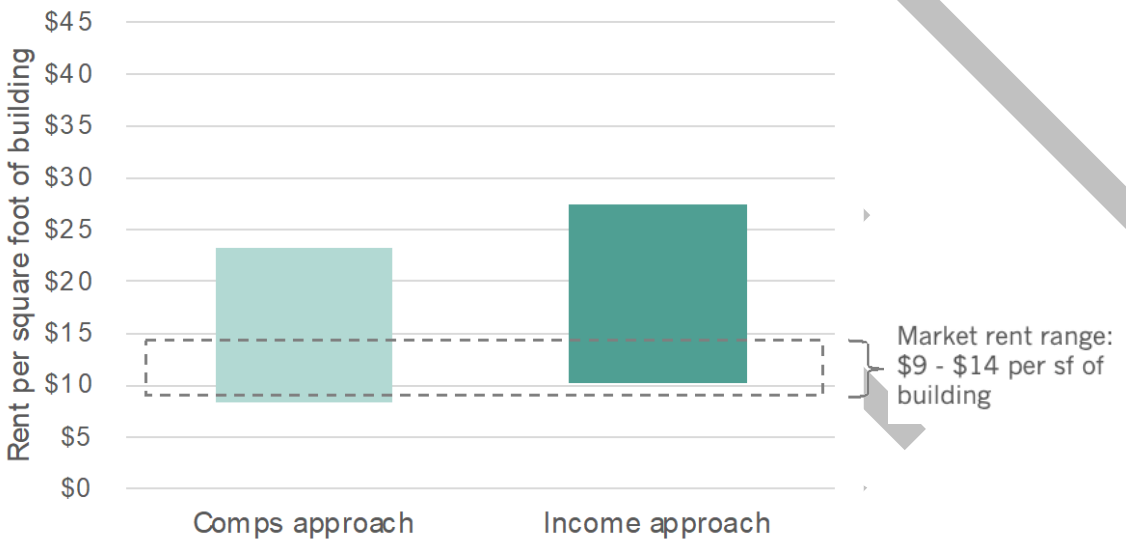
Rents would likely need to increase by at least one-third (33 percent), if not double (100 percent), to fund construction and create incentive to flip existing contractor establishments.

For our pro forma analysis, we evaluated a range of scenarios based on the variation in ownership and occupancy, future uses, future site utilization, and land acquisition costs (see Appendix for more detail). As previously discussed, ECOnorthwest solved for the rent needed to cover these various costs and then compared to the potential market rent of the flex and industrial uses observed in the I-5 South Submarket. We show these results, for a range of potential land acquisition prices and construction costs.

We analyzed results for three different physical scenarios based on observed comparable developments (using the relationship between building square footage and site square footage):

- **Very high site utilization** based on 45 percent site coverage similar to Graham's Ferry Industrial Center. Note: future development in some portions of BCPA may face constraints due to natural site features or zoning standards that may make achieving this site utilization challenging.
- **High site utilization** based on 35 percent site utilization, similar to the Sherwood Commerce Center
- **Low site utilization** based on 20 percent site utilization, similar to observed flex and industrial uses built over the last 20 years in the I-5 South Submarket

INTERPRETING THE RESULTS CHARTS



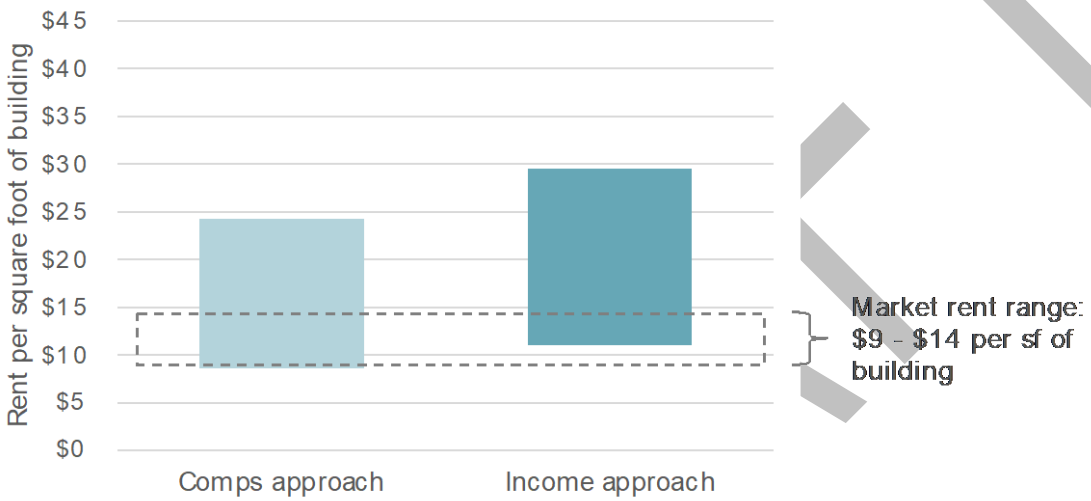
Development feasibility hinges on a range of different assumptions. Rather than picking one specific set of assumptions, the results charts shown in this memo encompass a range of potential assumptions, namely land acquisition costs and development costs.

ECOnorthwest compared the feasibility results to both the comps approach and income approach - **one column** in the following charts showing the resulting range of rents needed if assuming a comps approach and **one column** showing the range needed based on an income approach. **Both columns** also include sensitivity testing given a range of construction costs and land prices which is reflected in the size of the bars (the same range is assumed for each of the land price method scenarios). **A dashed box** is also shown to represent the range of observed rents for potential future uses. The rent results would ideally be within, if not lower, than this range for the development to be feasible.

DRAFT

In the **very high site utilization** scenario, future flex and industrial uses are only feasible when land acquisition costs remain low—below $20 per square foot—and other development costs are average or low. This combination of assumptions results in rents similar to the existing market rents of $9 to $14 per square foot of building (see comparison to gray bar shown in results chart in Figure 2). For properties with land costs higher than $20 per square foot (common for land with existing uses), the market rent for flex and industrial uses would likely need to increase by at least one-third, if not double, (while construction costs remain constant) to make redevelopment feasible.

Figure 2. Rent needed for very high site utilization (45%)

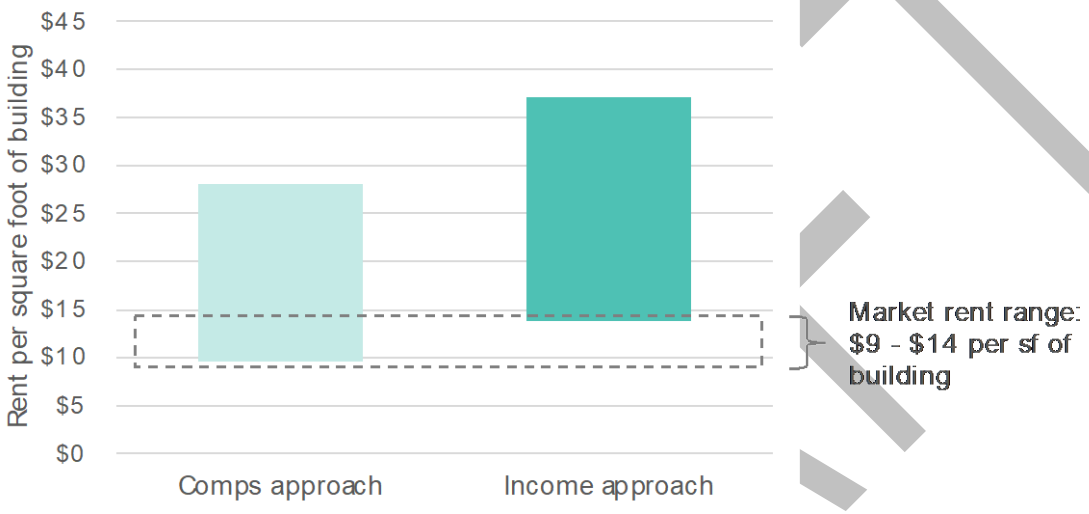


Source: ECOnorthwest analysis

DRAFT

In the **high site utilization scenario,** the results are similar to the very high site utilization, but rents would need to increase more, relative to the very high site utilization scenario, to cover the same ranges of land and development costs. Future flex and industrial uses are only feasible when land acquisition costs remain low—below $20 per square foot—and other development costs are average or low. This combination of assumptions results in rents similar to the existing market rents of $9 to $14 per square foot of building (see comparison to gray bar shown in results chart in Figure 3). For properties with land costs higher than $20 per square foot (common for land with existing uses), the market rent for flex and industrial uses must increase by at least forty percent, if not double, (while construction costs remain constant) to make redevelopment feasible.

Figure 3. Rent needed for high site utilization (35%)



Source: ECOnorthwest analysis

DRAFT

In the **low site utilization scenario**, future flex and industrial uses are only feasible when acquisition costs are assumed to be low, less than $10 per square foot of land (based on the low end of recent comparable sales of vacant land) and other development costs are low. This combination of assumptions results in rents similar to the existing market rents of $9 to $14 per square foot of building (see comparison to gray bar shown in results chart in Figure 4). For properties with existing uses (where land is likely to transact between $19 and $52 per square foot), the market rent for flex and industrial uses must double while construction costs remain constant to make redevelopment feasible.

Figure 4. Rent needed for low site utilization (20%)

Source: ECOnorthwest analysis

Owner-occupied sites face greater feasibility challenges when landowners want to maintain their business operations.

Owner-occupied sites present more complex financial considerations compared to vacant or tenant-occupied properties. Landowners using their property for their own business must account for additional costs if they relocate, including relocation expenses, higher rents (or purchase prices) for new properties, and potentially higher ongoing business costs. For example, moving farther from suppliers or services could result in increased fuel or labor expenses.

To justify relocating their business, landowners would likely need to sell their property at an even higher price than what the quantitative analysis assumes. This requirement would, in turn, translate to higher rents than those shown in the results charts (Figure 3 and Figure 4). However, if the landowner does not intend to maintain their business, financial considerations would be less complex. Without the need to account for future business costs or the loss of contractor tenant income, necessary rents could align more closely with those projected in the comps approach.

DRAFT

Conclusion and Next Steps

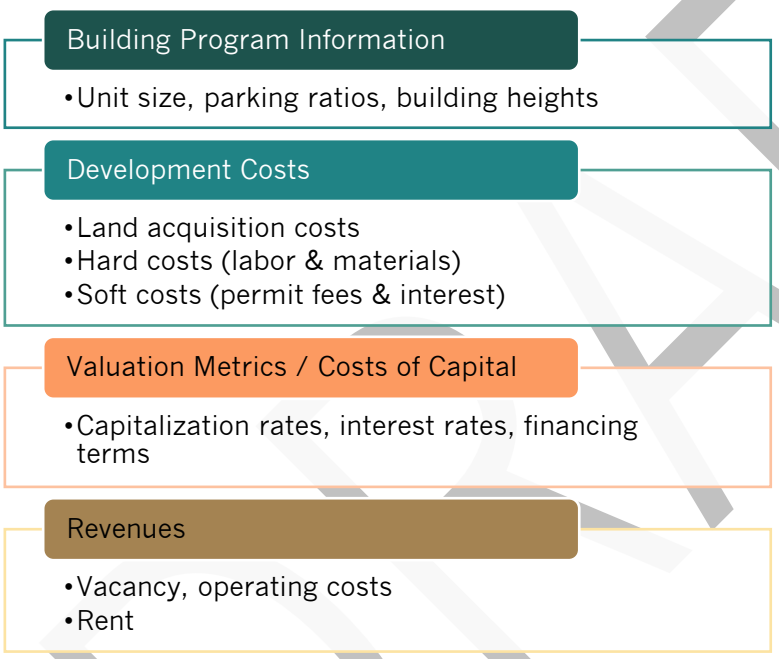
Current contractor establishments generate significant revenue with minimal effort or risk, reducing financial incentives for redevelopment. Rents for existing contractor establishments, particularly those with buildings, are already comparable to market rates for industrial and flex uses in the I-5 South Submarket. Therefore, for redevelopment to become financially feasible, market rents would likely need to rise by at least one-third, if not double, depending on site utilization, land acquisition costs, and construction costs. Higher site utilization scenarios present some redevelopment feasibility when land acquisition costs are low (below $20 per square foot). Conversely, properties with higher land costs or existing uses would require either substantially higher rents or have other development costs (e.g., construction, financing) reduce to achieve feasibility.

Owner-occupied properties are less likely to redevelop if the owner wants to maintain their business operations. Redevelopment is difficult for owner-occupants, as they must consider relocation costs and potential increases in operational expenses. Limited regional industrial land supply could push these businesses to relocate further from their markets, increasing costs for labor, transportation, and operations. Without substantial increases in land values or rents, redevelopment for these properties remains unlikely.

Achieving the City's development vision for Basalt Creek will require strategic interventions. Potential approaches could include purchasing and aggregating properties to create development-ready parcels, subsidizing infrastructure costs, adjusting system development charges (SDCs), offering other development incentives, or other strategies yet to be identified.

The findings in this memorandum are preliminary and will be refined through further analysis and discussions. This study is being conducted alongside updates to the buildable lands inventory and site suitability analysis. Ultimately, these components will be synthesized with insights from the Economic Inventory into a comprehensive final report that outlines key findings and actionable recommendations.

DRAFT



Appendix

Financial Feasibility Methods

To model development feasibility, ECOnorthwest employed a pro forma model which is a common method used in real estate feasibility studies as it simulates the decision-making process of investors and lenders. The pro forma assesses the balance between development costs, expected revenue, and financing structure, which helps to identify viability gaps.

Figure 5. Factors used in the pro forma analysis

Source: ECOnorthwest

This method provides a general analysis of prototypical development scenarios, or prototypes, without accounting for unique conditions that might influence development feasibility (e.g., higher predevelopment costs). Therefore, this analysis serves as a strong indicator of the relative likelihood of development rather than an absolute measure of feasibility.

The pro forma considers the site utilization and potential building program of each scenario, development hard costs (construction labor and materials), other development costs (soft costs, contingency, developer fee, etc.), costs of capital, relevant operating costs, and land acquisition costs. It then calculates the rent required to cover these costs for each scenario.

Scenarios Evaluated

To establish relevant assumptions for the pro forma model, we first identified the scenarios needed to address the research questions. These scenarios were based on variations in current ownership and occupancy, potential future uses, and site utilization.

DRAFT

CURRENT SITE OWNERSHIP AND OCCUPANCY

We started with an understanding of the current site ownership and occupancy. Based on our understanding, there were three main categories:

- **Owners of vacant or unused land.** This category includes people who recently purchased land with the intent to develop and existing owners potentially interested in selling their land for new development.
- **Owners renting to contractor establishment tenants.** These owners might sell their property but would need compensation for the foregone future revenue from their tenants.
- **Owners using the land for their own contractor establishments.** Financial considerations for this group vary substantially. Landowners would need to account for upfront and ongoing costs associated with relocating their businesses, making this scenario more complex to quantify compared to vacant or tenant-occupied sites.

APPROACH TO ESTIMATING LAND PRICE

- **Vacant and underutilized land:** We used a comparable sales ("comps") approach to estimate land price, which accounts for the sales price of recently purchased land, especially by those intending to develop (see the callout box on page 5 for details on the comps approach).
- **Tenant-occupied land:** For owners renting to contractor establishment tenants, we used an income-based approach to estimate the financial hurdle of land price. This better reflects the potential foregone revenue from tenants (see the callout box on page 5 for details on the income-based approach).
- **Owner-occupied land:** Due to varied business conditions of landowners who are using the land for their own contractor establishment, we evaluated this scenario qualitatively, considering insights from the other scenarios.

FUTURE BUILDING PROGRAMS

We then considered the potential future building programs that could occur on these former contractor establishment sites. We based the building square footage of our two prototypes on observed comparable flex and industrial spaces, based on CoStar data from the I-5 South Submarket. Key considerations included:

- **Site Utilization:** Over the past 20 years, average site utilization (building area relative to site area) in the I-5 South Submarket was about 20 percent. Recent developments like the Sherwood Commerce Center achieved 35 percent site utilization and Graham's Ferry Industrial Center achieved 45 percent site utilization but this was enabled by maximizing impervious coverage for parking and truck logistics. Future development in some portions of the study area may face constraints due to natural site features or

DRAFT

zoning standards. We therefore modeled three prototypes to capture a range of potential future development conditions:

- **Low utilization:** 20 percent
- **High utilization:** 35 percent
- **Very high utilization:** 45 percent

CONSTRUCTION COSTS

Lastly, for the scenarios we modeled we evaluated a range of potential construction costs for flex and industrial uses. We referenced the **2024 National Building Cost Manual** by Craftsman to arrive at a range of potential construction costs for various building types that could house future flex and industrial uses. We conducted sensitivity testing of the potential rents needed to cover low to high construction costs, and the results that informed our key findings are inclusive of the range used.

The land cost, site utilization, and building costs were all assumptions that varied in our analyses as we conducted sensitivity testing of different scenarios (e.g., high site coverage, high land costs, high construction costs). All other pro forma assumptions we held constant. We describe the specifics of these assumptions in the section below.

Detailed Methods and Assumptions

To evaluate future flex or industrial rental uses, we began by calculating development costs. This involved applying the cost per square foot values (see Table 1) to the building square footage derived from the site utilization. From that construction cost we calculated the soft cost, contingency, and developer fees to arrive at the total development cost.

Given the potential range of sources of money to fund these projects, we used a high-level approach and assumed all sources of money that funded the project would require a 6 percent annual return based on a 30-year term. We calculated a payment inclusive of this return, based on the total development cost, to arrive at the rent needed to cover these annual costs. We also assumed these rents would be triple net and therefore the operating costs would be passed on to the tenant, which is common for flex and industrial lease terms. We highlight the specific assumptions of this analysis, and any relevant ranges, in the table in Table 1.

DRAFT

Table 1. Scenarios and Assumptions Used

Source: ECOnorthwest, CoStar, Redfin, Craftsman, Stakeholder Interviews

Assumption	Values
Land price	Ranged from $7 to $26 based on observed sales comps of vacant land as well as one sale observation of a contractor establishment. Ranged from $19 to $52 per square foot based on income-based approach.
Building program	(3) square footage estimates based on a calculation of 20% site utilization, 35% site utilization, 45% site utilization
Construction cost	$75 to $200 per square foot of building; $20 per square foot of paving
Soft Costs	20% of hard costs
Contingency	5% of hard and soft costs
Developer fee	5% of hard and soft costs plus contingency
Costs of capital	5-7% annual interest range, 30-year term for all funding sources
Operating costs	Assumed triple net rents

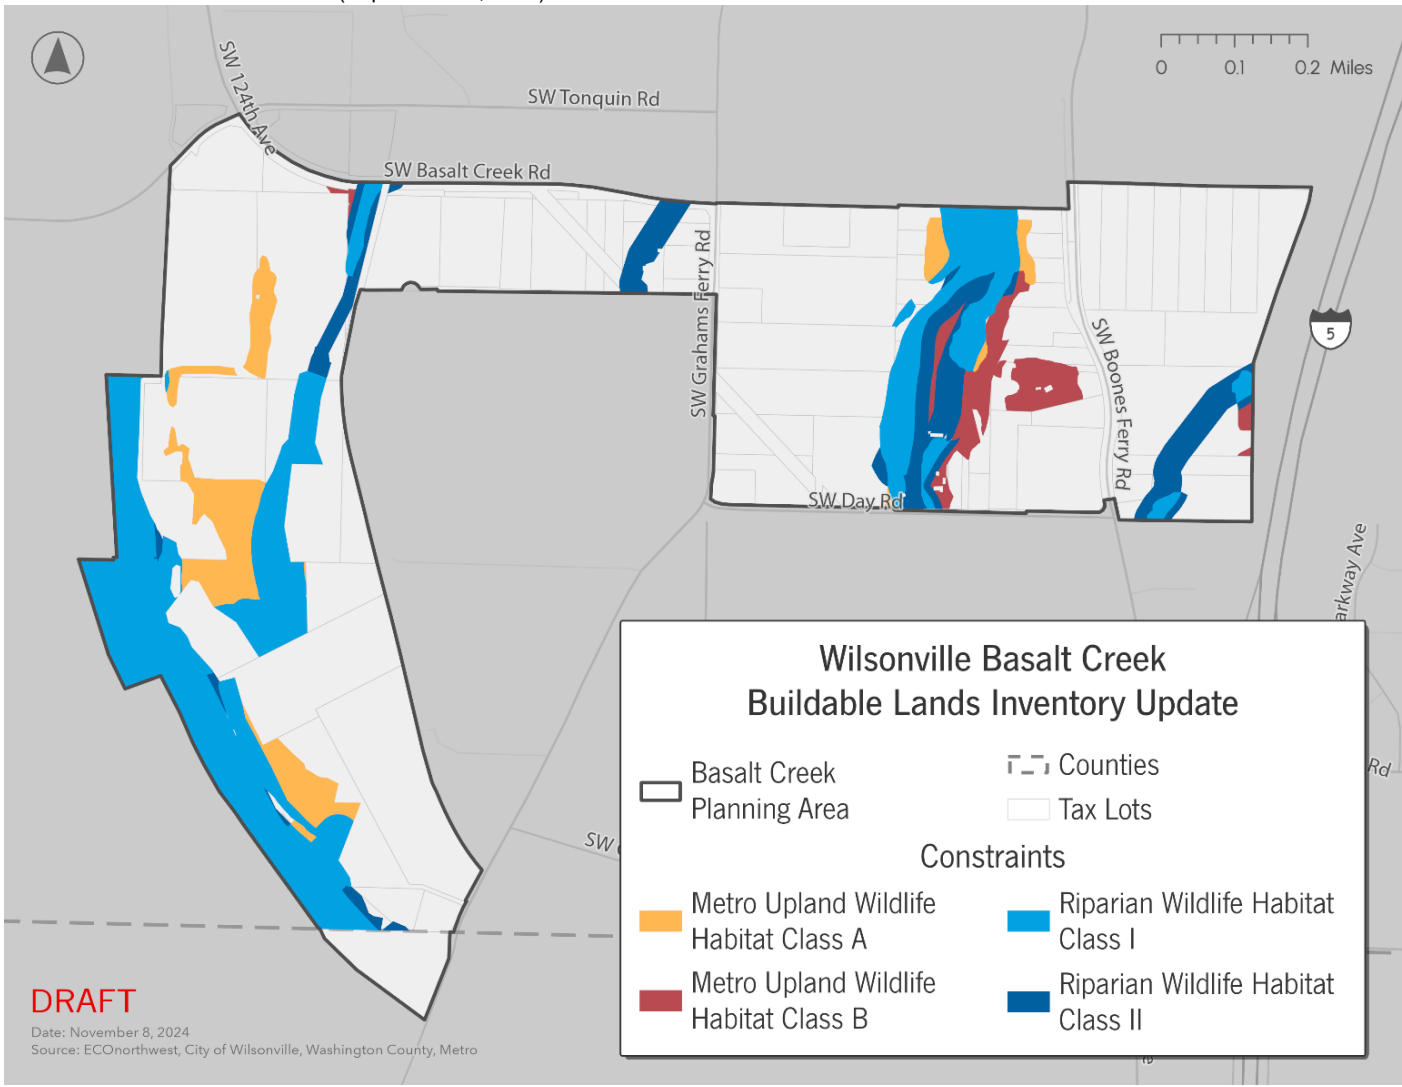
DRAFT

Wilsonville Industrial Land Readiness – Phase One/Basalt Creek

Planning Commission Work Session
December 11, 2024
Presented by: Cindy Luxhoj AICP, Associate Planner
Dan Pauly AICP, Planning Manager
Nicole Underwood, ECOnorthwest

Phase One Tasks

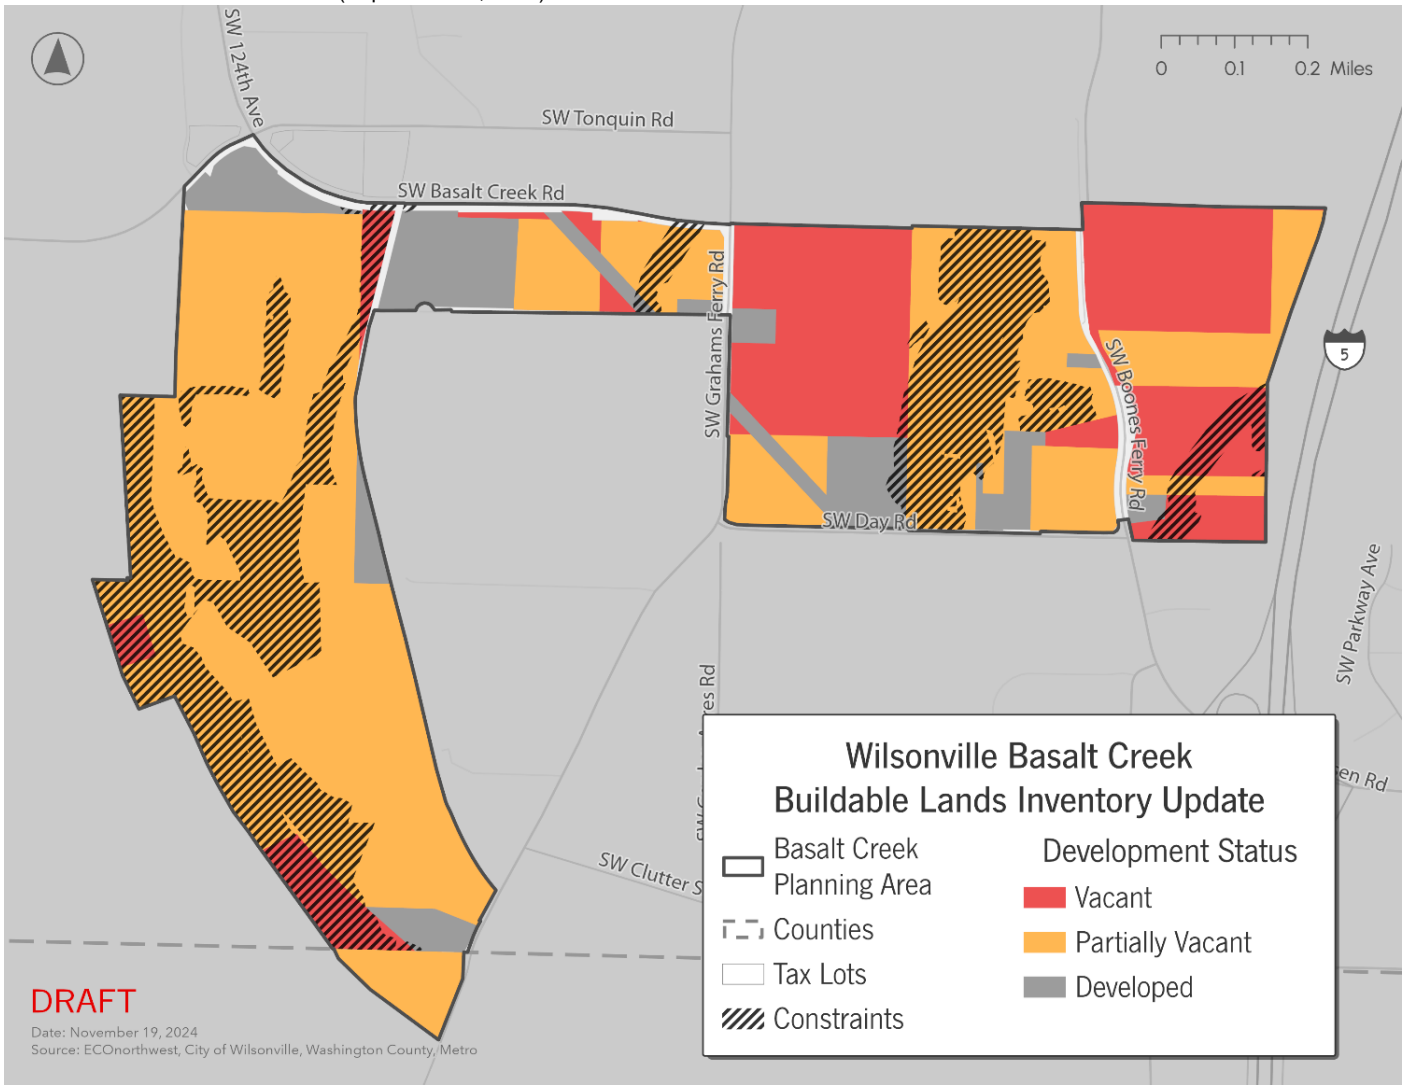
- ECOnorthwest
  - Economic Inventory / Land Use Analysis
  - Buildable Lands Inventory Update
  - Site Suitability Analysis
  - Redevelopment Feasibility of Contractor Establishments
- DKS Associates
  - Revised Conceptual Access Plan Map
- Pacific Habitat Services
  - Natural Resource Assessment
- Consor
  - Input to Infrastructure Funding Plan
- City Staff
  - Zoning Analysis
  - Code Amendments



Buildable Lands Inventory (BLI)

Land Base

453 acres across 85 tax lots

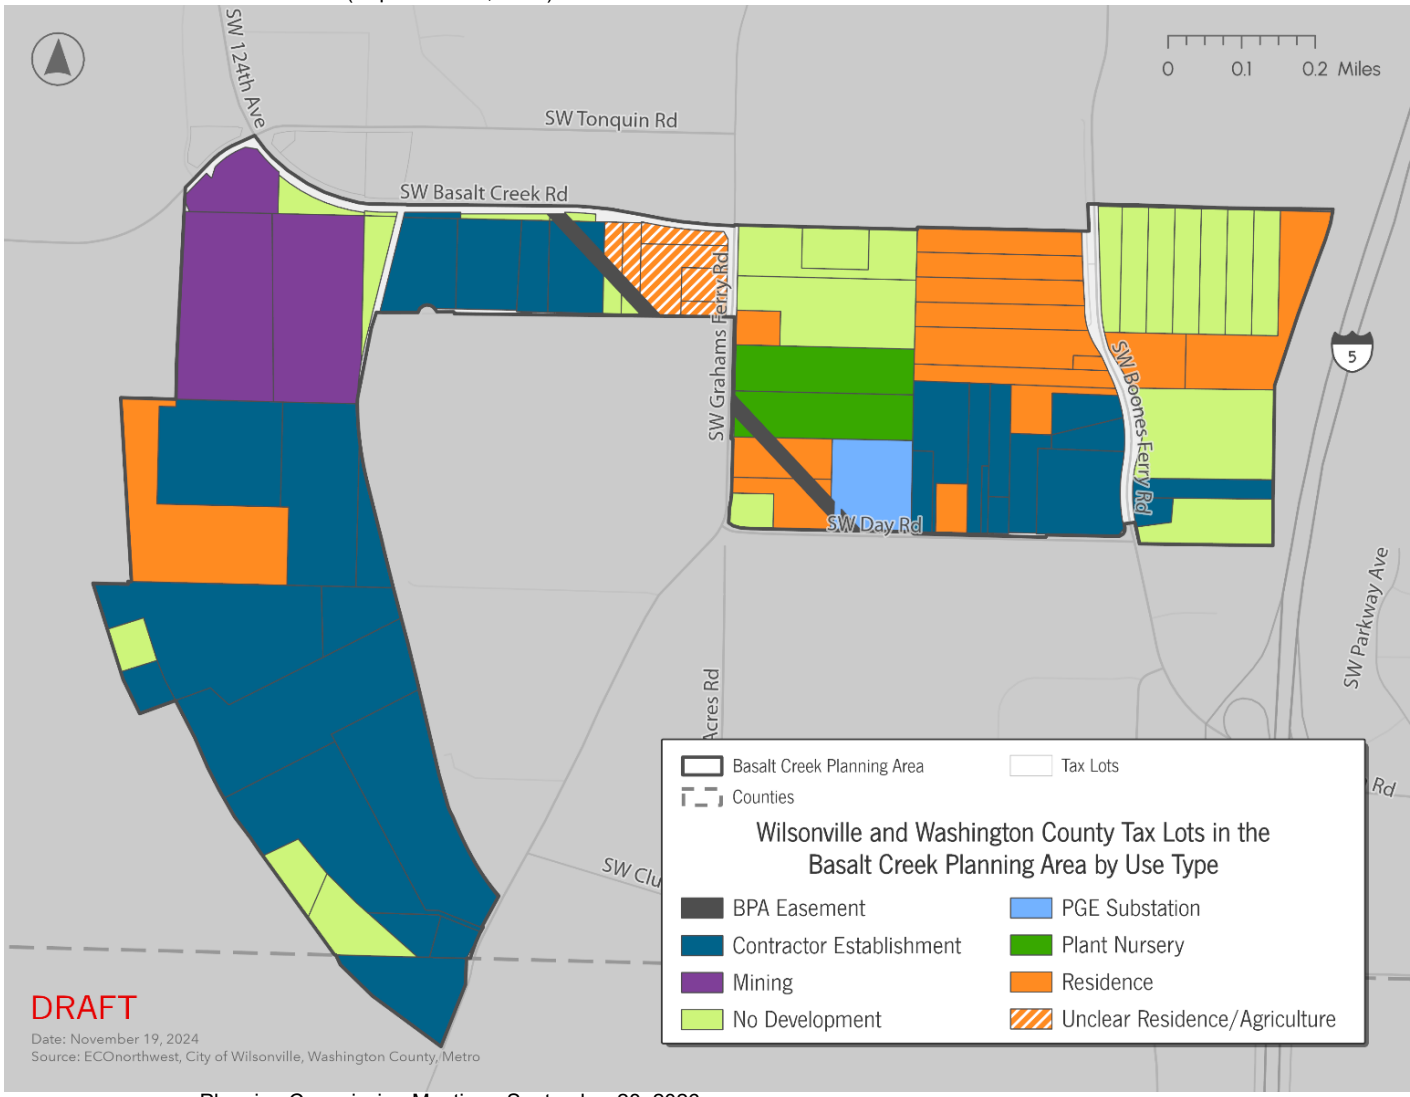


Development Constraints

127 acres considered undevelopable

Development Status

175 acres in active use and considered developed



Buildable Acres

150 acres considered buildable and available for development

Plan Designation	Total Buildable Acres	Buildable Acres on Vacant Lots	Buildable Acres on Partially Vacant Lots
Industrial	127	87	40
Undesignated	24	0.4	23
Total	**150**	**87**	**63**

Current Land Uses

Much of the land is used by contractor establishments

Site Suitability Analysis

ECOnorthwest

Which industries may be attracted to Basalt Creek?

- Semiconductor sector supply chain
- Clean Tech, including battery technology
- Advanced Manufacturing
- Distribution and Logistics
- Data Centers

Opportunity Sites

- **SW Greenhill Site:** Largely undeveloped with potential for near-term development
- **Craft Industrial Area:** Consider constraints and existing/neighboring uses
- **West Railroad Site:** Lacked a defined land use district in Concept Plan

Site Competitiveness Factors

- Site size and configuration
- Constraints
- Surrounding land uses
- Access to transportation and utility infrastructure
- Site-specific considerations

Evaluation of Uses: SW Greenhill Site

SW Greenhill Site

- Relatively flat, unconstrained site
- 57 total acres with 52 unconstrained (91% of area)
- 10 tax lots, 2 owners
- Largely undeveloped
- Proximity to existing infrastructure

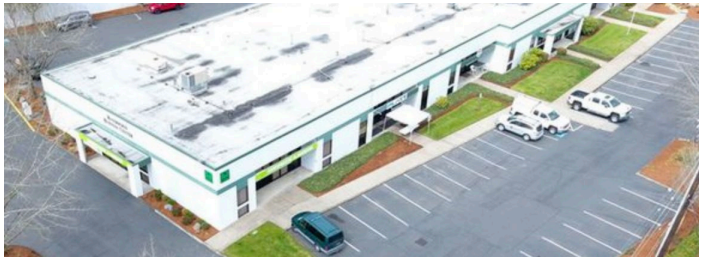
Potential users:

- High-tech supply chain
- Cleantech industries
- Advanced manufacturing
- Food processing
- Small warehousing and distribution
- Business and admin services; industrial business parks; R&D campuses.

Potential users align with the High Tech Employment district envisioned in the BCCP

Evaluation of Uses: Craft Industrial

Craft Industrial Area



- Highly constrained site, with constraints running north to south through site
- 32 total acres, 14 unconstrained split to the east and west (91% of area)
- 7 tax lots, 7 owners
- Existing residences
- Proximity to existing infrastructure

Existing residences, some of which are high-value, likely to extend redevelopment timelines relative to other opportunity sites

Potential users:

- Micro-uses such as live-work or makerspaces *(aligns with BCCP)*
- With site aggregation southeastern portion may be able support small-scale industrial condos and/or office user requiring up to 5 acres

Example small-scale industrial user:
Riverwood Business Center in Wilsonville

Evaluation of Uses: West Railroad Site

West Railroad Site

- Moderate constraints concentrated along western boundary and northern half
- 165 total acres with 90 unconstrained (55% of area)
- 15 tax lots, 8 owners (mix of land sizes)
- More challenging to serve with infrastructure
- Proximity to rail and mining

Potential users:

- General manufacturing
- Food processing
- Small warehousing and distribution
- Business and admin services
- Cleantech industries

The City is still exploring how infrastructure might influence industry suitability.

The project team is still assessing rail access and the potential impact of the railroad and nearby mining operations.

Redevelopment Feasibility of Existing Contractor Establishments

ECOnorthwest

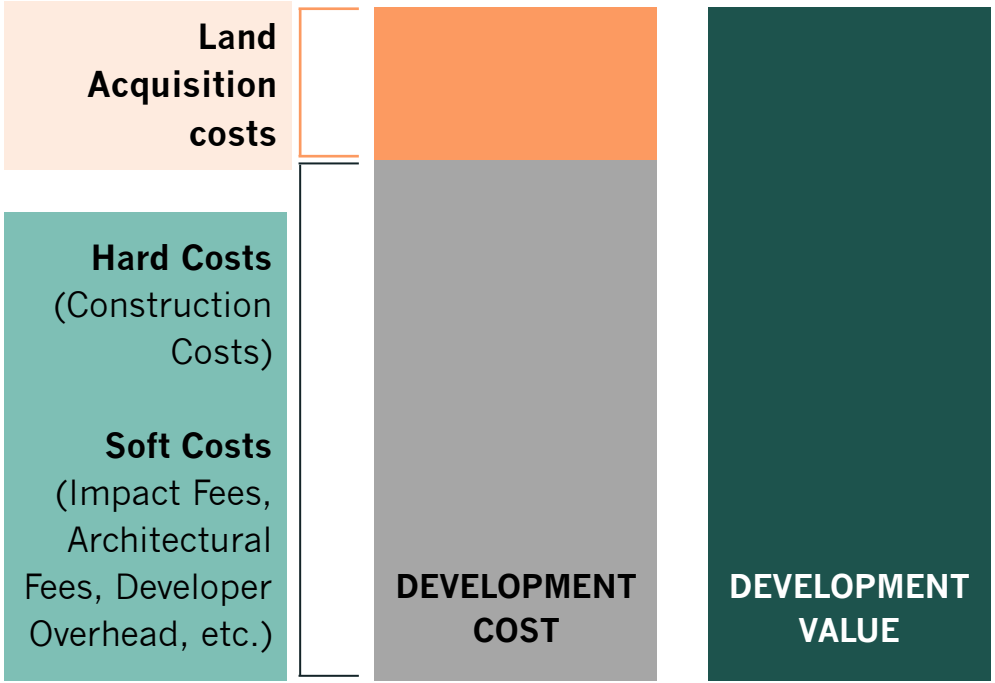
Key Question

What conditions are needed to promote and incentivize urban industrial development as envisioned in the BCCP?

Scenarios Evaluated

Site ownership and occupancy

- Owners of vacant or unused land
- Owners renting to contractor establishment tenants
- Owners using the land for their own contractor establishments



Site Utilization

- Low (20%)
- High (35%)
- Very high (45%)

Land and Construction Costs

- High
- Low

Pro Forma

If development cost is greater than development value than the project is not feasible

Key Findings / Considerations

- Current contractor establishments generate substantial revenue with minimal effort or risk, reducing financial incentives for redevelopment
- Rents would need to increase by 60%, if not double, to fund construction and create incentive to flip existing contractor establishments
- Owner-occupied sites face greater feasibility challenges when landowners want to maintain their business operations

Conclusion

- **Challenges:** Limited infrastructure, fragmented ownership, constraints, and preexisting low-density uses pose barriers to implementing the BCCP
- **Opportunities:** Strong industrial demand combined with development-ready sites and engaged property owners could present catalytic opportunities to spur further investment

The City's approach to addressing the challenges and opportunities depends on its desired outcomes and risk tolerance

Questions

- What comments or direction does Planning Commission have in response to the Buildable Lands Inventory and Site Suitability Analysis Memo? Does this align with the vision for Basalt Creek? If surprising, what questions would help guide future decisions?

- What input does Planning Commission have on the Redevelopment Feasibility of Contractor Establishments Memo? Does the Commission want planning efforts to focus on accommodating and managing contractor establishments as industrial businesses or encouraging their relocation and redevelopment of the land?

Chair Karr called for citizen input. There was none.

ADMINISTRATIVE MATTERS

2. Consideration of the November 13, 2024 Planning Commission Minutes

The November 13, 2024 Planning Commission minutes were accepted as presented.

WORK SESSION

3. Wilsonville Industrial Land Readiness(Basalt Creek) (Luxhoj)

Cindy Luxhoj, Associate Planner, stated the project team was requesting input on more draft work products for the first phase of the Wilsonville Industrial Land Readiness (WILR) project, noting City Council and Planning Commission work sessions on the associated Code amendments would occur January through April with adoption hearings expected in May or June. The documents presented tonight would further inform on what development types are viable under the current and future market conditions and what type of policy interventions would facilitate the development desired in the Basalt Creek area.

Nicole Underwood, ECO Northwest, presented the WILR work products via PowerPoint with key comments as follows:

- The Buildable Lands Inventory (BLI) update from the 2018 Basalt Creek Concept Plan provided a revised assessment of developable acres in Basalt Creek and identified lands with existing economic uses that may have redevelopment potential. She reviewed the existing land uses and stated that only 150 of the 453 acres in Basalt Creek were considered vacant, unconstrainted buildable acres and therefore, available for development. (Slides 3-7)
- The Site Suitability Analysis and draft Economic Inventory presented in October identified industries likely to be attracted to Basalt Creek. Site competitiveness factors, site specifics and potential uses for the SW Greenhill Site, Craft Industrial Area, and West Railroad opportunity sites were described. (Slides 8-14)
- Redevelopment Feasibility of Existing Contractor Establishments. Though permitted in Washington County, contractor establishments were not consistent with the vision in the Basalt Creek Concept Plan (BCCP) of increased job density ~~with~~ and especially, high wage jobs.
    - She described the modeling used to evaluate the feasibility of development projects, as well as the key findings and considerations, noting the 60% needed increase in rents was a revised estimate from the 33% provided in the memorandum. (Slide 19)
- In conclusion, given the challenges and opportunities, the City may need to use a “hands-on” approach to incentivize urban industrial redevelopment of contractor establishments in Basalt Creek; however, any recommended approach would depend on the City’s desired outcome and risk tolerance. (Slides 15-20)

The project team addressed questions from the Commission and the Commission provided feedback to the team’s questions (Slide 21) as follows:

- **Ms. Underwood** explained the list of potential industries came from the Cleantech Competitive Assessment report, which listed battery storage, and while battery manufacturing was not, it may still align with advanced manufacturing or other site characteristics. She stated she could return with more information.
    - Wind or solar equipment manufacturing was not suitable for the area due to the need for railroad access. The analyses' results were not definitive about which industries would not locate in Basalt Creek; it was just less competitive.
    - The 60% increase required in rent costs to encourage property owners to redevelop was an oversimplification of a very complex analysis with many factors; coming up with an exact number to communicate the analysis results had been challenging.
    - Additional slides "Results – Low Site Coverage" were displayed showing the current average market rent for urban flex industrial uses was $9 to $14 per sq ft and the total range of land and construction costs. With low land/construction costs, rents could be about $15.50 per sq ft. Using the average of the existing market rents and mid-range land/construction costs, the average rent cost would increase 60%. Key findings were focused around taken a more conservative and more likely, income-based approach to account for the rent revenue owners were already getting.
        - She confirmed property owners were getting an average $11.50 per sq ft for rent and would need closer to $25 per sq ft to make redevelopment feasible, making it unlikely that a developer because costs would exceed the project value.
- The City would not likely have any financial leverage or mechanisms to bridge that large of a gap or subsidize the difference in rental income to promote redevelopment.
    - **Ms. Underwood** explained "hands-on" approaches could include site aggregation and determining the City's role in infrastructure, especially in the West Railroad area.
        - The average rent cost of $9 to $14 per sq ft was for the I-5 South Corridor area, including Tualatin and Sherwood, based on the Economic Inventory. Given current market dynamics, she confirmed that even those rates were not financially feasible for developers.
        - She displayed an additional slide, "Very High Site Coverage Comps vs Income approach" noting that if the sites developed at 45% site coverage, rather than 20%, and land and infrastructure costs were kept low, required rent cost increases would be less than 60 percent. Low land costs could potentially be facilitated by the City.
        - She confirmed the findings of the Redevelopment Feasibility of Existing Contractor Establishments had only considered redevelopment of existing contractor establishments and did not include vacant land.
        - She agreed the Redevelopment Feasibility analysis presented significant challenges to the City with hurdles the City may not reasonably achieve.
- The construction workforce is aging with people leaving faster than they were entering, alongside increasing costs and supply chain issues. With the infill of the Metro area, contractor laydown yards were being pushed farther out, which also drove up costs. Keeping some contractor establishments in the area is good because it helps keep construction costs a little lower for the overall Metro area.

- While BCCP vision could still be realized someday, this was not the appropriate time given the current urban growth boundary and market conditions.
  - Many trucks could not fit under the 14-ft railroad overcrossing, which would be a huge infrastructure cost. The west side of Basalt Creek was not a viable option.
  - Completing the Craft Industrial and SW Greenhill buildouts may attract higher rents and fund redevelopment.
- **Associate Planner Luxhoj** sought input on whether planning efforts should focus on accommodating and managing contractor establishments versus encouraging and possibly incentivizing relocation in order to realize the vision in Basalt Creek, which had been a consideration while determining Code amendments and Zoning. The City could potentially accommodate contractor establishments by allowing them as a Conditional Use with limitations on expansion, rather than prohibiting contractor establishments and making them non-conforming. Staff recognized the value of contractor establishments to construction in the area and the increasing limitations on where these establishments could be located.
- **Daniel Pauly, Planning Manager,** added another consideration was potential site improvements over time. Often older existing homes are converted to offices or pole barns are constructed, which may not require building permits, and are converted to more intense uses later. How could the City facilitate and encourage improvements and more actively manage how contractor establishments mature over time, and how could these uses occur as quality development in the area? Some contractor establishments were nicely built.
  - He understood the zoning predating Washington County's FD-20 zoning allowed contractor establishments, and when FD-20 was adopted, the County did not want to make contractor establishments legal, non-conforming uses, which facilitated more contractor establishments moving into the area.
- **Miranda Bateschell, Planning Director,** added that since all County regulations applied, one issue is that sometimes the City was not engaged early enough to have any say regarding the potential impacts to Day Rd, potential dedication of right-of-way, etc. or ensuring the proportionality of impacts on the system. The Commission might consider how the County governs contractor establishments versus how the City might potentially facilitate, accommodate, and regulate contractor establishments moving forward, such as impacts to the system, screening standards, or other standards the City might want to regulate.
  - The Basalt Creek area is within the City's urban planning area for which the City had an agreement with the County. The County's FD-20 zoning designation would stay in effect until the City decides to annex the property. In Wilsonville, annexations were typically property-owner initiated. Typically, when developments in the urban planning area need access to services, the land is annexed, and the development would comply with City regulations. If contractor establishments were to be accommodated, ensuring those business types are an allowed use would be important if annexed into the city, which is more about how the property developed, not the use itself, versus having an industrial code in Basalt Creek where contractor establishments were not allowed.
  - Historically, Wilsonville has never annexed an entire area within the urban planning area. In Frog Pond West, each property submitted a development application and was annexed, and undeveloped parcels remained in the County until annexation. With these pre-

existing allowed uses, there is a lot more opportunity for the industrial area in the unincorporated County to develop prior to coming into the city.

- **Associate Planner Luxhoj** added the urban planning area agreement with Washington County could be amended or an intergovernmental agreement (IGA) could be created with Washington County to transfer the planning authority for these properties to the City without annexing the properties, so applications to build or expand a contractor establishments or other uses allowed in FD-20 would be submitted to the City for permitting, which would provide the opportunity to apply the City's standards to the developments. Troutdale had a similar agreement with Multnomah County.
  - **Planning Manager Pauly** noted no conversations had been held yet with Washington County regarding the possibility of creating an intergovernmental agreement.
- **Planning Manager Pauly** explained that typically, rural land is annexed and then developed in Wilsonville, but in other places, existing urban developments approved by Washington County were annexed to the adjacent city. The only specific examples of existing uses being annexed into Wilsonville were churches near the edge of the city limits that had been developed under County zoning and were later surrounded or needed utilities and were annexed into the city.
- Laydown yards did not generally need utility services and were less likely to ask for annexation.
  - **Planning Director Bateschell** agreed, noting contractor establishments often only had a few employees stopping by and the house turned office had septic service, which was sufficient since the property owners could show people were not on the site all the time, and the impact was mostly transportation. Day Rd and Garden Acres are City facilities, so the City wanted to have more input on allowing contractor establishments, which has been a struggle; however, oftentimes the properties were not connecting to water or sewer, so annexation was not triggered.
- Discussions were held previously on possibly annexing a portion of the West Railroad area to redo the railroad crossing and the road so trucks could use that road rather than looping through town
  - **Planning Director Bateschell** noted some property on the south side of Day Rd had been annexed as part of the Coffee Creek Industrial Area. Other properties along Day Rd could be annexed, but not until the zoning was set for the north side of Day Rd. While the City usually waited for property owners to initiate the annexation process, sometimes it was triggered by a request for a utility connection.
- Accommodating and managing contractor establishments made sense to the extent the City could without annexation, but encouraging relocation or redevelopment did not make sense at this time because in the City's big planning scheme, it was not a huge priority; unless the City had a vision for the land and wanted to actively invest in attracting a specific industry to the area.
  - **Planning Director Bateschell** noted with this new information and the passage of time since adopting the BCCP, the current conversations about Basalt Creek could potentially refine the vision to address some of the comments and ideas discussed. The BCCP is a foundation and its broad vision and goals, and guiding principles could still be used. Basalt

Creek was the only industrial area outside of Coffee Creek that was available for the city to grow into as part of its 20-year land supply and was an important consideration in planning and refining the vision for the future of Wilsonville's employment land.

- The City could potentially pursue specific industries with higher rent prices to justify development costs.
  - **Ms. Underwood** noted a high-intensity user like a data center in West Railroad could support infrastructure and lower development costs. Having a development plan for West Railroad that assembled multiple parcels for a much bigger area to impact the development potential would be useful.
  - With that suggestion, it made even more sense to manage the contractor establishments.
- **Ms. Underwood** explained from the analysis, many industries could be ideal for West Railroad, and the City could consider going after a specific industry like general manufacturing, food processing, and perhaps, warehousing and logistics, depending on the railway access, as well as other more advanced manufacturing industries. The mining north of the site could cause some complications or impacts.
  - She recalled Business Oregon and GPI both expressed excitement about Basalt Creek overall, adding City Staff could speak with them and other developers to see who may be interested in the site.
- Support was expressed for accommodating and managing contractor establishments, as the financial realities did not allow any other options and there were many challenges to manage upfront.
- Pursuing an IGA with the County for planning authority was a good idea to have more impact on design and ensure projects met the City's infrastructure requirements. The City should get more control over what the County was allowing contractor establishments to do.
- Wilsonville would be well-suited to keep its current precedent on annexation and continue on an owner-by-owner basis, rather than trying to force annexation.
- The conversation around the regional big picture and bringing in specific industry was appreciated. Perhaps resources were available at the state and federal levels to support bringing different kinds of industry to the Pacific Northwest.
  - **Ms. Underwood** noted the cleantech industries considered in the analysis had already been identified by the Oregon Task Force as having potential in Oregon.
- It was important to look beyond the next five years and not limit the approach to Basalt Creek based on what industry is "hot" right now.
- The infrastructure was a big concern. A lot of work is needed before the area is ready for industrial use. The rail bridge is a huge constraint as industrial uses would use 18-ft trailers and replacing a rail bridge is not inexpensive.

4. CFEC Parking (Pauly)

Planning Manager Pauly introduced the State Climate Friendly and Equitable Communities (CFEC) Parking Compliance and Standard Reform via PowerPoint, highlighting the legislative background leading to parking reform and parking rules, the City's project goals, and the purpose of the State rules. He described the two compliance phases, noting Parking A was already in

Attract high-quality industry and support economic opportunity for all in Wilsonville	Basalt Creek Concept Plan	

ISSUE BEFORE COMMISSION

Staff is seeking input from the Planning Commission on the draft Economic Inventory and Land Use Analysis for the first phase of the Wilsonville Industrial Land Readiness (WILR) project.

EXECUTIVE SUMMARY:

At the Planning Commission meeting on September 11, 2024, staff provided background about the first phase of the Wilsonville Industrial Land Readiness (WILR) project that is focused on the Basalt Creek Concept Plan (BCCP) area, including the Basalt Creek and West Railroad future industrial areas in northwest Wilsonville. This first phase of the WILR project lays the foundation for moving the Concept Plan area to a development ready status, thus enabling the City to accept development applications for industrial projects and realizing the area's economic development potential. The first phase includes, among other deliverables, conducting a focused Economic Inventory and Land Use Analysis to inform the drafting of zoning standards and creating an infrastructure funding plan.

The Economic Inventory and Land Use Analysis, prepared by ECOnorthwest, provides area-specific foundational information about economic activities in the Basalt Creek area in the context of local and regional markets and what industries may be expected to locate in the planning area in the future. Preliminary key findings of the analysis are listed below and the draft report is included as Attachment 1:

Key Findings of Economic Inventory/Land Use Analysis:

- Basalt Creek is strategically positioned for industrial development, with the potential to attract a variety of users. Industries that may be particularly attracted to Basalt Creek include:
    - Semiconductor supply chain businesses
    - Clean tech, including those involved in battery storage
    - Alternative energy technologies
- Realizing this potential, however, presents several challenges, particularly related to contractor establishments, which can hinder or complicate redevelopment efforts, availability of infrastructure, lot sizes and property aggregation, natural features including the Basalt Creek canyon, and growing power demands for industrial users.
- The City must navigate these challenges while working towards its vision for Basalt Creek: a diverse mix of industrial uses, higher employment density, high-wage jobs, an enhanced tax base, and increased community prosperity.

The analysis and related findings are preliminary and will be refined through further analysis, stakeholder engagement, and additional discussion with the Planning Commission and City Council. Upcoming tasks include completing the buildable lands inventory, conducting site suitability analyses for key locations, and assessing the feasibility of redeveloping contractor establishments. All these elements will ultimately be synthesized into a comprehensive final report outlining key findings and recommendations.

Following presentation of the project by staff, input is requested from the Planning Commission in response to the questions below:

- What questions or comments does the Planning Commission have about the Economic Inventory and Land Use Analysis report and related preliminary findings?
- Is there anything about the information presented that you find surprising or that changes your view of how the City should be thinking of the Basalt Creek planning area and implementation of the Concept Plan?

EXPECTED RESULTS:
Feedback from Planning Commission about this first phase of the WILR project will guide completion of the implementation items in the Concept Plan for the Basalt Creek and West Railroad planning areas, including drafting a package of proposed Code amendments, developing economic development strategies, and preparing an infrastructure funding plan.

TIMELINE:
Work sessions with the Planning Commission and City Council for the first phase of the WILR project are anticipated in October through December this year. Planning Commission and City Council public hearings on Code amendments are expected in early to mid-2025 with the infrastructure funding plan work occurring throughout 2025.

CURRENT YEAR BUDGET IMPACTS:
Funding for the current work on the first phase of the WILR project is allocated in the FY2024-25 Planning Division budget. The project is primarily funded by a $100,000 grant from Business Oregon. Additional funding, if needed, is available from a $290,000 Metro grant.

COMMUNITY INVOLVEMENT PROCESS:
The Basalt Creek Concept Plan review process included comprehensive community involvement to gather input. For the first phase of the WILR project, ECOnorthwest has focused on gathering input from Business Oregon, Greater Portland Inc., property owners, and developers, to understand demand for industrial land in Wilsonville as well as property owners' current and future plans for their property, to inform the economic inventory and site suitability analyses. This information also will be considered in determining appropriate zoning standards to apply and preparing needed Code amendments.

POTENTIAL IMPACTS OR BENEFIT TO THE COMMUNITY:
Adoption of appropriate zoning standards, creating an infrastructure funding plan, and identifying and pursuing economic development strategies will remove barriers to development and enable implementation of the Basalt Creek Concept Plan. When developed, the Basalt Creek and West Railroad areas will create jobs, thus contributing to the income and property tax base, support economic mobility for residents through family-wage employment in a highly livable, full-service City, and enable this industrial area to reach its full economic potential, resulting in positive impacts on the greater Wilsonville community.

ALTERNATIVES:
As zoning standards and an infrastructure funding plan are developed, a number of alternatives will be explored and developed with the Planning Commission.

Acknowledgments

ECOnorthwest prepared this report with support from the guidance and input of several partners, including members, staff, and leadership of the *City of Wilsonville*. Most notably we are appreciative of the involvement and input of *Cindy Luxhoj, Daniel Pauly, Miranda Bateschell, and Matt Lorenzen*. This work was financially supported by grants from *Business Oregon and Metro.*

That assistance notwithstanding, ECOnorthwest is responsible for the content of this report. The staff at ECOnorthwest prepared this report based on their general knowledge of the economics of recreation, amenities, and regional economies. ECOnorthwest staff contributing to this study included *Bob Parker, Nicole Underwood, Barrett Lewis, and Mackenzie Visser.* ECOnorthwest also relied on information derived from government agencies, private statistical services, the reports of others, interviews of individuals, or other sources believed to be reliable. ECOnorthwest has not independently verified the accuracy of all such information and makes no representation regarding its accuracy or completeness. Any statements nonfactual in nature constitute the authors' current opinions, which may change as more information becomes available.

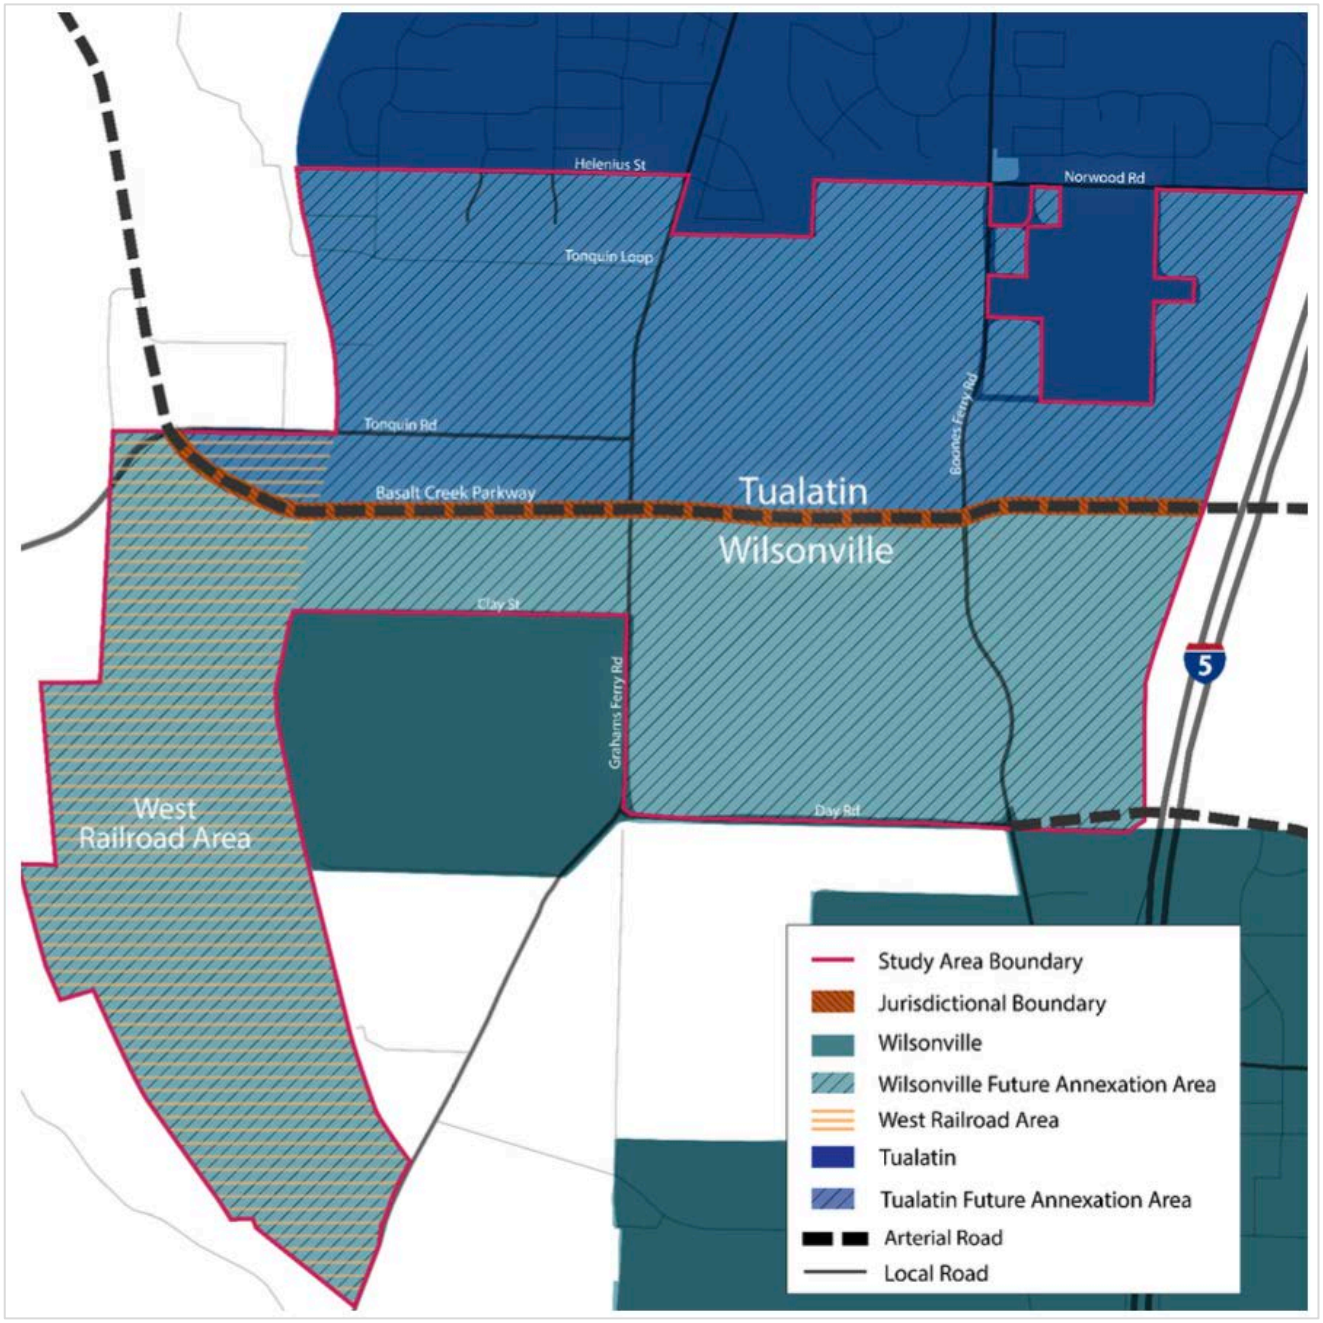
1. Introduction

Purpose and Background

After a multi-year planning process, Wilsonville, in partnership with Tualatin, developed and adopted the Basalt Creek Concept Plan (BCCP) in 2018. The BCCP established a framework for development in the area over the next twenty years. Wilsonville is planning for the development of its portion of the Basalt Creek Planning Area (BCPA), located in unincorporated Washington County.

The City adopted the BCCP in anticipation of future industrial development. However, at the time of adoption a number of implementation steps remained. In the years following the adoption of the BCCP, Washington County has approved development consistent with County zoning. The BCPA now hosts several contractor establishments that, while providing jobs and economic activity, are not the type of development or commerce envisioned in the Concept Plan.

The City is currently working on the final implementation steps to make the BCPA development ready. These steps include designating the zoning to be used in the area as well as refining infrastructure funding plans. Since adoption of the BCCP in 2018, significant economic shifts have occurred at national, state, regional, and local levels to be considered during the current implementation steps. Given these economic shifts, reassessing Basalt Creek's market conditions is crucial for Wilsonville's implementation process. This reassessment will help ensure that development plans align with current economic realities and future projections.



To understand the changing market conditions, Wilsonville engaged ECOnorthwest to conduct an updated market assessment and industrial lands study for Wilsonville’s portion of Basalt Creek. This Economic Inventory report is a key component of that study, providing an overview of the current economic conditions and trends affecting the BCPA. The findings from this analysis will inform recommendations on how to translate the BCCP’s land use concepts into zoning designations and inform infrastructure planning to support economic development opportunities in the area.

Basalt Creek Planning Area Overview

The Basalt Creek Planning Area (BCPA) is an 847-acre area located in unincorporated Washington County between the southern border of incorporated Tualatin and the northern border of incorporated Wilsonville. This report focuses on the Wilsonville section, which includes 480 acres within the designated Wilsonville Future Annexation Area and West Railroad Area (as depicted in Figure 1). The BCPA is centrally located in the southern portion of the Portland Metro, easily accessible and connected to other growing industrial areas, including Sherwood and Tualatin. It has access to the Portland Metro and Mid-Valley labor sheds, making it well-positioned to attract various types of industry.

Currently, the Wilsonville portion of the BCPA falls under Washington County's Future Development, 20-acre District (FD-20) zoning, which allows a variety of low-intensity uses. The area has limited development, with much of the developed land used for contractor establishments, including storage of equipment and vehicles. A contractor establishment is a facility where contractors and/or subcontractors store and organize their tools, equipment, supplies, and materials. These facilities can include buildings, grounds, or structures, and often have outdoor storage and assembly areas. While important uses, these lands host limited employment and assessed property value, much less than the employment densities and development typologies envisioned in the BCCP and typical of land within the Metro Urban Growth Boundary (UGB) and incorporated City limits.

Figure 1: Basalt Creek Planning Area

Source: Basalt Creek Concept Plan, 2018 Note: Wilsonville's portion of the Basalt Creek Planning Area (BCPA) is inclusive of the Wilsonville Future Annexation Area and West Railroad Area.

How does the Basalt Creek Concept Plan guide development?

After a multi-year planning process, Wilsonville, in partnership with Tualatin, developed and adopted the Basalt Creek Concept Plan (BCCP) in 2018. The BCCP established a framework for development in the area over the next 20 years. The BCCP identifies preferred land uses across the area and strives to coordinate future land use, transportation, and infrastructure investments between Tualatin, Wilsonville, and Washington County. In particular, the BCCP:

- Established a vision for urbanization of the Basalt Creek Planning Area
- Established a new jurisdictional boundary between Tualatin and Wilsonville (to determine which parts of the Planning Area may be annexed into and served by each City)
- Identified conceptual land uses across the area
- Recommended high-level designs for transportation and infrastructure systems to support future development
- Set specific action items and implementation measures

GUIDING PRINCIPLES

Guiding Principles represent the collective interests and goals for the Basalt Creek Planning Area as agreed to and established by the Joint Councils of Tualatin and Wilsonville.

- **Maintain and complement the Cities' unique identities.**
- **Capitalize on the area's unique assets and natural location.**
- **Explore creative approaches to integrate jobs and housing.**
- **Create a uniquely attractive business community unmatched in the metropolitan region.**
- **Ensure appropriate transitions between land uses.**
- **Meet region responsibility for jobs and housing.**
- **Design cohesive and efficient transportation and utility systems**
- **Maximize assessed property value**
- **Incorporate natural resource areas and provide recreational opportunities as community amenities and assets**

Land Use Designations

The BCCP identified a mix of land use designations for the area based on its land suitability analysis and adjacent land uses. For Wilsonville, the BCCP proposed four main land use designations. However, West Railroad did not include a specific concept because it was viewed as having lower development potential and was slated for future study and consideration. These designations, as defined in the BCCP, are:

HIGH-TECH EMPLOYMENT DISTRICT

Most of the buildable acres in the Planning Area south of the proposed Basalt Creek Parkway are devoted to a mix of higher-density employment land. The High-Tech Employment District is expected to accommodate the largest number of jobs (1,916) with a mix of warehousing, manufacturing, and office buildings. This land use is in the southern and eastern sections of the Planning Area, covering all Wilsonville land east of SW Boones Ferry Road and most of the land south of SW Clay Street extending to SW Day Road and bordered to the west by Coffee Creek Correctional Facility.

The BCCP assumed the following breakdown of uses for the High-Tech Employment District which helped estimate the amount of traffic the development would generate.

Table 1. BCCP Assumed Breakdown of Uses for the High-Tech Employment District

USE	SHARE
Retail	1%
Office	45%
Industrial	38%
Warehousing	15%
TOTAL	**100%**

Source: Basalt Creek Concept Plan, 2018 Note: Share may not equal 100% due to rounding.

CRAFT INDUSTRIAL

The southwest corner of the intersection of SW Boones Ferry Road and the new Basalt Creek Parkway is planned as Craft Industrial, which allows for a mix of smaller-scale commercial uses, which may include live-work units. These envisioned development types respond to the topography on those parcels and their location directly south across the Parkway from residential land and southwest of the neighborhood commercial node across the Parkway in Tualatin. Craft Industrial is a better fit with those surrounding uses, providing a transition to the higher intensity employment uses to the south. This area allows less than 20 percent residential use and is expected to accommodate 27 new jobs and 6 new housing units in the form of live-work units.

The BCCP assumed the following breakdown of uses for the Craft Industrial District which helped estimate the amount of traffic the development would generate.

Table 2. BCCP Assumed Breakdown of Uses for the Craft Industrial District

USE	SHARE
Retail	24%
Office	31%
Industrial	44%
Warehousing	1%
TOTAL	**100%**

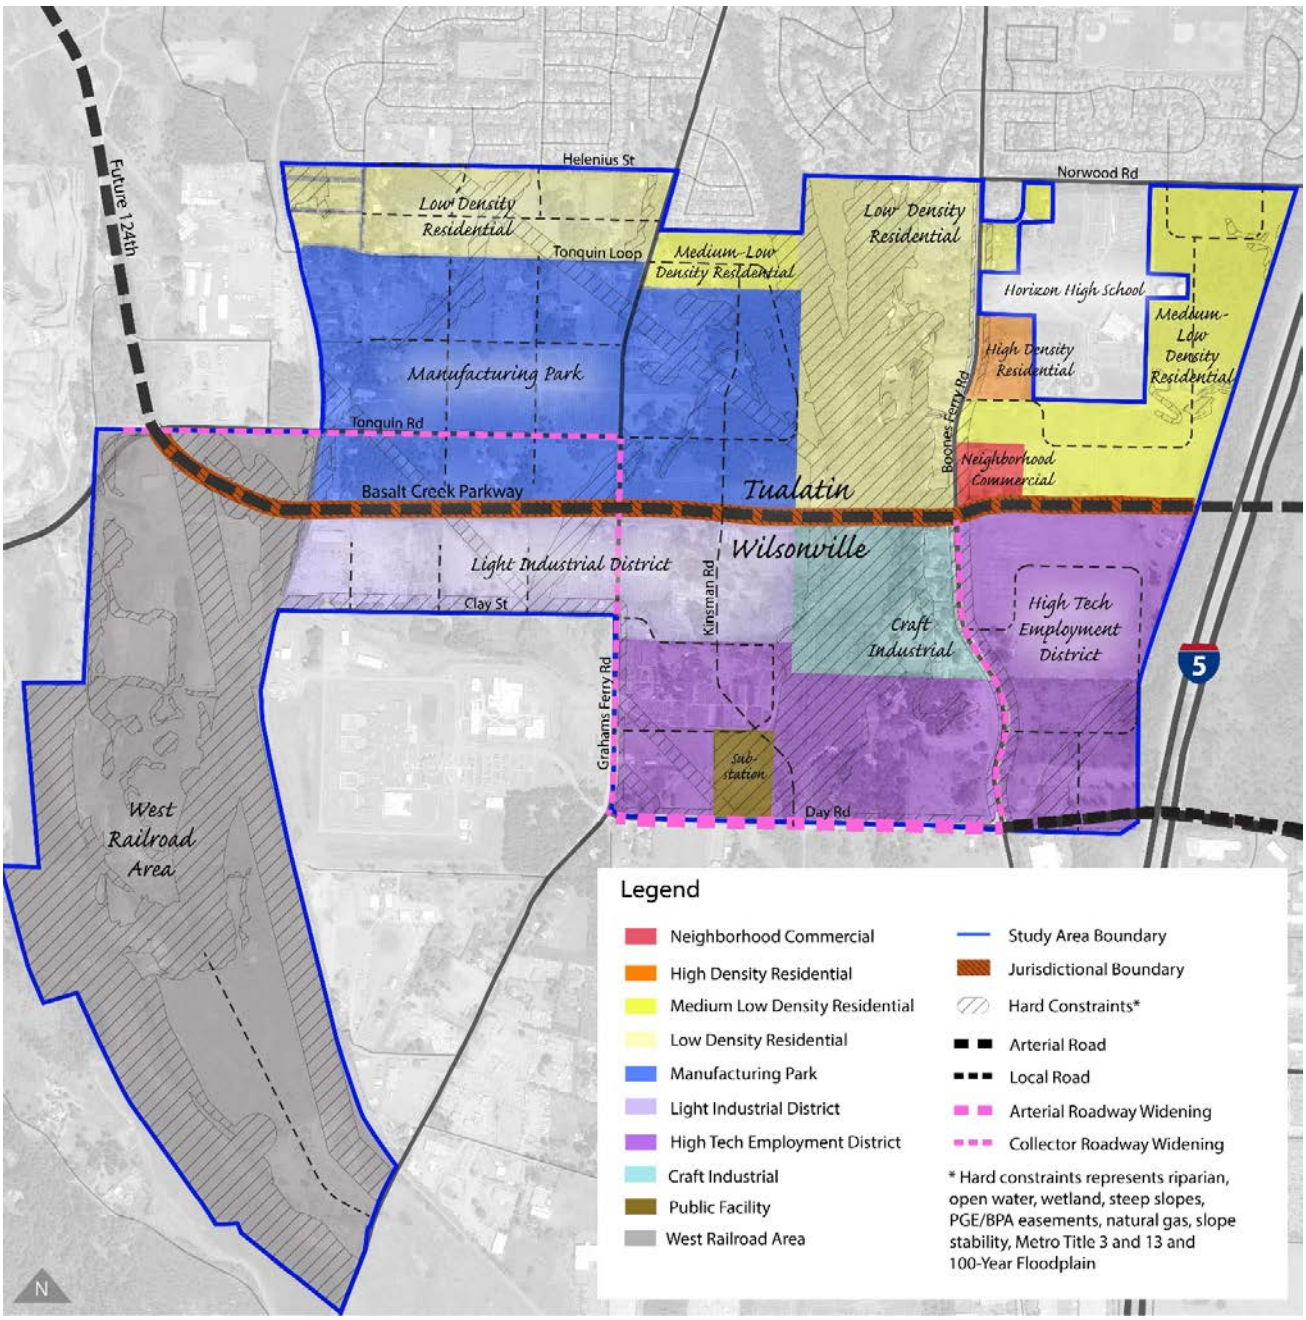
Source: Basalt Creek Concept Plan, 2018 Note: Share may not equal 100% due to rounding.

LIGHT INDUSTRIAL DISTRICT

This land is located across the southern edge of the existing and future extension of Basalt Creek Parkway just north of Coffee Creek Correctional Facility and will be able to accommodate 581 new jobs primarily in warehousing and light manufacturing.

The BCCP assumed the following breakdown of uses for the Light Industrial District which helped estimate the amount of traffic the development would generate.

Table 3. BCCP Assumed Breakdown of Uses for the Light Industrial District



USE	SHARE
Retail	1%
Office	19%
Industrial	69%
Warehousing	11%
TOTAL	**100%**

Source: Basalt Creek Concept Plan, 2018 Note: Share may not equal 100% due to rounding.

WEST RAILROAD AREA

The West Railroad Area is divided from the rest of the Planning Area by the Portland and Western Railroad (PNWR) and the Coffee Creek Correctional Facility. When the BCCP was adopted, the area was heavily constrained by wetlands habitat, steep slopes, and fragmented property ownership. Initial estimates indicated that it would be costly to serve this area with adequate infrastructure due to its location. However, it was identified as having potential for resource conservation, future public access to nature, and possibly additional land uses. Because it was considered to have much lower development potential than the rest of the Planning Area, a future land use scenario was not created. Additional analysis on infrastructure funding and appropriate land uses was recommended once development and extension of infrastructure occurred in the rest of Basalt Creek.

Figure 2. Basalt Creek Land Use Concept Map

Source: Basalt Creek Concept Plan, 2018

Note: West Railroad did not include a specific concept because it was viewed as having lower development potential and was slated for future study and consideration.

Implementation Measures

The BCCP also outlined the following implementation measures for the Cities:

1. **Update Urban Planning Area Agreements (UPAAs)** to acknowledge the future jurisdictional boundary and outline what areas may be annexed by each City, as well as transfer planning authority to the Cities.
2. **Amend Comprehensive Plans** to include the adoption of the Concept Plan.
3. **Assess zoning** and make sure it is compatible with anticipated land uses in the area and special design elements in the Concept Plan. The Concept Plan suggested Wilsonville consider applying the Coffee Creek Industrial Design Overlay District (form-based code) in the area.
4. **Annex as demand occurs** based on the pace of development and begin to make utility improvements adjacent to existing City services.
5. **Consider capital improvements** to spur development, either via financing the infrastructure themselves for reimbursement, creating a cooperative financing district, or developing the infrastructure to induce desired development.
6. **Consider master planning** in the area.

Wilsonville updated its UPAA in 2019 and amended its Comprehensive Plan after the Concept Plan was adopted. The City is now working on developing zoning and evaluating infrastructure needs as a part of this project.

Basalt Creek Concept Plan Proposed Employment Densities

The BCCP assigned employment densities to each land use designation to align with the regional employment capacity and traffic counts. According to the Concept Plan, the Wilsonville portion of the BCPA could support 2,524 jobs across 136.6 buildable acres, for an average employment density of 18.5 employees per gross buildable acre. The specific land use designations and respective employment densities are shown below. Note: West Railroad did not include a specific concept because it was viewed as having lower development potential in the near term and was slated for future study and consideration.

Table 4: Basalt Creek Concept Plan Land Use Designations

LAND USE DESIGNATION	BUILDABLE ACRES	TOTAL JOBS	JOBS PER GROSS BUILDABLE ACRE
Craft Industrial	1.3	27	21.7
Light Industrial District	35.3	581	16.5
High Tech Employment District	94.5	1,916	20.3
Functionally Unbuildable	5.6	0	0
TOTAL	**136.6**	**2,524**	**18.5**

Source: Basalt Creek Concept Plan

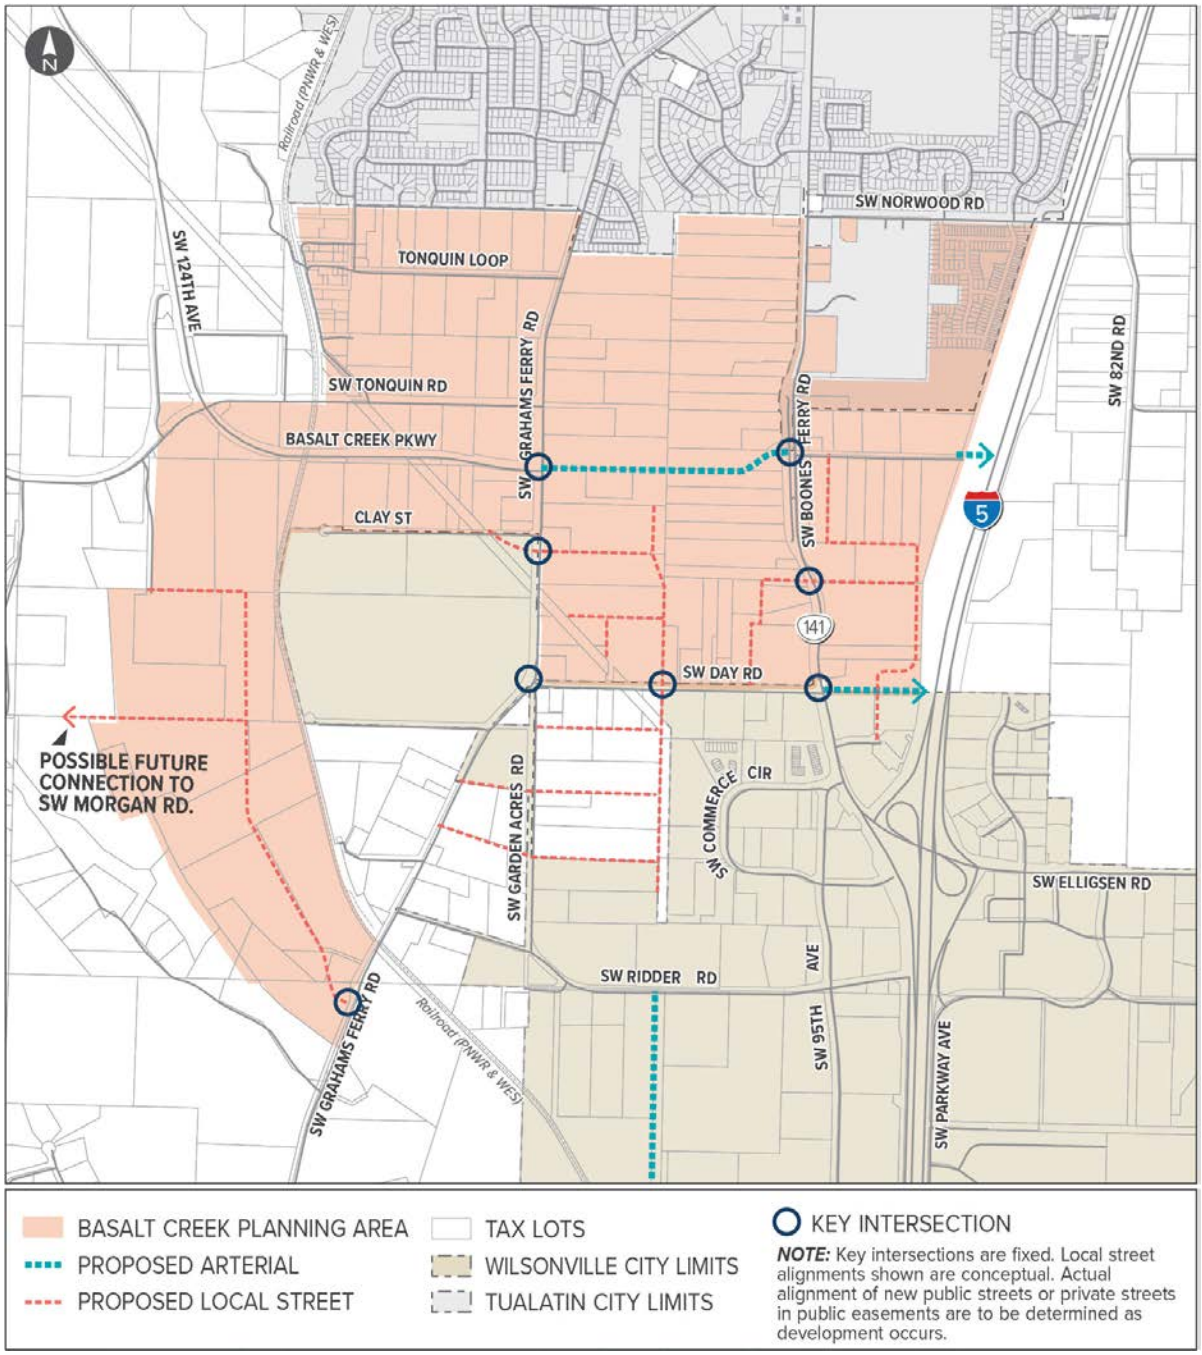
Other Guiding Plans and Documents

WILSONVILLE COMPREHENSIVE PLAN

Wilsonville's Comprehensive Plan, updated in 2024, designates Basalt Creek and West Railroad as areas of special concern (M and N), and describes special considerations that must be addressed in development of these areas. Design objectives established for Area of Special Concern M, Basalt Creek, include:

- Consider adopting a form-based code similar to that adopted in the Coffee Creek Industrial Area for new industrial development in Basalt Creek.
- Protect key natural resources and sensitive areas while making recreational opportunities accessible by integrating the new parkland, open spaces, natural areas and trails in Basalt Creek into existing regional networks. Development should protect, enhance, and provide access to these natural resources.
- Locate north to south trails near the Basalt Creek Canyon and provide bicycle connections that would connect to other cities and trail systems, serving as an asset for both residents and employees in the area.
- Provide strong transit access to support employment within Basalt Creek. Integrate transit access with the bike, pedestrian, and trail services at key access points along SW Grahams Ferry Road, SW Boones Ferry Road, SW Day Road, SMART Central, and the Coffee Creek Correctional Facility.

No design objectives were included for Area of Special Concern N, West Railroad, however, it is noted that the area will require additional planning before any development occurs.



BASALT CREEK TRANSPORTATION REFINEMENT PLAN

The 2013 Basalt Creek Transportation Refinement Plan (TRP) set the layout of major new roads and improvements for the area, including enhanced bike and pedestrian facilities and connections to the future SMART transit system. The TRP included an Action Plan the consisted of 18 transportation investments that were prioritized according to short-term, medium-term and long-term projects.

ONGOING INFRASTRUCTURE AND NATURAL RESOURCE PLANNING

The City is currently collaborating with several consultants to update its understanding of infrastructure needs, natural resources, and hazards in the BCPA. The City is working with DKS Associates to refine the street alignment in the BCPA. A preliminary street alignment, provided below, may undergo further changes in future iterations.

Figure 3. Proposed BCPA Street Plan

Source: DKS Associates

Simultaneously, Pacific Habitat Services is assisting the City in updating and refining natural hazard and resource maps of the area. For utility infrastructure, the City has engaged Consor to assist in assessing water, wastewater, and stormwater needs, as well as determining the costs of necessary upgrades. These collaborative efforts aim to provide a comprehensive and up-to-date overview of the area's development requirements and environmental considerations. These simultaneous projects will be incorporated and inform this planning process as information becomes available.

What has happened since the Basalt Creek Concept Plan was adopted?

Since adoption of the BCCP, significant shifts have occurred in the office and industrial real estate markets. The pandemic accelerated the trend toward remote work, leading to higher office vacancy rates and a redefinition of office space needs. Conversely, the industrial sector experienced strong growth driven in part by the federal Creating Helpful Incentives to Produce Semiconductors (CHIPS) and Science Act and characterized by high demand, rising rents, and robust development. National trends in these industries are detailed in Section 2, while regional and Wilsonville-specific trends are covered in Section 3.

The City of Wilsonville has not annexed any of Basalt Creek since the BCCP was adopted in 2018. As a result, the BCPA has remained under Washington County's jurisdiction and zoning. Some development has occurred, but at much lower densities than envisioned in the BCCP, which is allowed under the more permissive County zoning code. Many existing businesses, including contractor establishments, have few employees and are using large areas of land for equipment storage, which conflicts with the City's vision for higher employment density. These uses are permitted under Washington County zoning, but do not align with Wilsonville's goals for the area, or with the goals, priorities, and industrial land needs within the greater Portland Metro area. Wilsonville's portion of the BCPA consisted of 90 tax lots in 2022. Some areas have a high degree of parcelization, while others are less fragmented. There are a handful of large contiguous land holdings by single ownership. While there has been growth in contractor establishments, many of them existed before the BCCP was in place. These trends are discussed in more detail in Section 3.

The City is interested in future development in Basalt Creek that better aligns with its vision for higher industrial employment density. To make meaningful progress, the City must first establish appropriate zoning designations and plan for necessary infrastructure—key objectives of this project.

2. Changes in Market Conditions

Following the COVID-19 pandemic, office and industrial real estate markets faced challenging development conditions, particularly due to high interest rates, significantly slowing commercial real estate development activity. The increased cost of capital has made many projects economically unfeasible, especially speculative projects that rely on debt financing and those with longer loan payback periods.[1] Higher interest rates have also reduced property valuations, complicating the ability of developers to secure construction financing and attract equity investments.[2] Additionally, rising construction costs—driven by inflation and supply chain disruptions—have further complicated development efforts across these sectors.

This section examines national trends that have shaped office and industrial real estate markets in recent years. It compares these trends to projections from the 2014 Market Analysis by Leland Consulting Group, which informed the BCCP. Understanding the broader national context is crucial for several reasons. It provides a benchmark for comparing local performance. National trends often influence regional and local markets, albeit sometimes with a delay. This understanding helps identify potential opportunities or challenges that may affect Wilsonville and Basalt Creek in the future. It also allows for more informed decision-making and strategic planning at the local level.

Regional and Wilsonville-specific trends are addressed separately in Section 3, building upon this national overview.

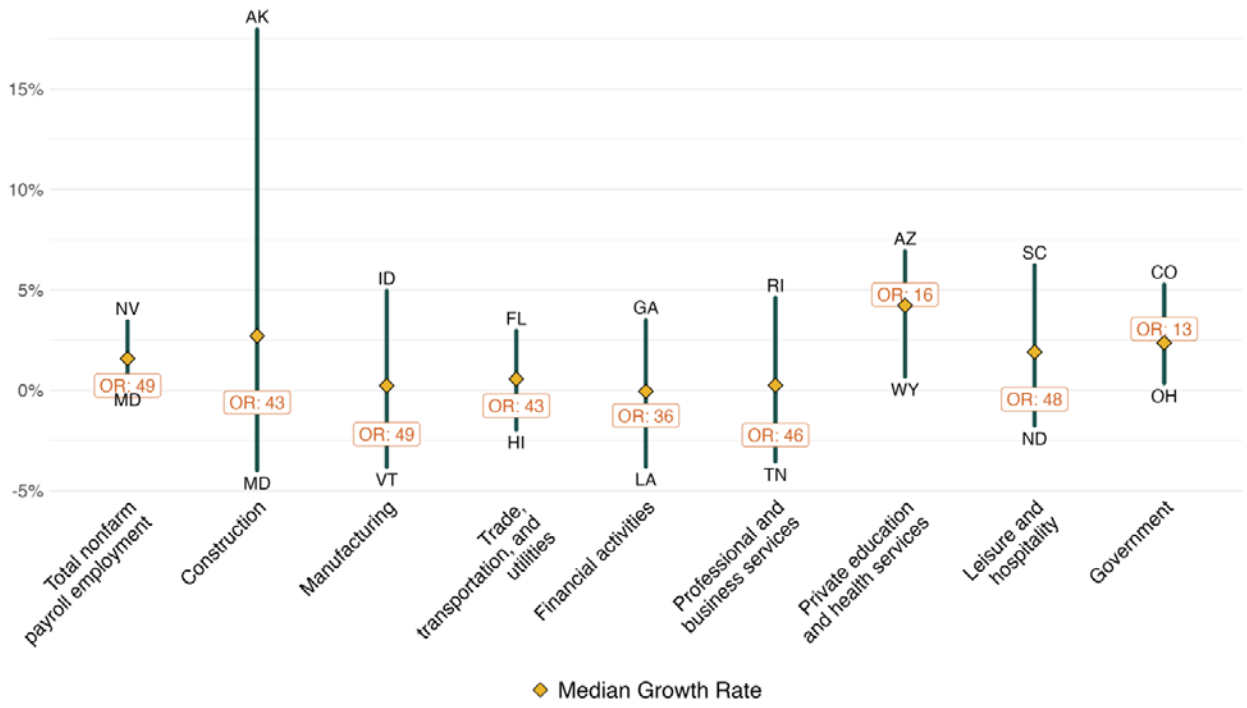
National and State Employment Trends

National Employment

The United States has seen robust employment growth since the COVID-19 pandemic. National employment increased by 21 percent between April 2020 and April 2024, surpassing pre-pandemic levels. The most recent year (April 2023 to April 2024) saw total non-farm employment grow by 1.8 percent.[3]

Oregon Employment

Oregon's employment recovery, while positive overall since 2020, has fallen behind the national trend. From April 2020 to April 2024, the state's employment grew by 17 percent.



---

[1] If developers take on debt to finance a project, the longer they take to repay the loan the more interest will accrue.
[2] In addition to loans, developers will typically finance projects in part with equity investments, in which investors become shareholders in the project.
[3] U.S. Bureau of Labor Statistics, Total Nonfarm Employment (not seasonally adjusted), 2020-2024

However, in contrast to national growth, Oregon experienced a slight decline of 0.1 percent in employment between April 2023 and April 2024.[4]

The state's recent economic performance is concerning across multiple sectors. Oregon ranked 49th out of all states in nonfarm employment growth rate between April 2023 and April 2024. During this period, the state was among the bottom ten for employment growth (losing jobs while other states saw gains) in manufacturing, construction, trade, transportation and utilities, professional and business services, and leisure and hospitality.

Figure 4. Employment Growth Rates for All States by Sector (April 2023 to April 2024)

Source: U.S. Bureau of Labor Statistics Current Employment Survey, April 2024 Note: This figure compares Oregon's employment growth rate to all other states. For example, "OR: 49" for total nonfarm payroll employment means Oregon ranked 49th out of all states in employment growth rate between April 2023 and April 2024.

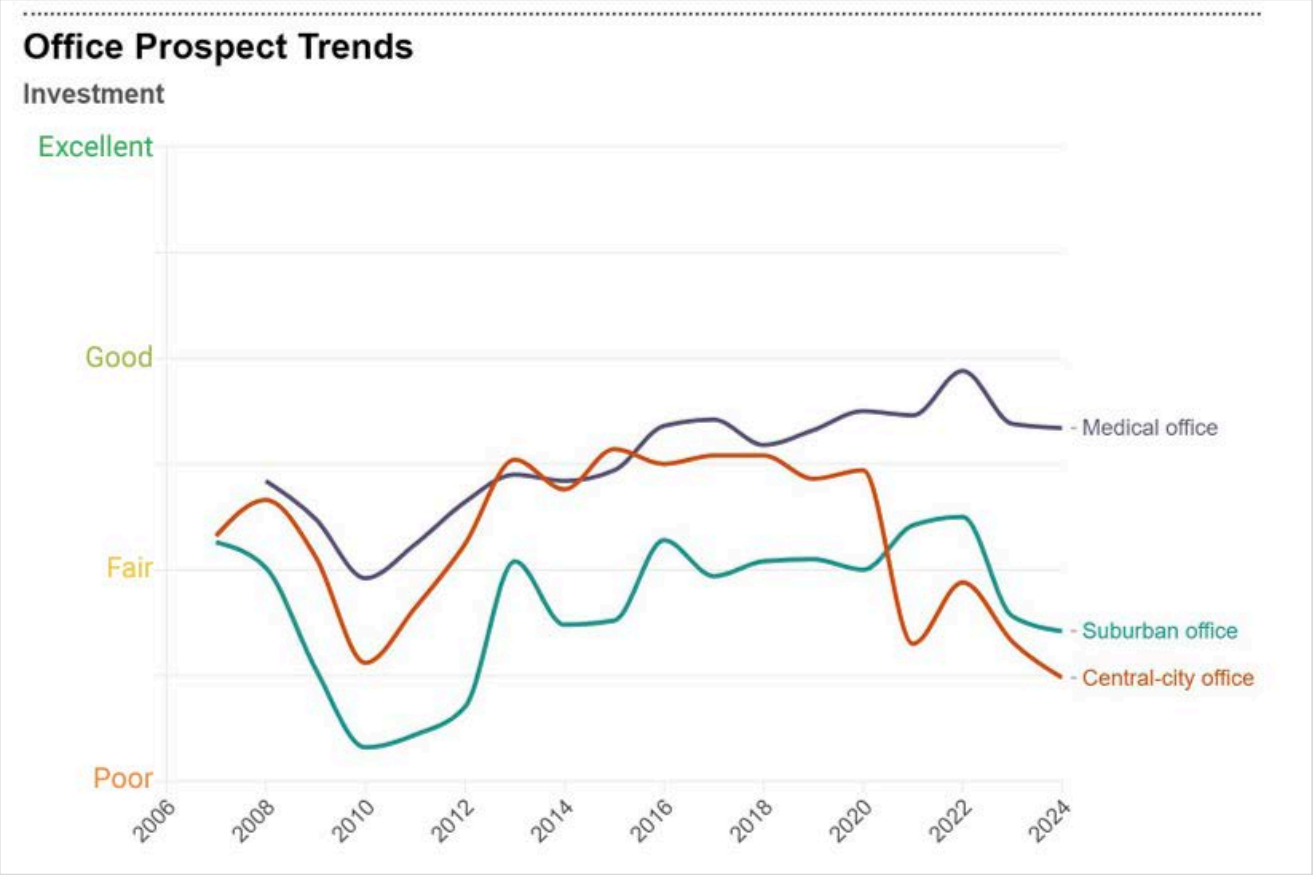
[4] U.S. Bureau of Labor Statistics, Total Nonfarm Employment (not seasonally adjusted), 2020-2024

National Office Trends

This section describes national trends for office space, not including industrial, manufacturing, or flex space, which is discussed in the following subsection. The 2014 Market Analysis, which informed the Basalt Creek concept planning process, highlighted a reduced demand for office space and a less robust market, predicting a slower pace for office development. This outlook was based on the fact that regional employment levels in Portland had only recently returned to their pre-recession levels of 2008.

These trends have been further exacerbated by the COVID-19 pandemic and resulting market shifts toward remote work. According to the Bureau of Labor Statistics' American Time Use Survey, the share of employees working from home rose from 24 percent in 2019 to 34 percent in 2022.[5] Nationally, the office market as a whole is declining, although high-quality office space remains in relatively strong demand. Key findings include:

- **Negative net absorption:** National net absorption for office space came in negative (at negative 18.2 million square feet) for the tenth quarter in a row.[6] However, this trend is not uniform across U.S. markets, with a third of U.S. office markets having positive net absorption. JLL, a global commercial real estate and investment management company that tracks and reports on commercial real estate dynamics, noted that many properties and markets with high negative net absorption are earmarked for conversion to other uses.[7]
- **Shrinking inventory:** The construction pipeline has decreased by 67 percent since early 2020. As of Q2, 2024 office deliveries (referring to new construction added to the market) were 27 percent below the average since 2020, and the current pipeline is at its lowest point in a decade.[8] As office inventory removals outpace market deliveries, overall office market inventory has declined.[9]
- **Favored product types:** Certain types of office space are outperforming others, with tenants favoring high-quality buildings, such as those in attractive locations or featuring additional amenities. With new construction slowing down, existing high-quality assets will likely continue to see demand as competition decreases. In contrast, older and obsolete spaces may require investment or conversion, and the performance of middle-market spaces will vary depending on factors like location, space type, and submarket.[10]



Looking ahead, the office sector is expected to adjust to a hybrid work model, with peak attendance levels stabilizing at around 60 to 70 percent. This shift will set a new baseline for office space requirements. Cushman & Wakefield predicts that office occupancy will start to stabilize in the latter half of 2025, as the pace of adjustments to hybrid spaces

[5] BLS, American Time Use Survey, 2023; does not differentiate between part- and full-time workers

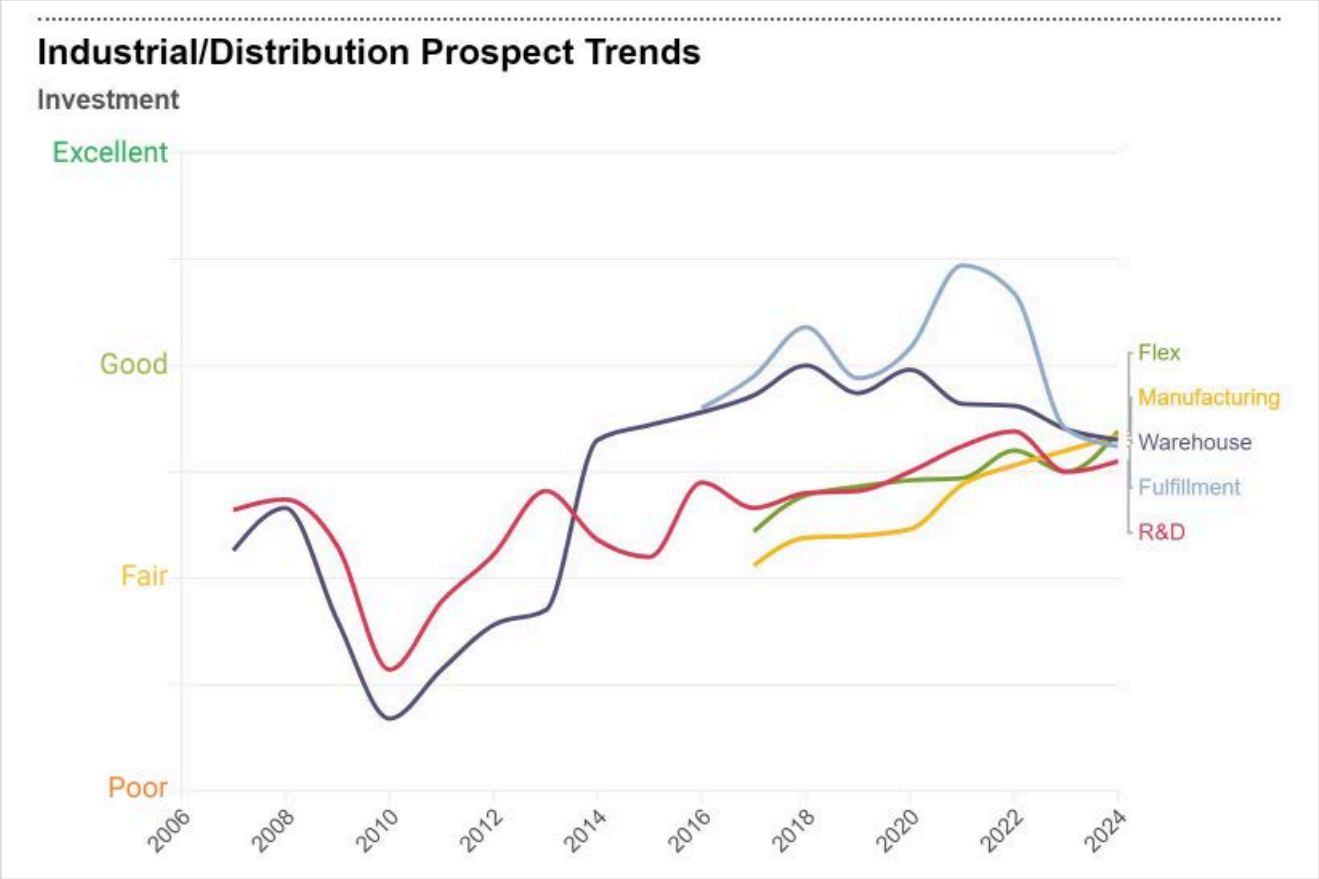
[9] JLL, JLL U.S. Office Outlook Q1 2024
[10] Cushman & Wakefield, U.S. Office Marketbeat Q2 2024

slows down and growth in both employees and new businesses generate demand for office space. [11]

Figure 5 shows the Urban Land Institute's national office market investment prospect trends by secondary market type. While the investment prospect for suburban and central city office space has fallen between "poor" and "fair" in recent years, the investment prospect for medical office space has risen relatively steadily and is rated just below "good".

Figure 5: Urban Land Institute National Office Investment Prospect Trends

Source: Urban Land Institute 2024 Emerging Trends in Real Estate, United States and Canada



[11] Cushman & Wakefield, U.S. Office Marketbeat Q2 2024

National Industrial Trends

The 2014 Market Analysis, which informed the Basalt Creek concept planning process, reported that industrial space demand was likely to surge as the economy continued to recover from the 2008 recession, citing significant industrial space in the Portland region's development pipeline. It also highlighted that the I-5 South submarket would see some of the greatest demand, predicting that industrial development would continue to outpace office development—an accurate forecast.

The 2014 Market Analysis also correctly predicted stronger markets for research and development, advanced manufacturing, general manufacturing, and warehousing space. Figure 6 shows the Urban Land Institute's trends in investment prospects for industrial and distribution space nationally, showing increased development prospects for these space types from 2014 to around 2021. Historically, fulfillment and warehouse space were rated as better investment prospects than research and development, manufacturing, and flex space. However, in recent years the investment prospects for the various secondary market types have coalesced toward a similar prospect rating, just below "good".

Figure 6: Urban Land Institute National Industrial and Distribution Prospect Trends

Source: Urban Land Institute 2024 Emerging Trends in Real Estate, United States and Canada

In recent years, the industrial real estate market has shown strong performance, particularly in 2022 and 2023, though growth has started to slow in 2024. Despite this slowdown, the national industrial market remains relatively robust overall. Key trends include:[12]

- **Stabilizing vacancy rates:** Since mid-2022, vacancy rates have been rising, but the pace of increase has slowed. As of Q2 2024, the national vacancy rate stands at 6.1 precent and is expected to continue increasing. However, it remains below the 10-year pre-pandemic average (2010-2019) of 7 percent.
- **Positive net absorption:** Industrial market demand remains strong, with positive net absorption and rising rents. However, the rate of change has slowed compared to previous years. For instance, rents rose by 3.7 percent year-over-year since 2023 Q2, marking the slowest growth rate since 2020.
- **Slowing construction:** One reason for rising vacancy rates is the influx of new supply, with over 1.2 billion square feet delivered nationally in 2022 and 2023. However, the construction of new industrial projects has slowed significantly, decreasing by 46 percent from Q2 2023, reaching its lowest point in four years.

Nationally, the market is expected to stabilize over the next year as the shrinking construction pipeline and positive net absorption limit the available supply of industrial space. However, Cushman & Wakefield report that "the tailwinds of e-commerce growth, onshoring and nearshoring, and a resilient consumer all set the stage for fundamentals to trend positively going forward, albeit at a pace below 2021 and 2022 highs."[13][14] Key forecasted trends include:

- **Decreasing vacancy rates:** While vacancy rates are expected to continue to rise until early 2025, they are expected to peak at around 6.7 percent and then begin to decrease in the second half of 2025. In conjunction with this trend, annual net absorption is expected to increase through 2025.[15]
- **Increasing rents:** Although the rate of rent increase is expected to slow, asking rents for industrial space are anticipated to continue growing through 2025.[16]
- **Manufacturing growth:** According to JLL, the sustained growth in manufacturing due to reshoring trends (returning production to the United States) will likely continue to drive industrial demand nationally. Supply chains will seek strategically located facilities that can accommodate localized manufacturing, efficient distribution, and resilient inventory management systems.[17]

3. Wilsonville Basalt Creek Updated Market Assessment

The Basalt Creek Concept Plan (BCCP) was based on a market assessment conducted in 2014. In the decade since, significant changes have occurred in employment patterns and market conditions. This section provides an updated analysis of regional and Wilsonville-specific employment trends, current forecasts, and present market dynamics, building on the national overview in Section 2.

This updated information establishes a new baseline for understanding Basalt Creek's current market context. Additionally, this section evaluates Basalt Creek's competitive strengths and weaknesses and identifies industries most likely to establish a presence in the area.

Employment Trends and Forecast

In 2022, Wilsonville's employment landscape was characterized by a strong concentration in industrial sectors, with manufacturing, wholesale trade, and construction making up 43 percent of the City's total employment—a much higher share compared to the broader tri-county region. This focus on industrial jobs sets Wilsonville apart, highlighting its distinct role in the regional economy.

Employment Trends

In 2022, Wilsonville had 21,383 covered employees, representing 2.2 percent of the region's covered employment.[18] The City's top three sectors are manufacturing (17.8 percent, 3,796 jobs), wholesale trade (14.4 percent, 3,083 jobs), and construction (10.5 percent, 2,248 jobs). These three industries combined represent 43 percent of Wilsonville's total employment, nearly double the 22 percent share these sectors hold in the broader tri-county region (Clackamas, Multnomah, and Washington Counties).

This concentration in industrial jobs sets Wilsonville apart from the surrounding area. While Wilsonville's top sectors are manufacturing, wholesale trade, and construction, the tri-county region's largest employers are in health care and social assistance, government, and manufacturing.

Table 5: Industry Distribution, Wilsonville and Tri-County Region, 2022

SECTOR	WILSONVILLE		TRI-COUNTY	
	2022 COVERED EMPLOYMENT	SHARE OF EMPLOYMENT	2022 COVERED EMPLOYMENT	SHARE OF EMPLOYMENT

Source: QCEW

[18] **Covered** employment includes employees covered by unemployment insurance. Examples of workers not included in covered employment are sole proprietors, some types of contractors (often referred to as "1099 employees"), or some railroad workers. Covered employment data is from the Oregon Employment Department.

Over the past decade, Wilsonville's employment grew slightly faster than that of the tri-county region. This growth was largely driven by an increase in construction jobs, which more than tripled during this period. Although the tri-county region also experienced growth in construction jobs, Wilsonville's rate of growth was considerably higher. Wilsonville also had strong employment growth in wholesale trade. Notably, while wholesale employment rose in Wilsonville, it declined across the broader tri-county region.

In contrast, Wilsonville experienced a decline in manufacturing employment, even as the region saw growth in this sector. Wilsonville maintained stable employment in the transportation and warehousing sector while the tri-county region grew substantially.

Table 6: Change in Employment, Wilsonville and Tri-County Region (2012 to 2022)

SECTOR	CHANGE 2012-2022			
	NUMBER		PERCENT	
	WILSONVILLE	TRI-COUNTY	WILSONVILLE	TRI-COUNTY

BASALT CREEK PLANNING AREA EMPLOYMENT

The BCPA (Wilsonville portion only) grew in employment from 2012 to 2022, with 275 covered employees reported as of 2022. The average wage in the BCPA was $85,863, which is higher than both the tri-county ($73,995) and City average wages ($74,252), suggesting these are relatively well-paying jobs.

Table 7. Change in Employment and Wage, BCPA 2012-2022

YEAR	TAX LOTS	ESTABLISHMENTS	EMPLOYMENT	TOTAL PAY*	AVERAGE WAGE*
2012	80	11.0	194	$9,593,330	$49,450
2022	90	10.0	275	$23,612,269	$85,863
CHANGE	**10**	**-1**	**81**	**$14,018,939**	**$36,413**

Source: QCEW
*not inflation adjusted

Wilsonville's portion of the BCPA consisted of 80 tax lots in 2012 and 90 tax lots in 2022. Some areas in the BCPA have a high degree of parcelization, while others are less fragmented. There are a handful of large contiguous land holdings by single ownership. In 2012, 8 tax lots had businesses with covered employment, increasing slightly to 10 tax lots in 2022. Employment density on lots with covered employment remains low at 4.4 employees per acre as of 2022, with most tax lots having no covered employment at all.

Table 8. Lots With and Without Covered Employment in the BCPA, 2012-2022

	2012			2022		
	TAX LOTS	ACRES	EMPLOYMENT DENSITY	TAX LOTS	ACRES	EMPLOYMENT DENSITY
With Employment	8	62	3.1	10	63	4.4
Without Employment	72	410	n/a	80	406	n/a
Total	**80**	**472**	**0.4**	**90**	**469**	**0.6**

Source: QCEW Note: The minor change in acreage from 2012 to 2022 resulted from constructing of the Basalt Creek Parkway and small adjustments in the recording of tax lots over that period.

It is important to note that these figures only account for covered employees.[19] Some of the land in the BCPA is actively used despite minimal reported employment. The area is primarily used for contractor establishments, including storage yards for various businesses, which typically require fewer employees. It is likely that additional workers are present but not included in the covered employment estimates, such as sole proprietors or other types of uncovered contractors. Due to the prevalence of storage-focused contractor establishments, many lots have minimal building improvements. The improvement-to-land value ratio is low and has changed little over the past decade.

Table 9. Improvement to Land Value, BCPA, 2012-2022

	LAND VALUE	BUILDING VALUE	IMPROVEMENT TO LAND VALUE
2012	$16,577,800	$6,738,020	0.41
2022	$32,892,790	$16,996,440	0.52

Source: Regional Land Information System (RLIS)

[19] **Covered** employment includes employees covered by unemployment insurance. Examples of workers not included in covered employment are sole proprietors, some types of contractors (often referred to as "1099 employees"), or some railroad workers. Covered employment data is from the Oregon Employment Department.

Employment Forecast

Between 2020 to 2045, the City is projected to grow by 3,471 employees at an average annual growth rate of 0.7 percent. This rate is faster than Tualatin but slightly slower than Sherwood and the region overall. Washington County is projected to grow the fastest of the three counties in the region.

Table 10: Metro Employment Forecast, 2020 to 2045

			CHANGE 2020-2045		
	2020	2045	NUMBER	PERCENT	AAGR

AAGR = Annual Average Growth Rate

The Oregon Employment Department (OED) forecasts the strongest growth for the Portland tri-county region in commercial sectors from 2022 to 2032 led by information, leisure and hospitality, and private education and health services. However, OED also predicts growth in industrial sectors, with the strongest relative growth in the construction industry followed by transportation, warehousing and utilities.

Table 11: Portland Tri-County Industry Projections, 2022 to 2032

INDUSTRY	EMPLOYMENT		CHANGE	
	2022	2032	NUMBER	PERCENT

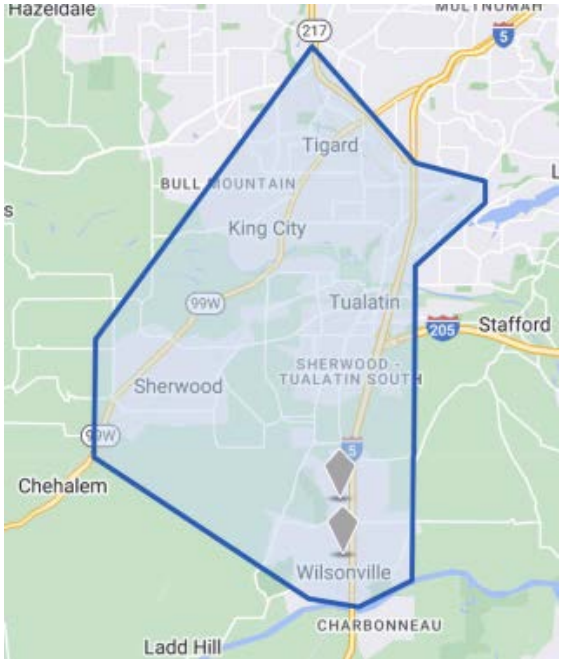
Real Estate Market Trends

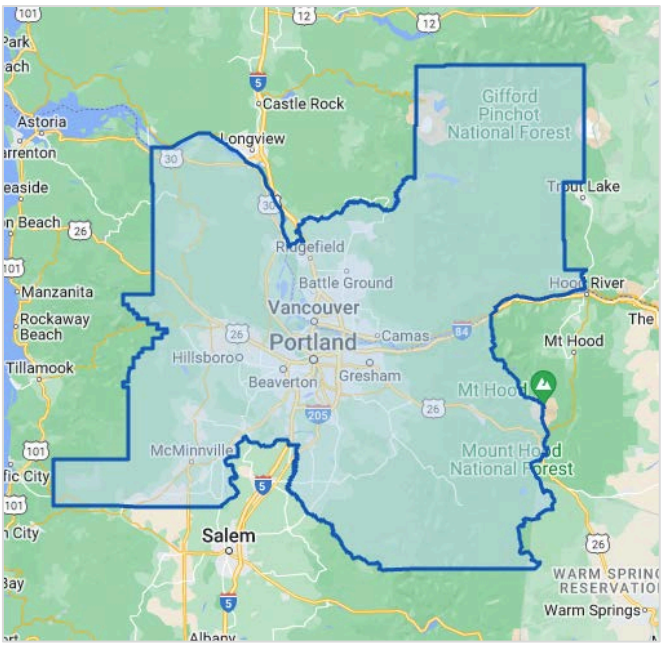
The real estate market trends in Wilsonville and the Portland region generally align with the national trends outlined in Section 2. While Wilsonville's office market typically has a lower vacancy rate compared to the broader region, it has had consistently negative net absorption and recent spikes in the vacancy rate, reaching over 12 percent in 2024.



More positively, Wilsonville's industrial market has a relatively low vacancy rate, large average building sizes, and a variety of industrial space types that could appeal to a mix of tenants. Wilsonville is also well-positioned to benefit from promising industrial trends in the broader region, including investments in semiconductor manufacturing and market growth that could attract tenants to the area. However, industrial development in Wilsonville has been limited over the past decade. Only 1.7 percent of its total industrial space has been built in the last 10 years, compared to 11 percent in the broader Portland metro area. According to CoStar, in the past five years three buildings have been under construction in Wilsonville: one completed in 2022 and two slated to be completed in 2025.

NOTE ON COSTAR DATA

While CoStar data provides valuable, up-to-date data across a wide range of metrics, data quality is more limited in smaller markets and at the property level. The data here should be read as an indication of overall market statistics and trends, rather than an exact reflection of all properties in a given market.



This section analyzes real estate market trends for various submarkets encompassing the BCPA, including the I-5 South submarket (Figure 7) and the Portland Metro area (Figure 8).

Figure 7: I-5 South Submarket Boundary

Office Market Trends

Portland Metro Regional Trends

Like the national office space market, office spaces in the Portland Metro are experiencing high vacancy rates and lower leasing activity. Work-from-home policies have decreased the demand for office space. Consequently, tenants have increased bargaining leverage; they are pressuring landlords to reduce rates, increase lease concessions, and raise tenant improvement budgets. Despite these adjustments, an increase in vacancies is expected, with interest rates and economic uncertainty adding volatility to the office market.[20] Other key findings include:

- **Record high vacancy rates:** High vacancy rates have continued to climb, reaching a record high of 13.3 percent vacant office space in 2024 Q2.[21]
- **Continued negative net absorption:** Net absorption in the Portland market was just over negative 500,000 square feet in 2024 Q2, the fourth quarter in a row of negative net absorption. Since the beginning of 2020, the Portland office market has only had positive net absorption for five quarters.[22]
- **Leasing activity:** Leasing and sales activity are on par with 2023, indicating that the vacancy and absorption trends are due to companies exiting the marketplace or downsizing at a higher rate, likely due to continued work-from-home policies.[23]

However, the Portland office market is not uniform, with the suburban office market performing better than the downtown and regional office markets. The Portland suburbs' office vacancy rates are 8.6 percent, compared to 23.9 percent downtown.[24]

Wilsonville Office Market

Wilsonville currently has roughly 1.4 million square feet of office space, representing roughly 18 percent of office space in the I-5 South submarket and 1 percent in the broader Portland Metro region. According to CoStar, over the past decade, one office building was added to Wilsonville's market in 2020, located at 29250 Southwest Town Center Loop West. This office building was about 30,000 square feet or roughly 2 percent of Wilsonville's total office space. Over the same time period, the Portland Metro added a greater share (9 percent) of space to its office market. These projects, on average, have been significantly

larger than usual office buildings, with a few very large projects surpassing 100,000 square feet.

Table 12: Office Space Development Trends, 2014 to 2024

GEOGRAPHY	TOTAL BUILDINGS	TOTAL SQUARE FEET	AVERAGE BUILDING SIZE
ALL OFFICE DEVELOPMENT			
Portland Metro	6,217	118,809,170	19,110
I-5 South Submarket	431	7,533,437	17,479
Wilsonville	62	1,358,335	21,909
BUILT IN THE LAST 10 YEARS			
Portland Metro	66	10,354,342	156,884
I-5 South Submarket	4	80,976	20,244
Wilsonville	1	30,000	30,000

Source: CoStar, pulled August 2024

Per Costar, the I-5 South submarket office vacancy rates have been higher than the Portland Metro's vacancy rates since 2014 although vacancy rates have been much more similar since 2022. Both have vacancy rates above 13 percent as of July 2024. While Wilsonville office vacancy rates have remained much lower, the end of a few leases are reflected in vacancy rate spikes in 2020, 2022, and 2024, when the vacancy rate spiked closer to the Portland metro average.

Figure 9: Office Vacancy Rate Trends, 2014-2024

Source: CoStar, pulled August 2024

Office rents have increased in the I-5 South submarket despite high vacancies, and they remain substantially above the Portland Metro region's average, according to Costar. Historically, office rents in Wilsonville have been lower than in the Portland Metro area. However, since an initial decline in 2020, rents in Wilsonville have risen steadily, reaching over $26 per square foot, now equal to the Portland Metro average for the first time in a decade.

Figure 10: Office Lease Rate Trends, 2014-2024

Source: CoStar, pulled August 2024

Net absorption and delivery trends also indicate a relatively slow office market. From 2019 to 2024 Q3, net absorption was negative in all three areas. Over the same time period, net absorption in the Portland metro area was negative 4.6 million square feet, negative 387,000 square feet in the I-5 South submarket, and negative 122,000 square feet in Wilsonville.

Industrial Market

Portland Metro Regional Trends

Like the national industrial market overall, the Portland Metro area industrial market has been strong in recent years, particularly from 2021 to 2023. However, similar to national trends, a few metrics indicate that demand for industrial space is decelerating in the region:[25]

- **Increasing vacancy rates:** Vacancy for industrial space in the Portland Metro region has risen steadily since early 2023, and net absorption was negative in both Q1 and Q2 of 2024. While overall leasing activity for industrial space in the area remained higher than the area's 10-year average, a few large companies downsizing or exiting the market contributed to negative net absorption and vacancy trends.
- **Slow lease-up for new construction:** The delivery of 1.2 million square feet to the market in early 2024 also contributed to the region's supply of vacant industrial space. However, newly constructed industrial space has been slow to lease up, with 93 percent of recent leasing activity in buildings built before 2010.
- **Rising unemployment rates:** In early 2024, Portland's unemployment rate (4.1 percent) surpassed the national average (3.8 percent) amid layoffs, including the shutdown of a large UPS location in North Portland, which impacted 300 sorting and distribution jobs.

However, investors and leasing professionals are confident in the regional market's long-term health, particularly due to significant investments in the region's semiconductor manufacturing sector.[26] Market strengths include:

- **CHIPS Act:** In 2022, the federal government allocated $50 billion as a part of the CHIPS Act to bolster U.S. semiconductor manufacturing, which is expected to create thousands of regional manufacturing and construction jobs.[27] The expansion of the semiconductor industry could also have a ripple effect, creating demand for industrial space for equipment suppliers, supply chain materials manufacturers, and testing facilities.
- **Strong submarkets:** According to market reports from Cushman & Wakefield and CBRE, other strong industrial submarkets include food and beverage warehousing, tech warehousing, and auto part manufacturing.[28] These are some of the most common types of tenants seeking space in the market, although deals are taking longer on average to reach completion.[29]

---

[25] CBRE, Q2 2024 Portland Industrial Market Update
[26] Cushman & Wakefield, Industrial Marketbeat Q2 2024 Portland Industrial Report
[27] Cushman & Wakefield, Industrial Marketbeat Q2 2024 Portland Industrial Report
[28] Cushman & Wakefield, Industrial Marketbeat Q2 2024 Portland Industrial Report
[29] CBRE, Q2 2024 Portland Industrial Market Update

- **Market growth:** Current forecasts estimate that 2.4 million square feet will be delivered to the market in 2024, roughly 1 percent of the current Portland industrial space inventory. As reported by CBRE, investors and leasing professionals are confident that the Portland market has additional room for growth.

Wilsonville Industrial Market

Wilsonville has about 8.6 million square feet of industrial and flex space, representing roughly 24 percent of the I-5 South submarket and 3 percent of the Portland metro region's industrial space. The average size of Wilsonville's industrial building is roughly 63,000 square feet, almost twice as large as the average industrial building in the broader Portland metro (34,000 square feet).

Wilsonville has had limited industrial development in the past decade. Only 1.7 percent of Wilsonville's total industrial space was built in the last 10 years, compared to roughly 11 percent of the I-5 South submarket and Portland metro industrial space. This slow pace of development makes sense given the limited supply of developable industrial land in the City, and more precisely, the development constraints that exist on those lands.

Table 13: Industrial & Flex Space Development Trends, 2014 to 2024

GEOGRAPHY	TOTAL BUILDINGS	TOTAL SQUARE FEET	AVERAGE BUILDING SIZE
ALL INDUSTRIAL DEVELOPMENT			
Portland Metro	7,535	257,487,989	34,172
I-5 South Submarket	900	35,089,559	38,988
Wilsonville	137	8,605,081	62,811
BUILT IN THE LAST 10 YEARS			
Portland Metro	278	30,328,230	109,094
I-5 South Submarket	50	3,848,383	76,968
Wilsonville	2[30]	145,611	72,806

Source: CoStar, pulled August 2024

[30] The two buildings listed in CoStar are located at 96500 SW Parkway Ave (2025) and 10680 SW Clutter Road (2022). However, city staff noted three others, the Black Creek development in the Coffee Creek industrial area and two SSI Shredding facilities.

Wilsonville's industrial vacancy rate has remained below 6 percent for most of the past decade. In 2020 and 2021 Wilsonville saw a brief spike in vacancy, likely driven by the COVID-19 pandemic, which quickly dropped to just over 1 percent in 2022. As of July 2024, Wilsonville's combined industrial and flex space vacancy rate was 2.6 percent (Figure 12). Wilsonville's industrial vacancy rate has been below the Portland Metro since 2021. As of July 2024, the Portland Metro had a vacancy rate of 5.9 percent and I-5 South submarket had a vacancy rate of 4.5 percent.

Figure 11: Industrial & Flex Vacancy Rate Trends, 2014-2024

Source: CoStar, pulled August 2024

Triple net industrial rents in Wilsonville increased from 2014 to 2020 and were generally higher than the Portland Metro Region over the period.[31] Wilsonville shows a large drop in lease rates between 2020 and 2021, likely due to COVID-19 impacts. However, rates rebounded in 2022, reaching $15.35 per square foot in July 2024, higher than the Portland Metro ($12.03) and I-5 South submarket ($12.99). The combination of rising rents and very low vacancy rates suggests a robust industrial market in Wilsonville, potentially attracting new development, especially speculative development.

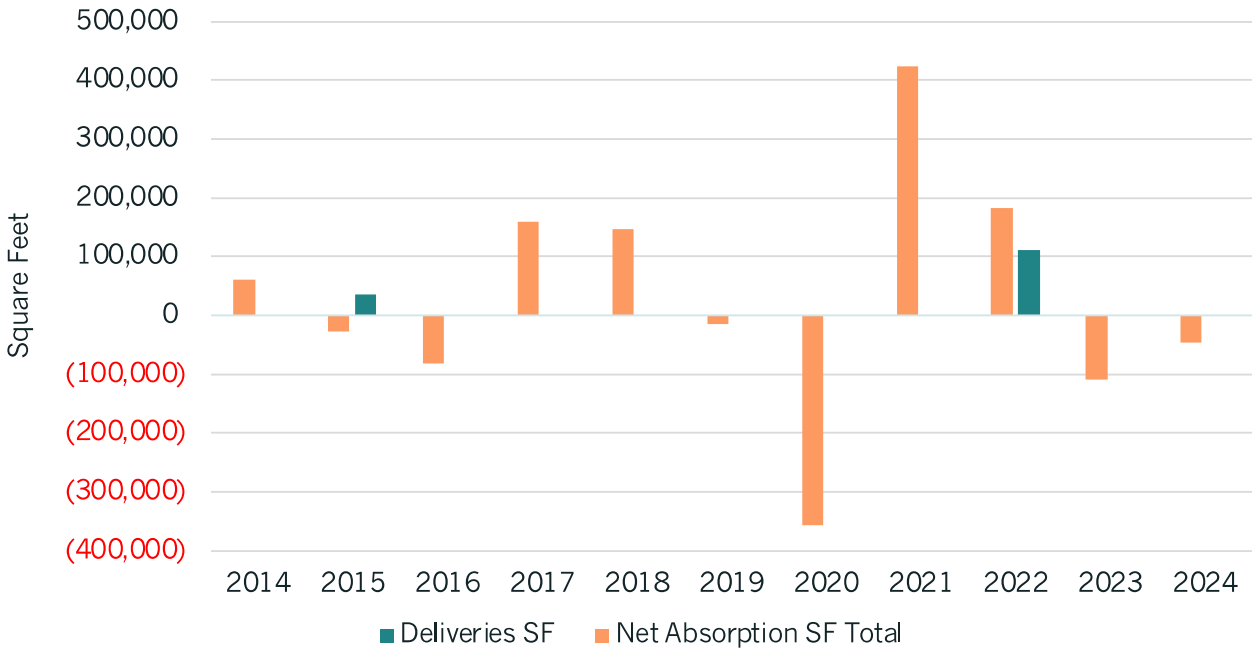

Figure 12: Industrial & Flex Rents Trends, 2014-2024

Source: CoStar, pulled August 2024

[31] Triple-Net (NNN) rents are annual rents on a per square foot basis not including any pass-through expenses such as taxes, insurance, and any utilities or maintenance costs, which are passed on to the tenant and paid separately.

Net absorption has been generally positive for industrial properties over the past decade, with a large vacancy in 2020; however, it was followed by high positive net absorption the following year. Net absorption was negative in 2023 and through August 2024 (when data was pulled), but at a smaller magnitude than in 2020.

Figure 13: Net Absorption for Industrial & Flex Space in Wilsonville, 2014 to 2024

Source: CoStar, pulled August 2024

TYPE OF INDUSTRIAL PRODUCT BUILT SINCE 2014

Within the industrial product type, CoStar delineates the properties into a secondary type based on their use, size, and amenities to industrial users. CoStar utilizes the following definitions for the secondary types of industrial space:

- **Distribution:** Spaces used for warehousing and distribution of inventory, that are typically 200,000 square feet or more, have clear heights of 28 feet, are less than 5 percent office space, and have site coverage that can be up to 40 percent.
- **Warehouse:** Buildings that are 25,000 square feet or greater, are up to 20 percent office area, have clear heights of 22 feet or greater, and have site coverage up to 50 percent.
- **Manufacturing:** Buildings that are typically 300,000 square feet or greater with an office area up to 50 percent.
- **R&D:** Flex space specifically used for research and development.
- **Flex/Other/Misc.:** A versatile building that may be used with office (corporate headquarters), research and development, mixed-use industrial and retail sales, and includes but is not limited to industrial, warehouse, and distribution uses. At least half of the rentable area of the building must be used as office space. Flex buildings typically have ceiling heights under 18 feet, with light industrial zoning. Flex buildings have also been called Incubator, Tech and Showroom buildings in markets nationwide.

Table 14 shows industrial development by submarket, or secondary market, types. Over the past 10 years, the I-5 South submarket has captured a slightly smaller share of the total market at 8.7 percent compared to its total share of 10.2 percent. The secondary market type distribution has also changed. While the I-5 South submarket contains roughly 27 percent of the total market space for R&D and warehouse space, it has captured about 35 percent of the space built in the last 10 years. Meanwhile it captured a smaller share of manufacturing and distribution development (19 percent in past 10 years compared to 27 percent of total market share).

Table 14: Industrial Development Trends by Secondary Market Type, Portland Metro and I-5 South Submarket, 2014 to 2024

	ALL DEVELOPMENT		PAST 10 YEARS		I-5 CAPTURE RATES	
	METRO	I-5	METRO	I-5	ALL DEV'T	2014-2024
Distribution	49,002,646	5,677,113	16,716,663	1,222,159	11.6%	7.3%
Manufacturing	43,382,806	6,661,789	5,802,456	700,301	15.4%	12.1%
R&D	4,036,770	409,055	514,319	87,476	10.1%	17.0%
Warehouse	116,255,396	19,920,386	11,999,179	2,178,085	17.1%	18.2%

Source: CoStar, pulled August 2024

Industrial development along the I-5 South submarket has recently concentrated in Tualatin and Sherwood, with Wilsonville falling behind. This trend is likely due to Wilsonville's shortage of development-ready industrial land and large parcels, a view supported by interviews with local developers, brokers, and economic development organizations.

Many speculative industrial developers are seeking large sites, as demonstrated by recent developments in Sherwood and Tualatin on parcels exceeding 10 acres. Notable examples include the recently completed Sherwood Commerce Center on a 30+ acre site and the proposed Rock Creek industrial site development on 25 acres in Sherwood. In Tualatin, the Tualatin Sherwood Corporate Park was completed in 2022 on over 40 acres, while the Hedges Creek Industrial Park is expected to be completed in 2025 on a 20-acre site.

Local developers report that most of the industrial demand is coming from existing regional businesses rather than out-of-state companies. These local industrial users are primarily looking to expand or upgrade their current facilities within the area. Many express a desire to be outside the City of Portland and Multnomah County, citing concerns about public safety and higher rates of taxation.

Figure 14. Secondary Industrial Space Recently Built or Proposed in I-5 South Submarket by City, 2019-2026

Source: CoStar, pulled August 2024

Target Industry Assessment

Wilsonville is well positioned within the region to capture industrial growth. It has access to a strong base of employment, proximity to I-5, and connections to other growing industrial areas in Sherwood and Tualatin. This section examines industries likely to be drawn to Wilsonville, considering its strengths and competitive edge. The analysis begins by identifying common barriers to industrial development, based on local stakeholder interviews. It then reassesses strengths and weaknesses outlined in the Basalt Creek Concept Plan (BCCP), updating these factors to reflect market and employment trends over the past decade. The section concludes by summarizing how these market trends will shape Basalt Creek's development.

Barriers to Industrial Development

Stakeholders identified a number of key barriers for industrial users that prevent development. While some of these challenges are more directly applicable to Basalt Creek than others, they all represent important considerations for the City as it prepares the area for development:

- **Site Readiness:** Many sites lack the necessary transportation and utility infrastructure and preparations to immediately accommodate industrial users.
- **Power Availability:** Immediate or quick access to heavy power is currently the most significant barrier for many industrial businesses. The increasing power demands of modern industrial operations make this a crucial factor.
- **Outdated Existing Buildings:** Many existing structures do not meet the needs of modern industrial users, requiring significant renovations or complete rebuilds.
- **Lack of Intermediate Industrial Spaces:** Medium sized industrial users (users that require 20,000 to 40,000 square feet) have limited spaces to choose from.
- **Misaligned Visions and Overly Prescriptive Zoning:** Sometimes, the landowners' or city's vision for an area does not align with the diverse needs of potential users. Discussions with local developers and brokers highlight the importance of allowing a mix of uses for better financing opportunities. This is particularly relevant for speculative development, where end-users are not known at the time of entitlement and construction. Overly prescriptive zoning that designates specific uses, such as manufacturing, can be more challenging to finance because banks see risk and concern if they perceive the list of potential tenants is too small or narrow. Additionally, various types of uses tend to cluster together due to supply chain benefits. For example, manufacturers often have suppliers located nearby. Overly prescriptive zoning can disrupt this natural ecosystem by preventing clustering.
- **Fragmented Land Ownership:** Areas with multiple small parcels under different ownership can make it difficult to assemble larger sites needed for significant industrial development.

- **Incompatible Neighboring Uses:** The presence of non-industrial uses in close proximity can preclude development out of concern for potential or future conflicts that have the potential to limit or complicate the operations of industrial businesses.
- **Requirements for Connectivity:** In some cases, required access roads can deter large industrial developers because the roads may decrease the area of developable land while adding significant cost to a speculative project. Additionally, some industrial users who prioritize confidentiality and security may be less attracted to areas with public access requirements.

Comparative & Competitive Advantage

The BCCP outlined the Basalt Creek area's advantages and challenges, many of which are still relevant. The following includes Basalt Creeks' advantages and challenges drawing from the BCCP and updating based on new information gathered as a part of this report.

STRENGTHS AND COMPETITIVE ADVANTAGES

- Centrally located in the south Metro, within the Urban Growth Boundary, and designated in the City's comprehensive plan for industrial uses.
- Large contiguous cluster of existing and planned industrial employment areas, including Wilsonville's Coffee Creek Industrial Area, and adjacent employment lands in Tualatin and Sherwood.
- Large areas of contiguous land ownership with property owners who are interested in developing or selling for redevelopment
- Long-term growth projections for employment and population in the southwest Portland metro area.
- Excellent access to I-5, as well as I-205 and Highway 217. Additional transportation strengths include existing and planned arterial roads, and local and regional transit service provided by TriMet, WES Commuter Rail, and SMART.[32]
- Access to an educated workforce as part of the Metro labor shed and Mid-Valley labor shed
- Easily accessible to other growing industrial areas, particularly in Tualatin and Sherwood
- Planned substation development

CHALLENGES

- Zoning needs to be in place prior to development.
- Planning, financing, and construction of new infrastructure.

[32] Existing major arterials include SW Grahams Ferry Road, SW Boones Ferry Road, and SW Day Road; The City is also planning the extension of Basalt Creek Parkway.

- Existing low employment density uses (contractor establishments and storage uses) that generate income for property owners may reduce appetite to sell for redevelopment
- Lot sizes and property aggregation. There is a mix of large and small lots throughout Basalt Creek. The time and cost required to secure properties from multiple parties to aggregate developable industrial properties of adequate size can be a significant deterrent to developers.
- Natural features including wetlands and slopes. Basalt Creek and its surrounding slopes and wetland areas run north-south through the study area and divide the area into east and west sections.
- Growing power demands from industrial users and uncertainty on timing and capacity of additional service[33]

Which industries may be attracted to Basalt Creek?

Basalt Creek's longstanding vision as an industrial area aligns well with current market trends, which show strong demand for industrial space both nationally and in the Portland metro region. Stakeholders point to Wilsonville's potential to attract a diverse range of industrial businesses, including those in the semiconductor supply chain, clean tech, advanced manufacturing, and data centers.

Wilsonville's appeal to these sectors stems from its strategic location in the south Metro area, access to a skilled labor force, and proximity to related industries. The semiconductor sector in particular is poised for expansion due to recent CHIPS Act investments. Similarly, clean tech industries are anticipated to see growth within the Portland Metro region. The availability of large areas of contiguous land ownership in the Basalt Creek Planning Area further enhances its attractiveness to major industrial users who seek large lots for development.

It is worth noting that while the Basalt Creek Concept Plan (BCCP) originally envisioned a mix of uses including office space associated with industrial operations, primarily in the High-Tech Employment district, current market conditions suggest that office use will likely play a smaller role than initially planned. Instead, the focus is expected to shift more towards industrial and tech-oriented developments to capitalize on emerging economic opportunities. Below are details about the potential sectors and industries that may be particularly attracted to Wilsonville:

- **Semiconductor Sector Supply Chain:** This sector includes companies involved in the design, manufacturing, and testing of semiconductor chips, as well as those providing materials, equipment, and services to chip manufacturers. Wilsonville is attractive for this industry due to its proximity to existing semiconductor clusters in

[33] ECOnorthwest has reached out to PG&E understand how much of a challenge access to adequate power may be and is waiting to hear back. This statement may be updated after that conversation.

the Portland metro area, access to a skilled workforce, and potential for large industrial sites. Basalt Creek would likely host businesses that support the supply chain rather than producing the chips themselves.

- **Clean Tech, including Battery Technology:** Clean tech encompasses renewable energy technologies, energy efficiency solutions, and sustainable manufacturing processes. Businesses in this sector include energy storage and related sustainable material technologies, and a variety of alternative energy technologies and production. Battery technology, crucial for electric vehicles and energy storage, is a growing subsector which is already present in Wilsonville. Wilsonville's strategic location and potential for large industrial sites make it suitable for clean tech manufacturing and R&D facilities.
- **Advanced Manufacturing:** This sector involves the use of innovative technologies to create products. It includes robotics, 3D printing, and smart manufacturing systems. Wilsonville's access to a skilled workforce and its location near tech hubs make it attractive for advanced manufacturing operations.
- **Distribution and Logistics:** This sector involves the storage, transportation, and delivery of goods. Wilsonville's location near major transportation routes (I-5 and I-205) and its proximity to Portland make it an ideal location for distribution centers and logistics hubs.
- **Data Centers:** Data centers are facilities used to house computer systems and associated components. Wilsonville's access to available land and the potential access to reliable power sources could make it attractive for data center development.[34] The proximity to tech companies in the Portland metro area is an additional advantage.

This diverse range of potential industries positions Wilsonville to capitalize on various economic opportunities, creating a resilient industrial base in Basalt Creek.

[34] Interviews with stakeholders have suggested that Wilsonville may be attractive to data centers. ECOnorthwest has reached out to PG&E understand if Basalt Creek has/will have access to the power necessary for this type of use and is waiting to hear back.

4. Conclusion

The Basalt Creek area in Wilsonville is strategically positioned for industrial development, with the potential to attract a variety of users, from manufacturing and logistics to data centers. The area's suitability for supporting the semiconductor supply chain is underscored by recent expansions of semiconductor suppliers in nearby Sherwood. Additionally, the area could be attractive to clean-tech businesses, including those involved in battery storage and alternative energy technologies.

However, realizing this potential presents several challenges. Existing contractor establishments generate sufficient income for some property owners, reducing their incentive to sell or redevelop the land for higher-intensity industrial uses. Furthermore, relocation options for these businesses may be limited, complicating redevelopment efforts. (The feasibility of redevelopment will be further explored in a subsequent separate study).

Conversely, some developers have already assembled land, and they are ready for immediate development, eager to capitalize on the strong industrial demand seen in nearby Coffee Creek, Tualatin, and Sherwood. Stakeholders emphasized the importance of large parcels in facilitating area redevelopment, with many developers willing to fund necessary infrastructure improvements if given access to such lots. For example, Schnitzer Properties owns property east of Grahams Ferry Road, south of Basalt Creek Parkway, and north of Day Road and eagerly awaits the adoption of zoning and policy to enable industrial development in this area. They intend to submit development and annexation applications as soon as zoning and policy is in place. Their recent development in Sherwood, known as the Sherwood Commerce Center, is an example of the type of development they are envisioning for their Basalt Creek property, offering flexible spaces for various industrial users.

It is crucial for Wilsonville to carefully balance its development goals for Basalt Creek with market realities. While the City may have preferences for certain types of businesses, being overly selective could deter development altogether. This is especially significant given the current economic climate. The BCCP originally envisioned office space within each district with the highest share in its High-Tech Employment District and anticipated that this office space would be in connection with industrial users. However, nationally and regionally demand for office space has been in decline with remote and hybrid work trends continuing to impact the need for office space. While office will likely still be a part of the BCPA, it may occupy a smaller share than originally envisioned.

Nationally, there's strong demand for industrial space, but Oregon's employment growth which has been lagged national trends since 2020 may moderate this trend locally. Developers have stated that current industrial demand in the Metro area is largely driven by regional businesses seeking to expand or upgrade their facilities. If Wilsonville imposes overly burdensome or restrictive requirements on the types of industrial users it allows (such as requiring a high share of manufacturing space), it risks limiting development feasibility and driving developers and industrial users to more accommodating locations.

The City must navigate these challenges while working towards its vision for Basalt Creek: a diverse mix of industrial uses, higher employment density, high-wage jobs, an enhanced tax base, and increased community prosperity

Next Steps

These findings are preliminary and will be refined through further analysis, stakeholder engagement, and discussions with the Planning Commission and City Council. Upcoming tasks include completing the buildable lands inventory, conducting site suitability analyses for key locations, and assessing the feasibility of redeveloping contractor establishments. All these elements will ultimately be synthesized into a comprehensive final report outlining key findings and recommendations.

WILSONVILLE
OREGON

Wilsonville Industrial Land Readiness – Phase One/Basalt Creek

Planning Commission Work Session
October 9, 2024
Presented by: Cindy Luxhoj AICP, Associate Planner
Dan Pauly AICP, Planning Manager
Nicole Underwood, ECOnorthwest

Phase One Tasks

- ECOnorthwest
  - Economic Inventory / Land Use Analysis
  - BLI Update
  - Site Suitability Analysis
  - Analysis of Contractor's Establishments
- DKS Associates
  - Revised Conceptual Access Plan Map
- Pacific Habitat Services
  - Natural Resource Assessment
- Consor
  - Input to Infrastructure Funding Plan
- City Staff
  - Zoning Analysis
  - Code Amendments

Wilsonville Industrial Lands Readiness: Basalt Creek

Planning Commission Meeting

October 9, 2024

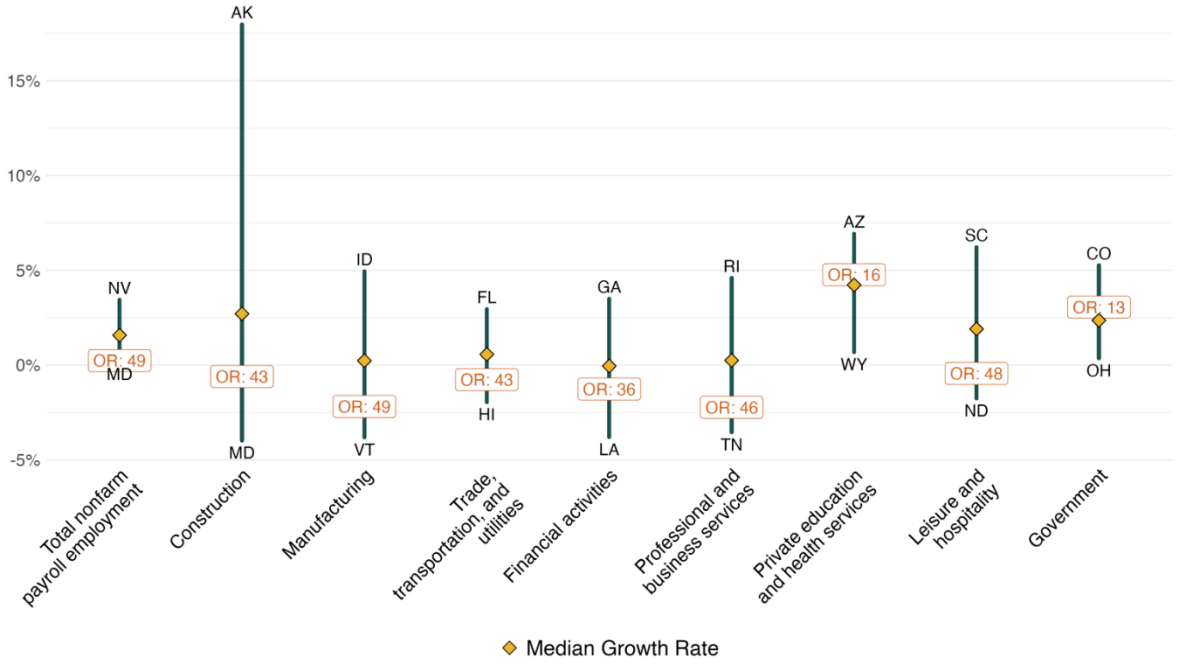
ECO northwest

Project Overview and Purpose

Project Purpose: Reassess the market potential of Basalt Creek and align Wilsonville's planning efforts with current economic realities

Key Question: What has changed since the Basalt Creek Concept Plan (BCCP) was adopted in 2018 and how does that impact the implementation of the plan?

Desired Outcomes:



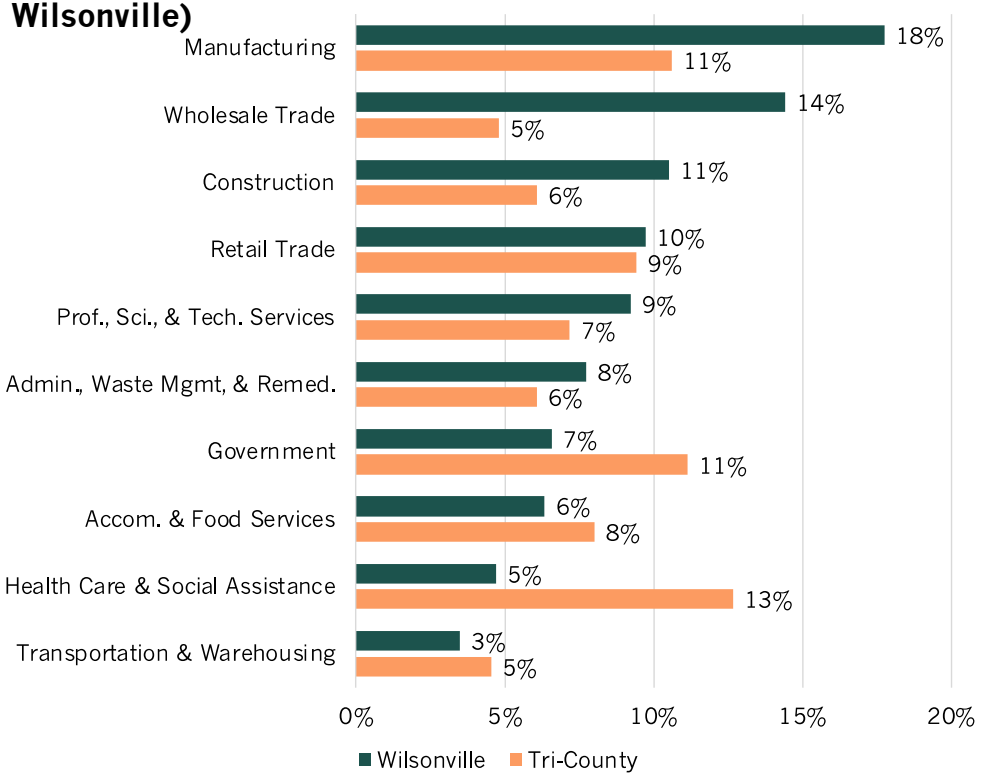
- Inform zoning designations to maximize economic opportunities
- Inform infrastructure planning
- Identify policy interventions to facilitate desired development

Changes in Employment

Strong national employment growth since 2020

- **National:** Strong employment growth since 2020
- **State:** Oregon's employment recovery from the pandemic, while positive, lagged national trends
  - Oregon ranked 49th in employment growth between April 2023 and April 2024

Employment Growth Rate for All States by Sector (April 2023 to April 2024)



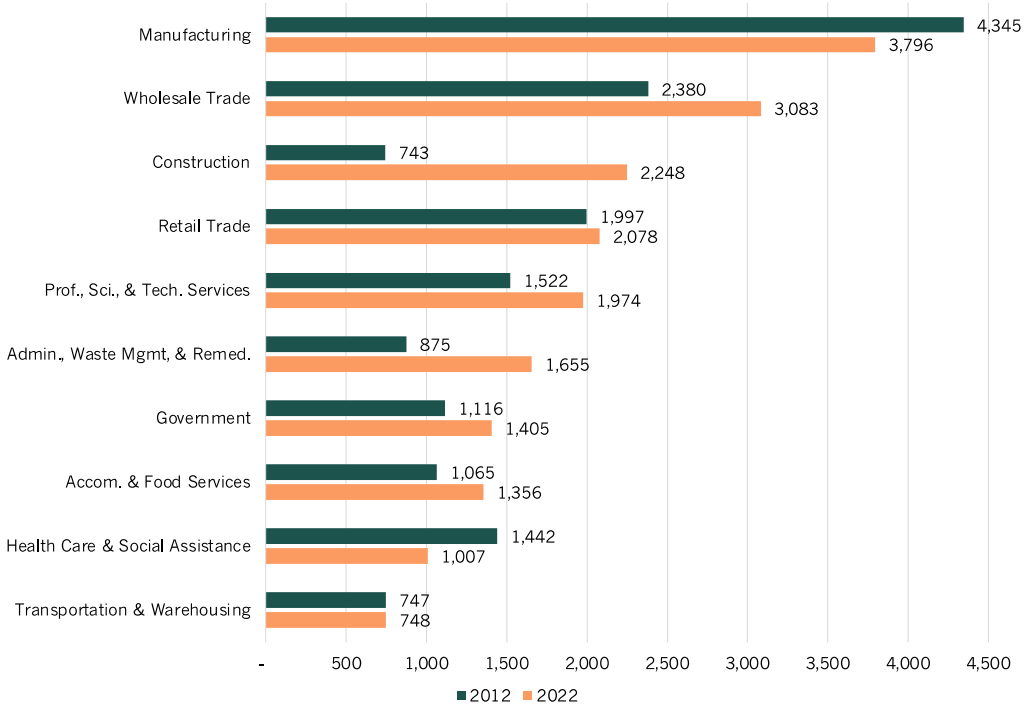
Source: U.S. Bureau of Labor Statistics Current Employment Survey

Wilsonville has a strong industrial employment base

In 2022

- Wilsonville had 21,383 covered employees
- Wilsonville's three largest industries were manufacturing, wholesale trade, and construction
  - These sectors make up 43% of jobs in Wilsonville and 22% of jobs in the Tri-County region

2022 Industry Distribution for Wilsonville and Tri-County Region (10 Industries with greatest employment in Wilsonville)



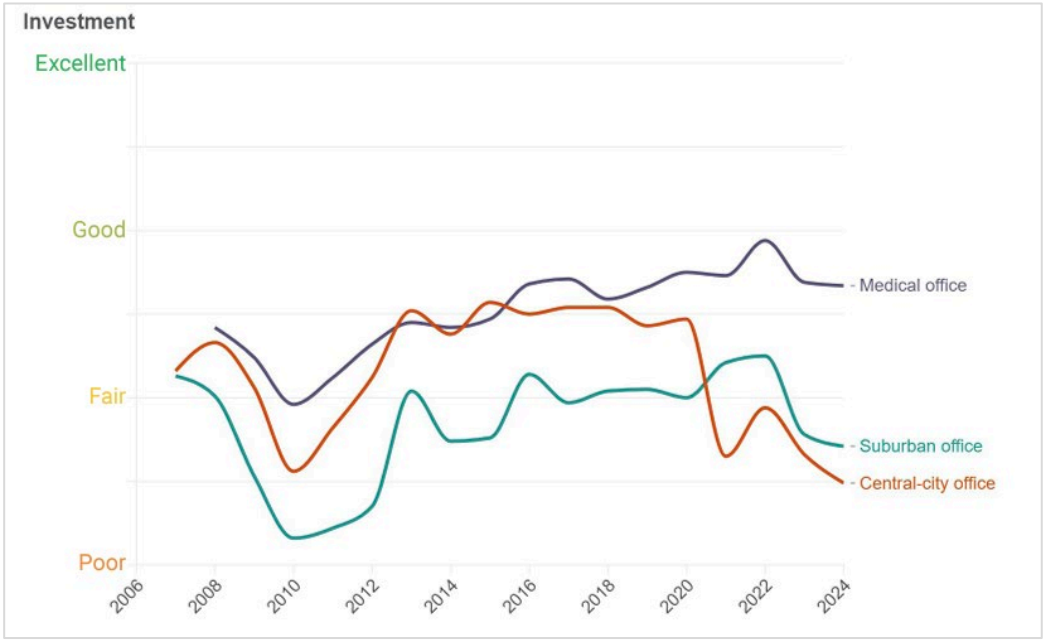
Source: QCEW

Wilsonville added 3,335 covered jobs since 2012

Between 2012 and 2022…

- Wilsonville's employment grew 18%
- Wilsonville's job growth was largely driven by construction, admin & waste management, wholesale trade, & professional services

2022 Industry Distribution for Wilsonville and Tri-County Region, (10 Industries with greatest employment in Wilsonville)

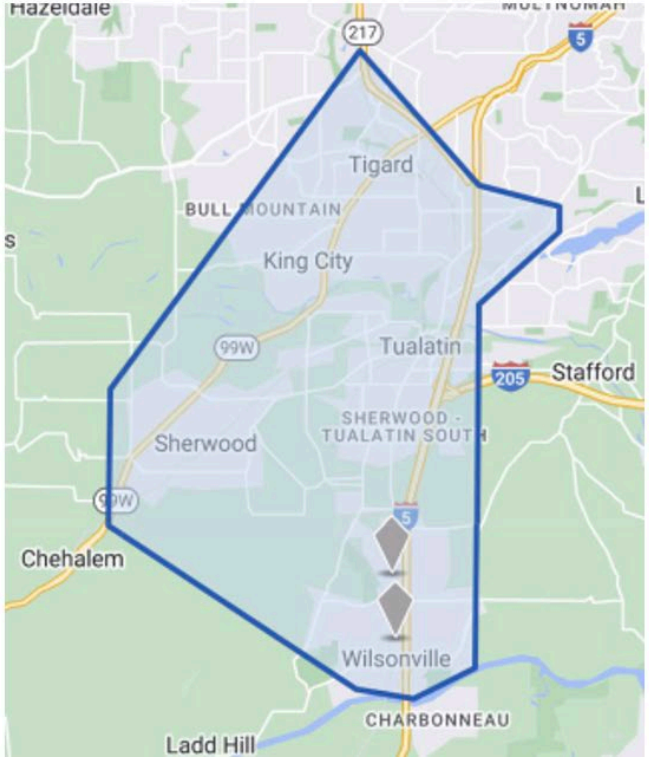


Source: QCEW

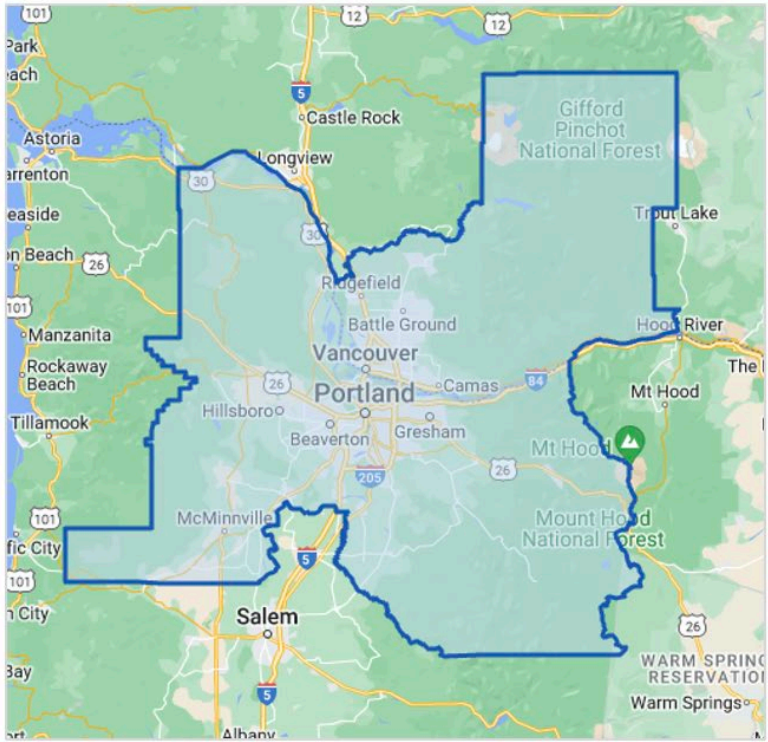
Office Market Trends

Nationally, the office market is declining

- **Nationally,** the office market is declining characterized by:
  - Negative net absorption
  - Shrinking inventory
  - Favored product types
- Looking ahead, the office sector is expected to adjust to a hybrid work model, with peak attendance levels stabilizing at around 60%-70%



National Office Investment Prospects



Source: Urban Land Institute 2024 Emerging Trends in Real Estate, U.S. and Canada

Market Boundaries

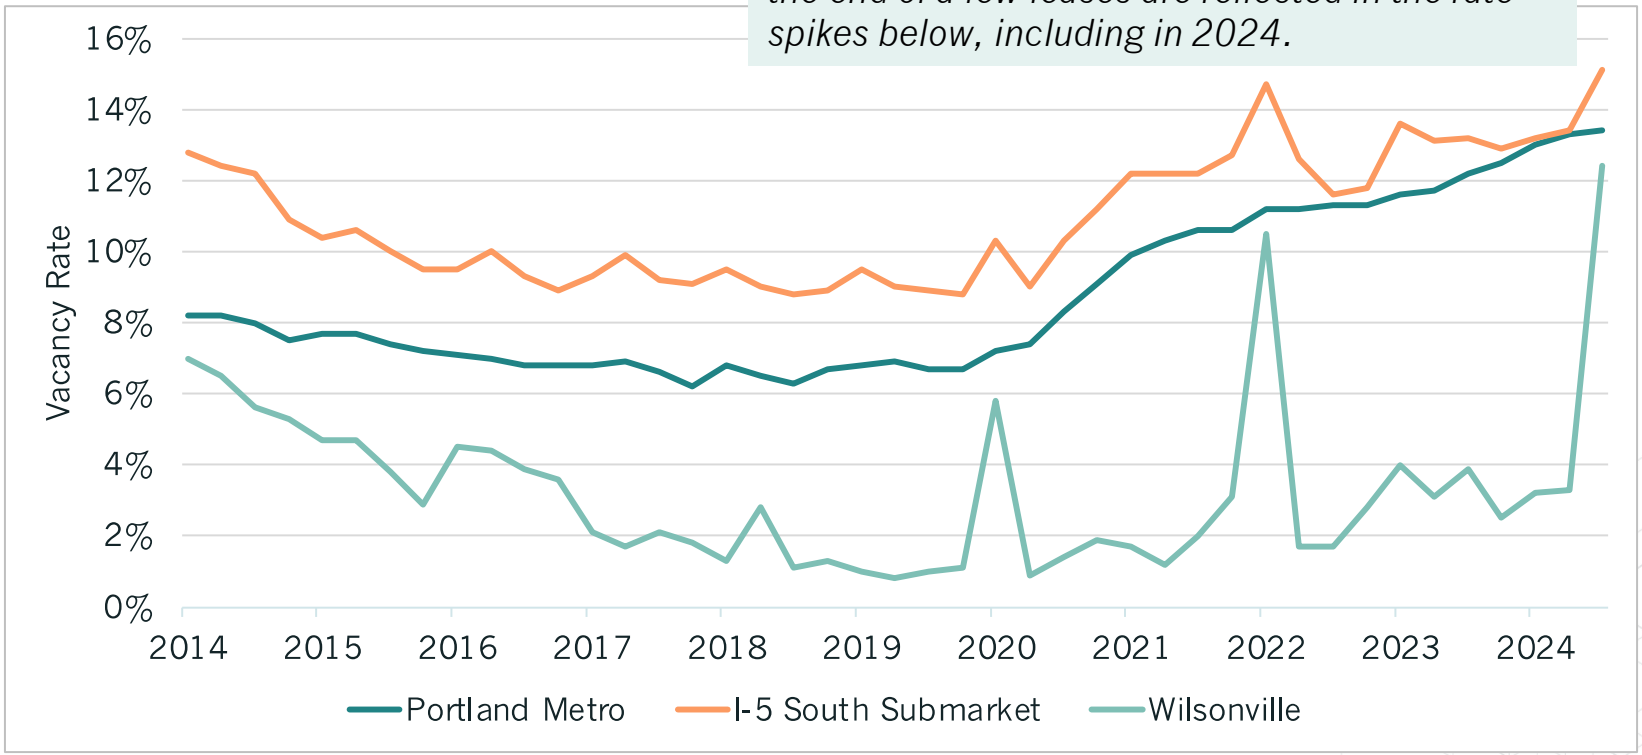
I-5 South Submarket Boundary

Portland Metro Boundary

Office Market Trends: Portland Region and Wilsonville

Summary

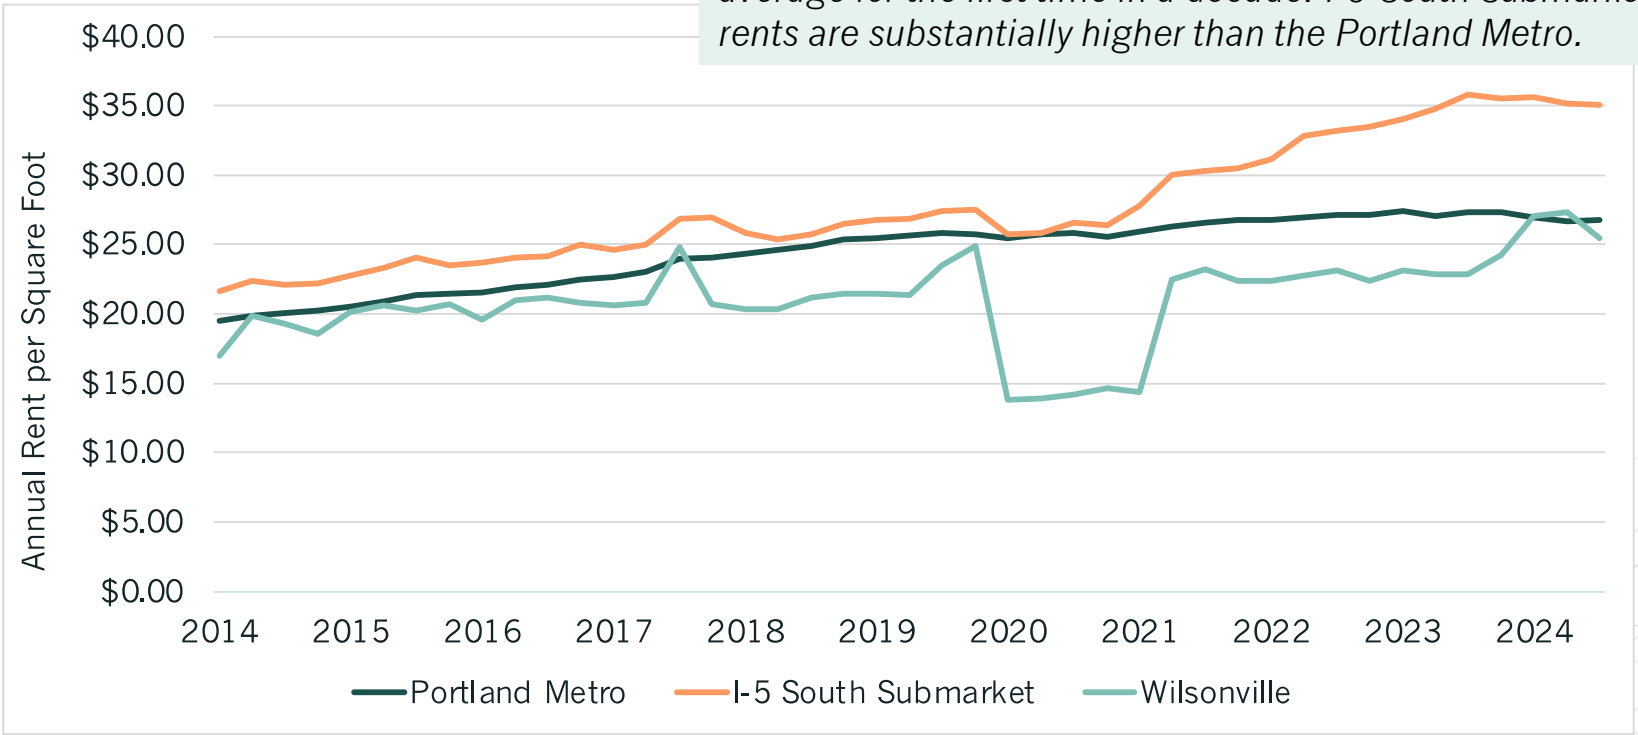
Portland Metro



- Record high vacancy rates
- Continued negative net absorption as companies reevaluate their need for space
- Low leasing activity
- Suburban office markets performing better than downtown

Wilsonville

- Lower vacancy rates than the broader region with recent spikes as leases end
- Rents on par with Portland Metro for first time in a decade but below I-5 South Submarket
- Negative net absorption 2020-2024



Office Market: Wilsonville

While Wilsonville's office vacancy rate has generally been lower than the broader region's, the end of a few leases are reflected in the rate spikes below, including in 2024.

Office Market: Wilsonville

Since the decline in 2020, office rents have risen in Wilsonville and are now equal to the Portland Metro average for the first time in a decade. I-5 South Submarket rents are substantially higher than the Portland Metro.

Industrial Market Trends

Nationally, industrial market growth is decelerating but remains relatively strong

- **Nationally,** industrial market growth is decelerating but remains relatively strong overall
  - Stabilizing vacancy rates
  - Positive net absorption
  - Slowing construction
  - Federal investment
- Looking ahead, e-commerce growth and reshoring trends are expected to drive growth (at a slower pace than 2021 and 2022)

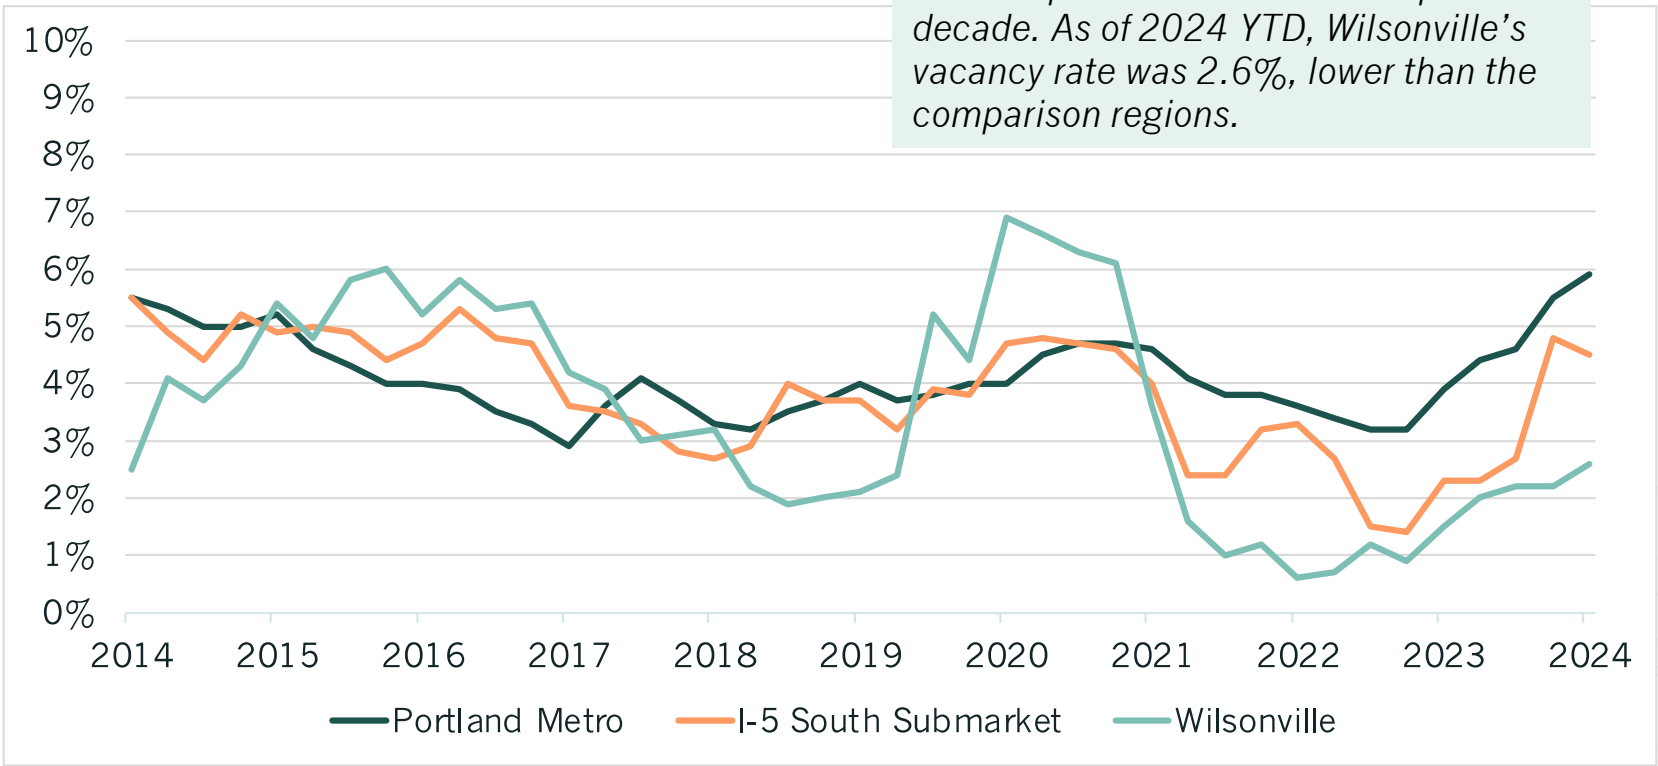
National Industrial Investment Prospects

Source: Urban Land Institute 2024 Emerging Trends in Real Estate, U.S. and Canada

Industrial & Flex Trends: Portland Region and Wilsonville

Summary

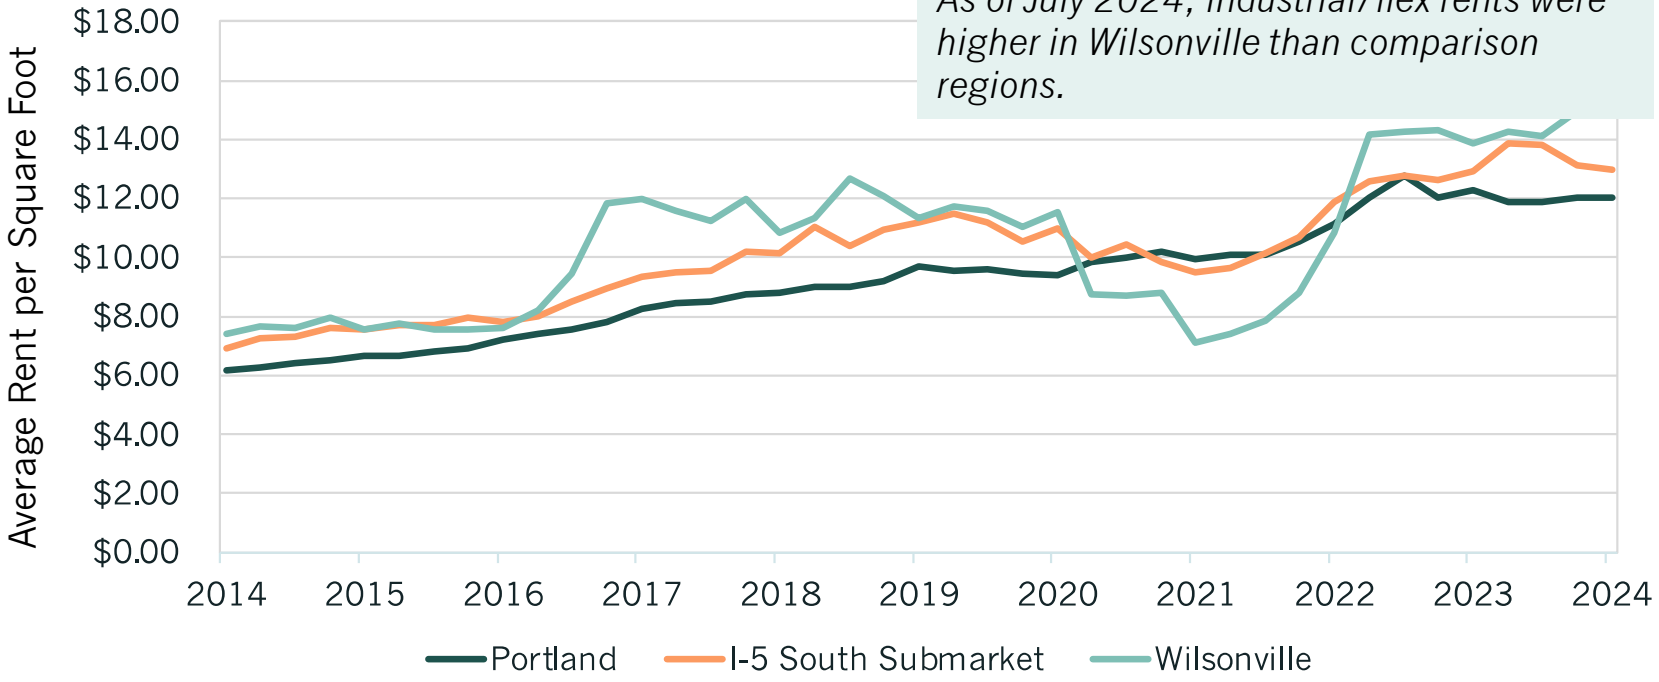
Portland Metro



- Strong growth between 2021-2023 but growth is decelerating
- Investor confidence in the market
  - CHIPS Act
  - Strong submarkets
  - Continued growth in industrial space

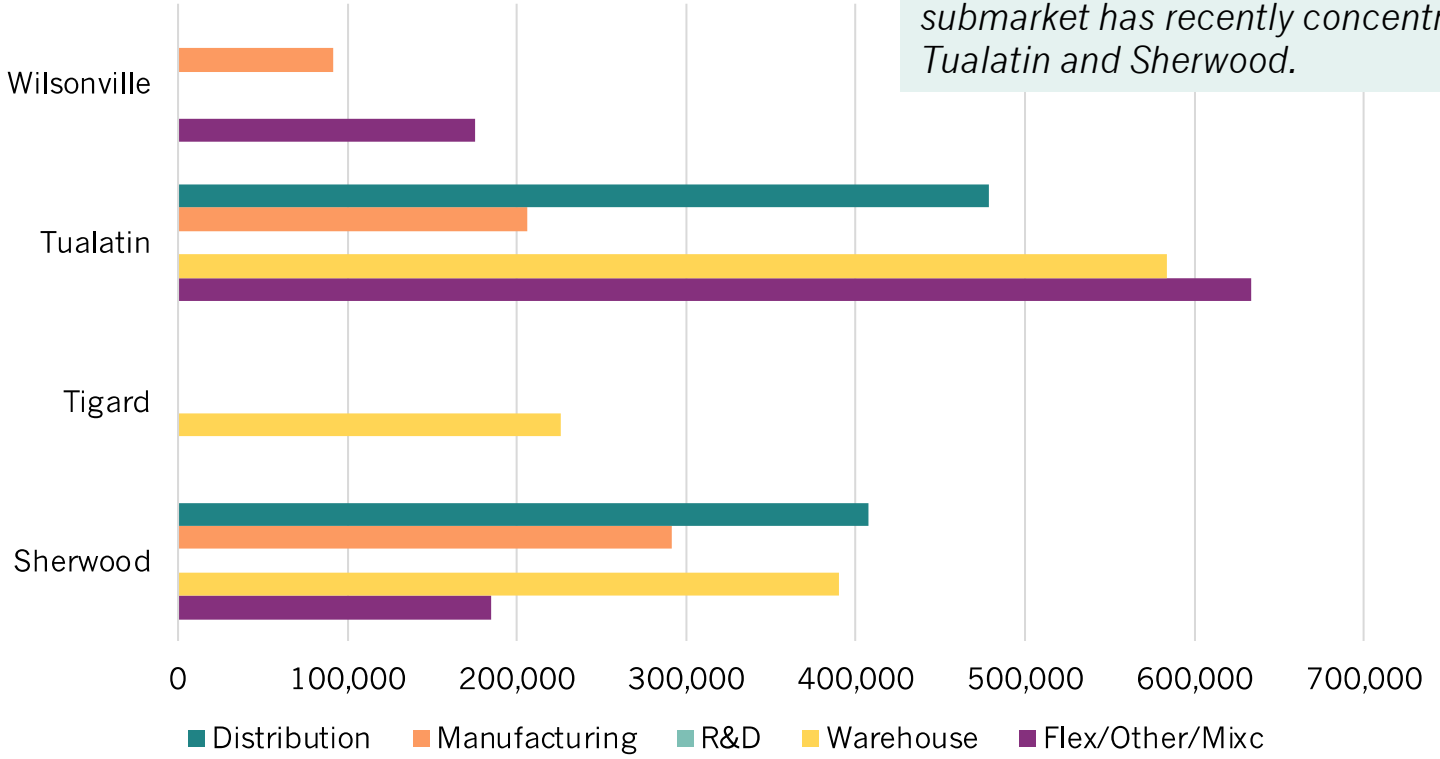
Wilsonville

- Very low vacancy, below broader market
- Increasing rents, above broader market
- Limited industrial development over the past decade



Industrial & Flex: Wilsonville

Wilsonville's vacancy rate has remained below 6 percent for most of the past decade. As of 2024 YTD, Wilsonville's vacancy rate was 2.6%, lower than the comparison regions.



Industrial & Flex: Wilsonville

Industrial rents in Wilsonville have generally increased over the past decade. As of July 2024, industrial/flex rents were higher in Wilsonville than comparison regions.

Industrial & Flex Trends I-5 South Submarket, 2019-2026

Industrial development in the I-5 South submarket has recently concentrated in Tualatin and Sherwood.

What we are hearing

Demand for industrial space is strong in the Portland Metro Area. However, key barriers exist for industrial users

- Site readiness
- Power availability
- Outdated existing buildings
- Lack of intermediate industrial spaces
- Zoning not aligned with desired development
- Fragmented land ownership
- Incompatible neighboring uses
- Requirements for connectivity

What has changed in Basalt Creek over the past decade?

What is Wilsonville's portion of Basalt Creek like today?

- Remains under Washington County's jurisdiction and zoning
- Existing businesses have few employees and large areas of land for storage
- Growth in contractor establishments since 2012, with low employment density

What is Wilsonville's portion Basalt Creek like today?

469 acres

90 tax lots (10 with covered employment)

275 covered employees*

$86,000 average wage

4.4 employment density in areas with employment

Little change in improvement to land value since 2012

Areas of high and low parcelization

*Some of the land in the BCPA is actively used despite minimal reported covered employment.

Key Advantages

- Centrally located in the South Metro
- Large contiguous cluster of existing and planned industrial employment areas
- Large areas of contiguous land ownership with property owners who are interested in development
- Access to I-5, I-205, and Highway 217; existing and planned arterial roads
- Access to an educated workforce
- Planned substation development
- Long-term growth projections

Key Challenges

- Existing zoning allowing low density uses
- Existing uses have low employment density but may generate substantial income for owners
- Financing and constructing new infrastructure
- Lot sizes and property aggregation
- Development constraints including wetlands and slopes
- Growing power demands for industrial users

Which industries may be attracted to Basalt Creek?

- Semiconductor sector supply chain
- Clean Tech, including battery technology
- Advanced Manufacturing
- Distribution and Logistics
- Data Centers

Conclusion

Basalt Creek is well-positioned for many types of industrial uses, but there are challenges

- Existing low-density uses
- Natural constraints
- Lack of infrastructure
- Property owner disposition and land aggregation

Wilsonville needs to carefully balance development goals with market realities

- Strong national employment growth but weaker statewide trends
- Declines in office market
- Strong industrial market but slower predicted growth
- Industrial demand driven by regional businesses
- Financing requirements

Questions for Planning Commission

- What questions or comments does the Planning Commission have about the Economic Inventory and Land Use Analysis report and related preliminary findings?

- Is there anything about the information that you find surprising or that changes your view of how the City should be thinking of the Basalt Creek Planning area and implementation of the Concept Plan?

Pond East and South Master Plan and related amendments. The motion was seconded by Commissioner Hendrix.

Commissioner Heberlein understood the public comment regarding the recommended changes but based on Staff's comments, fundamentally, the elements that the Planning Commission wanted were in the proposed Code, and the specific instances of variances should be covered in the waiver process as defined, which was why his motion was to adopt the Resolution as presented.

Chair Karr read his Chair summary as follows, "Housing is the focus of the Development Code changes for Frog Pond East and South, specifically to address a variety of housing options with an eye toward attainable and affordable housing options. To tie this development back to specific City Council goals, this development will have connected neighborhoods, cohesiveness between public spaces and private development, neighborhoods with walkable, active streets, quality development with a community design, and easy access to nature, parks, and open spaces."

Commissioner Hendrix acknowledged and commended the great work that had been done for quite some time, adding she was excited to be helping move Frog Pond forward.

The motion passed 6 to 0.

Chair Karr moved to recess the meeting and reconvene at 8:05 pm. Commissioner Heberlein seconded the motion, which passed 6 to 0.

Chair Karr reconvened the meeting at 8:05 pm.

WORK SESSION

3. Wilsonville Industrial Land Readiness (Basalt Creek) (Luxhoj)

Cindy Luxhoj, Associate Planner, reminded the Wilsonville Industrial Land Readiness (WILR) Project was introduced at the September 11th Planning Commission meeting. The City sought the Planning Commission's input on the draft Economic Inventory and Land Use Analysis report for Phase One of the WILR Project. The analysis provided area specific foundational information about economic activities in the Basalt Creek area in the context of local and regional markets, and what industries may be expected to locate in the planning area in the future. She initiated the PowerPoint presentation, noting that the analysis was a key task identified in the WILR project.

Nicole Underwood, ECONorthwest, presented the WILR report for Basalt Creek via PowerPoint, noting significant changes had occurred since the Cities of Wilsonville and Tualatin jointly adopted the 2018 Basalt Creek Concept Plan, including major economic shifts at the local, state and national levels, changes in land uses in Basalt Creek as Washington County continued to

approve developments consistent with County zoning, but not aligned with the type of development or commerce envisioned in the Concept Plan. The purpose of the analysis was to identify the changes in Basalt Creek since 2018 and how they could impact implementation of the Concept Plan. She described changes in employment, Office and Industrial market trends, as well as those within Wilsonville's portion of Basalt Creek and the key advantages and challenges of developing in the area. She concluded with ECONorthwest's conclusions based on the report. (Slide 28)

Commissioner comments and responses were as follows with the project team addressing questions as noted:

- Coordinating land use designations between Wilsonville and Tualatin was important, especially along the northern Basalt Creek boundary to ensure that land use plans were aligned to prevent conflicts.
- How would road maintenance be achieved through long-term development? Day Rd and Grahams Ferry Rd were a mess and always torn up, making travel really difficult. When considering some of the economic drivers of the land, responsibility for road maintenance is an important consideration.
    - **Associate Planner Luxhoj** noted as far as potential land use conflicts, most of the Basalt Creek area in Tualatin was being developed as residential, with some manufacturing west of the canyon, which Tualatin recently rezoned from Manufacturing Park to Basalt Creek Employment, which did include a component of commercial as allowed in Metro Code. On Tualatin's side, where the Basalt Creek Parkway would extend along Green Hill, Tualatin was to implement buffering and screening to that future arterial with the residential development, but it was uncertain whether that had been done.
        - The City of Wilsonville always planned to develop its Basalt Creek portion as industrial, except for the Craft Industrial area which would provide a transition from housing to future industrial.
    - **Miranda Bateschell, Planning Director,** offered context from the prior planning effort and the coordination on roadway improvements.
        - When added to the Metro UGB, the land was primarily for industrial employment, with a portion designated residential for Tualatin in the northern area to buffer existing residential neighborhoods. Lengthy discussions regarded having a transition to create design elements and a mixing of uses for a smooth transition between employment and residential areas.
        - She believed the intent of some of Tualatin's recent Code amendments was to make the area more relevant to the current market and to better integrate and balance residential and employment uses. Wilsonville Staff regularly coordinated with Tualatin, including meetings about their zoning code changes to understand the intent and impact of those changes. Staff also coordinated and reviewed development applications coming through the process.
        - The Basalt Creek Concept Plan contained valuable content, visioning, and guiding principles, but major topics of discussion were the transportation network and natural areas, particularly the Basalt Creek Canyon and surrounding wetlands that

drain to Wilsonville. Staff had concerns about the stormwater system pertaining to the area and the preservation of the canyon as a community asset for both cities to enjoy.

- The transportation system was planned before the concept plan through the Basalt Creek Transportation Refinement Plan, coordinated by Metro with Washington County and both cities, as it served as a major freight corridor for the entire south county industrial area, including Tualatin and Sherwood. So, the road network was a key concern for all parties, including Metro, to ensure Wilsonville's regional freight could move, which was very important when considering all the residential developing adjacent that tends to highly impact the system. As part of the planning process, Staff was tracking anticipated trip volumes, discussing the share of trips for each city and ensuring Wilsonville upheld its commitment to the transportation system. When going through the project, the City was be more proactive with the county about things like Day Road, especially regarding its timing and the impact of the phased construction of the Basalt Creek Parkway, which would likely increase traffic on Day Road.

- The South County Industrial Areas Infrastructure Funding Strategy successfully prioritized Day Road for financing and gaining Washington County's support for helping improve the road. Some challenges included the expansion of contractor establishments on Day Rd, which was not a county road, so the County had difficulty assessing a development's impact to the transportation system and therefore the proportionate impact and proportionate improvements, such as whether frontage improvements were being triggered. All this had been an issue for Wilsonville being able to make improvements on Day Rd, even though low investment development was occurring. Having the County approving land use impacting a City facility was challenging.
- The City could basically only do patchwork repairs on Day Rd until right-of-way improvements occurred with development or in coordinating with Tualatin and the County to get the improvements. Funding infrastructure remained a challenge, however, leading to broader discussions about possibly extending urban renewal into Basalt Creek to facilitate some improvements. While some improvements were already in the Coffee Creek Industrial Area Plan, changes would come with the timing of those improvements and as the City generated development improvements.

- While office space demand had declined in recent years, organizations were revamping for a return to the office, so the need for office space should not be discounted. Currently, with the innovation and collaboration required for what is coming in the future, more and more people and organizations would be returning to the office for in-person collaboration.
  - **Ms. Underwood** agreed about there being a return to the office but believed it was more hybrid in nature; some employees might only work in the office three days a week, not full-time. This shift meant that while businesses still desired office space, the amount of office space needed had changed, resulting in a slight downsizing of office

square footage overall. The expectation was that while office space was still needed, the new norm was that its function and configuration would differ from the past.

- Regarding Wilsonville's business development, the City should look to collaborate and partner with industries and organizations it wanted to attract and have some sort of business development plan with all the stakeholders involved to address environmental concerns, and the big energy demands for such businesses.
- Traffic was always a concern, and a solid plan would be needed for the roadways in Basalt Creek.
- **Ms. Underwood** clarified that in the subject presentation, flex space and industrial space were combined and used interchangeably. Flex spaces of 20,000 sq ft to 40,000 sq ft, often met the demand for intermediate industrial spaces, providing flexible uses since it was speculative development as the exact users for these spaces were not known in advance.
  - While there appeared to be a lot of flex space in the south Basalt Creek area, a lack of flex space existed due to the significant development in the area, making it attractive for more flex space. There was still demand for flex spaces and still space to develop more flex spaces.
- The City's focus should be to continue monitoring the trends and be flexible in its implementation of the Concept Plan based on those changing trends.
- While there was considerable development and demand for flex space in the Basalt Creek area, there were significant challenges. In 2017/2018, many sites were not ready for manufacturing or transportation, and a big barrier was the lack of power and the high cost to upgrade. Existing buildings were often outdated and expensive to retrofit. Midlevel and heavy manufacturing required entirely different requirements than warehousing and were almost nonexistent in the Basalt Creek area.
- **Ms. Underwood** explained that Wilsonville's higher industrial rent, but lower vacancy rate in the region showed there was demand and that people would be interested if the sites were made ready.
- With the allowed land use and zoning limiting the City's vision for Basalt Creek, what other options were available and how would the City work around or within those limitations?
  - **Planning Director Bateschell** explained that the land was still in the County with FD20 county zoning, which limited development to preserve future development for urbanization. The zoning restricted what could be developed until annexed by a city to be able to develop the land to a higher potential. However, FD20 allowed a certain amount of development, which was profitable, but created challenges for the City to be able to attract property owners to want to sell and develop into the city, which could be more costly and may not return their investment, especially without appropriate infrastructure. Ms. Luxhoj had considered options for navigating these challenges, and prepared a memo before COVID about contractor establishments, and the City's potential options. However, resources were reallocated elsewhere due to the pandemic.
  - **Associate Planner Luxhoj** stated one component of the project was to look specifically at the redevelopment potential of properties occupied by contractors' establishments and consider incentives to encourage transitions to more desirable development aligned with the City's Basalt Creek plans. The key challenge was that these properties generate

significant income for owners, making redevelopment less appealing. If contractors' establishments were prohibited in the PDI zone, a plan would be needed for where these businesses could relocate.

- **Ms. Underwood** noted another consideration was that some of the contractors' establishments provided high-wage jobs. ECONorthwest was starting to look into redevelopment feasibility to evaluate the issue. Particularly interesting was the fact that some landowners had shown interest in redevelopment, which was a positive sign.
- **Planning Director Bateschell** noted property owners or developers typically lead annexation efforts, rather than the City initiating annexation, which was work considering. Pursuing annexation more proactively would give the City more control over its vision for Basalt Creek. Even if contractor establishments were allowed to continue, the City would have more control over even new iterations of contractor establishments if they were in the city, including the design and integration with future facilities. Such control and influence was not available when under County's jurisdiction. In 2019, the City was discussing the idea of an area-wide annexation, but it set aside due to other priorities. Perhaps this policy question would be good to revisit, whether it would outweigh the difficulties the City had by not having any control in the area, which was due partly because the City was not ready. Past investments focused on Coffee Creek, and Basalt Creek was viewed as a longer-term project, but now the City was preparing to annex land in Basalt Creek.

- A survey of Basalt Creek residents would likely reveal they would not support forced annexation, so a lot of public outreach would be required to get the ground swell of public opinion needed to for that policy, especially since the City had not done an excellent job of doing that to date.
- The strengths and competitive advantage of Basalt Creek to the City of Wilsonville were great, but the barriers were big, including the zoning and the financing of the infrastructure, which would almost have to be in place before developers showed real interest. Aggregation of lot sizes and the power demands were also challenges, especially because the industries that have shown interest were big power consumers, like data centers. Based on this area of town, how could enough power be generated to support a the three, power-heavy industries noted in the report.
  - **Ms. Underwood** noted a key thing when talking to people was that there was a lot of excitement around Wilsonville, so there could be many different uses that want to locate in Basalt Creek. Another key takeaway was that the City was not super limited, though things being seeing at the statewide level was a cause for concern, like manufacturers leaving. She cautioned the City about putting too many requirements on Basalt Creek given so many challenges at the state level, and Wilsonville did not want to add another barrier.

Attract high-quality industry and support economic opportunity for all in Wilsonville	Basalt Creek Concept Plan	

ISSUE BEFORE COMMISSION

Staff has initiated the first phase of the Wilsonville Industrial Land Readiness (WILR) project, focused on the Basalt Creek Concept Plan area. Staff is providing an update on progress to date and upcoming milestones in this planning process.

EXECUTIVE SUMMARY:

The Wilsonville Industrial Land Readiness (WILR) project has two phases, which together will support attracting high-quality industry and economic opportunity to Wilsonville.

The first phase of the project, currently underway, is focused on the Basalt Creek and West Railroad planning areas in northwest Wilsonville (Attachment 1). These two future industrial areas are the subject of the Basalt Creek Concept Plan, jointly prepared with the City of Tualatin and adopted by Wilsonville in 2018. Comprising the City's newest industrial planning area, Basalt Creek and West Railroad are located north and west of the Coffee Creek Industrial area and adjacent to the Tualatin city limits. This first phase of the WILR project lays the foundation for moving Concept Plan area to a development ready status, thus enabling the City to accept development applications for industrial projects and realizing the area's economic development potential.

Two key elements of the Implementation and Phasing Strategy in the Basalt Creek Concept Plan are to "assure zoning is compatible with future land use" and to "consider capital improvements to spur development". Consistent with these objectives, the first phase of the WILR project will help prepare the land in the Basalt Creek and West Railroad planning areas for industrial development. The first phase includes conducting a focused economic inventory and market analysis to inform the drafting of zoning standards and creating an infrastructure funding plan. Zoning Code amendments will focus on refinements to the City's Planned Development Industrial (PDI) zone, as well as evaluate whether to extend the Coffee Creek Industrial Design Overlay District (form-based code) and, if so, how it could best be applied to the area, to enable implementation of the High Tech Employment, Light Industrial, and Craft Industrial land use categories envisioned in the Concept Plan (Attachment 2).

ECONorthwest is preparing an updated Buildable Lands Inventory (BLI) and site suitability analysis for the planning areas and has provided a draft economic inventory/market analysis to staff for review. The BLI reviews all land within the planning area to screen out parcels where there is limited or no development potential and identify the places where development is most suitable given environmental and regulatory constraints. The site suitability analysis looks in more detail at specific parcels or groups of parcels in the planning area to determine site suitability for the land use categories envisioned in the Concept Plan. The economic inventory/market analysis will provide area-specific foundational information about economic activities in the Concept Plan area in the context of local and regional markets and what industries may be expected to locate in the planning area in the future. In addition, ECONorthwest will prepare an analysis of land currently occupied by contractor's establishments, which have proliferated in recent years throughout this future industrial area and often include small office uses, storage buildings, and gravel or paved storage or laydown yards with few employees. This analysis will help inform expected redevelopment potential and potential impacts to the City's goals for employment in the Concept Plan area.

DKS Associates, the City's transportation consultant, is revising a conceptual, multi-modal access plan map included in the Basalt Creek Concept Plan and Transportation Refinement Plan to ensure that the land use assumptions and identified transportation projects are still applicable, as well as to review the local street and access plan to determine whether any changes are needed to support future development. Pacific Habitat Services is assessing natural resources in the planning aera to determine which of the resources are significant and will be protected by the Significant Resource Overlay Zone (SROZ) and will be providing a report for review by mid-September to inform the BLI and site suitability and zoning analyses.

This first phase of the project is anticipated to extend into mid-2025. The Planning Commission will hold a work session in October to review preliminary findings of the economic inventory/market analysis, BLI, access plan, and resource assessment, followed by review of the analysis of contractor's establishments, preliminary concepts for zoning amendments, and potential economic development strategies at the November work session.

The second phase of the WILR project is an update to the City's Economic Opportunities Analysis, which will expand the project's scope citywide to include such actions as reviewing market trends, inventorying and developing an economic strategy for all of Wilsonville's industrial lands over a 20-year planning horizon, and recommending citywide Development Code refinements to support anticipated economic activity in industrial areas throughout the City. This will serve as the companion to the City's Housing Capacity Analysis to help inform both future residential and job growth decisions. A Request for Proposals for the second phase of the project was issued in early September and work is expected to begin this fall, continuing to the end of 2025.

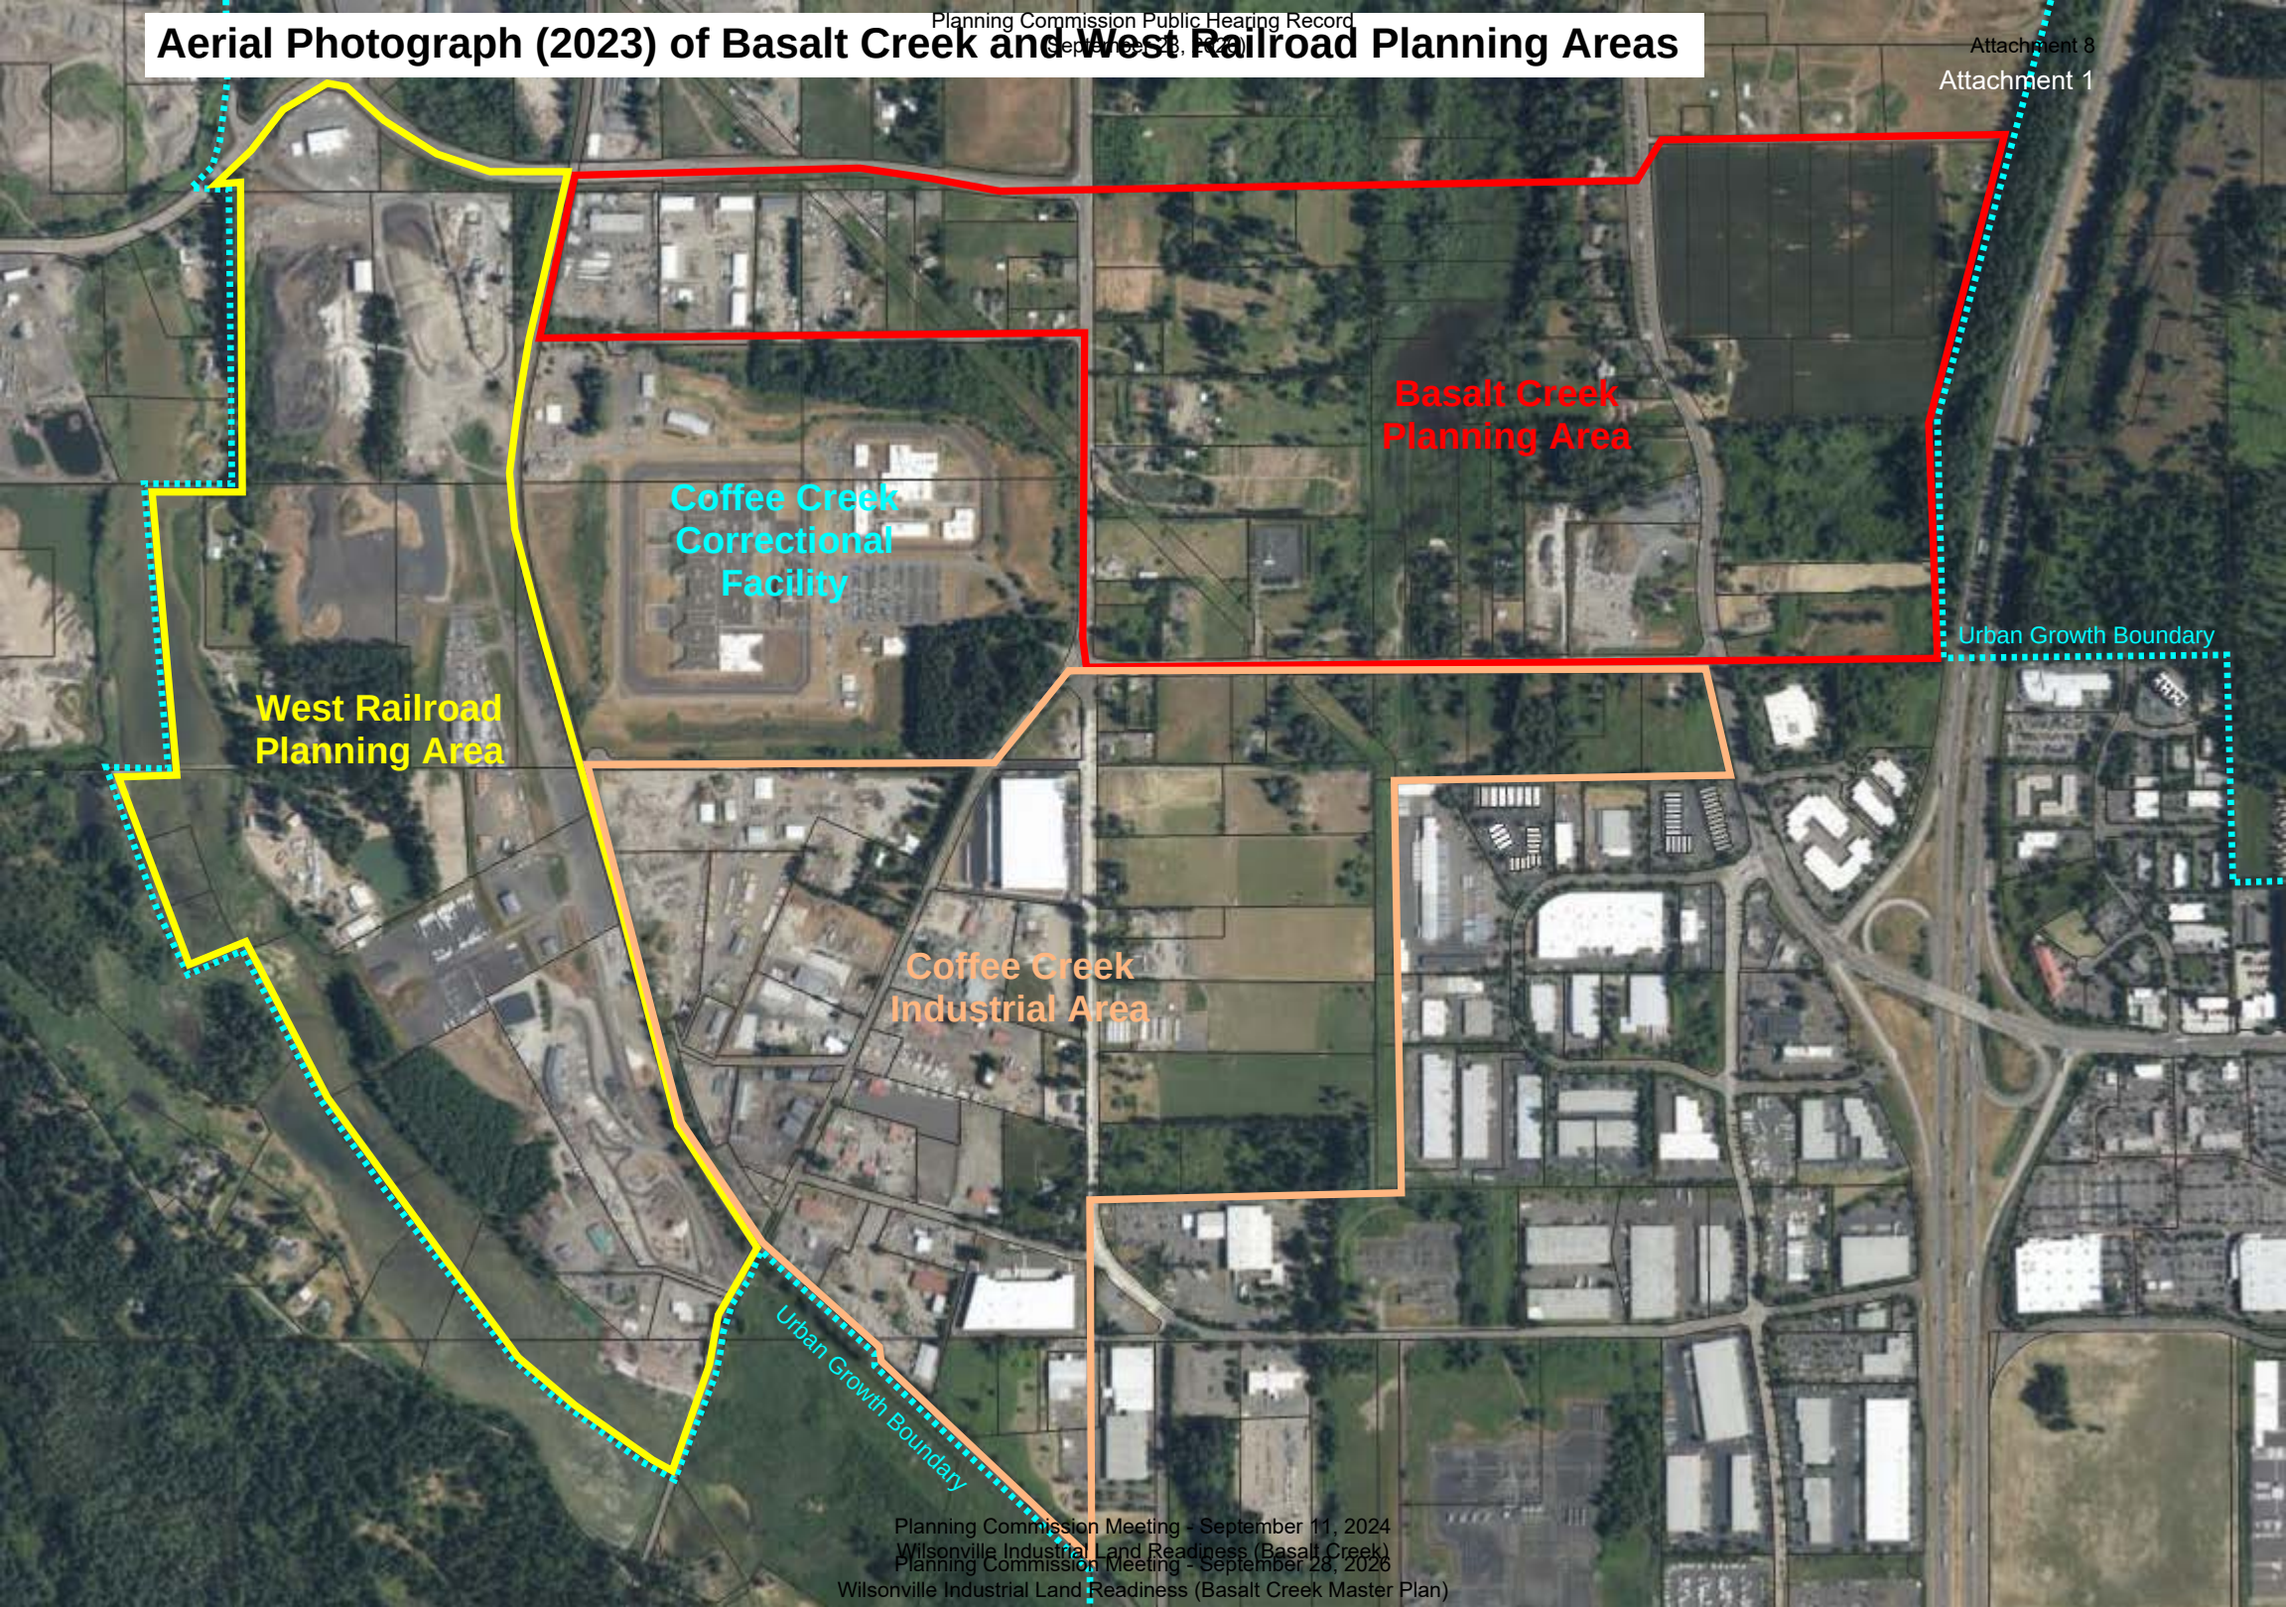
Following presentation of the project by staff, the following input is requested from the Planning Commission:

- What questions or comments does Planning Commission have about the first phase of the WILR project?

EXPECTED RESULTS:
Feedback from Planning Commission about this first phase of the WILR project will guide completion of the implementation items in the Concept Plan for the Basalt Creek and West Railroad planning areas, including drafting a package of proposed Code amendments, developing economic development strategies, and preparing an infrastructure funding plan. In addition, work products from this first phase of the project will help inform the citywide EOA and economic development strategy in the second project phase.

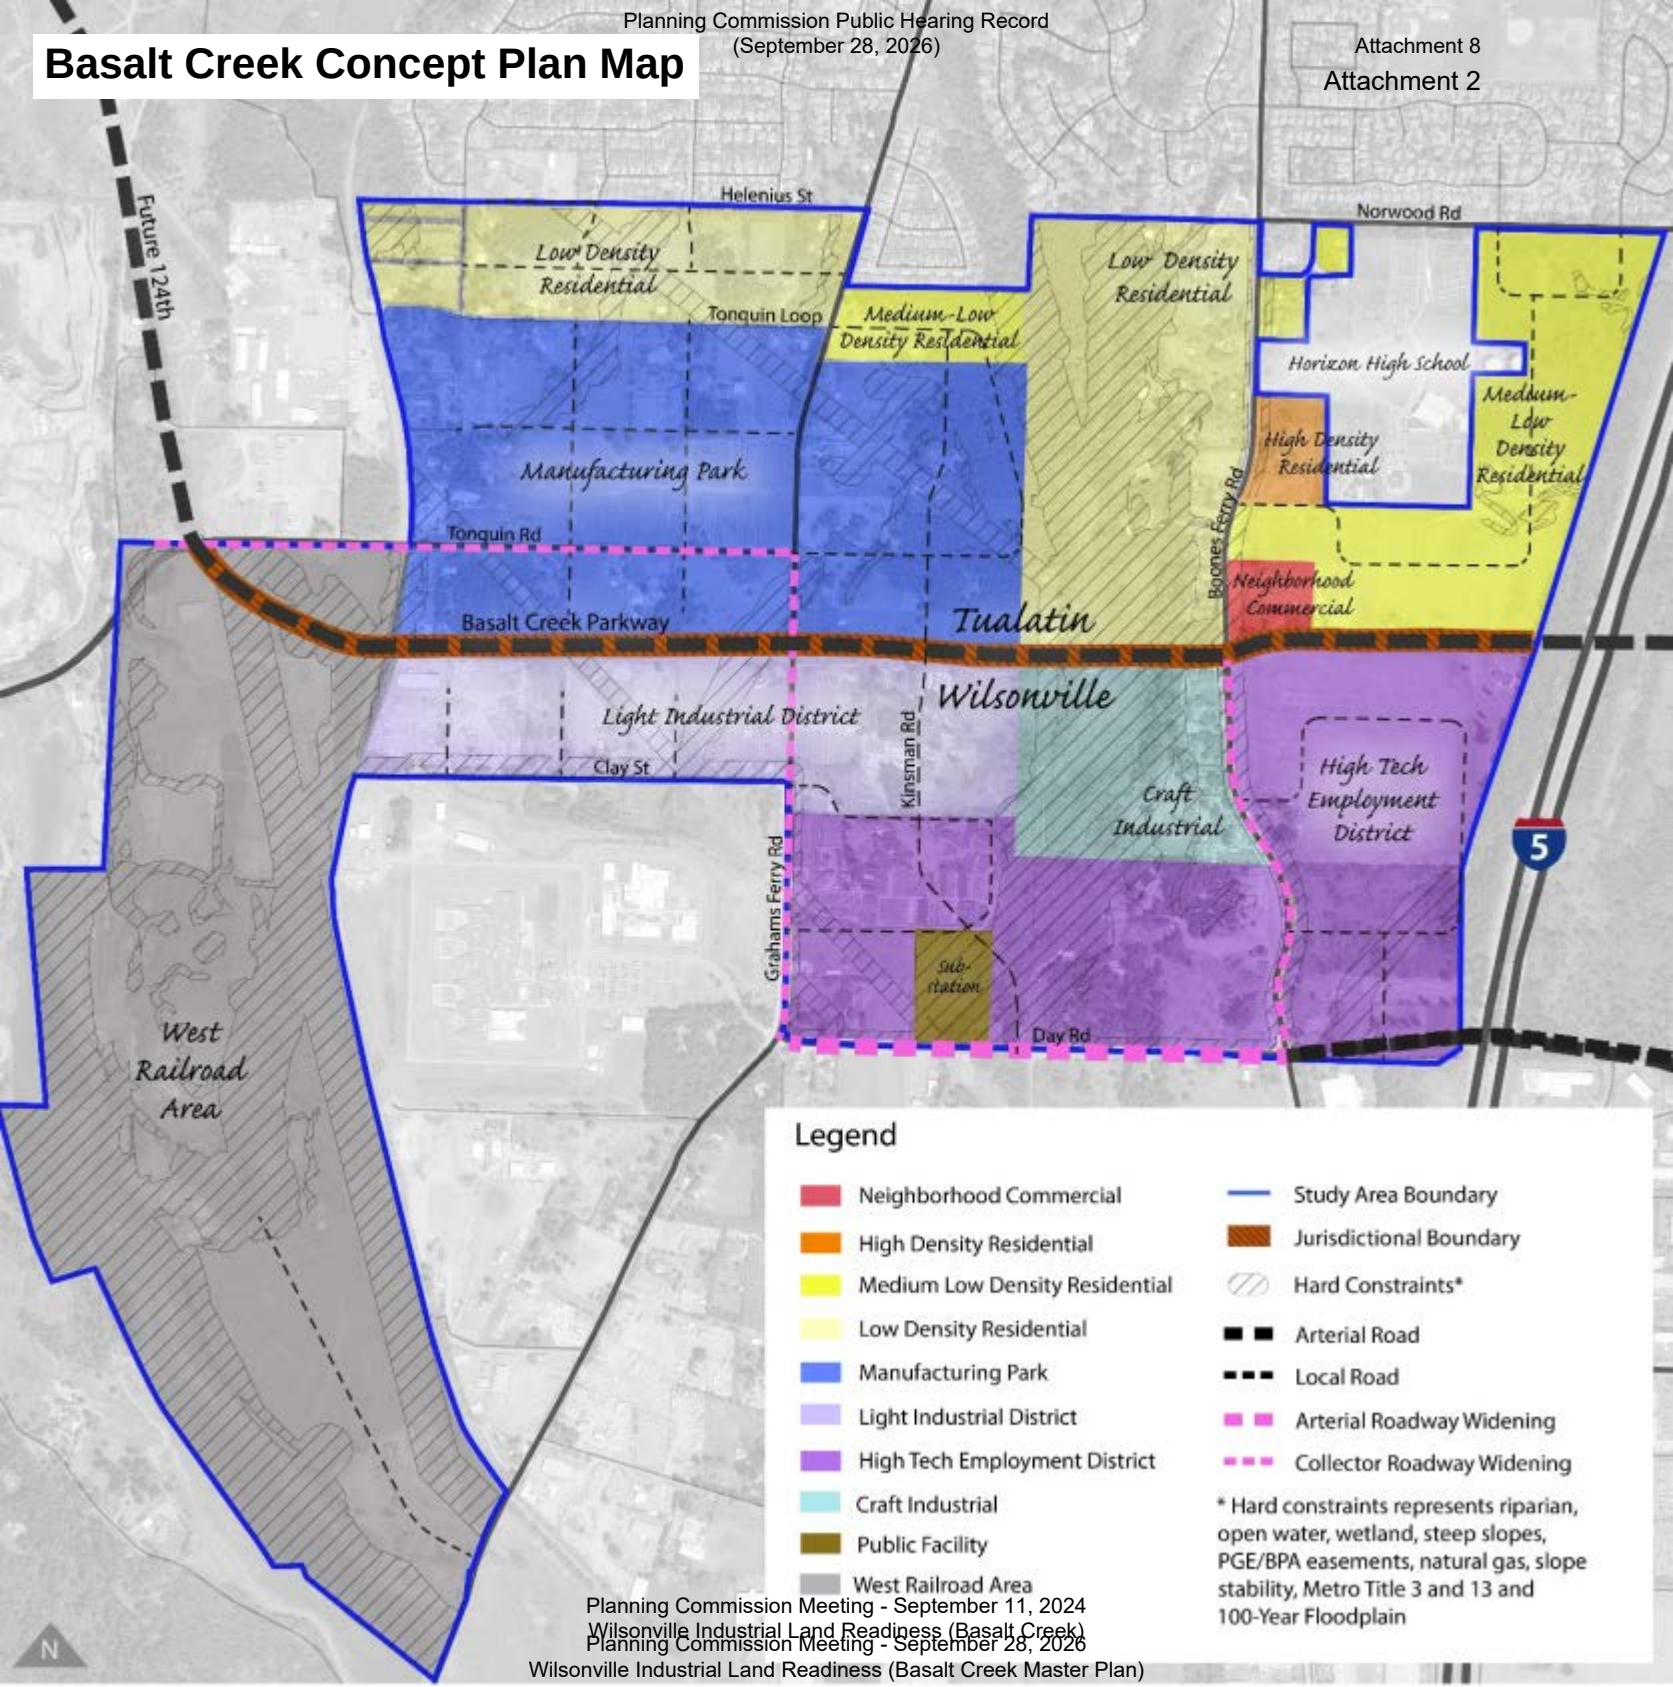
TIMELINE:
Work sessions with the Planning Commission and City Council for the first phase of the WILR project are anticipated in October through December this year. Planning Commission and City Council public hearings on Code amendments are expected in early to mid-2025 with the infrastructure funding plan work occurring throughout 2025. Work on the second citywide phase of the WILR project is expected to begin this fall and continue to the end of 2025.

CURRENT YEAR BUDGET IMPACTS:
Funding for the first phase of the WILR project is allocated in the FY2024-25 and for the second phase will be allocated in the FY2025-26 Planning Division budget. The project is funded by a $100,000 grant from Business Oregon and a $290,000 grant from Metro, for a total of $390,000 in grant funding.



COMMUNITY INVOLVEMENT PROCESS:
The Basalt Creek Concept Plan review process included comprehensive community involvement to gather input. For the first phase of the WILR project, ECONorthwest has focused on gathering input from Business Oregon, Greater Portland Inc., property owners, and developers, to understand demand for industrial land in Wilsonville as well as property owners' current and future plans for their property, to inform the market and site suitability analyses. This information also will be considered in determining appropriate zoning standards to apply and preparing needed Code amendments. The second phase of the WILR project will engage similar stakeholders, but will extend the information gathering citywide.

POTENTIAL IMPACTS OR BENEFIT TO THE COMMUNITY:
Adoption of appropriate zoning standards, creating an infrastructure funding plan, and identifying and pursuing economic development strategies will remove barriers to development and enable implementation of the Basalt Creek Concept Plan. When developed, the Basalt Creek and West Railroad areas will create jobs, thus contributing to the income and property tax base, support economic mobility for residents through family-wage employment in a highly livable, full-service City, and enable this industrial area to reach its full economic potential, resulting in positive impacts on the greater Wilsonville community.



ALTERNATIVES:
As zoning standards and an infrastructure funding plan are developed, a number of alternatives will be explored and developed with the Planning Commission.

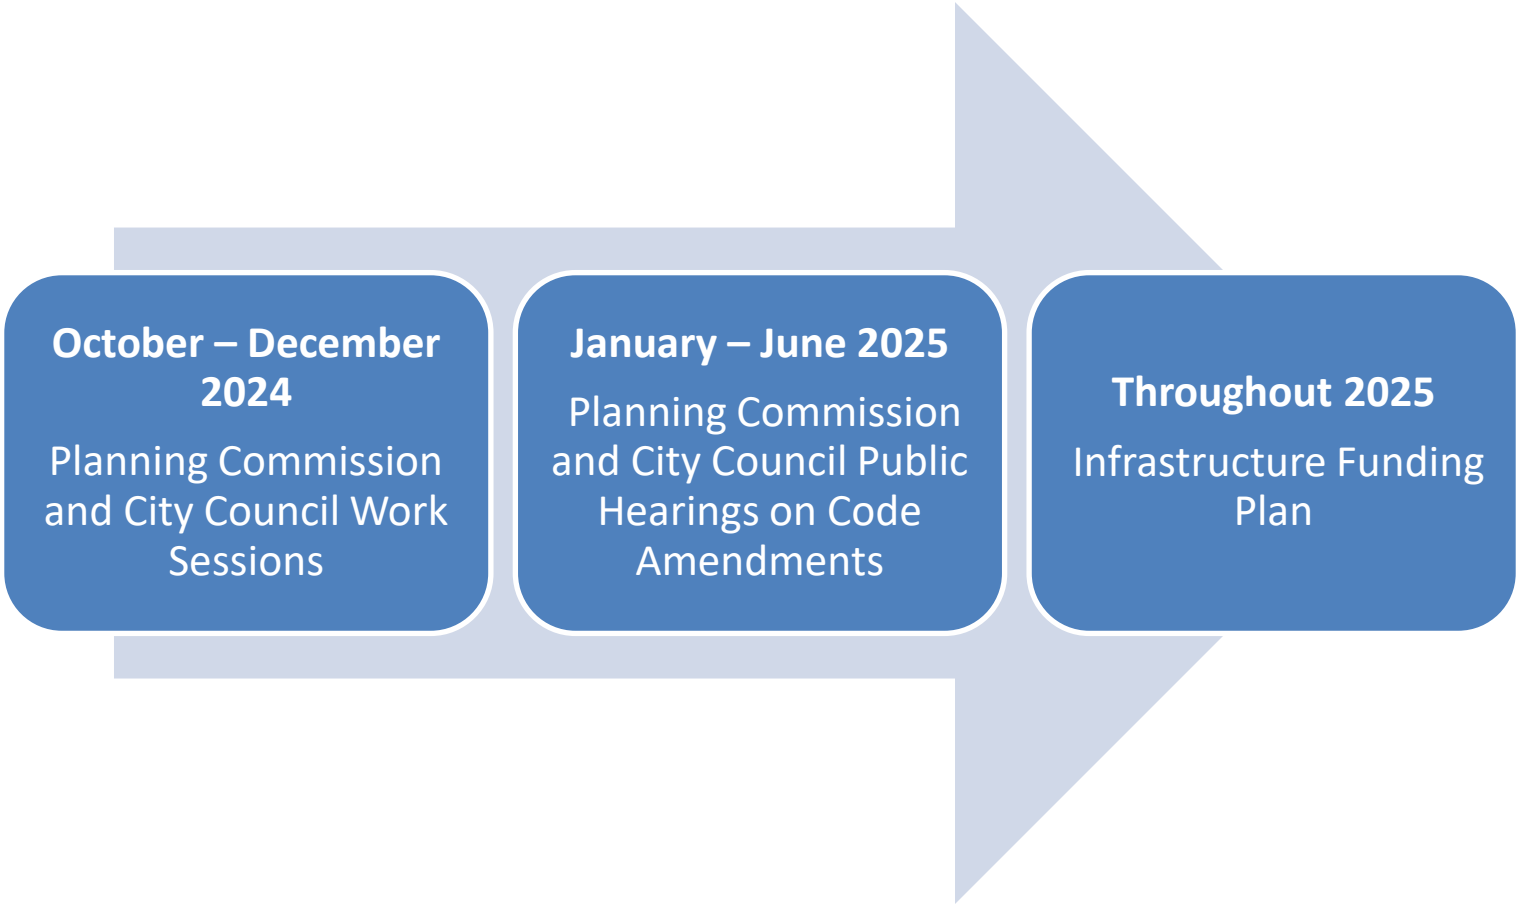
Wilsonville Industrial Land Readiness – Phase One/Basalt Creek

Planning Commission Work Session
September 11, 2024
Presented by: Cindy Luxhoj AICP, Associate Planner
Dan Pauly, Planning Manager

WILSONVILLE
OREGON



- **Land Use Categories:**
  - High Tech Employment
  - Light Industrial
  - Craft Industrial

Phase One Tasks

- ECONorthwest
  - Economic Inventory / Market Analysis
  - BLI Update
  - Site Suitability Analysis
  - Analysis of Contractor's Establishments
- DKS Associates
  - Revised Conceptual Access Plan Map
- Pacific Habitat Services
  - Natural Resource Assessment
- Consor
  - Input to Infrastructure Funding Plan
- City Staff
  - Zoning Analysis
  - Code Amendments

Phase One Timeline

Phase Two

- Update City's Economic Opportunities Analysis
  - Expand WILR scope Citywide
    - Review market trends
    - Inventory and develop economic strategy for all industrial lands
    - Recommend Code refinements to support anticipated economic activity in industrial areas
- Timeline: Fall 2024 through 2025

Question for Planning Commission

- What questions or comments does Planning Commission have about the first phase of the WILR project?

Ms. Mombert addressed questions from the Commission as follows:

- Intern Aria Azizi created a handbook with information on the significance of the people on the recommended street names list. The Planning Department could add the material to the City's website for developers and the public to access.
- Tribal approval would involve consultations with tribal leaders. The process could move quickly, depending on the information available, but it was important that the developer initiate the process and obtain the written tribal approval before naming any streets. Several of the policy criteria came from the Corvallis School District which had successfully sought tribal approval.
- Developers could propose names not included in the recommended list. Since Town Center's redevelopment was expected to take several years, developers wanting to honor an individual who had passed away could propose that name by following the established criteria outlined in the policy with final review and approval through the DEI Committee.

3. Wilsonville Industrial Land Readiness (Basalt Creek) (Luxhoj)

Cindy Luxhoj, Associate Planner, briefly updated on the Wilsonville Industrial Land Readiness (WILR) Project via PowerPoint, reviewing the Basalt Creek area's location, background, and land use categories, and describing how the two phases of the WILR Project would support and attract high quality industry and economic opportunity to Wilsonville.

Staff addressed questions from the Commission as follows:

- The Light Industrial District included a mix of light manufacturing, warehouse distribution, and speculative development buildings. The High-Tech Employment District was envisioned to include Office and corporate campus-like development. Craft Industrial would likely include some residential as it consisted of long, narrow lots with residential developments to the east. The Craft Industrial was intended to facilitate a transition towards micro-businesses or smaller entrepreneurial studios.
    - The West Railroad Area includes a lot of environmentally constrained property and very access coming only from Grahams Ferry Road unless one crossed the railroad tracks, which would entail railroad overcrossings.
        - Many contractor establishments had developed in recent years and the few property owners in the middle and southern portions of the West Railroad Area had been clearing, grading, paving, and constructing buildings, diminishing the resources. Pacific Habitat Services will survey the entire area to determine what resources remain and how the City might want to proceed with development, which would likely Light Industrial or a Planned Development Industrial (PDI) Zone, due to constraints on development and the distance from I-5 and major roads.
- Coordination between the Cities of Wilsonville and Tualatin would likely be minimal in the Basalt Creek area due to different goals. Tualatin's focus is primarily residential with some manufacturing park, having recently adopted a new zoning code for the area.
    - The Basalt Creek Parkway poses significant constraints to any kind of road connections in the area. Only the Parkway intersections at Grahams Ferry and Boones Ferry would

provide access between the two cities. Much of the Parkway would be elevated to cross over the canyon.
    - A proposed Kinsman Road extension for local access is no longer feasible.
- Unlike a typical arterial road with development facing and accessing off the road, the Basalt Creek Parkway has an expressway-type design, creating a dividing line and buffer between different types of development on either side.
    - Access points on the west side of the canyon would allow people to descend from the Parkway to reach trails on both the north and south sides, but there would be no vehicle connections.
- The Basalt Creek Concept Plan included a Transportation Refinement Plan (TRP) that assessed main arterials and roads for future improvements, analyzed proposed uses on both sides of the Parkway, and calculated anticipated trips from various development in each jurisdiction. A trip cap was established so if development on either side of the Parkway exceeded the trip estimate, traffic would be reassessed to avoid exceeding the anticipated trip estimates and triggering more road improvements than were in the TRP. Traffic is a concern given all the residential development in Tualatin, where residents naturally travel south to access Wilsonville's commercial areas, like Costco.
- Staff had discussions with Tualatin, and DKS was monitoring traffic for both cities under separate contracts. The City of Wilsonville ensures all land use decisions and development approvals include traffic analysis and impact assessments.
- Basalt Creek Parkway will be a Washington County road, and therefore maintained by the County. Two I-5 overcrossings were envisioned for the Parkway, but nothing was planned for the immediate future.
- Portland General Electric (PGE) was actively looking to expand power capacity and were building a new substation on the Town Center/Basalt Creek Parkway. Data centers, for instance, always looked for capacity or the potential to add capacity to the grid. While the City used conservative estimates to ensure water pipes were not undersized, capacity was analyzed when any significant developments came in.
    - PGE was installing significant battery and power storage at their substation in the area.
- Contractor establishments were large parcels of land typically rented to contractors for storing equipment, trucks, materials, etc. and often employing only one or two people. These sites were occupied by businesses like landscaping, painting, and construction companies that do not align with the vision for Basalt Creek, which aimed for manufacturing and distribution companies that create higher employment opportunities.

Commissioner Willard suggested the City advertise that power and water are available or can be expanded when applicants are ready to develop to attract developers to Basalt Creek or other industrial lands.

Ms. Luxhoj said she would return next month with more detailed information, including a draft economic inventory and market analysis, a preliminary local access map from DKS, and the natural resources information from Pacific Habitat.

Wilsonville Economic Opportunity Analysis

Technical Advisory Committee Meeting #1

May 6, 2025

ECO northwest

Agenda

- Welcome & Introductions
  - Role of the TAC
- Draft Results of EOA
  - What is an EOA?
  - Buildable Lands Inventory
  - Employment Growth Opportunities and Forecast
- Discussion
  - What are the advantages and disadvantages for economic development in Wilsonville?
  - What types of businesses do you think may locate in Wilsonville over the next 20 years?
- Next Steps

Role of the Technical Advisory Committee

Act as a collaborative partner to City staff and consultants, providing input and helping vet ideas throughout the Economic Opportunity Analysis and economic development strategy discussions.

Why do an EOA?

- Legal requirements (Goal 9: Economy)
- Understand existing conditions and forecast future conditions to inform:
  - Economic development strategy
  - Land use policy
  - Coordination
- Plan for long-term growth
  - Next 20 years

Wilsonville's Examination of Employment Lands

Wilsonville Industrial Land Readiness

Phase 1

Study of industrial land potential and development readiness in Basalt Creek, including zoning designation and infrastructure planning

Phase 2

- Economic Opportunity Analysis
- Economic Development Strategy

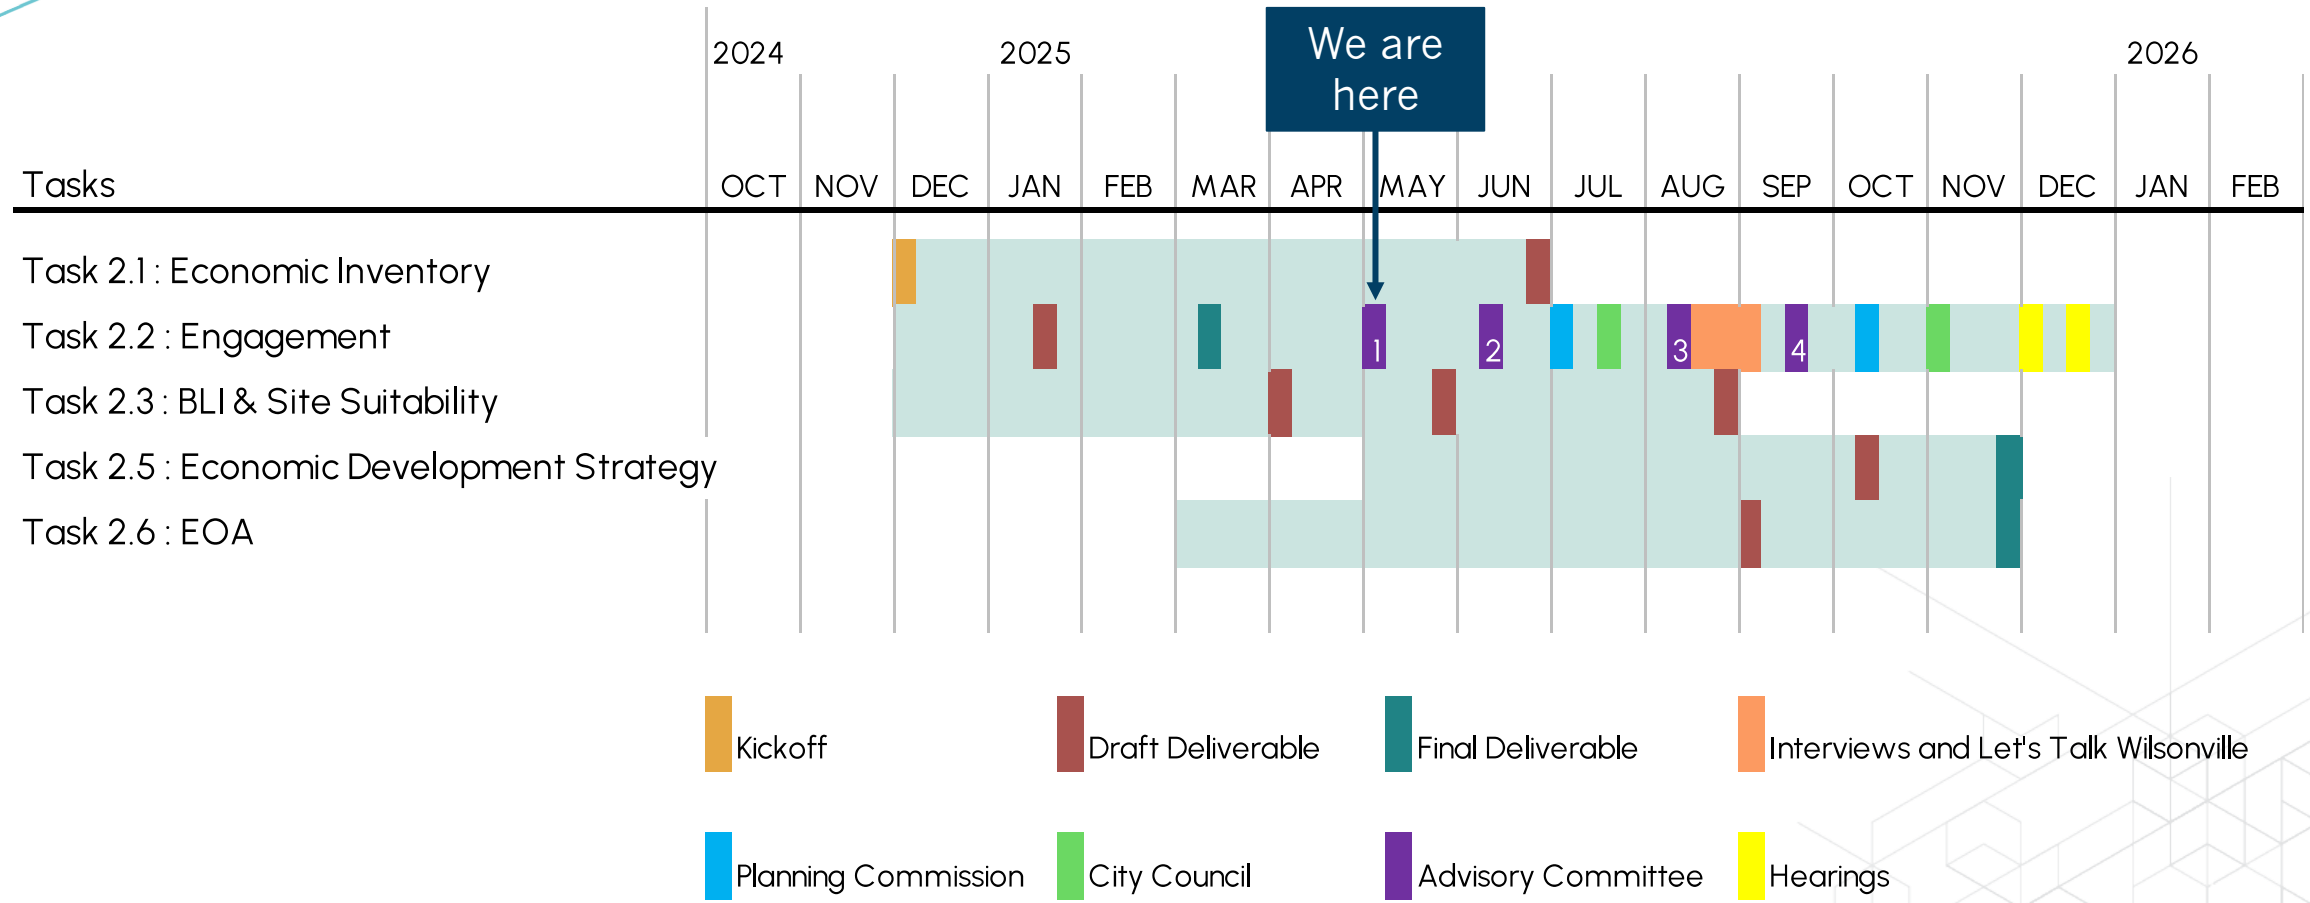
- **Revised Comprehensive Plan**
- **Potential changes to Zoning Code**
- **Potential changes to Zoning Map**

Other City projects informing the broader conversation around land needs:

Housing Our Future

- Housing Needs and Capacity Analysis (HNCA)
- Housing Production Strategy (HPS)

Project Overview



Project Products

- Economic Opportunities Analysis (EOA)
  - Technical document, meant to meet Goal 9 requirements
- Economic Development Strategy
  - Recommendations for actions capitalize on economic opportunities

City Limits Inventory Area

Constraints

- FEMA Regulatory Floodway & 100-Year Floodplains
- Pacific Habitat Resources (Riparian Areas, Upland Tree Grove, Wetlands)
- Significant Resource Overlay Zone
- Slopes Greater than 15%
- Title 3 (Stream and Floodplain Protection Plan)
- Title 13 (Habitat Conservation Areas)

Land Classifications

Developed

- Lands not classified as vacant, partially vacant, or public.

Vacant

A tax lot:

- Fully vacant based on aerial imagery
- Lots with less than 2,000 sq. ft. of developed land and developed area is less than 10% of lot.
- Lots that are 95% or more vacant

Partially vacant

A tax lot:

- Between 1-5 acres occupied by a use that could still be further developed based on zoning; or
- Equal to or larger than 5 acres where ½ acre or more is occupied by permanent buildings or improvements where excess land is present.

Public

- Lands in public, including Federal, State, County, or City ownership.

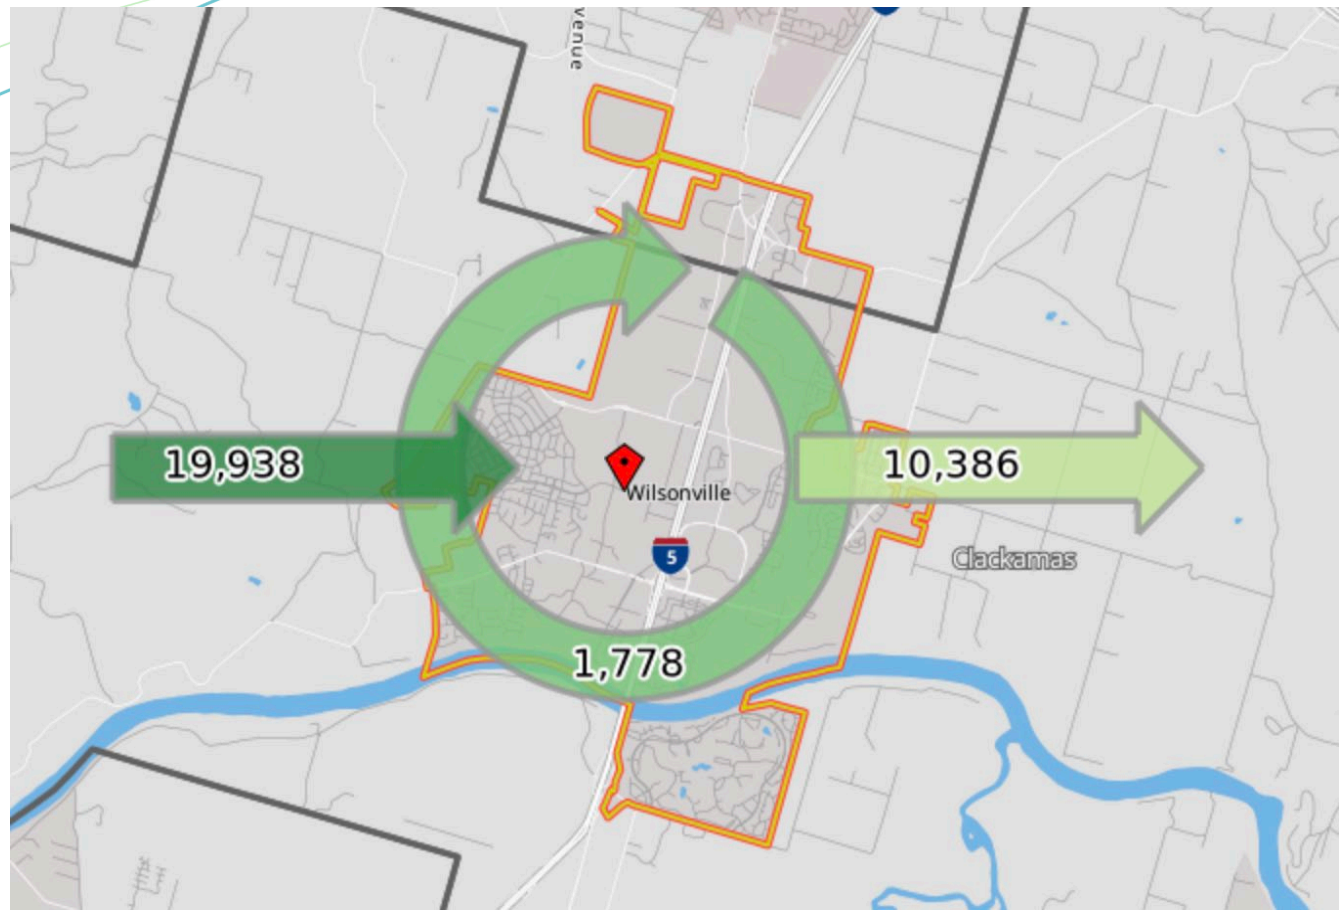
Employment Growth Opportunities and Forecast



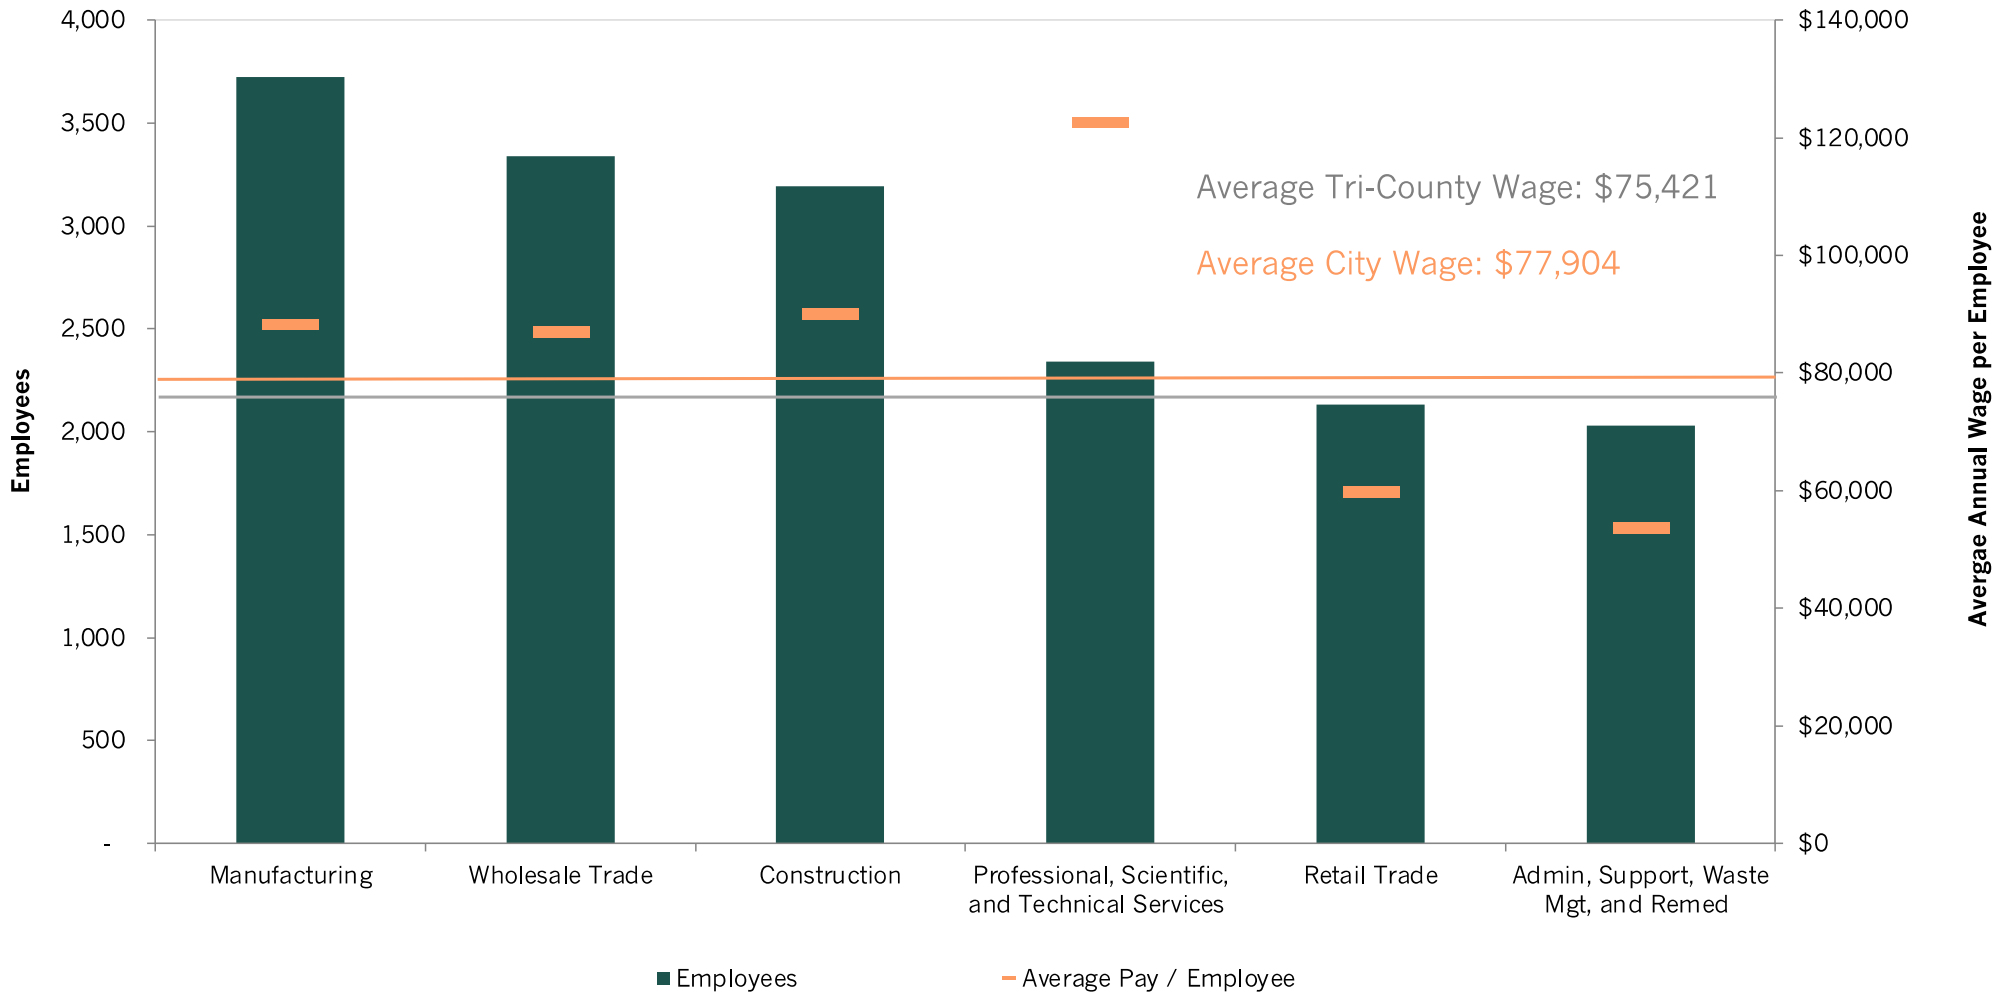
National and State Economic Trends

- Slowing labor force growth offset by increased productivity gains
- Increases in automation across sectors
  - AI is expanding automation possibilities
  - Lower and middle wage jobs at higher risk
- Inflation, tariffs, immigration reform, and economic uncertainty
  - Oregon is trade-sensitive, with over 50% of exports tied to Mexico, China, and Canada in key sectors like electronics and machinery.
- Aging population driving the need for replacement workers

National and State Economic Trends

- Shifts in commercial and industrial real estate markets
  - High interest rates and construction costs reducing development feasibility
  - Office demand shifts and hybrid work arrangements
  - Strong but slowing industrial market
- Continued transformation of the retail sector
- Rising energy prices and shifting sources
- Potential impacts of climate change

Commuting Trends



Source: Census OnTheMap, 2022

Wilsonville is part of an interconnected economy

- 8% of jobs in Wilsonville are held by people who live and work in Wilsonville
- 92% of people who work at businesses in Wilsonville live elsewhere
  - Portland
  - Salem
  - Beaverton
- Of the employed residents in Wilsonville, 15% work within the city limits. Common work destinations for Wilsonville residents include:
  - Portland
  - Tualatin
  - Tigard

Employment in Wilsonville

Covered Employment and Average Pay for Six Largest Sectors, Wilsonville, 2023

Total	**19,626**	**23,128**	**3,502**	**1.0%**

Source: Oregon Employment Department, Quarterly Census of Employment and Wages, 2007-2023.

Wilsonville had 23,128 covered jobs in 2023.

Wilsonville added 3,502 jobs at an average annual growth rate of 1.0% between 2007 and 2023.

Wilsonville sectors with the higher-than-average city wages ($77,904) in 2023 are highlighted in blue.

Discussion Questions

- What are the advantages and disadvantages for economic development in Wilsonville?
  - Why would a business want to locate in Wilsonville?
  - What would be a barrier to a business locating in Wilsonville?

Image Source: City of Wilsonville webpage

Wilsonville Advantages

- Strategically located in the southwest metro region with excellent access to I-5, I-205, and Highway 217
- Availability of industrial land and proximity to growing industrial areas
- Presence of high tech and manufacturing businesses
- Proximity to Portland International Airport
- Access to a skilled and educated workforce
- Urban Renewal in Coffee Creek; WIN Program city-wide
- High quality of life with access to schools, parks, and recreational amenities

Wilsonville Disadvantages

- Limited supply of development-ready industrial land
  - Lack of urban level infrastructure in Basalt Creek
- Contractor establishments in Basalt Creek complicate urban development
- I-5/I-205 traffic and congestion
- Lack of land for commercial development
- Regional housing affordability challenges

Draft Potential Growth Industries

What industries have the most growth potential in Wilsonville?

- Wilsonville Industrial Land Readiness Phase 1
  - Semiconductor Supply Chain
  - Cleantech, including Battery Technology
  - Advanced Manufacturing
  - Distribution and Logistics
  - Data Centers
- Higher Concentration in Wilsonville*
  - Specialty Trade Contractors and Construction
  - Wholesalers
  - Manufacturing (Machinery; Computer and Electronic Product; Electrical Equipment and Appliance)
  - Truck Transportation
  - Motor Vehicle and Parts Dealers
- More diverse retail, restaurant, and amenity businesses

Industries with an * have an LQ of 1.25 or more, greater than 250 employees, and higher than average wages

Employment Forecast, Wilsonville, 2026-2046

Employment Base: Estimate 2023 Total
In 2023 there were about 32,822 jobs in Wilsonville

Year	Jobs grow at the rate of... Urban Growth Report (0.42%)	OED Regional Employment Growth (0.85%)	Historic Employment Growth in Wilsonville (2007-23) (1.03%)	HNCA Household Growth Rate (1.20%)

Land Sufficiency

Preliminary Conclusion

Conclusion: Wilsonville may have enough industrial land but a shortage of commercial land to support projected employment growth.

Nearer Term Redevelopment Potential in Town Center

Summary of Redevelopment Potential

Redevelopment: 40.3 acres

Vacant: 8.6 acres

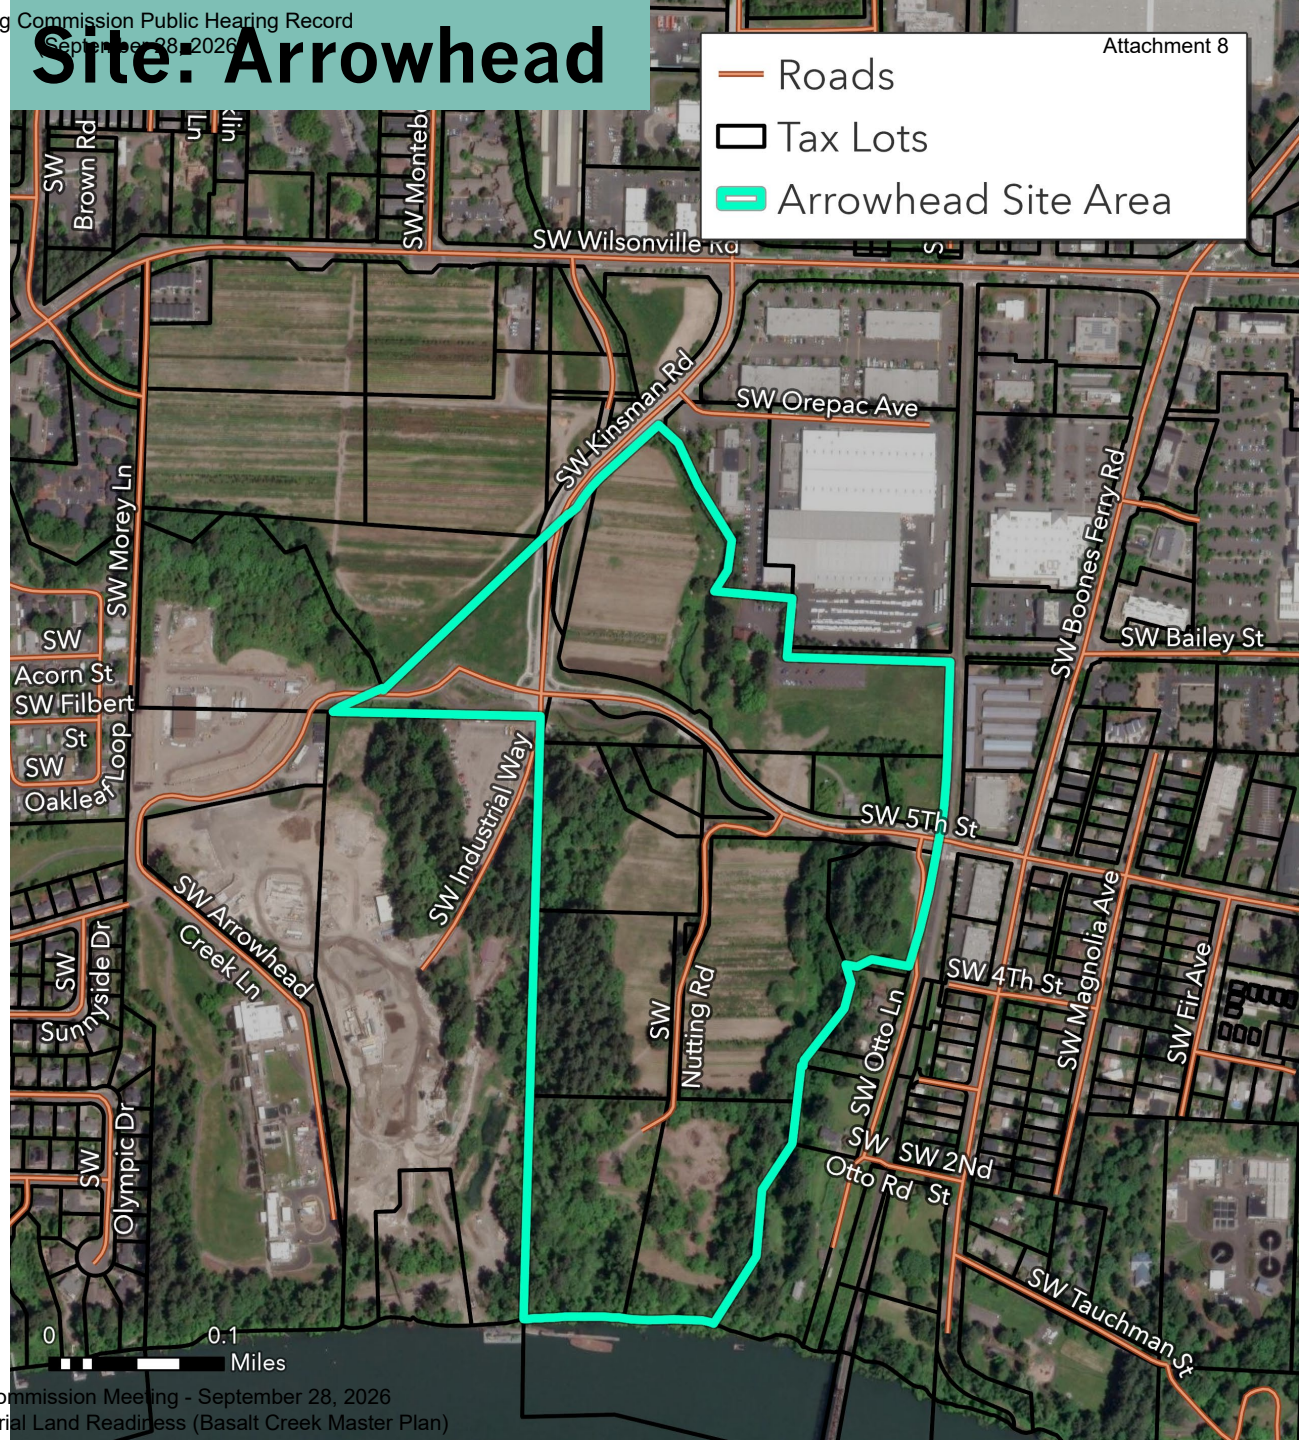
Considerations for Site Suitability Analysis:

Key question: Should these areas be used for something other than industrial? Are there changes to land use or other policies related to the land use?

Key considerations:

- Site size, ownership, and existing uses
- Historic context
- Constraints
- Surrounding uses
- Infrastructure and utilities
- Transportation access and proximity characteristics

Are there criteria we should be looking at that are *not* included in key considerations?



Site: Arrowhead

Site Overview

- **Total Area:** 53 acres
  - **Unconstrained:** 32 acres
- **Tax Lots:** 16
- **Property Owners:** 8

Surrounding Uses

- **Northwest:** Vacant – planned high-density residential
- **Northeast:** Developed – industrial
- **East:** Developed – industrial and commercial
- **Southeast:** Developed – residential
- **West:** Developed – industrial (Wilsonville Concrete)

Site Overview

- **Total Area:** 43 acres
  - **Unconstrained:** 30 acres
- **Tax Lots:** 1
- **Property Owners:** 1

Surrounding Uses

- **North:** Developed – industrial (same owner as site under review)
- **East:** Developed – low and medium density residential
- **South:** Developed – medium and multifamily residential
- **West:** Developed – medium and multifamily residential

Economic Development Strategy

Key Questions

- Do the proposed goals and strategies address the key economic challenges and opportunities in Wilsonville?
- Are there strategic priorities we haven't addressed that you think we should consider?
- Have you seen other cities successfully achieve similar goals? Are there any key learnings that could be applied to Wilsonville?

Desired Outcomes

- **Basalt and Coffee Creeks are fully built out** with high-quality, high-value development and home to major regional employers.
- **Town Center is redeveloped** with active retail, housing, and civic spaces.
- **Zoning and infrastructure** align with target industries and commercial demand, while remaining responsive to community needs.

Desired Outcomes

- **Retail and restaurant offerings are expanded,** including more locally owned and experience-oriented businesses.
- **Employment opportunities and wages have increased,** particularly in high-value sectors.
- **Wilsonville is recognized regionally** for its advanced industrial employment, quality of life, and high-caliber customer service.

Goals and Strategies

1. Support and Attract High-Value Employment in Industrial Areas

- Capitalize on Wilsonville's industrial strengths in manufacturing, clean tech, distribution and logistics, and construction and specialty trade contractors.
- Maximize the utility of Coffee Creek and Basalt Creek as regional employment anchors through:
  - Site readiness efforts
  - Infrastructure investments
  - Strategic marketing of prime industrial sites
  - Urban Renewal Area (URA) tools
  - Aligning Wilsonville Investment Now (WIN) incentives with catalytic sites and infrastructure priorities in Basalt Creek

Goals and Strategies

1. Support and Attract High-Value Employment in Industrial Areas (cont.)

- Facilitate the sale and redevelopment of underutilized industrial sites to increase employment density and tax base.
- Partner with Business Oregon, Greater Portland Inc., Metro, the Chamber of Commerce, and local institutions to amplify regional marketing, position and promote industrial sites, strengthen workforce pipelines, and enhance business recruitment and retention efforts.

Goals and Strategies

2. Ensure Land and Infrastructure Readiness

- Advance a phased land readiness strategy that aligns with market conditions and infrastructure feasibility (roads, water, power).
- Prioritize infrastructure upgrades in strategic areas.
- Partner with regional agencies to address infrastructure barriers, including power supply constraints and access challenges.
- Align infrastructure planning with other City planning efforts to ensure land use, economic development, transportation, and housing goals are harmonious.

Goals and Strategies

3. Promote Town Center Redevelopment as a Vibrant Mixed-Use Hub

- Implement the Town Center vision by supporting infill, pedestrian-oriented infrastructure, small-scale retail, and flexible commercial spaces.
- Work with property owners to find win-win scenarios that enable redevelopment of key sites along the Main Street spine and throughout Town Center.
- Explore tools such as Urban Renewal to help fund infrastructure and catalyze projects.
- Market the WIN program to recruit corporate headquarters and other non-industrial employers.

Goals and Strategies

4. Diversify the Economic Base by Supporting Commercial and Entrepreneurial Growth

- Encourage non-chain, experience-based retail and restaurants, especially in walkable areas and Town Center.
- Explore targeted zoning amendments to accommodate medical office, commercial, and flex-space uses within industrial zones, where appropriate.

REMINDER: Key Questions

- Do the proposed goals and strategies address the key economic challenges and opportunities in Wilsonville?
- Are there strategic priorities we haven't addressed that you think we should consider?
- Have you seen other cities successfully achieve similar goals? Are there any key learnings that could be applied to Wilsonville?

Next Steps

- Conduct site suitability analyses
- Continue to develop Economic Development Strategy
- Continue to develop EOA
- Stakeholder interviews and focus groups to inform strategies
- Planning Commission Meeting:7/9
- City Council Meeting: 8/4
- TAC meeting #3: TBD
  - Review site suitability analysis
  - Revisions to goals and strategies; discuss implementation actions

Wilsonville Economic Opportunity Analysis

Technical Advisory Committee Meeting #3

October 1, 2025

ECO northwest

Agenda

- REMINDER: Economic Development Strategy – Desired Outcomes
- DISCUSSION: Potential Actions
  - Are these the right mix of actions to advance Wilsonville's goals?
  - Are there actions missing that Wilsonville should consider?
  - What role do you see to partner in implementation? Where should Wilsonville focus its local resources to not be duplicative of existing efforts?
- Next Steps

REMINDER: Wilsonville's Examination of Employment Lands

Wilsonville Industrial Land Readiness

Phase 1

Study of industrial land potential and development readiness in Basalt Creek, including zoning designation and infrastructure planning

Phase 2

- Economic Opportunity Analysis
- Economic Development Strategy

- **Potential changes to Comprehensive Plan**
- **Potential changes to Zoning Code**
- **Potential changes to Zoning Map**

Other City projects informing the broader conversation around land needs:

Housing Our Future

- Housing Needs and Capacity Analysis (HNCA)
- Housing Production Strategy (HPS)

Project Schedule

We are here

Economic Development Strategy

REMINDER: Desired Outcomes

- **Basalt and Coffee Creeks are fully built out** with high-quality, high-value development and home to major regional employers.
- **Town Center is redeveloped** with active retail, housing, and civic spaces.
- **Zoning and infrastructure** align with target industries and commercial demand, while remaining responsive to community needs.

REMINDER: Desired Outcomes

- **Retail and restaurant offerings are expanded,** including more locally owned and experience-oriented businesses.
- **Employment opportunities and wages have increased,** particularly in high-value sectors.
- **Wilsonville is recognized regionally** for its advanced industrial employment, quality of life, and high-caliber customer service.

Engagement Feedback

Workforce Challenges: Difficulty finding and retaining skilled workers. Concerns with upskilling with AI.

Space & Land Constraints: Limited availability of developed space and land drives high rents and restricts opportunities for new and growing businesses.

High Costs: High rents and upgrade expenses create barriers to starting or expanding small business.

Retail Market Gaps: There aren't enough local services and businesses co-located to meet demand, prompting people to shop and seek services outside of Wilsonville.

City-Business Relationship:

- Businesses want proactive, customer-focused support, with the City identifying issues within its entitlement and permitting processes, solving problems, and showing flexibility to "find a path to yes."
- Desire for support connecting to resources (business planning, access to capital)

Challenges to Achieving Outcomes

1. Much of Wilsonville's undeveloped industrial land is not development-ready (un-serviced, fragmented)
2. Limited City funds to support economic development outside Coffee Creek Urban Renewal
3. Vacant commercial land is limited
4. Lack of unique retail & restaurants
5. Businesses struggling to get qualified workforce
6. Perceived limited supports for small businesses

Key Questions for Discussion with the TAC

- Are these the right mix of actions to advance Wilsonville's goals?
- Are there actions missing that Wilsonville should consider?
- What role do you see for partners in implementation? Where should Wilsonville focus its local resources to not be duplicative of existing efforts?

*Actions that require additional funding or staff are indicated in yellow

Potential Actions to Address Challenges

1. Much of Wilsonville's undeveloped industrial land is not development-ready (un-serviced, fragmented)

- Launch a land aggregation and resale program in Coffee Creek using Urban Renewal and RSIS
- Conduct a feasibility study for Basalt Creek URA
- Support contractor establishment compliance *(could require a new funding source if providing financial assistance)*
- Promote Wilsonville's industrial sites for development

Potential Actions to Address Challenges

1. Much of Wilsonville's undeveloped industrial land is not development-ready (un-serviced, fragmented) - CONTINUED

- Create a package of incentives for overcoming infrastructure barriers (*exploration with existing staff; may require establishing new funding source(s)*)
  - Explore additional funding mechanisms (LIDs, latecomer agreements, SDC deferrals)
  - Promote/refine WIN program
  - Public infrastructure cost-sharing
  - Pursue state and federal grants
  - Strengthen partnerships and advocacy

What other funding sources could offset upfront infrastructure and land readiness costs, reducing burden on the City?

Potential Actions to Address Challenges

2. Limited City funds to support economic development outside Coffee Creek Urban Renewal

- Explore a dedicated funding source (URA, expanded TLT, LID) to support commercial and mixed-use redevelopment
- Create a package of incentives for overcoming infrastructure barriers (see Issue Area 1)

Are there incentives for overcoming infrastructure barriers that we should be looking into but have not been discussed? (see the memorandum for details about the ideas under discussion)

Potential Actions to Address Challenges

3. Limited vacant commercial land

- Expand allowable non-retail commercial uses in select industrial areas
- Coordinate with other City departments to deliver on Town Center and tourism priorities (*Some priorities will require new funding source(s)*)
- Catalyze redevelopment of key sites in Town Center (*Requires a new funding source)*

Given the commercial activity in the southern Portland area, especially adjacent cities, do you have thoughts about the need for more retail and other locally-serving commercial activities in Wilsonville?

Potential Actions to Address Challenges

4. Lack of unique retail & restaurants

- Incentivize local dining and retail in Town Center (*Requires a funding source if providing financial incentives)*
- Explore the creation of a food cart incubator program in Town Center *(Requires a funding source if providing seed funding)*
- Recruit unique restaurants and shops to Town Center (*Requires a new funding source)*
- Explore and/or partner on affordable commercial space models (*May require a new funding source)*

Given the commercial activity in the southern Portland area, especially adjacent cities, do you have thoughts about the need for more retail and other locally-serving commercial activities in Wilsonville?

Potential Actions to Address Challenges

5. Businesses struggle to find qualified workers

- Facilitate workforce connections and support partner initiatives

- How could Wilsonville's role as a connector between employers and workforce partners complement initiatives your organization is advancing?
- Are there specific industries or skills gaps you believe Wilsonville should be highlighting to workforce partners?
- What partnership models have you seen work well to support workforce training or employer-education collaborations, assuming that cities do not directly deliver training programs?

Potential Actions to Address Challenges

6. Perceived limited supports for small business

- Further strengthen business communication, customer service, and resource connections *(Depending on level of effort, may require additional staff/resources)*
- Provide small business assistance for upgrades (industrial and commercial businesses) *(Requires a new funding source)*

- How can the City better support local businesses? What improvements to customer service will help small businesses?
- How do you see the City best aligning with the Chamber and other organizations? Where should Wilsonville plug in versus lead?
- Are there existing grant or technical assistance programs Wilsonville should be directing businesses toward?

REMINDER: Key Questions

- Are these the right mix of actions to advance Wilsonville's goals?
- Are there actions missing that Wilsonville should consider?
- What role do you see to partner in implementation? Where should Wilsonville focus its local resources to not be duplicative of existing efforts?

Next Steps

- Finalize draft Economic Development Strategy
- Finalize draft EOA
- Planning Commission Meeting: November 12, 2025
- City Council Meeting: December 1, 2025

ECOnorthwest

DATE:	January 30, 2026
TO:	City of Wilsonville
FROM:	Nicole Underwood, ECOnorthwest
SUBJECT:	WILR Phase 2: Engagement Summary

The City of Wilsonville recently completed an Economic Opportunities Analysis (EOA) to evaluate whether the City's existing supply of employment land is sufficient to support anticipated business and job growth between 2026 and 2046. This technical work was paired with development of an Economic Development Strategy (EDS), which identified targeted strategies and actions to advance economic growth aligned with local priorities.

To ensure the EOA and EDS reflected Wilsonville's on-the-ground economic conditions, the City engaged stakeholders, including traded-sector employers, small business owners, property owners, and economic development partners. This outreach complemented the technical analysis and helped shape actionable, inclusive economic development strategies.

This memorandum summarizes engagement completed for the EOA and EDS, including three Technical Advisory Committee (TAC) meetings. The TAC included representatives from:

- City of Wilsonville
- Business Oregon
- Greater Portland Inc (GPI)
- Oregon Metro
- Wilsonville Chamber of Commerce

Engagement also included four stakeholder interviews, representing: personal service small businesses, a small manufacturing business, a business-support organization, and a Town Center-area redevelopment stakeholder. The project team also invited property owners of key industrial sites to participate in interviews; however, those property owners declined to be interviewed.

TAC Meeting #1 (May 6, 2025)

Meeting Purpose: Introduce the TAC to the EOA process, share early results, and gather input on buildable lands, employment trends, and future growth opportunities.

Attendees:

- Kevin Ferrasci O'Malley – Wilsonville Chamber
- David Tetrick – Metro
- Sam Thomas and Jeff Hampton – Business Oregon

- Nick Triska – GPI
- Amy Pepper, Keith Katko, Daniel Pauly, Matt Lorenzen, Cindy Luxhoj – City of Wilsonville
- Nicole Underwood and Beth Goodman – ECOnorthwest

Key Topics Discussed

Overview of the EOA and Role of the TAC
The group reviewed the EOA's purpose (identifying employment land needs over a 20-year horizon) and the TAC's advisory role in shaping analysis and strategies.

Buildable Lands Inventory (BLI)

- Question about the exclusion of a 10% slope constraint for industrial lands
- Clarified that the BLI constraints do include significant wetlands as part of the Significant Resource Overlay Zone (SROZ).
- Noted that this project can help set Wilsonville up for discussions with Metro about UGB expansion in the future
- Request to share BLI maps with TAC after meeting
- Discussion of commercially used properties within or near industrial zones raised questions about land use compatibility and long-term strategy.
- Recognition that commercial uses often locate on industrial land, more so than the reverse.
- Acknowledged the challenge of protecting industrial land while meeting commercial and retail needs.

Employment Data and Metro's Regional Context

- TAC suggested the project team review Metro's Urban Growth Report for data on regional economic advantages and disadvantages.

Economic Development Advantages and Industry Growth Opportunities

NOTE: The group completed a zoom whiteboard activity to identify advantages and disadvantages for economic development in Wilsonville. A picture of that whiteboard activity is included at the end of the TAC Meeting #1 summary.

- Brainstormed sectors where Wilsonville could be competitive:
  - Bioscience and life sciences (potential for clustering)
  - Modular housing and mass timber as innovative industries worth exploring further.

- Contractor establishments were highlighted for their higher wages, though most workers operate at external job sites, limiting local economic impact.
- Matt noted a lack of unique retail and restaurant options (currently mostly chains), and a need for more diverse commercial offerings.
- Challenges to more boutique retail development include:
    - Historical zoning focused on freeway interchanges.
    - Young age of the city, compared to older areas with more affordable space.
    - Limited commercial land availability.
    - Dominance of large REIT landlords who prioritize national credit tenants.

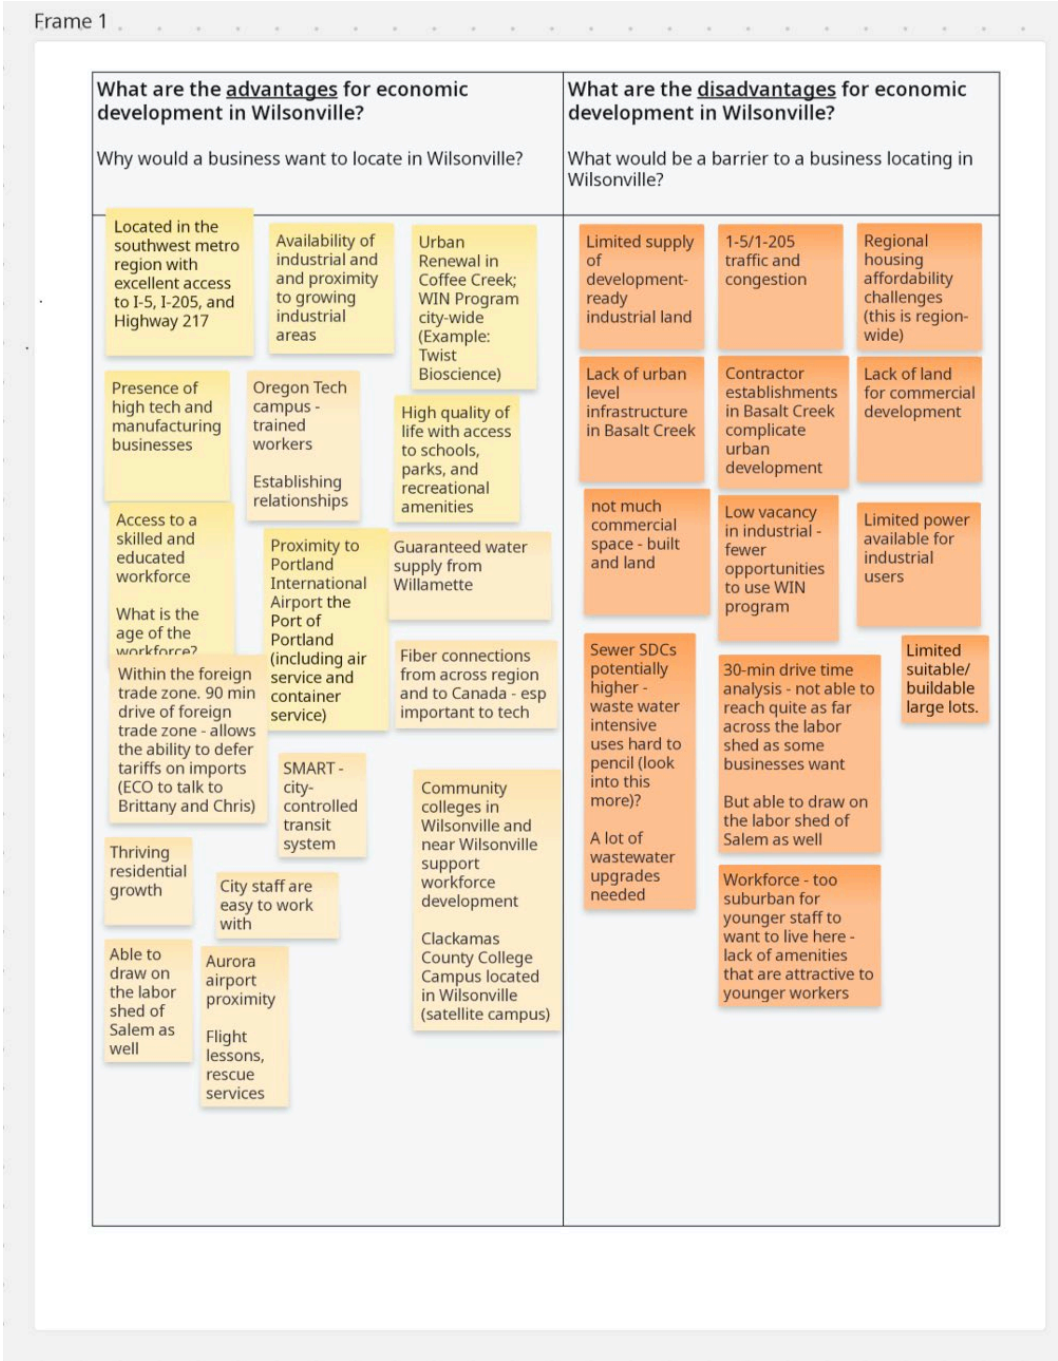
Land Use Dynamics and Constraints

- Discussion of how commercial activity is occupying land zoned for industrial use.
- Beth suggested ECO review how much commercial NAICS activity occurs on industrial parcels.
- Matt and Dan discussed the potential for more flexible land uses in industrial zones, including medical office and indoor recreation
- City staff noted that the Planned Development Industrial (PDI) zone had allowed broader uses in the past but was scaled back due to car dealership proliferation.
- Town Center map flagged as inaccurate and in need of correction.

Fiscal Considerations

- Kevin emphasized the importance of industrial lands for payroll generation.
- Matt discussed property tax revenue per acre, comparing commercial strips to industrial uses, and highlighted the city's fiscal reliance on property tax generation.

Emerging Trends and Long-Term Planning



- Kevin raised a forward-looking question about the impact of AI on employment in the region.
- Nick noted recent layoffs in tech and encouraged continued dialogue on how AI may augment or displace workers.
- Suggested reaching out to Chris and Mike at ECO for further insights on AI's implications.

Next Steps

- The next TAC meeting will focus on policy development.
- Members were encouraged to come prepared with ideas about stakeholders or organizations the City should engage with.

- Follow-up items include:
  - Sharing BLI maps with the TAC
  - Looking into commercial uses on industrial land using NAICS codes
  - Updating the Town Center map
  - Further examining impact of AI on industry

Figure 1. Zoom Whiteboard Activity: Advantages and Disadvantages for Economic Development in Wilsonville

TAC Meeting #2 (June 25, 2025)

Meeting Purpose: Review updated EOA results, discuss redevelopment potential in Town Center, assess site suitability considerations, and provide feedback on the draft Economic Development Strategy.

Attendees:

- Kevin Ferrasci O'Malley – Wilsonville Chamber
- David Tetrick – Metro
- Jeff Hampton – Business Oregon
- Nick Triska – GPI
- Amy Pepper, Matt Lorenzen, Cindy Luxhoj – City of Wilsonville
- Nicole Underwood and Beth Goodman – ECOnorthwest

Key Topics Discussed

Takeaways from the EOA

- Jeff thinks the OED forecast is a reasonable way to go given Wilsonville's historical growth rate and current trends
- Metro cities show a wide range of growth assumptions
- Matt emphasized the value of the EOA in helping the City determine how it wants to position itself for future growth.
- Amy - For the wastewater forecast, the City assumed a much higher population growth rate than the official population growth. With leveling out later in the 20-period because they would near build out.

Town Center Redevelopment and Site Suitability

- Need to reconnect with Kevin (Wilsonville Chamber) for feedback on Town Center redevelopment.
- Include a map with better geographic context in the PC presentation.
- **Arrowhead Site**
    - Nick noted the need for a clear pathway to land aggregation to make the area more developable for an industrial land users. Less desirable as a site for industrial development as it is. The shape of the site is awkward. Roadway alignments are also awkward. Need more rectilinear site. Is it possible to aggregate into 3 or 4 sites, rather than 1 big site?

- Matt stated that there is no formal tool for property aggregation right now
- Amy mentioned Kinsmen Street is complete - the aerial image is outdated.
- Matt asked whether Industrial Way is vacated; Amy responded it is not, but status is unclear and needs follow-up.
- Cindy highlighted the presence of constraints: residential uses, the treatment plant, park, and SROZ watershed areas. The question is whether industrial use is obsolete in this location. Is it more appropriate to consider commercial, "craft industrial" (a new zone under development), or some residential?
- Jeff agreed that this area doesn't make a lot of sense for large scale industrial, especially given the SROZ and planned high-density residential.

- **Boeckman Site**
  - Cindy provided context: the site is owned by Siemens (Mentor Graphics) and was intended to develop as a campus, similar to the site to the north. Access is an issue to get to I-5 (freight should not go through Town Center). Close proximity to residential. Also has SROZ in it.
  - Matt noted that Siemens is considering selling the site. The current zoning is essentially a placeholder, with policies requiring campus-style development similar to Mentor Graphics.
  - This development model may no longer be market viable.

Economic Development Strategy Goals and Policies

The team reviewed the draft goals and policies. Overall, the group agreed with the initial direction of the goals and policies. These will be discussed further in a future meeting along with actions to implement these goals/policies.

Next Steps

- Incorporate improved map orientation in PC presentation.
- Reconnect with Kevin to gather feedback on Town Center redevelopment.
- Follow up on the status of Industrial Way.
- Consider how to address policy direction for Boeckman and Arrowhead in light of market realities and site constraints.
- Prepare for upcoming policy-focused TAC discussion and refine EOA narrative for PC and CC presentations.

TAC Meeting #3 (October 1, 2025)

Meeting Purpose: Review the draft Economic Development Strategy desired outcomes and potential actions.

Attendees:

- Kevin Ferrasci O'Malley – Wilsonville Chamber
- Jeff Hampton – Business Oregon
- Nick Triska – GPI
- Matt Lorenzen, Cindy Luxhoj, and Keith Katko – City of Wilsonville
- Nicole Underwood and Beth Goodman – ECOnorthwest

Key Topics Discussed

EDS Desired Outcomes

- TAC members generally supported the direction of desired outcomes, while emphasizing the need to ensure outcomes are feasible given staffing and implementation capacity.
- Members discussed whether some desired outcomes may be too ambitious or potentially in tension with one another, particularly where actions span both Town Center and employment areas.
- Members noted that major redevelopment and ecosystem-building efforts can take many years (sometimes a decade or more), with different sites moving at different speeds.

Discussion of Draft Actions

- **Action 1: Development-ready land**
    - Business Oregon discussed infrastructure funding approaches that can support bringing infrastructure to the property line and the possibility of creative agreements for ownership and maintenance, along with loan programs.
    - The group discussed challenges with the City being on the hook for upfront funds (e.g., for programs like RISIS), and the cost of borrowing compared to potentially more affordable funding sources.
    - A new ~$10 million loan fund through Business Oregon was discussed as a potential risk-mitigation tool for upfront funding.

- Wilsonville may be in line to receive a ~$250,000 loan for sewer infrastructure related to Coffee Creek/Basalt Creek, with discussion of relevant programs (including semiconductor-related tools).
- Participants discussed constraints around borrowing and repayment, including concerns if borrowing is backed by the General Fund. Urban renewal tools were discussed, along with practical constraints about which entities are eligible to borrow and how City/URA coordination would need to work.
- TAC members cautioned against assuming SDC deferrals without early discussions with City engineers.
- The team raised the need for an action focused on the City's ability to be flexible and solution-oriented with applicants—supporting development outcomes by reducing rigidity and helping projects find a path to compliance and feasibility.

- **Action 2: Limited city funds outside of Coffee Creek URA**
  - None
- **Action 3: Limited commercial land**
  - Participants noted it can be a tough sell to argue for more commercial land when prominent vacancies remain (e.g., Fry's, Albertson's).
  - TAC members suggested framing the question as "If the vision for TC shifts, there is a much clearer need for commercial land."
- **Action 4: Lack of unique retail and restaurants**
  - Discussion focused on whether the City wants to be "serious" about small business support and what level of resourcing that implies.
  - Members emphasized broadening incentives beyond writing grant checks, including tools that reduce risk and improve feasibility.
  - Mixed-use feasibility was raised repeatedly: developers report ground-floor commercial often does not pencil without an incentive or risk-reduction tool.
  - A potential tool discussed was a URA lease guarantee (or similar) to increase developer confidence in leasing to local restaurants/retail rather than national chains.
  - Members discussed food-cart incubator concepts, including examples such as Tigard Launch Pod (City-owned carts leased at low rates to incubate local restaurants), noting both potential benefits and community concerns.
  - Participants also raised concerns that subsidized incubators can be perceived as subsidizing competition; non-financial or longer-term supports may be more broadly acceptable.
- **Action 5: Workforce**

- Members discussed the value of coalition-building models, including Hillsboro's advanced manufacturing partnership approach, and emphasized that these efforts can take years.
- Participants suggested the City role could be more proactive than a connector/concierge—acting as an advocate that carries employer needs forward to partners.
- Members discussed employer engagement, convening larger employers, and partnering with colleges/training providers (including examples such as Mt. Hood Community College's employer partnerships).
- Kevin noted a regional initiative underway and offered to share information (Willamette Collective).

- **Action 6: Limited supports for small businesses**
  - Members discussed how to increase visibility and traction for existing supports and strengthen the City's "welcome mat" role for small businesses, even without major new funding.
  - Participants raised the idea of City/Chamber coordination to avoid duplication while improving responsiveness.
  - Emerging needs included small business adaptation to AI and whether the City can play a role in facilitating training or partnerships that help businesses respond to change.
- **Overall feedback on the action package**
  - TAC members emphasized that one desired outcome is buildout of Basalt Creek and Coffee Creek, while many actions focus on Town Center. The action package should more clearly reconcile how Town Center and employment land strategies support each other.
  - Members noted Town Center and employment lands likely need to advance simultaneously: Town Center amenities support employment areas, and retail needs customers and activity to succeed.

Stakeholder Interviews (Summer – Fall 2025)

Engagement purpose: Gather perspectives from businesses and property owners to ensure the EOA and EDS reflected the realities of Wilsonville's economy. This outreach helped ground-truth the team's understanding of local business opportunities and constraints and informed the economic development strategies and actions recommended for City consideration.

Stakeholder categories represented: Interviews included a small set of stakeholders representing (1) a Town Center-area redevelopment stakeholder/property owner, (2) a local personal service small business, (3) a small industrial/manufacturing business, and (4) a representative of the Wilsonville Chamber of Commerce

Key Themes

- **Workforce challenges (including upskilling and AI).** Interviewees described difficulty finding and retaining skilled workers, particularly for manufacturing and specialized roles, and noted that smaller employers often lack capacity to upskill their employees when new technology becomes available (like AI). The Chamber raised the importance of considering how AI may affect workforce needs. Interviewees expressed interest in stronger coordination across employers, education/training partners, and workforce programs.
- **Space and land constraints limit business options and growth.** Stakeholders emphasized that limited availability of developed space constrains business choices and expansion. The small industrial/manufacturing perspective highlighted limited opportunities to purchase smaller industrial buildings, with ownership viewed as important for long-term stability.
- **High costs create barriers, especially for small businesses.** Interviewees noted that high rents and tenant improvement/upgrade costs can make it difficult to start, sustain, or expand small businesses. Limited supply of business space can amplify pricing pressures and reduce the ability to find spaces that match business size and financial constraints.
- **Retail market gaps and unmet demand for local-serving businesses.** Participants described gaps in locally serving retail and services, prompting residents to shop or seek services outside Wilsonville. Several linked this challenge to the inability for small business to find affordable space to provide these local-serving businesses
- **City–business relationship: "path to yes" and proactive support.** A recurring message was that businesses value a City approach that is proactive and solutions-oriented—supportive in "finding a path to yes." Interviewees highlighted the importance of clear points of contact, predictable processes, and support connecting to resources (e.g., access to capital, technical assistance, and workforce supports).

Several also emphasized that implementation flexibility can be essential to enabling redevelopment and investment while still meeting City goals.

Planning Commission Record

Comments

MEMORANDUM

DATE: July 8, 2026

TO: CITY OF WILSONVILLE
29799 Town Center Loop E
Wilsonville, OR 97070

FROM: Brendan Buckley
Johnson Economics, LLC

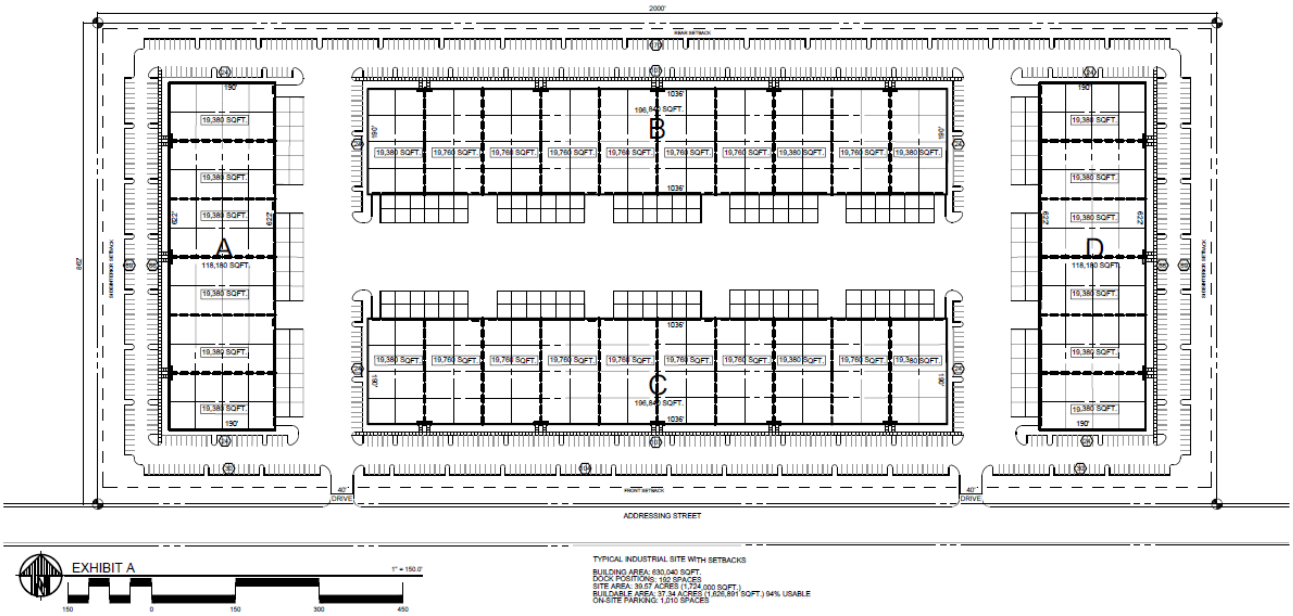
SUBJECT: Impact Analysis of Industrial Use Alternatives for the Basalt Creek Plan Area in Wilsonville

---

I. INTRODUCTION

JOHNSON ECONOMICS has conducted an alternative use analysis on an industrial site of roughly 40 total acres located in Wilsonville, Oregon.

The site is located within the future Northwest Industrial Zone (NWI), in the Basalt Creek planning area on the boundary of Wilsonville, and adjacent to Tualatin. The proposed NWI zone will apply to areas with the existing Coffee Creek Master Plan Area, and the Basalt Creek Master Plan area. The NWI zone has a number of standards for industrial development that will shape the form of private development that can happen in the area.



The purpose of this analysis is to examine how a development built on the 40-acre site under the proposed NWI zoning standards will differ from a typical market-driven flex industrial development on the same site. The analysis compares the amount of potential development under the two scenarios and the impact on assessed value, tax generation, and employment.

As detailed below, due to market demand, the prospective timing of development differs, with the typical flex industrial development expected to develop significantly sooner due to immediate market feasibility, and the development under the NWI zoning expected to take significantly longer due to the fragmentation of the site, number of resulting buildings, and reduced marketability.

II. TYPICAL FLEX INDUSTRIAL DEVELOPMENT PROGRAM

Figures 2.1 shows a typical site plan for a modern flex use industrial development designed to maximize the use of a 40-acre site. This development program is what the private development industry could be expected to deliver in the suburban Portland market in response to market-based signals.

FIGURE 2.1: TYPICAL FLEX INDUSTRIAL SITE PLAN, 40-ACRE SITE

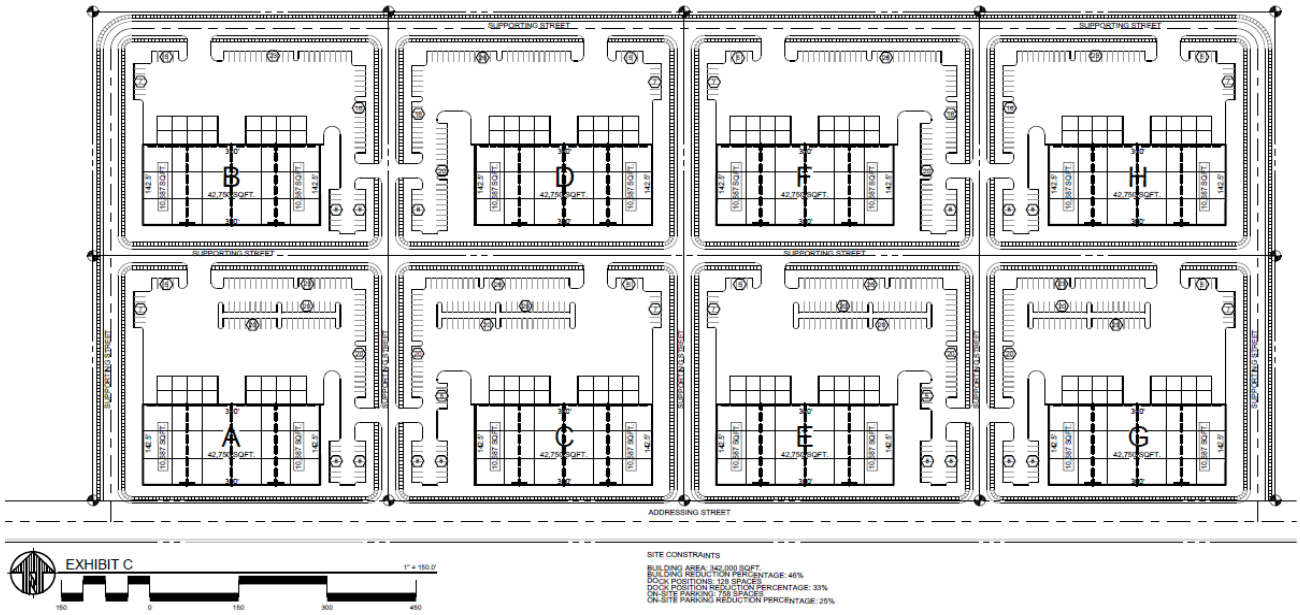
Source: VLMK Engineering and Design

This development program offers 630,000 sqft of built industrial space with 192 docking positions and 1,000 on-site parking spaces. This format allows for flexible use of the space to allow one or more companies of a wide range of sizes to operate side-by-side, with ample circulation for freight, employees and customers.

Figure 2.2 presents the typical flex industrial scenario and estimated value of capital improvements at the site for a flex industrial development. These estimates form the basis for projected tax revenue generation from the development, as discussed in following section. Overall, this facility would have an estimated future value of nearly $120 million in real property and equipment, and an assessed value of $73.8 million based on a changed property ratio of .617 (Washington County).

FIGURE 2.2: TYPICAL DEVELOPMENT PLAN AND ESTIMATED CAPITAL INVESTMENT (FLEX INDUSTRIAL USE)

		Estimated Capital Investment Value		
Distribution Facility	**Built Area (Square Feet)**	**Real Prop. Value/s.f.**	**Real Prop. Value**	**Assessed Value**
Building A	118,180	$190	$22,454,000	$13,854,000
Building B	196,840	$190	$37,400,000	$23,076,000
Building C	196,840	$190	$37,400,000	$23,076,000
Building D	118,180	$190	$22,454,000	$13,854,000
TOTAL:	***630,040***	***$190***	***$119,708,000***	***$73,860,000***



Source: VLMK Engineering and Design, Schnitzer Properties, CoStar, Johnson Economics

Tenants and Land Uses: Flex use industrial is typcially home to a range of business types including light manufacturing, wholesale sales, and warehousing. Spaces would be suitable for flex industrial/office use. The development scenario would be able to accommodate a range of business sizes.

III. HYPOTHETICAL NWI ZONING STANDARDS DEVELOPMENT PROGRAM

To compare the impacts of the proposed NWI zoning standards with the market driven development program above, VLMK modeled a development program for the 40-acre site that follows the proposed standards of the NWI zone. The largest constraints presented by the standards are the need to impose a block pattern on the site, as well as set back and addressable street standards.

FIGURE 3.1: NWI ZONING STANDARDS SITE PLAN, 40-ACRE SITE

Source: VLMK Engineering and Design

This development program splits the 40-acre site into eight separate sites due to the block structure. The buildings that each site can house are necessarily much smaller than in the first scenario. Public street right of way now occupies a large significant share of the site, further reducing the size of the buildable sites.

In total this site plan offers 342,000 sqft of space divided amongst eight buildings of 42,750 sqft each. These buildings offers significantly less flexibility to reconfigure internal spaces to serve a range of employer sizes. At 42,750 total, large employers will not be able to use these sites at all.

Figure 3.2 presents the NWI zoning scenario and estimated value of capital improvements on these sites. Overall, this configuration would have an estimated future value of nearly $65 million in real property and equipment, and an assessed value of $40 million based on a changed property ratio of .617 (Washington County).

FIGURE 3.2: TYPICAL DEVELOPMENT PLAN AND ESTIMATED CAPITAL INVESTMENT (FLEX INDUSTRIAL USE)

		Estimated Capital Investment Value		
Distribution Facility	**Built Area (Square Feet)**	**Real Prop. Value/s.f.**	**Real Prop. Value**	**Assessed Value**
Building A	42,750	$190	$8,123,000	$5,012,000
Building B	42,750	$190	$8,123,000	$5,012,000
Building C	42,750	$190	$8,123,000	$5,012,000
Building D	42,750	$190	$8,123,000	$5,012,000
Building E	42,750	$190	$8,123,000	$5,012,000
Building F	42,750	$190	$8,123,000	$5,012,000
Building G	42,750	$190	$8,123,000	$5,012,000
Building H	42,750	$190	$8,123,000	$5,012,000
TOTAL:	***342,000***	***$190***	***$64,984,000***	***$40,096,000***

Source: VLMK Engineering and Design, Schnitzer Properties, CoStar, Johnson Economics

Tenants and Land Uses: For the sake of comparison the employment mix and achievable density is assumed to be the same under this scenario.

IV. FORECAST OF TAXABLE VALUE AND TIF REVENUE POTENTIAL

It is our understanding that the Northwest Industrial Area is under consideration for a TIF district (urban renewal) to capture the value of new growth and use the resulting TIF revenue to fund infrastructure improvements. Johnson Economics prepared a basic forecast of potential TIF revenue

under the two development scenarios, and two baseline growth scenarios for the TIF district as a whole.

Figure 4.1 below presents the estimated results of four scenarios for the 40-acre site, located in the NWI area, over a 30 year forecast period:

- Basic TIF Projection: This scenario applies a basic 6% annual growth rate to the site, which might be the high end of the projected growth range used in a typical TIF feasibility analysis (6% average annual growth). A conservative achievable growth rate is often assumed in the feasibility analysis so that projections are not unrealistic.
- Proposed Typical Flex Industrial Scenario: Modeling the Typical Flex Industrial development program results in highest assessed value beginning in 2029.
- NWI Zoning Standards Scenario: The hypothetical NWI standards scenario is assumed to have less square footage of space, over a greater number of buildings, leading to a lower valuation. The pace of build out is expected to be significantly slower than the market-driven flex industrial scenario, as discussed below, which would negatively impact the growth of TIF revenues over time.
- Land Bank/No Growth Scenario: The final scenario assumes that no near-term development will be viable in the study area under the limitations of the NWI zoning. In this scenario, the land remains undeveloped, and property values grow at a base rate of 3% per year. This scenario results in the lowest growth of TIF revenues over time.

Timing of development: Figure 4.1 (following page) presents forecast of tax increment (TIF) revenue that goes to the URA over the 30-year period of the district, under the four scenarios outlined above.

- Proposed typical flex industrial development timing: Phase I is projected to happen in the near term, with half of the taxable value being added to the tax rolls in 2029, and half in 2030. TIF revenue grows earlier on a larger base valuation.
- NWI Zone timing: The NWI standards dictate a block pattern that is unusual for industrial development and industrial districts. This is expected to make a greater number of individual sites that most be absorbed (eight rather than one) and a smaller format that will be less desirable to developers and many end users. For this analysis it was assumed that the value across all eight sites would be realized over four phases between 2031 and 2037. This results in full value (which is less than the first scenario) being realized over a longer period of time.
- Steady Growth Scenarios: The two remaining scenarios assume an average annual growth rate over the 30-year period: 6% under the high-end of the current Urban Renewal projections scenario, and 3% under the Land Bank/No Growth scenario.

FIGURE 4.1: FORECASTED TAX INCREMENT FINANCING REVENUE GROWTH, 40-ACRE INDUSTRIAL SITE
(SCENARIOS: BASELINE TIF PROJECTIONS / TYPICAL FLEX INDUSTRIAL / NWI ZONE STANDARDS / LAND BANK/NO GROWTH)

			Estimated RMV		New Taxable Value				Tax	Annual TIF Revenue (Net)*				Cummulative TIF Revenue (Net)

Tax Revenue Generation: Findings

Modeling of the development scenarios discussed above result in vastly different outcomes for TIF revenue generation, with the flex industrial development producing an estimated $26.4M over 30 years, while the development keeping to the NWI zoning standards would generate roughly half as much revenue (Figure 4.2).

FIGURE 4.2: FORECASTED TIF REVENUE GROWTH COMPARISON, 40-ACRE SITE

Source: Washington County Assessor, CoStar, Johnson Economics, VLMK Engineering and Design

The reasons for this are:

- A typical flex industrial development floorplan using the entire 40-acre site results in significantly more built space at a higher valuation than possible under the NWI scenario. The NWI standards require multiple sites with smaller structures totaling to less square footage of built space at a lower total value.
- Furthermore, these requirements essentially divide a single site into eight sites, which can expect to be absorbed more slowly and less marketable to many developers and end users. This slower absorption mean that the lower total assessed value will also be slower to materialize to the benefit the TIF district and local employment.

V. EMPLOYMENT DENSITY AND WAGES

Employment Density

Modern flex industrial parks offer a high density of employment through offering a mix of spaces suitable for a broad range of light industrial, office, wholesale, warehousing, and related sectors. A multi-tenant development is also likely to feature increased employment concentration via offering smaller leasable spaces per business.

In recent years, industrywide trends have included a decrease in employment density in manufacturing businesses, and an increase in employment density in some categories that were traditionally thought of as having low employment density, including warehouse and distribution.[1]

This shift is because investment in automation in modern industries is, on the one hand, decreasing the number of employees needed in sophisticated manufacturing plants relative to growing production lines and robotics. On the other hand, investment in equipment is increasing the vertical density of operations like storage and distribution, meaning less floor area is required per employee. These two trends are increasing the parity among industrial users over time. (As noted, any real-world company is likely to feature unique operating characteristics that can vary widely from any average estimate of density.)

Using estimates of square footage per employee from the US Energy Information Admin. for the sectors common in flex industrial space, Johnson Economics determined a blended average of 880sqft/employee for the two scenarios modeled.

Industrial Wage Levels

The following figure shows average annual wage rates among the major industry sectors that might locate in a multi-tenant flex industrial space. Traditionally, manufacturing has been emphasized as an industrial employment sector that pays uniquely high wages relative to other industrial users.

The mix of users in the a typical flex industrial center is likely to include various categories of manufacturing including advanced manufacturing and fabrication, as well as wholesale trade, warehousing, and some mix of business services or high-tech industries, such as software. As shown in Figure 5.1, this mixture of business sectors that could be included in flex industrial space is likely to

support many family-wage blue-collar jobs, at a comparable employment density to the density envisioned in the Basalt Creek Master Plan.

FIGURE 5.1: AVERAGE WAGE LEVELS IN RELEVANT SECTORS, WASHINGTON CO., 2025

Industry	Avg. Annual Wage
All Washington County Employment	$90,061
Manufacturing	$137,862
Wholesale trade	$123,881
Transportation, warehousing & utilities	$64,090
Blended Avg. of Proposed Uses:	$108,611

Source: Oregon Employment Department, QCEW Data, Washington County 2025

Based on the blended income and job density assumptions presented above, held constant across both scenarios, we see that the typical flex industrial scenario, with its much greater usable built space is estimated to house many more jobs and produce significantly more in income taxes.

FIGURE 5.2: EMPLOYMENT DENSITY & INCOME TAX GENERATION

	Typical Flex Indust	NWI Standards	Reduction
Building Area:	630,000	342,000	46%
Dock Positions:	192	128	33%
On-Site Parking:	1,010	758	25%
Acreage:	39.57	39.57	
Sqft Built Space/Job:	880	880	
Job Creation:	716	389	46%
Job Density (jobs/acre):	18.1	9.8	46%
Avg. State Tax:	$8,300	$8,300	
Est. Annual State Income Tax:	$5,942,045	$3,225,682	46%

Source: State of Oregon, Energy Information Administration, Johnson Economics.

The scenario modeling the NWI zoning standards results in 46% of the number of jobs and the 46% lower income tax benefit to the state.

RE: Written Testimony — Wilsonville Industrial Land Readiness (Basalt Creek) / Northwest Industrial (NWI) Zone Standards

July 8, 2026 Planning Commission Work Session

Dear Chair and Commissioners of the Commission:

Schnitzer Properties, with the assistance of VLMK Engineering + Design, respectfully submits the enclosed written testimony for the Commission's consideration in connection with the Wilsonville Industrial Land Readiness effort and the development of standards for the proposed Northwest Industrial (NWI) Zone, which is understood to apply to all properties within the Coffee Creek and Basalt Creek Master Plan areas.

Schnitzer Properties owns and is actively planning the development of industrial land within the Basalt Creek and Coffee Creek Planning Areas. We share the City's objectives for high-quality industrial district. Our purpose in this testimony is constructive: to identify where the current form-based code, carried forward from the Coffee Creek Design Overlay, does not yet provide a clear and objective development track for the large-format flex industrial and employment sites and buildings the State, Metro, and Business Oregon are actively seeking to make shovel-ready in this region, and to offer specific, narrowly tailored amendments that preserve the City's policy goals while making them workable at industrial scale.

The economic consequences of the current standards are significant. As demonstrated in the enclosed analysis, applying the connection-spacing and associated site-design standards to a representative industrial site significantly reduces usable land and cuts achievable building area. These reductions impact and determine whether projects can be financed and built at all. Industrial development is underwritten on the leasable building area a site can support relative to its land and infrastructure cost; when usable area and footprints are cut to this degree, projects no longer pencil, financing cannot be

Schnitzer PROPERTIES

1121 SW Salmon Street
Portland, OR 97205
503.242.2900
schnitzerproperties.com

secured, and the land sits undeveloped as demonstrated in lack of development in Coffee Creek to date. The proposed amendments are therefore necessary for projects in both Coffee Creek and Basalt Creek to obtain financing and proceed.

When these sites are allowed to develop with the large-format buildings that major employers require, they generate the assessed value, jobs, and property-tax revenue the City and County rely upon. That revenue is also what funds the Coffee Creek and future Basalt Creek area's tax-increment financing and supports the Urban Renewal Districts, ultimately, the City's broader investment in public infrastructure, including the improvements the Districts are intended to deliver. Standards that fragment sites or create unfunctional sites and buildings directly suppress the long-term tax base, the increment available to the District, and the employment density the Coffee Creek and Basalt Creek area is intended to achieve.

We would also note that the prescriptive standards applied here, particularly the maximum connection spacing, the parking-location restrictions along addressing streets, and the building setback and retaining-wall limitations are not found in the employment and industrial zones of any other jurisdiction in the metro area. The Coffee Creek and NWI standards impose a level of street, block, and frontage prescription on industrial land that is not applied to comparable industrial districts elsewhere in the region.

It is also important to put the origin of these standards in context. The direction frequently cited from the prior Basalt Creek master planning and the Coffee Creek Design Overlay process occurred under a different plan, a different market, and a different set of commissioners and councilors than those now guiding this effort. Neither that earlier process nor the current Basalt Creek master planning process has incorporated meaningful input from the stakeholders who actually design, finance, construct and operate employment and industrial property. The result is a set of standards that, in our experience, no such stakeholder would support and as noted above, has contributed to the lack of development to date and that no other jurisdiction in the metro area has adopted similarly for its employment and industrial zones.

Underlying many of these concerns is a fundamental mismatch in design intent. The connectivity and block standards, maximum block lengths, frequent supporting streets and through connections, parking placed between the building and the street, primary-entrance visibility, and articulated street-facing façades, reflect the design vocabulary of a town center or office/mixed-use district, where small blocks, walkability, and street-fronting storefronts are the goal. They are not well suited to industrial development, where large flat building pads, deep truck-maneuvering and loading areas, and the separation of freight from passenger and pedestrian traffic are essential to function and safety. The repeated need for waivers documented in the enclosed case files reflects this mismatch: the current standards ask industrial buildings to behave like town-center, mixed use or office buildings, and the result is reduced developability, compromised site safety, and the recurring waiver requests the record now shows.

The clearest evidence of this mismatch is the City's own record of waivers. Each of the four recently completed industrial projects reviewed in the enclosed analysis was unable to be built as designed

Schnitzer PROPERTIES

1121 SW Salmon Street
Portland, OR 97205
503.242.2900
schnitzerproperties.com

without waivers from the Coffee Creek Design Overlay standards. The applicants in those cases (Case Files DB20-2022, DB21-088, DB22-0007, and DB22-0011) collectively requested numerous waivers, including five and seven waivers on two of the sites alone, addressing parking location along addressing streets, the number and width of driveways needed for truck maneuvering, loading-berth placement, and retaining-wall height. These were not edge cases or poor designs; they were conventional industrial buildings responding to ordinary site, grading, and freight circulation needs. When every industrial project that has come through the district has required waivers to function, that is a strong indication that the standards themselves, not the projects, need revision. Keep in mind these projects were not large scale and even with the waivers, the resulting designs were still lack functionality. Our proposed amendments would convert these recurring, discretionary waivers into a clear and objective track, giving both the City and applicants greater predictability while preserving the underlying design intent.

Our intent behind our memos is to set these districts up to succeed. The changes we propose are not about easing standards for their own sake. They are about providing functional sites with the characteristics and operating needs that all large industrial and employment businesses require. Without them, larger aggregated sites become difficult to develop in a way that does not deliver the desired industries, job density, and tax base the community is expecting. We have already seen this consequence play out as there continues to be a significant lack of development in Coffee Creek today, due in part to the existing standards. Basalt Creek should not be set up in the same manner only to follow the same outcome.

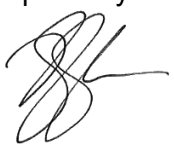
Two attachments accompany this letter:

Attachment 1 — Review of NWI Zone / Coffee Creek Development Standards. An illustrated narrative analyzing how the existing Coffee Creek Design Overlay standards apply to large, speculative, flex/multi-tenant industrial sites, together with a review of four recently completed projects within the Coffee Creek Design Overlay District. Each of those projects required multiple waivers from the adopted standards, demonstrating that the requirements are difficult to satisfy for industrial use as currently written.

Attachment 2 — Proposed Code Amendments to the Northwest Industrial (NWI) Zone. A set of specific proposed amendments to the draft NWI Zone form-based code, each accompanied by supporting findings. The amendments address connection spacing for aggregated industrial sites, driveway widths, parking location and design, grading and retaining walls, primary building entrance definitions and visibility, building setbacks, and permitted uses. They do not remove the City's existing requirements, but rather expand upon the original Form-Based Code and Pattern Book goals so they function for industrial-scale sites and buildings.

Schnitzer PROPERTIES

1121 SW Salmon Street
Portland, OR 97205
503.242.2900
schnitzerproperties.com



We offer this testimony candidly, and with respect for the Commission and staff. To date, our efforts to work collaboratively with City planning staff on these standards have not been met with the level of engagement we had hoped for. At the City's request, we invested significant time and expense to prepare the enclosed memos, which identify the specific standards in need of revision and propose targeted, alternative code language for each. Our expectation was that staff would evaluate those memos on their substance and provide a written explanation of why any particular proposed standard does not work so that we could collaborate toward a workable solution. We remain ready and willing to work through each proposal in detail, and we respectfully ask the Commission's assistance in directing that level of substantive, written engagement.

We respectfully request that the Commission consider the enclosed analysis and proposed amendments on their merits as it refines the NWI Zone standards. We believe these changes will help the City deliver regionally competitive, shovel-ready industrial land and the jobs, tax base, and Urban Renewal District revenue that come with it while maintaining the design-quality objectives that the form-based code was intended to achieve.

Given the technical nature of these standards and the detail in the enclosed memos, we would welcome the opportunity to present this material to the Commission directly. We respectfully request that the Commission allow sufficient time at the July 8th work session for our team to walk through the analysis and proposed amendments and to respond to the Commission's questions. We are prepared to present and to engage in a substantive discussion, and we will tailor our presentation to whatever time the Commission is able to allot.

We appreciate the Commission's time and consideration of this important effort, and we look forward to working together toward standards that allow the Basalt Creek and Coffee Creek areas to succeed. Please do not hesitate to contact me with any questions.

Respectfully submitted,

Ryan Schera
Vice President of Development
Schnitzer Properties

Enclosures (2):

1. Review of NWI Zone / Coffee Creek Development Standards
2. Proposed Code Amendments to the Northwest Industrial (NWI) Zone

VLMK
ENGINEERING + DESIGN

CC NARRATIVE

OVERVIEW:

This series of exhibits will explore the City of Wilsonville Coffee Creek Overlay Standards and how they affect traditional, speculative, multi-tenant industrial sites. The four most recent developments within the existing Coffee Creek Overlay District will also be reviewed. The purpose of these exhibits is to provide topics for discussion with the City of Wilsonville.

EXHIBIT A

The exhibit depicts a typical multi-tenant, speculative industrial building. These speculative buildings are typically in excess of 800 feet in length and can sometimes exceed 1,000 feet. Large building areas like these provide the greatest level of flexibility for prospective tenants, allowing them to lease as much or as little as necessary. Primary building entrances are spaced at regular intervals insuring even proximity to nearby site elements. By placing the majority of on-site parking between the right-of-way and the primary building entrances, employees and potential clients can enter and exit the building without needing to walk excessive distances. This also provides a level of safety for ingressing pedestrians as their path does not traverse the truck maneuvering areas. Typical drive aisles are 40 feet in width, allowing ample maneuvering for a wide range of delivery vehicles entering and exiting.

EXHIBIT B

This exhibit has taken the same site dimensions and began to apply the proposed Coffee Creek Design Overlay Standards. Particularly, this exhibit explores the connection spacing requirement (Table CC-1). The site is divided into four separate areas to comply with the maximum spacing requirement of supporting streets. Each area is also required to meet the street improvement, building setback, and parking setback requirements. In comparison to exhibit A, this lowers the usable site from 87% down to 55%, a reduction of 32%. The maximum spacing requirement also limits the size of potential buildings which ultimately limits the end-user's flexibility. Each divided parcel section is also shown with two driveways, a primary driveway of 24 feet and a secondary driveway of 40 feet. It is unclear if more than two driveways are allowed. Parcel access is also shown complying with the minimum 150 foot distance separation between connection intersections.

Table CC-1: Street Design and Connectivity

	Addressing Streets	Supporting Streets	Through Connections
General	Development Standards within this table are not adjustable.		
Connection Spacing	Not applicable, Addressing Streets exist or are planned	600 feet, maximum, centerline to centerline. Supporting Streets and Through Connections shall intersect with Garden Acres Road as shown on Figure CC-1, Regulating Plan; or if the Addressing Street is Day Road, no less than 1,000 feet apart, centerline to centerline.	
Connection Type	Addressing Streets are Day Road, Grahams Ferry Road, Cahalin Road, Garden Acres Road, Clutter Street, and "Future" Street.	Supporting Streets are those meeting Specifications, Figure CC-2. A Required Supporting Street is one that intersects with an Addressing Street. The exact location and design of these connections will be determined at the time of development review.	Through Connections are those meeting Specifications, Figure CC-3. Through Connections may be multimodal or used exclusively for bicycle and pedestrian access.
Connection Hierarchy and Primary Frontage	If one of the streets or connections bounding a parcel is an Addressing Street, the Addressing Street shall be the Primary Frontage. If none of the bounding streets or connections is an Addressing Street, a Supporting Street shall be the Primary Frontage. See Figure CC-5.		

Table CC-3: Site Design			
	Addressing Streets	Supporting Streets	Through Connections
1. Parcel Access			
General	Unless noted otherwise below, the following provisions apply: • Section 4.177(.02) for street design; • Section 4.177(.03) to (.10) for sidewalks, bike facilities, pathways, transit improvements, access drives & intersection spacing. The following Development Standards are adjustable: • Parcel Driveway Spacing: 20% • Parcel Driveway Width: 10%		
Parcel Driveway Access	Not applicable	Limited by connection spacing standards Parcel Driveway Access may be employed to meet required connectivity, if it complies with Supporting Street Standards for Connection Spacing and Connection Type, see Figure CC-6. Subject to approval by City Engineer	Limited by connection standards for motorized vehicle access. Parcel Driveway Access may be employed to meet required connectivity, if it complies with Through Connection Standards for Connection Spacing and Connection Type, see Figure CC-6. Subject to approval by City Engineer
Parcel Driveway Spacing	Not applicable	150 feet, minimum See Figure CC-6	150 feet, minimum See Figure CC-6
Parcel Driveway Width	Not applicable	24 feet, maximum or complies with Supporting Street Standards for primary driveway providing access for passenger vehicles, light delivery, etc. 40 feet, maximum for secondary driveway providing access for heavy delivery vehicles, large trucks, etc.	24 feet, maximum or complies with Through Connection Standards for primary driveway providing access for passenger vehicles, light delivery, etc. 40 feet, maximum for secondary driveway providing access for heavy delivery vehicles, large trucks, etc.

EXHIBIT C

Exhibit C depicts an example site plan meeting the Coffee Creek Design Overlay standards. Here in this example, to comply with the connectivity and site design standards, the buildings' potential footprints are reduced by nearly half. This ultimately restricts an end-user's flexibility and limits the potential type of building occupant to small businesses or user-specific buildings. These standards also do not provide clear direction for multi-tenant buildings that have multiple primary entrances. This presents a multitude of unforeseen problems. Buildings C & D are allowed to face any supporting street per Table CC-4. However, to meet the visibility requirement, all primary building entrances are required to have a direct line of sight to an Addressing Street. Another example is that the parking restriction along Addressing Streets is limited to just sixteen spaces. In the example layout shown, a number of potential tenants in both building's A and B are at an immense disadvantage as their proximity to available parking is remote. In some cases, customers could expect to walk over 300 feet to arrive at the front door. These standards force much of the parking to occur at the back of the building. Many staff can also expect to walk well over 600 feet to the primary building entrance as much of the parking is behind the delivery vehicle maneuvering area. Additionally, this presents a safety hazard as staff will be required to walk through these same areas.

It should be noted that in Table CC-3, parking is permitted between the right-of-way of the Supporting Street and the building with a 15 foot minimum setback from the right-of-way. However, as noted below in Table CC-4 the maximum setback allowed for buildings facing a Supporting Street is 30 feet. Typical parking stall depths are 18 feet, when combined with the 15 foot minimum setback, the minimum space needed for parking between the building and the street is 33 feet. This does not take into account the 24 feet needed for travel lanes and the additional 18 feet for a double loaded parking lot. In essence, this combination of zoning ordinance requirements is a de facto ban on parking between a Supporting Street and a Building. The only recourse for this is to request a waiver.

Table CC-3: Site Design			
	Addressing Streets	**Supporting Streets**	**Through Connections**
4. Parking Location and Design			
General	Unless noted otherwise below, the following provisions apply: • Section 4.155 (03) Minimum and Maximum Off-Street Parking Requirements • Section 4.155 (04) Bicycle Parking • Section 4.155 (06) Carpool and Vanpool Parking Requirements • Section 4.176 for Parking Perimeter Screening and Landscaping—permits the parking landscaping and screening standards as multiple options The following Development Standards are adjustable: • Parking Location and Extent: up to 20 spaces permitted on an Addressing Street		
Parking Location and Extent	Limited to 16 spaces, maximum. 50% of spaces designated for short-term (1 hour or less), visitor, and disabled parking only between right-of-way of Addressing Street and building.	Parking is permitted between right-of-way of Supporting Street and building.	Parking is permitted between right-of-way of Through Connection and building.
Parking Setback	20 feet minimum from the right-of-way of an Addressing Street.	15 feet minimum from the right-of-way of a Supporting Street.	10 feet minimum from the right-of-way of a Through Connection.
Parking Lot Sidewalks	Where off-street parking areas are designed for motor vehicles to overhang beyond curbs, sidewalks adjacent to the curbs shall be increased to a minimum of seven (7) feet in depth.	Where off-street parking areas are designed for motor vehicles to overhang beyond curbs, planted areas adjacent to the curbs shall be increased to a minimum of nine (9) feet in depth.	
Parking Perimeter Screening and Landscaping	Screen parking area from view from Addressing Streets and Supporting Streets by means of one or more of the following: a. General Landscape Standard, Section 4.176 (.02) C. b. Low Berm Standard, Section 4.176 (.02) E., except within 50 feet of a perpendicular Supporting Street or Through Connection as measured from the centerline.		Screen parking area from view from Through Connections by means of a. Low Screen Landscape Standard, Section 4.176(.02) D., or b. High Screen Landscaping Standard, Section 4.176(.02)F., or c. High Wall Standard, Section 4.176(.02)G., or d. Partially Sight-obscuring Fence Standard, Section 4.176(.02).

Table CC-4: Building Design			
	Addressing Streets	**Supporting Streets**	**Through Connections**
1. Building Orientation			
Front Façade	Buildings shall have one designated front façade and two designated side façades. If one of the streets or connections bounding a parcel is an Addressing Street, the front façade of the building shall face the Addressing Street. If two of the streets or connections bounding a parcel are Addressing Streets, the front façade of the building may face either Addressing Street, except when one of the Addressing Streets is Day Road. In that case, the front façade must face Day Road. If none of the bounding streets or connections is an Addressing Street, the front façade of the building shall face a Supporting Street. See Figure CC-5.		
Length of Front Façade	A minimum of 100 feet of the Primary Frontage shall be occupied by a building. The maximum Primary Frontage occupied by a building shall be limited only by required side yard setbacks.		
Articulation of Front Façade	Applies to a Front Façade longer than 175 feet that has more than 5,250 square feet of street-facing façade area: At least 10% of the street-facing façade of a building facing an Addressing Street must be divided into façade planes that are offset by at least 2 feet from the rest of the façade. Façade area used to meet this standard may be recessed behind, or project out from, the primary façade plane.		
2. Primary Building Entrance			
General	The following Development Standards are adjustable: • Required Canopy: 20% • Transparency: 20%		
Accessible Entrance *	The Primary Building Entrance shall be visible from, and accessible to, an Addressing Street (or a Supporting Street if there is no Addressing Street frontage). A continuous pedestrian pathway shall connect from the sidewalk of an Addressing Street to the Primary Building Entrance with a safe, direct and convenient path of travel that is free from hazards and provides a reasonably smooth and consistent surface consistent with the requirements of Americans with Disabilities Act (ADA). The Primary Building Entrance shall be 15 feet wide, minimum and 15 feet tall, minimum.		
Location	150 feet, maximum from right-of-way of an Addressing Street, see Figure CC-7.	150 feet, maximum from right-of-way of a Supporting Street, if there is no Addressing Street Frontage, see Figure CC-7.	
Visibility	Direct line of sight from an Addressing Street to the Primary Building Entrance.		
Accessibility	Safe, direct, and convenient path from adjacent public sidewalk.		
Required Canopy *	Protect the Primary Building Entrance with a canopy with a minimum vertical clearance of 15 feet and an all-weather protection zone that is 8 feet deep, minimum and 15 feet wide, minimum.		
Transparency	Walls and doors of the Primary Building Entrance shall be a minimum of 65% transparent.		
Lighting	The interior and exterior of the Primary Building Entrance shall be illuminated to extend the visual connection between the sidewalk and the building interior from day to night. Pathway lighting connecting the Primary Building Entrance to the adjacent sidewalk on an Addressing Street shall be scaled to the needs of the pedestrian. Comply with Outdoor Lighting, Section 4.199		
3. Overall Building Massing			
General	The following Development Standards are adjustable: • Required Minimum Height: 10% • Ground Floor Height: 10% • Base, Body, and Top Dimensions: 10% • Base Design: 10% • Top Design: 10%		
Front Setback	30 feet, minimum, except as provided below	30 feet maximum	30 feet maximum

EXISTING PROJECTS IN THE COFFEE CREEK DESIGN OVERLAY DISTRICT

Exhibits D through G review some of the most recent completed projects in the Coffee Creek Design Overlay District. As noted below, there are several deviations from the Coffee Creek Overlay Standards. It is understood that the Pattern Book is an available tool and provides alternate design pathways for proposed projects. The purpose of these exhibits is to provide topics of discussion for some of the as-built deviations.

EXHIBIT D

SW Clutter Road is identified as an Addressing Street in the Overlay Standards. The building located at 10680 SW Clutter Road has two primary entrances, neither of which appear to be Supporting Streets or Through Connections as required in Figure CC-5. Additionally, based on the site design, it appears neither entrance complies with the primary entrance width requirements of 24 feet. A 19 bay, recessed truck-well is located along the Addressing Street, this is something that is not permitted as noted in Table CC-3 (Off-Street Loading Berth).

Table CC-3: Site Design

	Addressing Streets	Supporting Streets	Through Connections
Off-Street Loading Berth	One loading berth is permitted on the front façade of a building facing an Addressing Street. The maximum dimensions for a loading are 16 feet wide and 18 feet tall. A clear space 35 feet, minimum is required in front of the loading berth. The floor level of the loading berth shall match the main floor level of the primary building. No elevated loading docks or recessed truck wells are permitted. Access to a Loading Berth facing an Addressing Street may cross over, but shall not interrupt or alter, a required pedestrian path or sidewalk. All transitions necessary to accommodate changes in grade between access aisles and the loading berth shall be integrated into adjacent site or landscape areas. Architectural design of a loading berth on an Addressing Street shall be visually integrated with the scale, materials, colors, and other design elements of the building.	No limitation. Shall meet minimum standards in Section 4.155(.05).	
Carpool and Vanpool Parking	No limitation		

Excerpt from Case File DB20-2022
Waivers to Coffee Creek Industrial Design Overlay District Standards

The applicant is requesting five waivers, all of which relate to Table CC-3 Site Design and Table CC-4 Building Design within Section 4.134 (.11) Development Standards Table. To facilitate shifting the building to the south in order to preserve the strand of mature Douglas fir trees, the loading berths have been positioned to the front of the building. As only one loading berth is permitted on an Addressing Street frontage a waiver is required. In addition, with a public entrance at each corner of the building and loading berths in between, it is not practically feasible to locate the short term and ADA parking in a single bay on the SW Clutter Street frontage as allowed by the Development Code, as it would require visitors to walk a significant distance and navigate the circulation areas for the trucks to get to the other building entrance. Locating the parking spaces in two separate parking bays requires a waiver from the Site Design standards. In order to provide a cohesive design the applicant has matched the canopy at the building entrances with the canopy along the loading docks, which triggers the three (3) waivers for required ground floor height, canopy height, and based body and top dimensions.

Outlined in Case File DB20-0022, the applicant of this project requested five waivers. One of the waivers granted was to allow more than one bay of parking between the Addressing Street and the building due to the impracticality of locating the short term and ADA parking in a single bay as it would require visitors to walk a significant distance and navigate the circulation areas for the trucks to get to the other building entrance. A similar condition exists on Exhibit C if the hypothetical project site would be required to comply fully with the design overlay standards.

The applicant also requested a waiver to grant one at-grade loading berth and 19 recessed loading berths between the building and the Addressing Street. As noted above, only one at-grade berth is allowed. Due to existing on-site conditions the design was required to request a waiver in order to comply with another design standard.

While the applicant did not request a waiver for the larger parcel drive access points, it should be noted that this is a reoccurring theme throughout the example projects.

EXHIBIT E

Both SW Grahams Ferry Road and SW Green Acres Road are identified Addressing Streets. The property located at 25080 SW Grahams Ferry Road has three driveway access points, one of which is off of SW Garden Acres Road. Based on the site design, there is one primary entrance off of the supporting street and two secondary parcel access points, one of which is along an identified addressing street. As outlined in Table CC-3 on-site parking along an Addressing Street is limited to 16 stalls with a maximum adjustment up to 20 spaces permitted along the street. The as-built parking along SW Garden Acres Road shows a total of 49 parking stalls along the Addressing Street, an excess of 29 stalls even with the maximum adjustment.

Excerpt from Case File DB21-088
Waivers to Coffee Creek Industrial Design Overlay District Standards

The subject property is uniquely challenging for industrial use for several reasons. The irregular four-sided site is surrounded on all four boundaries by right-of-way or access roads including Addressing Streets SW Garden Acres Road and SW Grahams Ferry Road on the east and west, the unimproved right-of-way for SW Cahalin Road on the north, and a required Supporting Street on the south. This coupled with the slightly sloping topography of the site, need for a large level industrial building that is oriented on a north/south axis, and desired separation of truck from passenger vehicle and pedestrian circulation results in little area on the north and south sides of the building for required site improvements. The applicant is, therefore, requesting seven waivers, all of which relate to Table CC-3 Site Design and Table CC-4 Building Design within the Section 4.134 (.11) Development Standards Table.

… The applicant proposes to increase the width of the southwest driveway to 50 feet to accommodate vehicle turning movements into the site from the Supporting Street, exceeding the maximum allowed width…

Waivers are requested to: widen the southwest driveway from the Supporting Street to the truck circulation area on the west side of the building (Waiver 1); locate the majority of vehicle parking at the front of the building on SW Garden Acres Road, an Addressing Street (Waiver 2); reduce the parking area setback from SW Garden Acres Road (Waiver 3); exceed the allowed retaining wall height on SW Grahams Ferry Road (Waiver 4); and locate the trash/recycling enclosure on SW Grahams Ferry Road, an Addressing Street, proximate to the loading docks and truck circulation at the back of the building (Waiver 5). In addition, two waivers are requested at the buildings primary entryways to allow exterior/interior design continuity and increase weather protection for pedestrians by reducing the height of the entry canopies (Waiver 6) and the interior ceilings in the office endcaps (Waiver 7). The waiver requests are outlined in the Summary section, above, and in detail under Request D, later in this staff report.

The applicant for the above project requested a total of seven waivers to the design overlay standards. They have also indicated a desire for separation of truck from passenger vehicle and

pedestrian circulation. This, again, is an issue that the 'by the book' standards do not consider. The solution for this problem was for the design to require 49 of the 71 stalls to be placed between one of the Addressing Streets and the Building. Another waiver requested was the need for a larger than allowed parcel access width due to delivery trucks needing a greater level of maneuvering clearance than their passenger vehicle counterparts.

EXHIBIT F

Table CC-3 indicates that retaining walls that are not visible from an adjacent street are to be 60 inches maximum in height. Retaining walls also may be stepped when grade differential is over 30 inches. Located at 9710 SW Day Road, a substantial retaining wall exists along the Northwest portion of the site. Based on street imagery, substantial portions of the retaining wall are in excess of 10 feet in height along the Western property boundary.

Table CC-3: Site Design			
	Addressing Streets	Supporting Streets	Through Connections
5. Grading and Retaining Walls			
General	The following Development Standards are adjustable: • Retaining Wall Design: 20%		
Maximum height	Where site topography requires adjustments to natural grades, landscape retaining walls shall be 48 inches tall maximum when visible from adjacent streets and 60 inches tall maximum when visible only to users from within a site. Where the grade differential is greater than 30 inches, retaining walls may be stepped.		
Required Materials	Materials for retaining walls shall be unpainted cast-in-place, exposed-aggregate, or board-formed concrete; brick masonry; stone masonry; or industrial-grade, weathering steel plate.		
Retaining Wall Design	Retaining walls longer than 50 linear feet shall be tiered, introducing a 5-foot, minimum horizontal offset between the lowest part and upper part(s) of the wall to reduce their apparent mass.		

Excerpt from Case File DB22-0007
Waivers

The applicant requests two (2) waivers from Section 4.134 (.11) Development Standards Table CC-3 Site Design. The requested waivers relate to Parking Location and Extent on an Addressing Street and Retaining Wall Height and Design on an Addressing Street. The waiver requests are discussed in more detail in the Discussion Points – Discretionary Review of this staff report. See also Request D…

Request D

The applicant requests to waive the vehicle parking area design standards from the Coffee Creek Design Overlay District. Subsection 4.134 (.11), Table CC-3, 4. Parking Location and Extent/Addressing Streets allows 16 spaces maximum with an adjustment to 20 spaces on an Addressing Street. This parking is limited to one double-loaded bay to be designated for short-term (1 hour of less), visitor, and disabled parking only between the right-of-way of the Addressing Street and building… The applicant proposes 15 vehicle parking spaces on the north side of the building between the building and Addressing Street SW Day Road, which is less than the maximum of 16 spaces. However, the applicant proposes to designate nine (9) of the 15 spaces for employees, which is not permitted by the standard, thus requiring a waiver. The applicant states the rationale for requesting this waiver as summarized below:
The configuration is proposed because the northwest corner of the building, closest to SW Day Road, is where the primary building entrance and office endcap is located. This corner, therefore, will be immediately visible to any motorist entering the driveway and the northern parking area will be conveniently located for use by visitors. Two (2) ADA accessible spaces are proposed to be located closest to the main entrance; however, an industrial facility of the type and size proposed typically has relatively few short-term visitors. Therefore, prohibiting employees from parking within the north

parking area would reserve an excessive number of parking spaces for a non-existent user group, which would be wasteful and inefficient… The north parking area is ideal for safe and efficient access to the building for drivers with disabilities and short-term visitors, but their number cannot reasonably be expected to reach 15 at any time. The north parking area is also the appropriate parking location for employees who work primarily in the office part of the building, located at its northwest corner. Office employees who park in the spaces provided south of the building would have to walk through the warehouse to reach the office area. Further, a pedestrian walkway along the west side of the building is not feasible as it is the primary loading area for trucks. Therefore, it is reasonable to allow office staff to park in the north parking area, while meeting the intent of the standard by designating an appropriate number of spaces for short-term/visitor use.

The applicant requests to waive the maximum retaining wall height standard from the Coffee Creek Design Overlay District. Subsection 4.134 (.11), Table CC-3, 5. Grading and Retaining Walls/Maximum Height/Addressing Streets requires landscape retaining walls to be a maximum of 48 inches tall; there is an allowed adjustment of 20% to 57.6 inches…
The retaining wall is proposed to exceed four (4) feet in height over a span of approximately 785 feet, including roughly 182 feet in the north, 450 feet in the center, and 153 feet in the south sections. The wall height varies from grade at the west extent of the north wall to 18.7 feet at the northeast corner of the wall, 18.7 feet along the entire eastern (central) segment to the southeast corner, and descending to grade at the west extent of the south wall…
The applicant provides detailed rationale for requesting this waiver as summarized below:
Tapman Creek flows from north to south through the site within the SROZ, with a required 50-foot vegetated corridor (protective buffer) on both sides of this wetland resource. The larger part of the property's upland developable area is located east of the Tapman Creek corridor. This area has an east-west dimension between roughly 555 and 600 feet and increases in grade from about 244 feet at the west (along the Tapman Creek 50-foot buffer edge) to 285 feet along the east property boundary. This 41-foot vertical difference results in an overall cross-slope of about 7.1%, which is incompatible with development of a large-floor industrial building that generally requires flat floors (zero percent slope) with egress or fire/emergency access doors at multiple locations around the perimeter. In addition, operational areas for semi-truck and trailer circulation should not exceed a cross-slope of 3%. In this context, creating a pad area capable of supporting industrial use at scale requires cutting into the uphill side of the subject site and filling on the downhill side, to form a sufficiently level platform area of adequate size for the proposed use.

As indicated above, the applicant expresses the incompatibility stepped grading has on large-floor industrial buildings. Additionally, operational areas for semi-trucks and trailers for any industrial development require a cross-slope of no more than 3%. The required solution for this problem was to develop a retaining wall in excess of 18 feet in order to construct a building that would meet the above criteria. It was also briefly mentioned in Exhibit E that a waiver for grading and retaining was necessary because the site conditions were not compatible with the overlay standards.

EXHIBIT G

With the most recent change to the Coffee Creek Design Overlay District, this site complies with the standards. However, as noted in the previous exhibit, a waiver was required at the time of design to

construct a 40 foot drive aisle necessary for truck maneuvering. The exhibit also demonstrates that the 'by the book' site design requires parking for the employees to be placed behind the truck maneuvering and loading areas. This was noted as a safety hazard in previous exhibits and created excessive travel distances for the building staff.

Excerpt from Case File DB22-0011
Waiver to Coffee Creek Industrial Design Overlay District Standards The applicant requests to waive the driveway width standards from the Coffee Creek Design Overlay District for the east site access from the Supporting Street. This driveway is proposed to be 40 feet wide to accommodate truck turning movements into the site from the Supporting Street. This requires a waiver from Subsection 4.134 (.11) Table CC-3 1. Parcel Access/Parcel Driveway Width/Supporting Streets, which allows a driveway width of 24 feet maximum or compliance with the Supporting Street standards… The applicant states the rationale for requesting this waiver as follows: the 40-foot-wide driveway is necessary to accommodate truck operations for turning requirements, movement, circulation, and safety considerations.

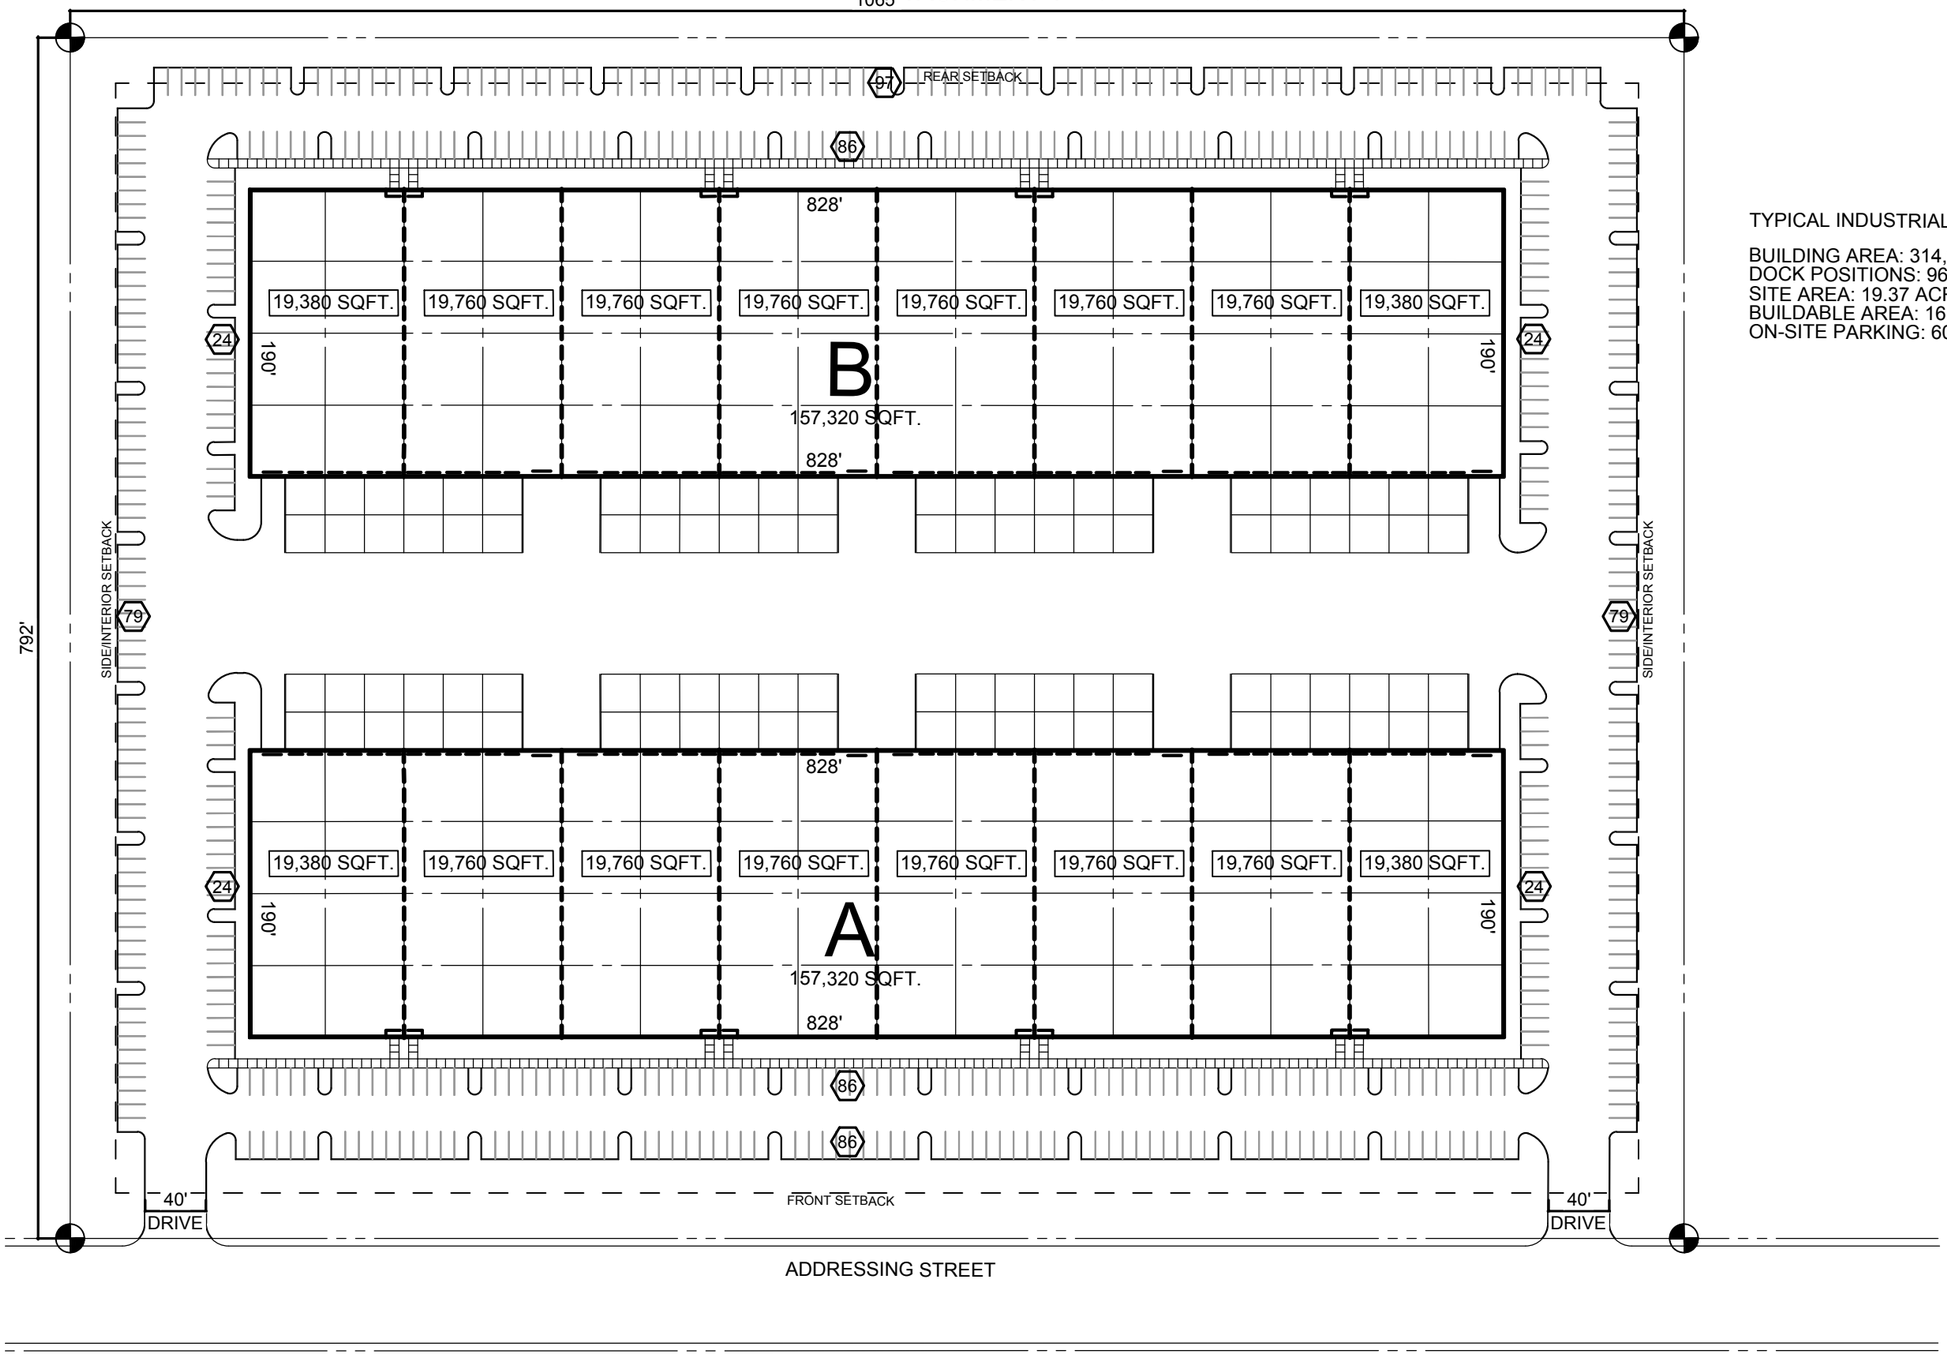
PRELIMINARY SITE PLANS (SCHEME 08)

This exhibit, (Scheme 08) shows the project site utilizing the required connection spacing standards outlined in Table CC-1. This design focuses on creating the maximum blocks allowed in the overlay standards. The assumed footprints are reduced to less than half of what is typically needed for large-footprint industrial buildings.

The next exhibit demonstrates the remaining usable area when the grading and retaining wall standards in Table CC-3. Each quadrant's usable site area is considerably reduced, leaving little to no room for on-site parking.

PRELIMINARY SITE PLANS (SCHEME 05)

Scheme 05 shows a possible master plan for the project site. Buildings are elongated to provide ample semi-truck and trailer docking positions as well as several primary building entrances that will accommodate several diverse tenants. Overlayed in this exhibit, are the Coffee Creek connection spacing standards placed between the buildings. These connection spacing standards will require six supporting streets and the end result will reduce building footprints to a fraction of their intended design.



The final and preferred site plan, shows several buildings of varying sizes which provide the greatest level of flexibility for the end-user. Semi-truck and trailer maneuvering areas are concentrated centrally between the buildings, minimizing their potential interaction with passenger vehicles and pedestrians. On-site parking for staff and visitors is located between the right-of-way and the building, providing ease of access and direct line of site from the Addressing and Supporting Streets to the building entrances. All parcel access points are proposed to be at least 40 feet in width which will provide semi-truck and trailers the necessary maneuverability and safety clearances needed to enter and exit the roadways.

WILSONVILLE PROPOSED ROADWAY EXHIBIT

In conjunction with the preferred site plan, the proposed roadway exhibit raises concerns for the level of developability on site. The project would propose to retain the existing intersection at Clay Street and SW Grahams Ferry Road. Additionally, given that the parcels are under the same ownership and will be designed simultaneously, the local streets proposed within subject properties are not necessary and would only further reduce the parcel(s) usable space.

CONCLUSION

The Coffee Creek Overlay requirements are meant to provide clear and objective regulations and guidelines for street design, circulation, building form and architecture, and landscaping. However, as more projects and sites are developed this area and moreover, developed in the Basalt Creek Planning Area, the City will continue to see waivers from developers for the standards mentioned above. This site is no exception, and as demonstrated, will require several waivers if the standards are allowed to go into effect.

VLMK ENGINEERING + DESIGN

CODE AMENDMENTS

OVERVIEW

It is our understanding the proposed Northwest Industrial (NWI) Zone shall apply to all properties within the Coffee Creek Master Plan and Basalt Creek Master Plan area. The latest draft of the Northwest Industrial (NWI) Zone Form-Based Code Standards do not provide a clear and objective track for large-format industrial sites and buildings. Therefore, Schnitzer Properties, with the assistance of VLMK Engineering + Design, proposes the following amendments to the Northwest Industrial (NWI) Zone. These proposals do not remove existing code requirements entirely but rather expand upon the City's original Form-Based Code and Pattern Book Goals and aim to achieve the following:

- Maintaining the City policy objectives for connectivity requirements but are appropriate for industrial scale sites and buildings.
- Retaining a multi-modal transportation network that accommodates all types of transit and freight in the context of a modern industrial district by expanding the requirements around industrial scale sites and buildings.
- Expanding the public realm design that considers the contribution that landscape design has made to the design quality of other industrial lands in Wilsonville.
- Maintaining the goal of an industrial district that features cohesive and high-quality site, landscape and building design.

Supporting information for each of the proposed amendments can be found under the *Findings* heading.

PROPOSED AMENDMENTS

Proposal 1:
Amend Table NWI-2: Street Design and Connectivity – Connection Spacing to add: 1,400 feet, maximum centerline to centerline for developments in aggregate of 9 or more acres across all phases of development.

Proposal 2:
Revise Table NWI-4: Site Design Section 1. Parcel Access – Parcel driveway Width (Supporting Streets, Through Connections) to read - 24 feet, maximum or complies with Supporting Street Standards for primary driveway providing access for passenger vehicles, light delivery, etc. 40 feet, maximum for accessory driveway(s) providing access for heavy delivery vehicles, large trucks, etc. Where the primary driveway provides combined access for passenger vehicles and heavy delivery vehicles, the maximum width shall be 40 feet.

Proposal 3:
Revise Table NWI-4: Site Design Section 2. Parcel Pedestrian Access – Parcel Pedestrian Access Width to read: 6 feet wide, minimum for pedestrian connections between the primary street frontage and Primary Building Entrance(s).

Proposal 4:
Revise Table NWI-4: Site Design Section 4. Parking Location and Design – Parking Location and Extent (Addressing Streets) to read: Limited to 28 spaces per Primary Building Entrance, maximum. 10% of spaces designated for short-term (1-hour or less), visitor, and disabled parking only between right-of-way of Addressing Street and building.

Proposal 5:
Revise Table NWI-4: Site Design Section 4. Parking Location and Design – General to read:
The following Development Standards are adjustable:

- Parking Location and Extent: up to 120 spaces permitted on an Addressing Street.

Proposal 6:
Revise Table NWI-4: Site Design Section 5. Grading and Retaining Walls – Maximum Height to read: Where grade differential is greater than 30 inches, retaining walls shall be stepped or provided with horizontal reveals or other techniques (such as a mechanically stabilized earth, concrete panel wall with quarry stone face look or modular/ultra block) no greater than 60 inches in height to reduce their apparent mass.

Proposal 7:
Revise Table NWI-4: Site Design Section 5. Grading and Retaining Walls – Required Materials to read: Materials for retaining walls shall be unpainted cast-in-place, exposed-aggregate, or board-formed concrete; brick masonry; stone masonry; or industrial-grade, weathering steel plate. Or mechanically stabilized earth, concrete panel wall with quarry stone face look; or modular/ultra block.

Proposal 8:
Revise Table NWI-4: Site Design Section 5. Grading and Retaining Walls – Retaining Wall Design to read: Retaining walls longer than 50 linear feet shall be offset horizontally, introducing a 5-foot deep, minimum horizontal offset, or provided with vertical reveals or other techniques (such as a mechanically stabilized earth, concrete panel wall with quarry stone face look or modular/ultra block) at 50-foot intervals to reduce their apparent mass.

Proposal 9:
Amend Table NWI-5: Building Design Section 2. Primary Building Entrance to include: Primary Building Entrance, Defined – The Primary Building Entrance shall be defined as any doorway, set of doors, revolving door, vestibule or other portal that is ordinarily used to gain access to the building by its users and occupants. Where more than one entrance is provided, each entrance shall comply with the applicable provisions of the design overlay district.

Proposal 10:
Revise Table NWI-5: Building Design Section 2. Primary Building Entrance – Visibility to read: Direct line of sight from the Primary Frontage to the Primary Building Entrance.

Proposal 11:
Revise Table NWI-5: Building Design Section 3. Overall Building Massing – Front Setback (Supporting Streets) to read: 20 feet minimum.

Proposal 12:
Revise Table NWI-5: Building Design Section 3. Overall Building Massing – Front Setback (Through Connections) to read: 10 feet minimum.

Proposal 13:
Revise Section 4.134 (.12) Performance and Other Standards: F. Rear and Side Yard Setbacks to read: Ten feet, except as otherwise provided for properties within this zone.

Proposal 14:
Revise Section 4.134 (.12) Performance and Other Standards: B. Block and access standards and Revise Tables NWI-2 and NWI 4 as indicated below:

The aggregation and development of large industrial sites remains a top economic priority for both Business Oregon and Metro. The barriers to doing so in the Portland metro region are well documented and districts like Coffee Creek and Basalt Creek represent large and scalable opportunities to deliver shovel-ready, regionally competitive industrial land the state is advocating for to foster industrial development. The goal is to preserve and utilize as much of the land for site and building operations (employment) in an efficient manner and not to dissect or break up the land with streets which are not necessary. The industrial development community is able to determine what level of connectivity is needed.

Below is the preferred connection route for the Northwest Industrial Regulating Plan. The preferred connective route maintains the City's proposed intersections and complies with the proposed connection spacing.

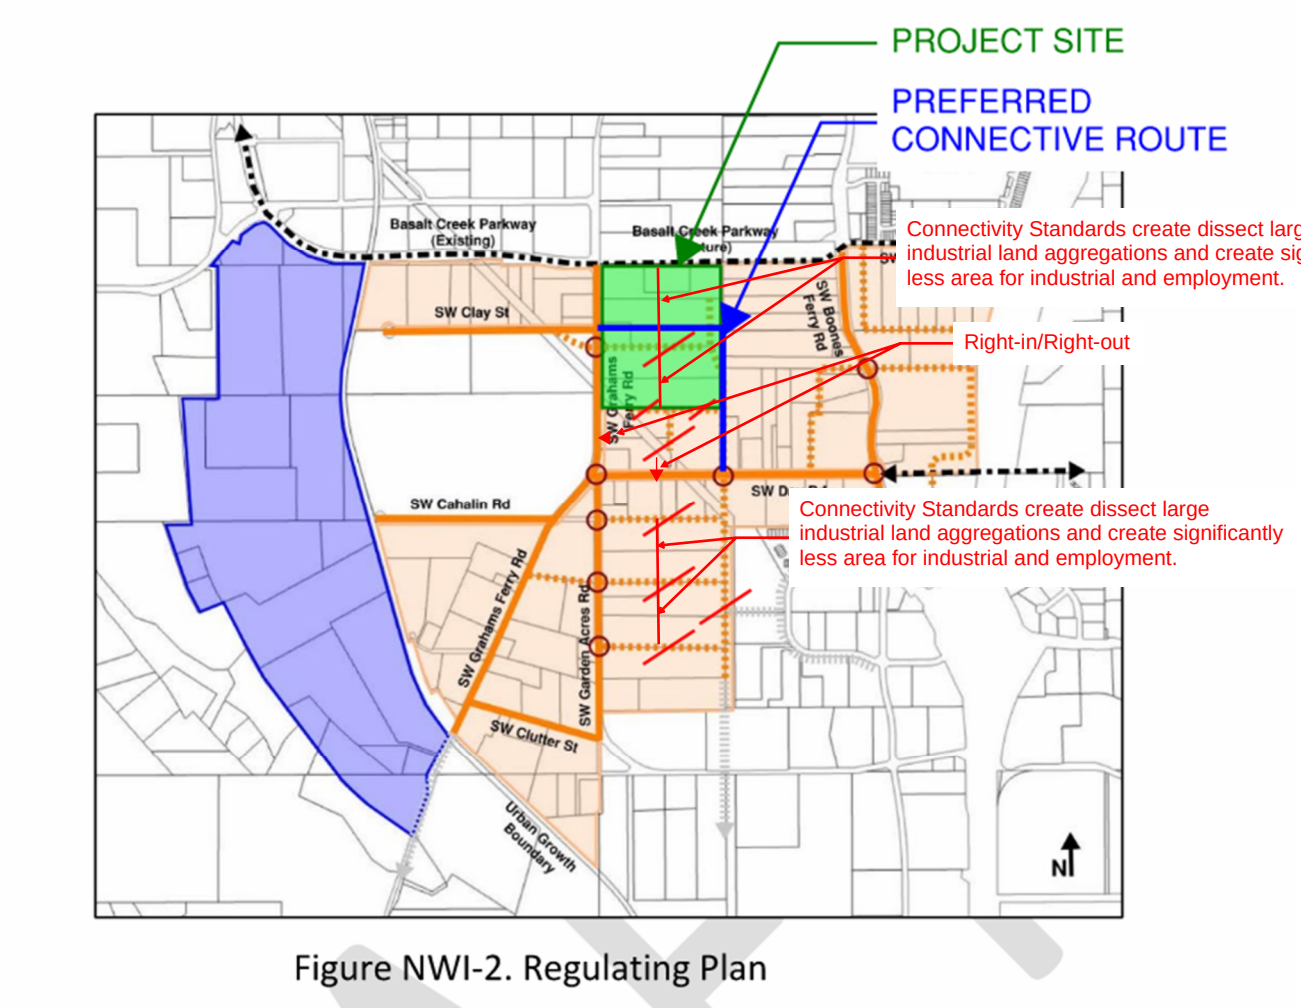

Figure NWI-2. Regulating Plan

Proposal 15:
Revise Tables NWI-1. Typically Permitted Uses to include the following changes:

Use	Coffee Creek Subdistrict	High Tech Employment Subdistrict	Light Industrial Subdistrict
Fabrication.	A – Allowed Allowed outright. No restrictions.	No change.	No change.
Repair, Finishing, and Testing of products manufactured or fabricated within the zone.	A – Allowed Allowed outright. No restrictions.	No change.	No change.
Research and Development.	A – Allowed Allowed outright. No restrictions.	No change.	No change.
Industrial Services	A – Allowed Allowed outright. No restrictions.	A – Allowed Allowed outright. No restrictions.	No change.
Outdoor Storage	A – Allowed Allowed outright. No restrictions.	A – Allowed Allowed outright. No restrictions.	A – Allowed Allowed outright. No restrictions.
Storage of products, parts, raw materials, equipment, machinery, inventory.	A – Allowed Allowed outright. No restrictions.	A – Allowed Allowed outright. No restrictions.	A – Allowed Allowed outright. No restrictions.

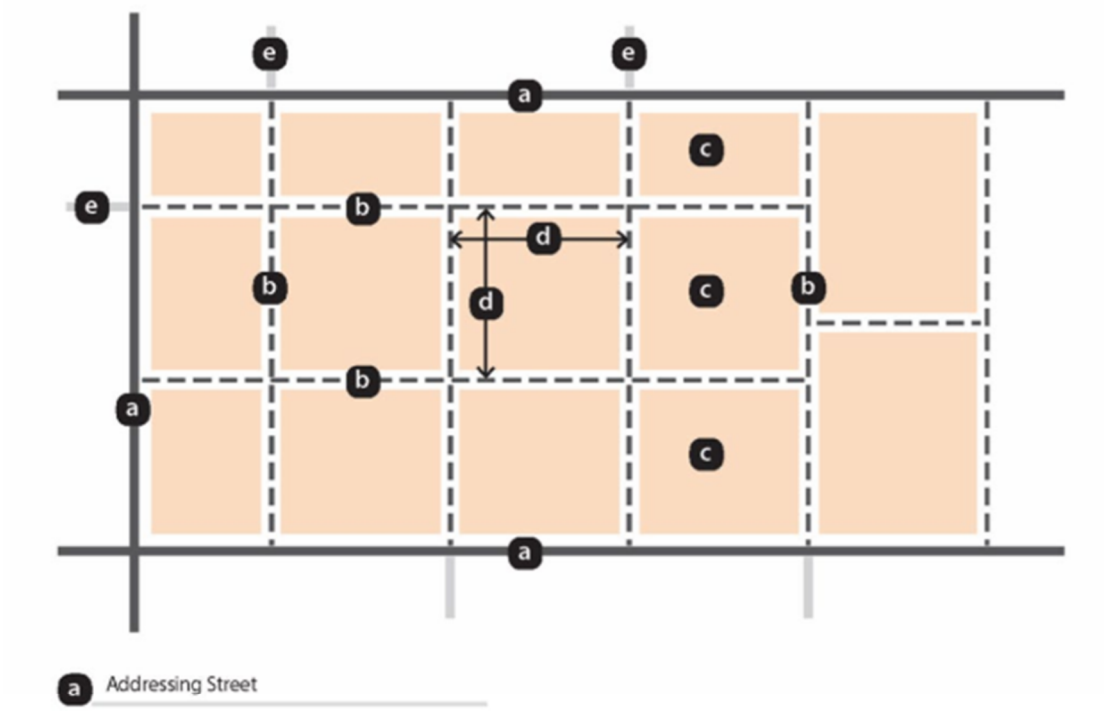
Cold Storage.	**A – Allowed** **Allowed outright. No restrictions.**	**A – Allowed** **Allowed outright. No restrictions.**	**A – Allowed** **Allowed outright. No restrictions.**
Showrooms, Display Area and Sales accessory to and occupying a smaller square footage than the primary use.	**R – Allowed with Restrictions** **Not to exceed 20 percent of total floor area within a site.**	**R – Allowed with Restrictions** **Not to exceed 30 percent of total floor area within a site.**	**R – Allowed with Restrictions** **Not to exceed 30 percent of total floor area within a site.**

Proposal 16:
Revise Table NWI-2: Street Design and Connectivity – Connectivity Hierarchy and Primary frontage to include: "Where an Addressing Street parcel frontage is less than 650 linear feet, buildings shall be allowed to face any direction."

FINDINGS

Proposal 1 and 14:
The aggregation and development of large industrial sites remains a top economic priority for both Business Oregon and Metro. The barriers to doing so in the Portland metro region are well documented and districts like Coffee Creek and Basalt Creek represent large and scalable opportunities to deliver shovel-ready, regionally competitive industrial land the state is advocating for to foster industrial development. The goal is to preserve and utilize as much of the land for site and building operations (employment) in an efficient manner and not to dissect or break up the land with streets which are not necessary. The industrial development community is able to determine what level of connectivity is needed. Thus a maximum connection spacing of 600 feet (centerline to centerline) between streets and connections leaves little room for final building footprints and truck/vehicle maneuvering areas which translates to jobs and property tax revenue. A square parcel that is 600 feet both ways is only 360,000 square feet. After removing the area for half street improvements (travel lane, sidewalks, and required planting strip width), parking setbacks, and building setbacks, the remaining usable site is less than 300,000 square feet. Large industrial footprint buildings themselves can sometimes exceed 300,000 square feet. These building types also have lengths regularly between 800 – 1,000 feet. For large developments on sites greater than 9 acres, it becomes economical to provide large building footprints. By restricting developments to relatively small and numerous buildings, tenants have little to no room for expansion. Those who are seeking to expand and grow will be required to look elsewhere (outside of Basalt Creek, Coffee Creek, Portland

Metro and Oregon) to meet their needs. It also would appear that there is flexibility allowed for connectivity spacing in excess of 600 feet as shown in Figure NWI-5.



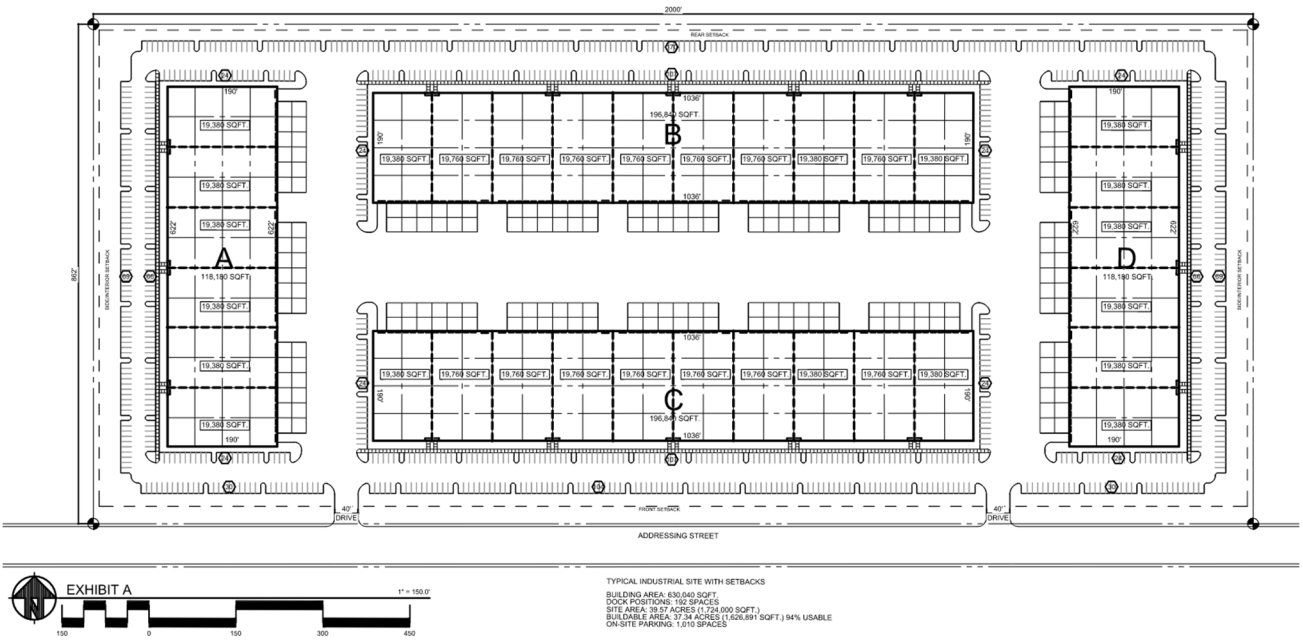


Figure NWI-5 - Connectivity Standards

To further demonstrate the connectivity restrictions, as shown above, Exhibit A depicts a typical speculative industrial site with four multi-tenant industrial buildings that provide end users with ample flexibility and opportunity for expansion. Primary building entrances are spaced at regular intervals insuring even proximity to nearby site elements. By placing the majority of on-site parking between the right-of-way and the primary building entrances, employees and potential clients can enter and exit the building without needing to walk excessive distances. This also provides a level of safety for ingressing pedestrians as their path does not traverse the truck maneuvering areas. Typical drive aisles are 40 feet in width, allowing ample maneuvering for a wide range of delivery vehicles entering and exiting.

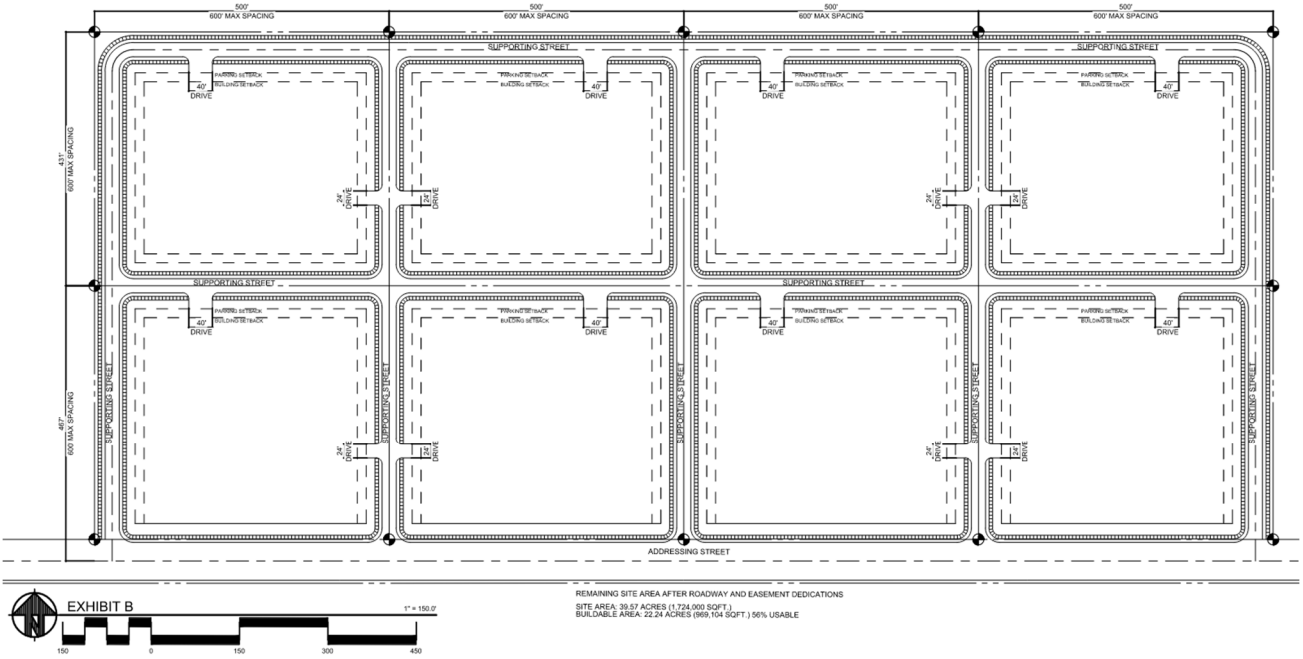

Exhibit B has taken the same site dimensions and applied the proposed NWI Standards. Particularly, this exhibit explores the connection spacing requirement (Table NWI-1). The site is divided into eight separate areas to comply with the maximum spacing requirement of supporting streets. Each area is also required to meet the street improvement, building setback, and parking setback requirements. In comparison to exhibit A, this lowers the usable site from 94% down to 56%, a reduction of 38%. The maximum spacing requirement also limits the size of potential buildings which ultimately limits the end-user's flexibility. Each divided parcel section is also shown with two driveways, a primary driveway of 24 feet and a secondary driveway of 40 feet. Access is also shown complying with the minimum 150 foot distance separation between connection intersections.

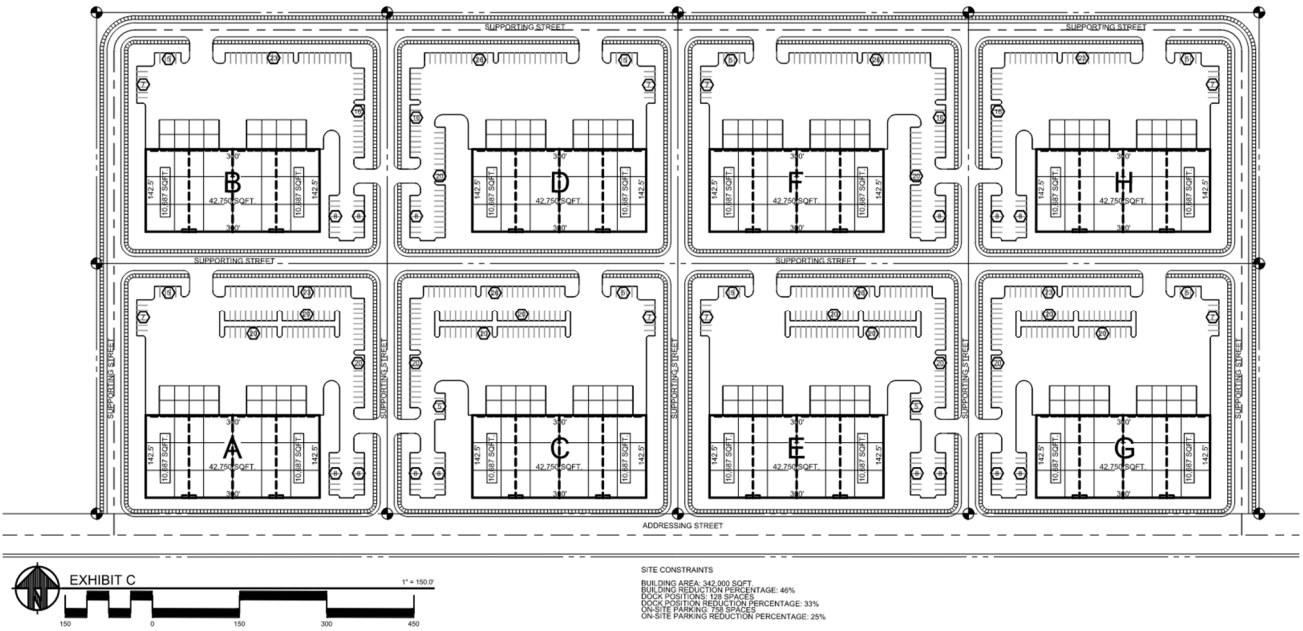

Exhibit C depicts an example site plan meeting the NWI standards. Here in this example, to comply with the connectivity and site design standards, the buildings' total potential footprint is reduced by nearly half. This ultimately restricts an end-user's flexibility and limits the potential type of building occupant to small businesses or user-specific buildings. These standards also do not provide clear direction for multi-tenant buildings that have multiple primary entrances. This presents a multitude of unforeseen problems. Buildings B, D, F, & H are allowed to face any supporting street per Table NWI-5. However, to meet the visibility requirement, all primary building entrances are required to have a direct line of sight to an Addressing Street. Another example is that the parking restriction along Addressing Streets is limited to just sixteen spaces. In the example layout shown, a number of potential tenants in building's A, C, E, & G are at an immense disadvantage as their proximity to available parking is remote. In some cases, customers could expect to walk over 300 feet to arrive at the front door. These standards force much of the parking to occur at the back of the building. Many staff can also expect to walk well over 600 feet to the primary building entrance as much of the parking is behind the delivery vehicle maneuvering area. Additionally, this presents a safety hazard as staff will be required to walk through these same areas.

Parking also encourages larger employers with lots of employees (job density, tax revenue).

Proposal 2:
Coffee Creek Pattern Book acknowledges the essential role freight plays in industrial business. Both automobile and freight modes of transportation need to have equal opportunities for access and ease of circulation into, out of and around the site. *Automobile and freight access from Addressing Streets and Supporting Streets to a parcel should be obvious, clear, simple, and safe. Parcel access provides an opportunity to create a gateway and reinforce a strong sense of place.* – Page 23 of the Coffee Creek Pattern Book. By restricting the primary entrance to 24 feet in width, the form-based code requires a smaller and less noticeable gateway than what is allowed for heavy delivery vehicles. The primary entrance, and all entrances, need to be able to accommodate all modes of transportation,

especially for freight ingress and egress access of industrial complexes so that each entrance meets the objective of being obvious, clear, simple, and safe. This is important for safe maneuverability and circulation and also for when only a primary entrance is available. There is a consistent pattern for the need as the case files noted below, all applicants also requested widening the driveway widths to provide a clearer and safer entrance for the occupants.

Excerpt from Case File DB21-088
… The applicant proposes to increase the width of the southwest driveway to 50 feet to accommodate vehicle turning movements into the site from the Supporting Street, exceeding the maximum allowed width… Waivers are requested to: widen the southwest driveway from the Supporting Street to the truck circulation area on the west side of the building (Waiver 1).

Excerpt from Case File DB22-0011
Waiver to Coffee Creek Industrial Design Overlay District Standards The applicant requests to waive the driveway width standards from the Coffee Creek Design Overlay District for the east site access from the Supporting Street. This driveway is proposed to be 40 feet wide to accommodate truck turning movements into the site from the Supporting Street. This requires a waiver from Subsection 4.134 (.11) Table CC-3 1. Parcel Access/Parcel Driveway Width/Supporting Streets, which allows a driveway width of 24 feet maximum or compliance with the Supporting Street standards… The applicant states the rationale for requesting this waiver as follows: the 40-foot-wide driveway is necessary to accommodate truck operations for turning requirements, movement, circulation, and safety considerations.

Proposal 3:
The current NWI zone standards for entrance sidewalks of 8 feet is excessive. Many of these entrances will see little traffic. This has been alluded to in Case File DB20-2022 with relation to the short-term visitor parking. Similarly, a wider entrance path will see little visitor use compared to its size. Most of the traffic will be from tenant employees.

Excerpt from Case File DB22-0007
Request D
… an industrial facility of the type and size proposed typically has relatively few short-term visitors. Therefore, prohibiting employees from parking within the north parking area would reserve an excessive number of parking spaces for a non-existent user group, which would be wasteful and inefficient…

Proposal 4 & 5:
The limitation to parking along addressing streets is not conducive to buildings with multiple primary entrances and a density mix of employees and visitors across multiple industrial uses. Additionally, reserving 50% of addressing street parking for short-term, visitor, and disabled is excessive. The OSSC (Oregon Structural Specialty Code) already provides provisions for the number of required disabled parking spaces as outlined in OSSC table 1106.2. Such reserved spaces limit the accessibility of a building's regular occupants and is otherwise wasteful. Providing visitor parking and disabled parking at a 10% ratio is better aligned with the OSSC's accessibility requirements and the average anticipated visitor amount for the building use types. Restricting the number of parking along

an addressing street also creates unsafe site conditions as building occupants and visitors unfamiliar with the site are required to navigate truck maneuvering areas and loading docks. As outlined in the below case files, it is not practically feasible to locate the majority of the parking away from the front entrance and in some cases would prohibit persons with disabilities from accessing the building.

Excerpt from Case File DB20-2022
Waivers to Coffee Creek Industrial Design Overlay District Standards
…with a public entrance at each corner of the building and loading berths in between, it is not practically feasible to locate the short term and ADA parking in a single bay on the SW Clutter Street frontage as allowed by the Development Code, as it would require visitors to walk a significant distance and navigate the circulation areas for the trucks to get to the other building entrance. Locating the parking spaces in two separate parking bays requires a waiver from the Site Design standards.

Excerpt from Case File DB22-0007
Request D
The applicant requests to waive the vehicle parking area design standards from the Coffee Creek Design Overlay District. Subsection 4.134 (.11), Table CC-3, 4. Parking Location and Extent/Addressing Streets allows 16 spaces maximum with an adjustment to 20 spaces on an Addressing Street. This parking is limited to one double-loaded bay to be designated for short-term (1 hour of less), visitor, and disabled parking only between the right-of-way of the Addressing Street and building… The applicant proposes 15 vehicle parking spaces on the north side of the building between the building and Addressing Street SW Day Road, which is less than the maximum of 16 spaces. However, the applicant proposes to designate nine (9) of the 15 spaces for employees, which is not permitted by the standard, thus requiring a waiver. The applicant states the rationale for requesting this waiver as summarized below:
The configuration is proposed because the northwest corner of the building, closest to SW Day Road, is where the primary building entrance and office endcap is located. This corner, therefore, will be immediately visible to any motorist entering the driveway and the northern parking area will be conveniently located for use by visitors. Two (2) ADA accessible spaces are proposed to be located closest to the main entrance; however, an industrial facility of the type and size proposed typically has relatively few short-term visitors. Therefore, prohibiting employees from parking within the north parking area would reserve an excessive number of parking spaces for a non-existent user group, which would be wasteful and inefficient… The north parking area is ideal for safe and efficient access to the building for drivers with disabilities and short-term visitors, but their number cannot reasonably be expected to reach 15 at any time. The north parking area is also the appropriate parking location for employees who work primarily in the office part of the building, located at its northwest corner. Office employees who park in the spaces provided south of the building would have to walk through the warehouse to reach the office area. Further, a pedestrian walkway along the west side of the building is not feasible as it is the primary loading area for trucks. Therefore, it is reasonable to allow office staff to park in the north parking area, while meeting the intent of the standard by designating an appropriate number of spaces for short-term/visitor use.

Proposal 6, 7, & 8:

The requirement for stepping a retaining wall can have adverse effects on the site as a whole. Stepping retracts more from a site's usable area and could push buildings deeper into the site than desired. It would also reduce their usable footprint. *Industrial building types typically need extensive, relatively flat surfaces for buildings, parking lots, service yards, access lanes, and truck maneuvering areas.* - Page 24 of the Coffee Creek Pattern Book. By expanding the language for grading and retaining walls to allow for reveals, patterns, or other techniques, in the horizontal plane, it provides an additional means to comply with the form-based code and meets the design intent.

Similarly, offsetting the retaining wall horizontally because of wall lengths can have adverse impacts to the site's usable area. Adding additional language to the retaining wall design will allow for greater flexibility and provide clearer language that is in line with the NWI Standard design intent. Sometimes it is not practically feasible to provide a tiered design, as noted in the case files below, the applicants faced a similar situation and requested waivers from the form-based code.

Excerpt from Case File DB22-0007
The applicant requests to waive the maximum retaining wall height standard from the Coffee Creek Design Overlay District. Subsection 4.134 (.11), Table CC-3, 5. Grading and Retaining Walls/Maximum Height/Addressing Streets requires landscape retaining walls to be a maximum of 48 inches tall; there is an allowed adjustment of 20% to 57.6 inches…
The retaining wall is proposed to exceed four (4) feet in height over a span of approximately 785 feet, including roughly 182 feet in the north, 450 feet in the center, and 153 feet in the south sections. The wall height varies from grade at the west extent of the north wall to 18.7 feet at the northeast corner of the wall, 18.7 feet along the entire eastern (central) segment to the southeast corner, and descending to grade at the west extent of the south wall…
The applicant provides detailed rationale for requesting this waiver as summarized below:
Tapman Creek flows from north to south through the site within the SROZ, with a required 50-foot vegetated corridor (protective buffer) on both sides of this wetland resource. The larger part of the property's upland developable area is located east of the Tapman Creek corridor. This area has an east-west dimension between roughly 555 and 600 feet and increases in grade from about 244 feet at the west (along the Tapman Creek 50-foot buffer edge) to 285 feet along the east property boundary. This 41-foot vertical difference results in an overall cross-slope of about 7.1%, which is incompatible with development of a large-floor industrial building that generally requires flat floors (zero percent slope) with egress or fire/emergency access doors at multiple locations around the perimeter. In addition, operational areas for semi-truck and trailer circulation should not exceed a cross-slope of 3%. In this context, creating a pad area capable of supporting industrial use at scale requires cutting into the uphill side of the subject site and filling on the downhill side, to form a sufficiently level platform area of adequate size for the proposed use.

Proposal 9:
Current development standards do not provide clear guidelines for buildings designed with multiple building entrances or where there may be multiple businesses within the development. The proposal uses language already found in the Oregon Energy Efficiency Specialty Code (OEESC) and the Oregon Structural Specialty Code (OSSC) to clearly define the Primary Building Entrance and align with the Development Code design intent.

OSSC – Public Entrance: An entrance that is not a service entrance or a restricted entrance.
OEESC – Any doorway, set of doors, revolving door, vestibule, or other form of portal that is ordinarily used to gain access to the building or to exit from the building by its users and occupants. This does not included doors solely used to directly enter mechanical, electrical, and other building utility service equipment rooms.

Proposal 10:
For large parcels, where there may be multiple buildings with multiple entrances, it is not always possible to provide all primary entrances with visibility to the Addressing Street. Instead, by requiring the Primary Entrance to be visible from the Primary Frontage, it provides a more clear objective as Table NWI-4: Site Design already defines Primary Frontage. This change in code clears up the conflicting information found in the *Accessible Entrance Section* and is more in line with Figure NWI-6 – Connection Hierarchy which shows a clear and understandable design intent for buildings without Addressing Street Frontage.

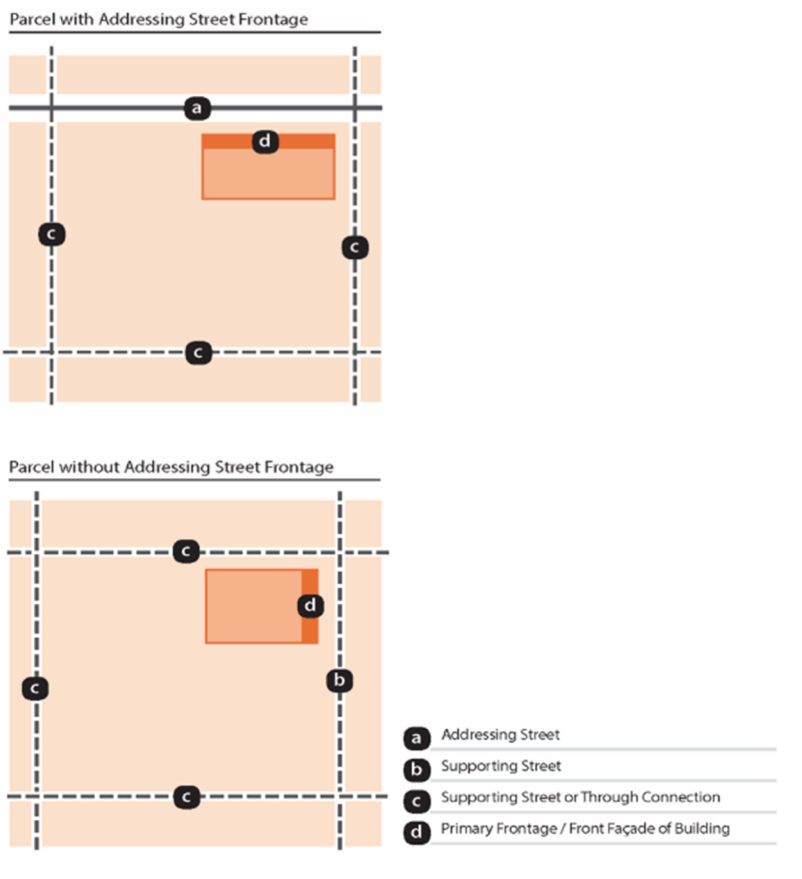

Figure NWI-6 - Connection Heriarchy and Primary Frontage

Proposals 11 & 12:
The driving point for this proposal is due to an issue in the design code. As Described in Table NWI-4: Site Design 4. Parking Location and Design: *Parking is permitted between right-of-way and of*

Supporting Street and building. *Parking Setback for Supporting Streets shall be 15 feet from the right-of-way of a Supporting Streets.* Then, as described in Table NWI-5: Building Design 3. Overall Building Massing: *Supporting Streets shall have a maximum setback of 30 feet.* This leaves 15 feet of available space for parking areas. Parking stalls are typically 18 feet in depth with 24 foot travel lanes for two-way traffic. Double-loaded parking areas will have another 18 feet in depth for the additional row of parking. The total depth that a parking area will occupy is 60 feet. Any parking area proposed is automatically in excess of 45 feet according to the form-based code. The recommendation is to revise the Building Setbacks for Supporting Streets and Through Connections to 20 feet minimum and 10 feet minimum respectively.

4. Parking Location and Design			
General	Unless noted otherwise below, the following provisions apply: • Section 4.155 (03) Minimum and Maximum Off-Street Parking Requirements • Section 4.155 (04) Bicycle Parking • Section 4.155 (06) Carpool and Vanpool Parking Requirements • Section 4.176 for Parking Perimeter Screening and Landscaping—permits the parking landscaping and screening standards as multiple options The following Development Standards are adjustable: • Parking Location and Extent: up to 20 spaces permitted on an Addressing Street		
Parking Location and Extent	Limited to 16 spaces, maximum. 50% of spaces designated for short-term (1 hour or less), visitor, and disabled parking only between right-of-way of Addressing Street and building.	Parking is permitted between right-of-way of Supporting Street and building.	Parking is permitted between right-of-way of Through Connection and building.
Parking Setback	20 feet minimum from the right-of-way of an Addressing Street.	15 feet minimum from the right-of-way of a Supporting Street.	10 feet minimum from the right-of-way of a Through Connection.
Parking Lot Sidewalks	Where off-street parking areas are designed for motor vehicles to overhang beyond curbs, sidewalks adjacent to the	Where off-street parking areas are designed for motor vehicles to overhang beyond curbs, planted areas adjacent to the curbs shall be increased to a minimum of nine (9) feet in depth.	
	curbs shall be increased to a minimum of seven (7) feet in depth.		
Parking Perimeter Screening and Landscaping	Screen parking area from view from Addressing Streets and Supporting Streets by means of one or more of the following: a. General Landscape Standard, Section 4.176 (.02) C. b. Low Berm Standard, Section 4.176 (.02) E., except within 50 feet of a perpendicular Supporting Street or Through Connection as measured from the centerline.		Screen parking area from view from Through Connections by means of a. Low Screen Landscape Standard, Section 4.176(.02) D., or b. High Screen Landscaping Standard, Section 4.176(.02)F., or c. High Wall Standard, Section 4.176(.02)G., or d. Partially Sight-obscuring Fence Standard, Section 4.176(.02)I.

Table NWI-5: Building Design			
	Addressing Streets	**Supporting Streets**	**Through Connections**
1. Building Orientation			
Front Façade	Buildings shall have one designated front façade and two designated side façades. If one of the streets or connections bounding a parcel is an Addressing Street, the front façade of the building shall face the Addressing Street. If two of the streets or connections bounding a parcel are Addressing Streets, the front façade of the building may face either Addressing Street, except when one of the Addressing Streets is Day Road. In that case, the front façade must face Day Road. If none of the bounding streets or connections is an Addressing Street, the front façade of the building shall face a Supporting Street. See Figure NWI-6.		
Length of Front Façade	A minimum of 100 feet of the Primary Frontage shall be occupied by a building. The maximum Primary Frontage occupied by a building shall be limited only by required side yard setbacks.		
Articulation of Front Façade	Applies to a Front Façade longer than 175 feet that has more than 5,250 square feet of street-facing façade area: At least 10% of the street-facing façade of a building facing an Addressing Street must be divided into façade planes that are offset by at least 2 feet from the rest of the façade. Façade area used to meet this standard may be recessed behind, or project out from, the primary façade plane.		
3. Overall Building Massing			
General	The following Development Standards are adjustable: • Required Minimum Height: 10% • Ground Floor Height: 10% • Base, Body, and Top Dimensions: 10% • Base Design: 10% • Top Design: 10%		
Front Setback	30 feet, minimum, except as provided below	30 feet maximum	30 feet maximum

Proposal 13:
Typical setback requirements for industrial zones is between 0 and 15 feet if adjacent to other industrial zones. This proposal would align the city's setback requirements with other jurisdictions.

City of Portland Title 33, Planning and Zoning
33.140.215 Setbacks, Lot Line Setbacks for IG1, IG2, IH: 0 feet

City of Newberg Municipal Code Title 15, Development Code
15.410.030 Interior Yard Setback: Industrial and Mixed Employment. All lots or development sites in the AI, M-1, M-2, M-3, M-4, M-5, and M-E districts shall have no interior yards where said lots or development sites abut property lines of commercially or industrially zoned property. When interior lot lines of said districts are common with property zoned residential, institutional, or community facilities, interior yards of not less than 10 feet shall be required opposite the residential, institutional, or community facilities districts.

Proposal 15:
The draft NWI Standard did not include allowed uses for the Basalt Creek area. These proposed uses provide the greatest level of flexibility for the Basalt Creek and Coffee Creek areas. By restricting uses to a specific user group, the pool of prospective tenants will be very limited and many will be required to look elsewhere to meet their needs.

Proposal 16:
Typical large format buildings regularly exceed lengths of 600 linear feet as indicated in exhibit A. It is not always possible for an existing parcel to exceed these lengths along an addressing street. By waiving the required frontage hierarchy for parcels less than 650 linear feet, the site can retain its flexibility for these large footprint buildings.
